A common globe, of 12 inches diameter, has generally 24 meridian ſemicircles drawn upon it. If ſuch a globe be elevated to the latitude of any given place, and turned about until one of theſe meridians cut the horizon in the north point, where the hour of XII is ſuppoſed to be marked, the reſt of the meridians will cut the horizon at the reſpective diſtances of all the other hours from XII. Then if theſe points of diſtance be marked on the horizon, and the globe be taken out of the horizon, and a flat board or plate be put into its place, even with the ſurface of the horizon; and if ſtraight lines be drawn from the center of the board, to thoſe points of diſtance on the horizon which were cut by the 24 meridian ſemicircles, theſe lines will be the hour-lines of a horizontal dial for that latitude, the edge of whoſe gnomon muſt be in the very ſame ſituation that the axis of the globe was, before it was taken out of the horizon: that is, the gnomon muſt make an angle with the plain of the dial, equal to the latitude of the place for which the dial is made.

If the pole of the globe be elevated to the co-latitude of the given place, and any meridian be brought to the north point of the horizon, the reſt of the meridians will cut the horizon in the reſpective diſtances of all the hours from XII, for a direct ſouth dial, whoſe gnomon muſt be an angle with the plane of the dial, equal to the co-latitude of the place; and the hours muſt be ſet the contrary way on this dial to what they are on the horizontal.

But if your globe have more than 24 meridian ſemicircles upon it, you muſt take the following method for making *horizontal* and *ſouth dials*.

Elevate the pole to the latitude of your place, and turn the globe until any particular meridian (ſuppoſe the firſt) comes to the north point of the horizon, and the oppoſite meridian will cut the horizon in the ſouth. Then, ſet the hour-index to the uppermoſt XII on its circle;

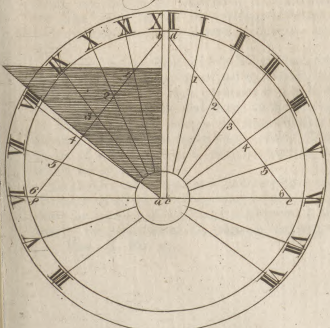

Fig. 6.

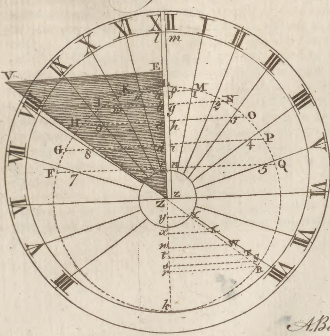

A. Bell. Sculp.t

circle; which done, turn the globe westward until 15 degrees of the equator pass under the brasen meridian, and then the hour-index will be at I (for the sun moves 15 degrees every hour) and the first meridian will cut the horizon in the number of degrees from the north point, that I is distant from XII. Turn on, until other 15 degrees of the equator pass under the brasen meridian, and the hour-index will then be at II, and the first meridian will cut the horizon in the number of degrees that II is distant from XII: and so, by making 15 degrees of the equator pass under the brasen meridian for every hour, the first meridian of the globe will cut the horizon in the distances of all the hours from XII to VI, which is distant just 90 degrees; and then you need go no farther, for the distances of XI, X, IX, VIII, VII, and VI, in the forenoon, are the same from XII, as the distances of I, II, III, IIII, V, and VI, in the afternoon: and these hour-lines continued through the center, will give the opposite hour-lines on the other half of the dial.

Thus, to make a horizontal dial for the latitude of London, which is $51\frac{1}{2}$ degrees north, elevate the north pole of the globe $51\frac{1}{2}$ degrees above the north point of the horizon, and then turn the globe, until the first meridian (which is that of London on the English terrestrial globe) cuts the north point of the horizon, and set the hour-index to XII at noon.

Then turning the globe westward until the index points successively to I, II, III, IIII, V, and VI, in the afternoon, or until 15, 30, 45, 60, 75, and 90 degrees of the equator pass under the brasen meridian, you will find that the first meridian of the globe cuts the horizon in the following numbers of degrees from the north towards the east, *viz.* $11\frac{2}{3}$, $24\frac{1}{4}$, $38\frac{1}{12}$, $53\frac{1}{2}$, $71\frac{1}{7}$, and 90; which are the respective distances of the above hours from XII upon the plane of the horizon.

To transfer these, and the rest of the hours, to a horizontal plane, draw the parallel right lines *a c* and *d b*, (Plate LXIX. fig. 3.) upon that plane, as far from each other as is equal to the intended thickness of the gnomon or stile of the dial, and the space included between them will be the meridian or twelve o'clock line on the dial. Cross this meridian at right angles with the six o'clock line *g h*, and setting one foot of your compasses in the intersection *a*, as a center, describe the quadrant *g e* with any convenient radius or opening of the compasses: then, setting one foot in the intersection *b*, as a center, with the same radius describe the quadrant *f h*, and divide each quadrant into 90 equal parts or degrees, as in the figure.

Because the hour-lines are less distant from each other about noon, than in any other part of the dial, it is best to have the centers of these quadrants at a little distance from the center of the dial-plane, on the side opposite to XII, in order to enlarge the hour-distances thereabouts, under the same angles on the plane. Thus, the center of the plane is at *C*, but the centers of the quadrants are at *a* and *b*.

Lay a ruler over the point *b* (and keeping it there for the center of all the afternoon hours in the quadrant *f h*) draw the hour-line of I through $11\frac{2}{3}$ degrees in the quadrant; the hour-line of II, through $24\frac{1}{4}$ degrees; of III, through $38\frac{1}{12}$ degrees; IIII, through $53\frac{1}{2}$; and V, through $71\frac{1}{17}$: and because the sun rises about four in the morning, on the longest days at London, continue the hour-lines of IIII and V in the afternoon through the center *b* to the opposite side of the dial.—This done, lay the ruler to the center *a* of the quadrant *e g*, and through the like divisions or degrees of that quadrant, *viz.* $11\frac{2}{3}$, $24\frac{1}{4}$, $38\frac{1}{12}$, $53\frac{1}{2}$, and $71\frac{1}{17}$, draw the forenoon hour-lines of XI, X, IX, VIII, and VII; and because the sun sets not before eight in the evening on the longest days, continue the hour-lines of VII and VIII in the forenoon, through the center *a*, to VII and VIII in the afternoon; and all the hour-lines will be finished on this dial; to which the hours may be set, as in the figure.

Lastly, through $51\frac{1}{2}$ degrees of either quadrant, and from its center, draw the right line *a g* for the hypothenuse or axis of the gnomon *a g i*; and from *g*, let fall the perpendicular *g i*, upon the meridian line *a i*, and there will be a triangle made, whose sides are *a g*, *g i*, and *i a*. If a plate similar to this triangle be made as thick as the distance between the lines *a c* and *b d*, and set upright between them, touching at *a* and *b*, its hypothenuse *a g* will be parallel to the axis of the world, when the dial is truly set; and will cast a shadow on the hour of the day.

N. B. The trouble of dividing the two quadrants may be saved, if you have a scale with a line of chords upon it, such as that on the top of Plate LXX.: for if you extend the compasses from 0 to 60 degrees of the line of chords, and with that extent, as a radius, describe the two quadrants upon their respective centers, the above distances may be taken with the compasses upon the line, and set off upon the quadrants.

To make an erect direct south dial, Plate LXIX. fig. 4. Elevate the pole to the co-latitude of your place, and proceed in all respects as above taught for the horizontal dial, from VI in the morning to VI in the afternoon, only the hours must be reversed, as in the figure; and the hypothenuse *a g* of the gnomon *a g f*, must make an angle with the dial-plane equal to the co-latitude of the place. As the sun can shine no longer on this dial than from six in the morning until six in the evening, there is no occasion for having any more than twelve hours upon it.

To make an erect dial, declining from the south towards the east or west. Elevate the pole to the latitude of your place, and screw the quadrant of altitude to the zenith. Then, if your dial declines towards the east (which we shall suppose it to do at present) count in the horizon the degrees of declination, from the east point towards the north, and bring the lower end of the quadrant to that degree of declination at which the reckoning ends. This done, bring any particular meridian of your globe (as suppose the first meridian) directly under the graduated edge of the upper part of the brazen meridian, and set the hour-index to XII at noon. Then, keeping the quadrant of altitude at the degree of declination in the horizon, turn the globe eastward on its axis, and observe the degrees cut by the first meridian in the quadrant of altitude (counted from the zenith) as the hour index comes to

to XI, X, IX, &c. in the forenoon, or as 15, 30, 45, &c. degrees of the equator paſs under the brazen meridian at theſe hours reſpectively; and the degrees then cut in the quadrant by the firſt meridian, are the reſpective diſtances of the forenoon hours from XII on the plane of the dial.——Then, for the afternoon hours, turn the quadrant of altitude round the zenith until it comes to the degree in the horizon oppoſite to that where it was placed before: namely, as far from the weſt point of the horizon towards the ſouth, as it was ſet at firſt from the eaſt point towards the north; and turn the globe weſtward on its axis, until the firſt meridian comes to the brazen meridian again, and the hour-index to XII: then, continue to turn the globe weſtward, and as the index points to the afternoon hours I, II, III, &c. or as 15, 30, 45, &c. degrees of the equator paſs under the brazen meridian, the firſt meridian will cut the quadrant of altitude in the reſpective number of degrees from the zenith that each of theſe hours is from XII on the dial.——And note, that when the firſt meridian goes off the quadrant at the horizon in the forenoon, the hour-index ſhews the time when the ſun will come upon this dial: and when it goes off the quadrant in the afternoon, the index will point to the time when the ſun goes off the dial.

Having thus found all the hour-diſtances from XII, lay them down upon your dial plane, either by dividing a ſemicircle into two quadrants of 90 degrees each (beginning at the hour-line of XII) or by the line of chords, as above directed.

In all declining dials, the line on which the ſtile or gnomon ſtands (commonly called the *ſubſtile-line*) makes an angle with the twelve o'clock line, and falls among the forenoon hour-lines, if the dial declines towards the eaſt; and among the afternoon hour-lines, when the dial declines towards the weſt; that is, to the left hand from the twelve o'clock line in the former caſe, and to the right hand from it in the latter.

To find the diſtance of the ſubſtile from the twelve o'clock line; if your dial declines from the ſouth toward the eaſt, count the degrees of that declination in the horizon from the eaſt point toward the north, and bring the lower end of the quadrant of altitude to that degree of declination where the reckoning ends: then, turn the globe until the firſt meridian cuts the horizon in the like number of degrees, counted from the ſouth point toward the eaſt; and the quadrant and firſt meridian will then croſs one another at right angles, and the number of degrees of the quadrant, which are intercepted between the firſt meridian and the zenith, is equal to the diſtance of the ſubſtile line from the twelve o'clock line; and the number of degrees of the firſt meridian, which are intercepted between the quadrant and the north pole, is equal to the elevation of the ſtile above the plane of the dial.

If the dial declines weſtward from the ſouth, count that declination from the eaſt point of the horizon towards the ſouth, and bring the quadrant of altitude to the degree in the horizon at which the reckoning ends; both for finding the forenoon hours, and diſtance of the ſubſtile from the meridian: and for the afternoon hours, bring the quadrant to the oppoſite degree in the horizon, namely, as far from the weſt towards the north, and then proceed in all reſpects as above.

Thus, we have finiſhed our declining dial; and in ſo doing, we made four dials, *viz.*

1. A north dial, declining eaſtward by the ſame number of degrees. 2. A north dial, declining the ſame number weſt. 3. A ſouth dial, declining eaſt. And, 4, a ſouth dial declining weſt. Only, placing the proper number of hours, and the ſtile or gnomon reſpectively, upon each plane. For (as above mentioned) in the ſouth-weſt plane, the ſubſtilar-line falls among the afternoon hours; and in the ſouth-eaſt, of the ſame declination, among the forenoon hours, at equal diſtances from XII. and ſo, in all the morning hours on the weſt decliner, will be like the afternoon hours on the eaſt decliner: the ſouth-eaſt decliner will produce the north-weſt decliner; and the ſouth-weſt decliner, the north-eaſt decliner, by only extending the hour-lines, ſtile and ſubſtile, quite through the center: the axis of the ſtile (or edge that caſts the ſhadow on the hour of the day) being in all dials whatever parallel to the axis of the world, and conſequently pointing towards the north pole of the heaven in north latitudes, and toward the ſouth pole in ſouth latitudes.

But becauſe every one who would like to make a dial, may perhaps not be provided with a globe to aſſiſt him, and may probably not underſtand the method of doing it by logarithmic calculation; we ſhall ſhew how to perform it by the plain dialling lines, or ſcale of latitudes and hours; ſuch as thoſe on the top of Plate LXX. and which may be had on ſcales commonly ſold by the mathematical inſtrument makers.

This is the eaſieſt of all mechanical methods, and by much the beſt, when the lines are truly divided: and not only the half hours and quarters may be laid down by all of them, but every fifth minute by moſt, and every ſingle minute by thoſe where the line of hours is a foot in length.

Having drawn your double meridian line *a b*, *c d*, (Plate LXIX. fig. 5.) on the plane intended for a horizontal dial, and croſſed it at right angles by the ſix o'clock line *f e* (as in fig. 31.) take the latitude of your place with the compaſſes, in the ſcale of latitudes, and ſet that extent from *c* to *e*, and from *a* to *f*, on the ſix o'clock line: then, taking the whole ſix hours between the points of the compaſſes in the ſcale of hours, with that extent ſet one foot in the point *c*, and let the other foot fall where it will upon the meridian line *c d*, as at *d*. Do the ſame from *f* to *b*, and draw the right lines *e d* and *f b*, each of which will be equal in length to the whole ſcale of hours. This done, ſetting one foot of the compaſſes in the beginning of the ſcale at XII, and extending the other to each hour on the ſcale, lay off theſe extents from *d* to *e* for the afternoon hours, and from *b* to *f* for thoſe of the forenoon: this will divide the lines *d e* and *b f* in the ſame manner as the hour-ſcale is divided at 1, 2, 3, 4, and 6; on which the quarters may alſo be laid down, if required. Then, laying a ruler on the point *c*, draw the firſt five hours in the afternoon, from that point, through the dots at the numeral figures 1, 2, 3, 4, 5, on the line *d e*; and continue the lines of IIII and V through the center *c* to the other ſide of the dial, for the like hours of the morning: which done, lay the ruler on the point *a*, and draw the laſt five hours in the forenoon through the dots 5, 4, 3, 2,

2, 1, on the line fb; continuing the hour-lines of VII and VIII through the center a to the other side of the dial, for the like hours of the evening; and set the hours to their respective lines, as in the figure. Lastly, make the gnomon the same way as taught above for the horizontal dial, and the whole will be finished.

To make an erect south dial, take the co-latitude of your place from the scale of latitudes, and then proceed in all respects for the hour-lines, as in the horizontal dial; only reversing the hours, as in fig. 4. and making the angle of the stile's height equal to the co-latitude.

But lest the young dialist should have neither globe nor wooden scale, we shall now shew him how he may make a dial without any of these helps. Only, if he has not a line of chords, he must divide a quadrant into 90 equal parts or degrees for taking the proper angle of the stile's elevation; which is easily done.

With any opening of the compasses, as ZL, describe the two semicircles LFk and LQk, upon the centers Z and z, where the six o'clock line crosses the double meridian line, and divide each semicircle into 12 equal parts, beginning at L (though, strictly speaking, only the quadrants from L to the six o'clock line need be divided;) then connect the divisions which are equidistant from L, by the parallel lines KM, IN, HO, GP, and FQ. Draw VZ for the hypothenuse of the stile, making the angle VZE equal to the latitude of your place; and continue the line VZ to R. Draw the line Rr parallel to the six o'clock line, and set off the distance aK from Z to Y, the distance bI from Z to X, cH from Z to W, dG from Z to T, and eF from Z to S. Then draw the lines Ss, Tt, Ww, Xx, and Yy, each parallel to Rr. Set off the distance yY from a to 11, and from f to 1; the distance xX from b to 10, and from g to 2; wW from c to 9, and from h to 3; tT from d to 8, and from i to 4; sS from e to 7, and from n to 5. Then laying a ruler to the center Z, draw the forenoon hour-lines through the points 11, 10, 9, 8, 7; and laying it to the center z, draw the afternoon lines through the points 1, 2, 3, 4, 5; continuing the forenoon lines of VII and VIII through the center Z, to the opposite side of the dial, for the like afternoon hours; and the afternoon lines IIII and V through the center z, to the opposite side, for the like morning hours. Set the hours to these lines as in the figure, and then erect the stile or gnomon, and the horizontal dial will be finished.

To construct a south dial, draw the line VZ, making an angle with the meridian ZL equal to the co-latitude of your place; and proceed in all respects as in the above horizontal dial for the same latitude, reversing the hours as in fig. 4. and making the elevation of the gnomon equal to the co-latitude.

Perhaps it may not be unacceptable to explain the method of constructing the dialing lines, and some others; which is as follows.

With any opening of the compasses, (Plate LXX. fig. 1.) as EA, according to the intended length of the scale, describe the circle $ADCB$, and cross it at right angles by the diameters CEA and DEB. Divide the quadrant AB first into 9 equal parts, and then each part into 10; so shall the quadrant be divided into 90 equal parts or degrees. Draw the right line AFB for the chord of this quadrant, and setting one foot of the compasses in the point A, extend the other to the several divisions of the quadrant, and transfer these divisions to the line AFB by the arcs 10, 10, 20, 20, &c. and this will be a line of chords, divided into 90 unequal parts; which, if transferred from the line back again to the quadrant, will divide it equally. It is plain by the figure, that the distance from A to 60 in the line of chords, is just equal to AE, the radius of the circle from which that line is made; for if the arc 60, 60 be continued, of which A is the center, it goes exactly through the center E of the arc AB.

And therefore, in laying down any number of degrees on a circle, by the line of chords, you must first open the compasses so, as to take in just 60 degrees upon that line, as from A to 60: and then, with that extent, as a radius, describe a circle, which will be exactly of the same size with that from which the line was divided: which done, set one foot of the compasses in the beginning of the chord line, as at A, and extend the other to the number of degrees you want upon the line; which extent, applied to the circle, will include the like number of degrees upon it.

Divide the quadrant CD into 90 equal parts, and from each point of division draw right lines, as i, k, l, &c. to the line CE; all perpendicular to that line, and parallel to DE, which will divide EC into a line of sines; and although these are seldom put among the dialing lines on a scale, yet they assist in drawing the line of latitudes. For if a ruler be laid upon the point D, and over each division in the line of sines, it will divide the quadrant CB into 90 unequal parts, as Ba, Bb, &c. shewn by the right lines 10a, 20b, 30c, &c. drawn along the edge of the ruler. If the right line BC be drawn, subtending this quadrant, and the nearest distances Ba, Bb, Bc. &c. be taken in the compasses from B, and set upon this line in the same manner as directed for the line of chords, it will make a line of latitudes BC, equal in length to the line of chords AB, and of an equal number of divisions, but very unequal as to their lengths.

Draw the right line DGA, subtending the quadrant DA; and parallel to it, draw the right line rs, touching the quadrant DA at the numeral figure 3. Divide this quadrant into six equal parts, as 1, 2, 3, &c. and through these points of division draw right lines from the centre E to the line rs, which will divide it at the points where the six hours are to be placed, as in the figure. If every sixth part of the quadrant be subdivided into four equal parts, right lines drawn from the centre through these points of division, and continued to the line rs, will divide each hour upon it into quarters.

In Fig. 2. Plate LXX. we have the representation of a portable dial, which may be easily drawn on a card, and carried in a pocket-book. The lines ad, ab, and bc of the gnomon must be cut quite through the card; and as the end ab of the gnomon is raised occasionally above the plane of the dial, it turns upon the uncut line cd as on a hinge. The line dotted AB must be slit quite through the card, and the thread C must be put through the slit, and have a knot tied behind, to keep it from being easily drawn out. On the other end of this thread

thread is a ſmall plummet *D*, and on the middle of it a ſmall bead for ſhewing the hour of the day.

To rectify this dial, ſet the thread in the ſlit right againſt the day of the month, and ſtretch the thread from the day of the month over the angular point where the curve-lines meet at XII; then ſhift the bead to that point on the thread, and the dial will be rectified.

To find the hour of the day, raiſe the gnomon (no matter how much or how little) and hold the edge of the dial next the gnomon towards the ſun, ſo as the uppermoſt edge of the ſhadow of the gnomon may juſt cover the *ſhadow-line;* and the bead then playing freely on the face of the dial, by the weight of the plummet, will ſhew the time of the day among the hour-lines, as it is forenoon or afternoon.

To find the time of ſun-riſing and ſetting, move the thread among the hour-lines, until it either covers ſome one of them, or lies parallel betwixt any two; and then it will cut the time of ſun-riſing among the forenoon hours, and of ſun-ſetting among the afternoon hours, for that day of the year to which the thread is ſet in the ſcale of months.

To find the ſun's declination, ſtretch the thread from the day of the month over the angular point at XII, and it will cut the ſun's declination, as it is north or ſouth, for that day, in the proper ſcale.

To find on what days the ſun enters the ſigns: when the bead, as above rectified, moves along any of the curve-lines which have the ſigns of the zodiac marked upon them, the ſun enters thoſe ſigns on the days pointed out by the thread in the ſcale of months.

The conſtruction of this dial is very eaſy, eſpecially if the reader compares it all along with fig. 3. as he reads the following explanation of that figure.

Draw the occult line, (Plate LXX. fig. 9.) *AB* parallel to the top of the card, and croſs it at right angles with the ſix o'clock line *ECD*; then upon *C*, as a centre, with the radius *CA*, deſcribe the ſemicircle *AEL*, and divide it into 12 equal parts (beginning at *A*) as *Ar*, *As*, &c. and from theſe points of diviſion draw the hour-lines *r*, *s*, *t*, *u*, *v*, *E*, *w*, and *x*, all parallel to the ſix o'clock line *EG*. If each part of the ſemicircle be ſubdivided into four equal parts, they will give the half-hour lines and quarters, as in fig. 2. Draw the right-line *ASDo*, making the angle *SAB* equal to the latitude of your place. Upon the centre *A* deſcribe the arch *RST*, and ſet off upon it the arcs *SR* and *ST*, each equal to $23\frac{1}{2}$ degrees, for the ſun's greateſt declination; and divide them into $23\frac{1}{2}$ equal parts, as in fig. 2. Through the interſection *D* of the lines *ECD* and *ADo*, draw the right line *FDG* at right angles to *ADo*. Lay a ruler to the points *A* and *R*, and draw the line *ARF* through $23\frac{1}{2}$ degrees of ſouth declination in the arc *SR*; and then laying the ruler to the points *A* and *T*, draw the line *ATG* through $23\frac{1}{2}$ degrees of north declination in the arc *ST*: ſo ſhall the lines *ARF* and *ATG* cut the line *FDG* in the proper length for the ſcale of months. Upon the centre *D*, with the radius *DE*, deſcribe the ſemicircle *FoG*; which divide into ſix equal parts, *Fm*, *mn*, *no*, &c. and from theſe points of diviſion draw the right lines *mh*, *ni*, *pk*, and *ql*, each parallel to *oD*. Then ſetting one foot of the compaſſes in the point *F*, extend the other to *A*, and deſcribe the arc *AzH* for the tropic of ♑: with the ſame extent, ſetting one foot in *G*, deſcribe the arc *AEO* for the tropic of ♋. Next ſetting one foot in the point *h*, and extending the other to *A*, deſcribe the arc *ACI* for the beginnings of the ſigns ♒ and ♐; and with the ſame extent, ſetting one foot in the point *l*, deſcribe the arc *AN* for the beginnings of the ſigns ♊ and ♌. Set one foot in the point *i*, and having extended the other to *A*, deſcribe the arc *AK* for the beginnings of the ſigns ♓ and ♏; and with the ſame extent, ſet on foot in *k*, and deſcribe the arc *HM* for the beginnings of the ſigns ♉ and ♍. Then ſetting one foot in the point *D*, and extending the other to *A*, deſcribe the curve *AL* for the beginnings of ♈ and ♎; and the ſigns will be finiſhed. This done, lay a ruler from the point *A* over the ſun's declination in the arch *RST*; and where the ruler cuts the line *FDG*, make marks; and place the days of the months right againſt theſe marks, in the manner ſhewn by fig. 2. Laſtly, draw the ſhadow-line *PQ* parallel to the occult line *AB*; make the gnomon, and ſet the hours to their reſpective lines, as in fig. 2. and the dial will be finiſhed.

There are ſeveral kinds of dials, which are called *univerſal*, becauſe they ſerve for all latitudes. Of theſe, the beſt is Mr Pardie's, (Plate LXX. fig. 4.) which conſiſts of three principal parts; the firſt whereof is called the horizontal plane (*A*), becauſe in practice it muſt be parallel to the horizon. In this plane is fixed an upright pin, which enters into the edge of the ſecond part *BD*, called the meridional plane; which is made of two pieces, the loweſt whereof (*B*) is called the quadrant, becauſe it contains a quarter of a circle, divided into 90 degrees; and it is only into this part, near *B*, that the pin enters. The other piece is a ſemicircle (*D*) adjuſted to the quadrant, and turning in it by a groove, for raiſing or depreſſing the diameter (*EF*) of the ſemicircle, which diameter is called the axis of the inſtrument. The third piece is a circle (*G*), divided on both ſides into 24 equal parts, which are the hours. This circle is put upon the meridional plane ſo, that the axis (*EF*) may be perpendicular to the circle, and the point *C* be the common centre of the circle, ſemicircle, and quadrant. The ſtraight edge of the ſemicircle is chamfered on both ſides to a ſharp edge, which paſſes through the centre of the circle. On one ſide of the chamfered part, the firſt ſix months of the year are laid down, according to the ſun's declination for their reſpective days, and on the other other ſide the laſt ſix months. And againſt the days on which the ſun enters the ſigns, there are ſtraight lines drawn upon the ſemicircle, with the characters of the ſigns marked upon them. There is a black line drawn along the middle of the upright edge of the quadrant, over which hangs a thread (*H*), with its plummet (*I*), for levelling the inſtrument. *N. B.* From the twenty-third of September to the twentieth of March, the upper ſurface of the circle muſt touch both the centre *C* of the ſemicircle, and the line of ♈ and ♎; and from the twentieth of March to the twenty-third of September, the lower ſurface of the circle muſt touch that centre and line.

A Bell Sc.

To find the time of the day by this dial. Having set it on a level place in sun-shine, and adjusted it by the leveling screws *k* and *l*, until the plumb-line hangs over the black line upon the edge of the quadrant, and parallel to the said edge; move the semicircle in the quadrant, until the line of ♈ and ♎ (where the circle touches) comes to the latitude of your place in the quadrant: then turn the whole meridional plane *BD*, with its circle *G*, upon the horizontal plane *A*, until the edge of the shadow of the circle falls precisely on the day of the month in the semicircle; and then, the meridional plane will be due north and south, the axis *EF* will be parallel to the axis of the world, and will cast a shadow upon the true time of the day, among the hours on the circle.

N. B. As, when the instrument is thus rectified, the quadrant and semicircle are in the plane of the meridian, so the circle is then in the plane of the equinoctial. Therefore, as the sun is above the equinoctial in summer (in northern latitudes) and below it in winter; the axis of the semicircle will cast a shadow on the hour of the day, on the upper surface of the circle, from the twentieth of March to the twenty-third of September: and from the twenty-third of September to the twentieth of March, the hour of the day will be determined by the shadow of the semicircle, upon the lower surface of the circle. In the former case, the shadow of the circle falls upon the day of the month, on the lower part of the diameter of the semicircle; and in the latter case, on the upper part.

The method of laying down the months and signs upon the semicircle is as follows. Draw the right line *ACB*, equal to the diameter of the semicircle *ADB*, and cross it in the middle at right angles with the line *ECD*, equal in length to *ADB*; then *EC* will be the radius of the circle *FCG*, which is the same as that of the semicircle. Upon *E*, as a centre, describe the circle *FCG*, on which set off the arcs *Ch* and *Ci*, each equal to $23\frac{1}{2}$ degrees, and divide them accordingly into that number, for the sun's declination. Then, laying the edge of a ruler over the centre *E*, and also over the sun's declination for every fifth day of each month (as in the card dial) mark the points on the diameter *AB* of the semicircle from *a* to *g*, which are cut by the ruler; and *there* place the days of the months accordingly, answering to the sun's declination. This done, setting one foot of the compasses in *C*, and extending the other to *a* or *g*, describe the semicircle *a b c d e f g*; which divide into six equal parts, and through the points of division draw right lines, parallel to *CD*, for the beginning of the signs (of which one half are on one side of the semicircle, and the other half on the other) and set the characters of the signs to their proper lines, as in the figure.

Having shewn how to make sun-dials by the assistance of a good globe, or of a dialing-scale, we shall now proceed to the method of constructing dials arithmetically; which will be more agreeable to those who have learned the elements of trigonometry, because globes and scales can never be so accurate as the logarithms in finding the angular distances of the hours. Yet, as a globe may be found exact enough for some other requisites in dialing, we shall take it in occasionally.

The construction of sun-dials on all planes whatever, may be included in one general rule: intelligible, if that of a horizontal dial for any given latitude be well understood. For there is no plane, however obliquely situated with respect to any given place, but what is parallel to the horizon of some other place; and therefore, if we can find that other place by a problem on the terrestrial globe, or by a trigonometrical calculation, and construct a horizontal dial for it; that dial, applied to the plane where it is to serve, will be a true dial for that place.——Thus, an erect direct south dial in $51\frac{1}{2}$ degrees north latitude, would be a horizontal dial on the same meridian, 90 degrees southward of $51\frac{1}{2}$ degrees north latitude; which falls in with $38\frac{1}{2}$ degrees of south latitude. But if the upright plane declines from facing the south at the given place, it would still be a horizontal plane 90 degrees from that place, but for a different longitude, which would alter the reckoning of the hours accordingly.

CASE I.

1. Let us suppose, that an upright plane at London declines 36 degrees westward from facing the south; and that it is required to find a place on the globe, to whose horizon the said plane is parallel; and also the difference of longitude between London and that place.

Rectify the globe to the latitude of London, and bring London to the zenith under the brass meridian, then that point of the globe which lies in the horizon at the given degree of inclination (counted westward from the south point of the horizon) is the place at which the above-mentioned plane would be horizontal.——Now, to find the latitude and longitude of that place, keep your eye upon the place, and turn the globe eastward, until it comes under the graduated edge of the brass meridian; then, the degrees of the brass meridian that stands directly over the place, is its latitude; and the number of degrees in the equator, which are intercepted between the meridian of London and the brass meridian, is the place's difference of longitude.

Thus, as the latitude of London is $51\frac{1}{2}$ degrees north, and the declination of the place is 36 degrees west; elevate the north pole $51\frac{1}{2}$ degrees above the horizon, and turn the globe until London comes to the zenith, or under the graduated edge of the meridian; then count 36 degrees on the horizon westward from the south point, and make a mark on that place of the globe over which the reckoning ends, and bringing the mark under the graduated edge of the brass meridian, it will be found to be under $30\frac{1}{4}$ degrees in south latitude: keeping it there, count in the equator the number of degrees between the meridian of London and the brasen meridian (which now becomes the meridian of the required place) and you will find it to be $42\frac{3}{4}$. Therefore an upright plane at London, declining 36 degrees westward from the south, would be a horizontal plane at that place, whose latitude is $30\frac{1}{4}$ degrees south of the equator, and longitude $42\frac{3}{4}$ degrees west of the meridian of London.

Which difference of longitude being converted into time, is 2 hours 51 minutes.

The vertical dial declining weſtward 36 degrees at London, is therefore to be drawn in all reſpects as a horizontal dial for ſouth latitude $30\frac{1}{4}$ degrees; ſave only, that the reckoning of the hours is to anticipate the reckoning on the horizontal dial, by 2 hours 51 minutes: for ſo much ſooner will the ſun come to the meridian of London, than to the meridian of any place whoſe longitude is $42\frac{3}{4}$ degrees weſt from London.

2. But to be more exact than the globe will ſhew us, we ſhall uſe a little trigonometry.

Let $NESW$ (Plate LXX. fig. 6.) be the horizon of London, whoſe zenith is Z, and P the north pole of the ſphere; and let Zh be the poſition of a vertical plane at Z, declining weſtward from S (the ſouth) by an angle of 36 degrees; on which plane an erect dial for London at Z is to be deſcribed. Make the ſemidiameter ZD perpendicular to Zh, and it will cut the horizon in D, 36 degrees weſt of the ſouth S. Then a plane, in the tangent HD, touching the ſphere in D, will be parallel to the plane Zh; and the axis of the ſphere will be equally inclined to both theſe planes.

Let $W\mathfrak{Q}E$ be the equinoctial, whoſe elevation above the horizon of Z (London) is $38\frac{1}{2}$ degrees; and PRD be the meridian of the place D, cutting the equinoctial in R. Then it is evident, that the arc RD is the latitude of the place D (where the plane Zh would be horizontal) and the arc $R\mathfrak{Q}$ is the difference of longitude of the planes Zh and DH.

In the ſpherical triangle WDR, the arc WD is given, for it is the complement of the plane's declination from S to ſouth; which complement is 54° (viz. $90^\circ - 36^\circ$:) the angle at R, in which the meridian of the place D cuts the equator, is a right angle; and the angle RWD meaſures the elevation of the equinoctial above the horizon of Z, namely, $38\frac{1}{2}$ degrees. Say therefore, as radius is to the co-ſine of the plane's declination from the ſouth, ſo is the co-ſine of the latitude of Z to the ſine of RD the latitude of D: which is of a different denomination from the latitude of Z, becauſe Z and D are on different ſides of the equator.

As radius - - - - -		10.00000
To co-ſine $36^\circ\ 0' = R\mathfrak{Q}$		9.90796
So co-ſine $51^\circ\ 30' = \mathfrak{Q}Z$		9.79415

To ſine $30^\circ\ 14' = DR$ (9.70211) = the lat. of D, whoſe horizon is parallel to the vertical plane $Z\ h$ at Z.

N. B. When radius is made the firſt term, it may be omitted, and then, by ſubtracting it mentally from the ſum of the other two, the operation will be ſhortened. Thus, in the preſent caſe,

To the logarithmic ſine of $WR = {}^*\ 54^\circ\ 0'$	9.90796
Add the logarithmic ſine of $RD = \dagger\ 38^\circ\ 30'$	9.79415
Their ſum — radius - - - - - - - -	9.70211

give the ſame ſolution as above. And we ſhall keep to this method in the following part of this article.

To find the difference of longitude of the places D and Z, ſay, as radius is to the co-ſine of $38\frac{1}{2}$ degrees, the height of the equinoctial at Z, ſo is the co-tangent of 36 degrees, the plane's declination, to the co tangent of the difference of longitudes. Thus,

To the logarithmic ſine of * $51^\circ\ 30'$	9.89354
Add the logarithmic tang. of † $54^\circ\ 0'$	10.13874
Their ſum — radius - - - - - - -	10.013228

is the neareſt tangent of $47^\circ\ 8' = WR$; which is the co-tangent of $42^\circ\ 52' = R\mathfrak{Q}$, the difference of longitude ſought. Which difference, being reduced to time, is two hours $51\frac{1}{2}$ minutes.

3. And thus having found the exact latitude and longitude of the place D, to whoſe horizon the vertical plane at Z is parallel, we ſhall proceed to the conſtruction of a horizontal dial for the place D, whoſe latitude is $30^\circ\ 14'$ ſouth; but anticipating the time at D by 2 hours 51 minutes (neglecting the $\frac{1}{2}$ minute in practice) becauſe D is ſo far weſtward in longitude from the meridian of London; and this will be a true vertical dial at London, declining weſtward 36 degrees.

Aſſume any right line CSL, (Plate LXX fig. 7.) for the ſubſtile of the diale, and make the angle KCP equal to the latitude of the place (viz. $30^\circ\ 14'$) To whoſe horizon the plane of the dial is parallel; then CRP will be the axis of the ſtile, or edge that caſts the ſhadow on the hours of the day, in the dial. This done, draw the contingent line $E\mathfrak{Q}$, cutting the ſubſtilar line at right angles in K; and from K make KR perpendicular to the axis CRP. Then KG (=KR) being made radius, that is, equal to the chord of 60° or tangent of 45° on a good ſector, take $42^\circ\ 52'$ (the difference of longitude of the places Z and D) from the tangents, and having ſet it from K to M, draw CM for the hour-line of XII. Take KN, equal to the tangent of an angle leſs by 15° degrees than KM; that is, the tangent $27^\circ\ 52'$; and through the point N draw CN for the hour line of I. The tangent of $12^\circ\ 52'$ (which is 15° leſs than $27^\circ\ 52'$) ſet off the ſame way, will give a point between K and N, through which the hour-line of II is to be drawn. The tangent of $2^\circ\ 8'$ (the difference between 45° and $42^\circ\ 52'$) placed on the other ſide of CL, will determine the point through which the hour-line of III is to be drawn: to which $2^\circ\ 8'$, if the tangent of 15° be added, it will make $17^\circ\ 8'$; and this ſet off from K towards $\mathfrak{Q}$ on the line $E\mathfrak{Q}$, will give a point for the hour-line of IIII: and ſo of the reſt.—The forenoon hour lines are drawn the ſame way, by the continual addition of the tangents 15°, 30°, 45°, &c. to $42^\circ\ 52'$ (=the tangent of KM) for the hours of XI, X, IX, &c. as far as neceſſary; that is, until there be five hours on each ſide of the ſubſtile. The ſixth hour, accounted from that hour or part of the hour on which the ſubſtile falls, will be always in a line perpendicular to the ſubſtile, and drawn through the center C.

4.

* The co-ſine of 36. 0. or of $R\mathfrak{Q}$.
† The co-ſine of 51. 30. or of $\mathfrak{Q}Z$.

* The co-ſine of 38. 30. or of WDR.
† The co-tangent of 36. 0, or of DW.

4. In all erect dials, CM, the hour-line of XII, is perpendicular to the horizon of the place for which the dial is to ferve: for that line is the interfection of a vertical plane with the plane of the meridian of the place, both which are perpendicular to the plane of the horizon: and any line HO, or ho, perpendicular to CM, will be a horizontal line on the plane of the dial, along which line the hours may be numbered; and CM being fet perpendicular to the horizon, the dial will have its true pofition.

5. If the plane of the dial had declined by an equal angle toward the eaft, its defcription would have differed only in this, that the hour-line of XII would have fallen on the other fide of the fubftile CL, and the line HO would have a fubcontrary pofition to what it has in this figure.

6. And thefe two dials, with the upper points of their ftiles turned toward the north pole, will ferve for other two planes parallel to them; the one declining from the north toward the eaft, and the other from the north toward the weft, by the fame quantity of angle. The like holds true of all dials in general, whatever be their declination and obliquity of their planes to the horifon.

CASE II.

7. If the plane of the dial not only *declines*, but alfo *reclins*, or *inclines* Suppofe its declination from fronting the fouth S, (Plate LXXI. fig. 1.) be equal to the arc SD on the horizon; and its reclination be equal to the arc Dd of the vertical circle DZ: then it is plain, that if the quadrant of altitude ZdD on the globe cuts the point D in the horizon, and the reclination is counted upon the quadrant from D to d; the interfection of the hour circle PRd, with the equinoctial WQE, will determine Rd, the latitude of the place d, whofe horizon is parallel to the given plane at Z; and RQ will be the difference in longitude of the planes at d and Z.

Trigonometrically thus: let a great circle pafs through the three points W, d, E; and in the triangle WDd, right-angled at D, the fides WD and Dd are given; and thence the angle DWd is found, and fo is the hypothenufe Wd. Again, the difference, or the fum, of DWd and DWR, the elevation of the equinoctial above the horizon of Z, gives the angle dWR; and the hypothenufe of the triangle WRd was juft now found; whence the fides Rd and WR are found, the former being the latitude of the place d, and the latter the complement of RQ, the difference of longitude fought.

Thus, if the latitude of the place Z be 52° 10′ north; the declination SD of the plane Zh (which would be horizontal at d) be 36°, and the reclination be 15°, or equal to the arc Dd; the fouth latitude of the place d, that is, the arc Rd, will be 15° 9′; and RQ, the difference of longitude, 36° 2′. From thefe data, therefore, let the dial (fig. 2.) be defcribed, as in the former example.

9. There are feveral other things requifite in the practice of dialing; the chief of which fhall be given in the form of arithmetical rules, fimple and eafy to thofe who have learned the elements of trigonometry. For in practical arts of this kind, arithmetick fhould be ufed as far as it can go; and fcales never trufted to, except in the final conftruction, where they are abfolutely neceffary in laying down the calculated hour-diftances on the plain of the dial.

RULE I. *To find the angles which the hour-lines on any dial make with the fubftile.*

To the logarithmic fine of the given latitude, or of the ftile's elevation above the plane of the dial, add the logarithmic tangent of the hour * diftance from the meridian, or from the † fubftile; and the fum *minus* radius will be the logarithmic tangent of the angle fought.

For, in fig. 7. Plate LXX. KC is to KM in the ratio compounded of the ratio of KC to KG ($=KR$) and of KG to KM; which, making CK the radius 10,000000, or 10,0000, or 10, or 1, are the ratio of 10,000000, or of 10,0000, or of 10, or of 1, to $KG \times KM$.

Thus, in a horizontal dial, for latitude 51° 30′, to find the angular diftance of XI in the forenoon, or I in the afternoon, from XII.

To the logarithmic fine of 51° 30′	9.89354 ‡
Add the logarithmic tang. of 15° 0′	9.42805
The fum — radius is - - - - - -	9.32159

=the logarithmic tangent of 11° 50′, or of the angle which the hour-line of XI or I makes with the hour of XII.

And by computing in this manner, with the fine of the latitude, and the tangents of 30, 45, 60, and 75°, for the hours of II, III, IIII, and V in the afternoon; or of X, IX, VIII, and VII in the forenoon; you will find their angular diftances from XII to be 24° 18′, 38° 3′, 53° 35′ and 71° 6′; which are all that there is occafion to compute for.——And thefe diftances may be fet off from XII by a line of chords; or rather, by taking 1000 from a fcale of equal parts, and fetting that extent as a radius from C to XII; and then, taking 209 of the fame parts (which, in the tables, are the natural tangent of 11° 50′) and fetting them from XII to XI and to I, on the line ho, which is perpendicular to CXII: and fo for the reft of the hour-lines, which, in the table of natural tangents, againft the above diftances, are 451, 782, 1355, and 2920, of fuch equal parts from XII, as the radius CXII contains 1000. And laftly, fet off 1257 (the natural tangent of 51° 30′) for the angle of the ftile's height, which is equal to the latitude of the place.

RULE II. *The latitude of the place, the fun's declination, and his hour-diftance from the meridian, being given; to find* (1.) *his altitude*; (2.) *his azimuth.*

1. Let

* That is, of 15, 30, 45, 60, 75°, for the hours of I, II, III, IIII, V in the afternoon; and XI, X, IX, VIII, VII in the afternoon. † In all horizontal dials, and erect north or fouth dials, the fubftile and meridian are the fame: but in all declining dials, the fubftile line makes an angle with the meridian. ‡ In which cafe, the radius CK is fuppofed to be divided into 1000000 equal parts.

1. Let d, (Plate LXXI. fig. 1.) be the ſun's place, dR, his declination; and in the triangle PZd, Pd the ſum, or the difference, of dR, and the quadrant PR, being given by the ſuppoſition, as alſo the complement of the latitude PZ, and the angle dPZ, which meaſures the horary diſtance of d from the meridian; we ſhall (by Caſe 4. of Keill's oblique ſpheric Trigonometry) find the baſe Zd, which is the ſun's diſtance from the zenith, or the complement of his altitude.

And (2.) As ſine Zd: ſine Pd : : $dPZ : dZP$, or of its ſupplement DZS, the azimuthal diſtance from the ſouth.

Or, the practical rule may be as follows.

Write A for the ſign of the ſun's altitude, L and l for the ſine and co-ſine of the latitude, D and d for the ſine and co-ſine of the ſun's declination, and H for the ſine of the horary diſtance from VI.

Then the relation of H to A will have three varieties.

1. When the declination is toward the elevated pole, and the hour of the day is between XII and VI; it is $A = LD + Hld$, and $H = \frac{A - LD}{ld}$

2. When the hour is after VI, it is $A = LD - Hld$ and $\frac{LD + A}{ld}$

3. When the declination is toward the depreſſed pole, we have $A = Hld - LD$, and $H = \frac{A + LD}{ld}$.

Which theorems will be found uſeful, and expeditious enough for ſolving thoſe problems in geography and dialing, which depend on the relation of the ſun's altitude to the hour of the day.

EXAMPLE I.

Suppoſe the latitude of the place to be $51\frac{1}{2}$ degrees north: the time five hours diſtant from XII, that is, an hour after VI in the morning, or before VI in the evening; and the ſun's declination 20° north. *Required the ſun's altitude?*

Then to log. L = log. ſin. 51° 30′	1.89354*	
add log. D = log. ſin. 20° 0′	1.53405	
Their ſum	1.42759	gives

LD = logarithm of 0.267664, in the natural ſines.

And, to log. H = log. ſin. † 15° 0′	1.41300	
add { log. l = log. ſin. ‡ 38° 0′	1.79415	
add { log. d = log. ſin. * 70° 0′	1.97300	
Their ſum	1.18015	gives

Hld = logarithm of 0.151408, in the natural ſines.

And theſe two numbers (0.267664 and 0.151408) make 0.419072 = A; which, in the table, is the neareſt natural ſine of 24° 47′, the ſun's altitude ſought.

The ſame hour-diſtance being aſſumed on the other ſide of VI, then $LD - Hld$ is 0.116256, the ſine of 6° $40'\frac{1}{2}$; which is the ſun's altitude at V in the morning, or VII in the evening, when his north declination is 20°.

But when the declination is 20° ſouth (or towards the depreſſed pole) the difference $Hld - LD$ becomes negative, and thereby ſhews that, an hour before VI in the morning, or paſt VI in the evening, the ſun's center is 6° $40'\frac{1}{2}$ below the horizon.

EXAMPLE II.

From the ſame *data* to find the ſun's *azimuth*.

If H, L and D are given, then (by par. 2. of Rule II.) from H having found the altitude and its complement Zd; and the arc Pd (the diſtance from the pole) being given; ſay, As the co-ſine of the altitude is to the ſine of the diſtance from the pole, ſo is the ſine of the hour-diſtance from the meridian to the ſine of the azimuth diſtance from the meridian.

Let the latitude be 51° 30′ north, the declination 15° 9′ ſouth, and the time II h. 24. m. in the afternoon, when the ſun begins to illuminate a vertical wall, and it is required to find the poſition of the wall.

Then, by the foregoing theorems, the complement of the altitude will be 81° $32'\frac{1}{2}$, and Pd the diſtance from the pole being 109° 5′, and the horary diſtance from the meridian, or the angle dPZ, 36°.

To log. ſin. 74° 51′ - - - -	1.98464
Add log. ſin. 36° 0′ - - - -	1.76922
And from the ſum - - - - -	1.75386
Take the log. ſin. 81° $32'\frac{1}{2}$ - -	1.99525
Remains	1.75861 = log. ſin.

35°, the azimuth diſtance ſought.

When the altitude is given, find from thence the hour, and proceed as above.

This praxis is of ſingular uſe on many occaſions; in finding the declination of vertical planes more exactly than in the common way, eſpecially if the tranſits of the ſun's center is obſerved by applying a ruler with ſights, either plain or teleſcopical, to the wall or plane, whoſe declination is required.—In drawing a meridian line, and finding the magnetic variation —In finding the bearings of places in terreſtrial ſurveys; the tranſits of the ſun over any place, or his horizontal diſtance from it being obſerved, together with the altitude and hour.—And thence determining ſmall differences of longitude.—In obſerving the variation at ſea, *&c.*

Of the double horizontal dial; *and the* Babylonian *and* Italian *dials*.

To the *gnomonic* projection, there is ſometimes added a *ſtereographic* projection of the hour-circles, and the parallels of the ſun's declination, on the ſame horizontal plane; the upright ſide of the gnomon being ſloped into an edge, ſtanding perpendicularly over the center of the projection: ſo that the dial, being in its due poſition, the ſhadow

* Here we conſider the radius as unity, and not 10,00000, by which, inſtead of the index 9, we have—1, as above; which is of no farther uſe, than making the work a little eaſier.

† The diſtance of one hour from VI.

‡ The co-latitude of the place.

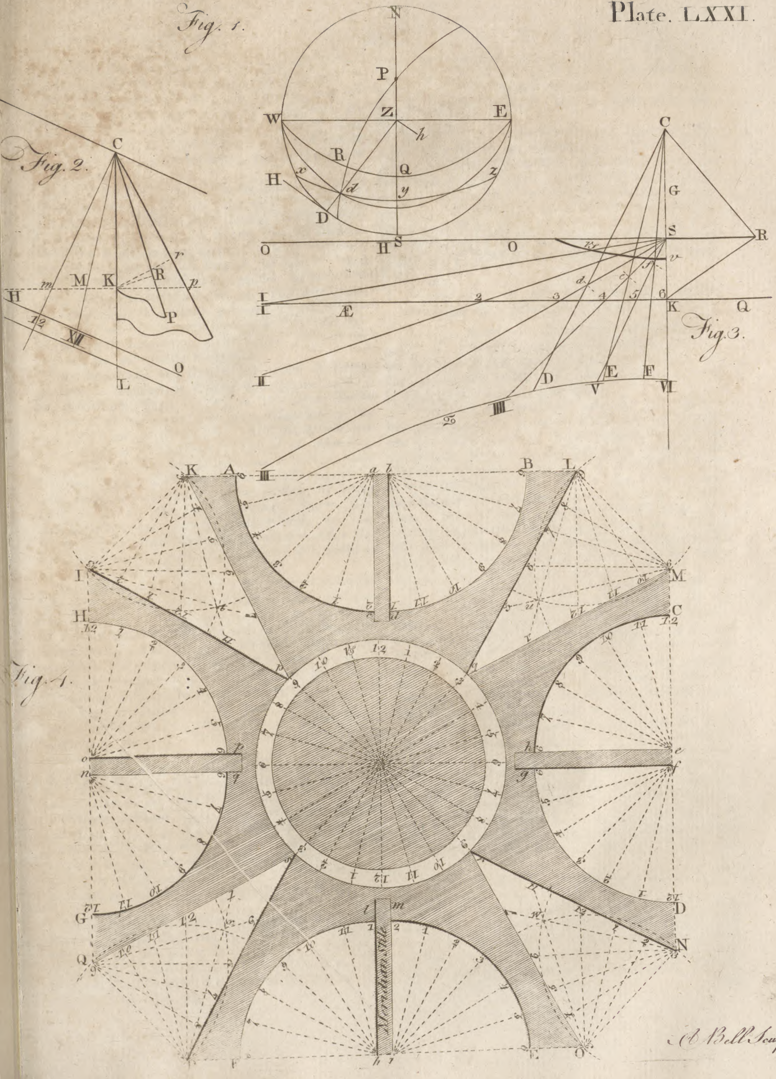
* The co-declination of the ſun.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.



A. Bell Sculp.

ſhadow of *that* perpendicular edge is a vertical circle paſſing through the ſun, in the ſtereographic projection.

The months being duly marked on this dial, the ſun's declination, and the length of the day at any time, are had by inſpection (as alſo his altitude, by means of a ſcale of tangents.) But its chief property is, that it may be placed true, whenever the ſun ſhines, without the help of any other inſtrument.

Let d (Plate LXXI. fig. 1.) be the ſun's place in the ſtereographic projection, $x\ d\ y\ z$ the parallel of the ſun's declination. $Z\ d$ a vertical circle through the ſun's center, Pd the hour-circle; and it is evident, that the diameter NS of this projection being placed duly north and ſouth, theſe three circles will paſs through the point d. And therefore, to give the dial its due poſition, we have only to turn its gnomon toward the ſun, on a horizontal plane, until the hour on the common gnomonic projection coincides with that marked by the hour-circle $P\ d$, which paſſes through the interſection of the ſhadow $Z\ d$ with the circle of the ſun's preſent declination.

The *Babylonian* and *Italian* dials reckon the hours, not from the meridian, as with us, but from the ſun's riſing and ſetting. Thus, in *Italy*, an hour before ſun-ſet is reckoned the 23d hour; two hours before ſun-ſet, the 22d hour; and ſo of the reſt. And the ſhadow that marks them on the hour-lines, is *that* of the point of a ſtile. This occaſions a perpetual variation between their dials and clocks, which they muſt correct from time to time, before it ariſes to any ſenſible quantity, by ſetting their clocks ſo much faſter or ſlower. And in *Italy*, they begin their day, and regulate their clocks, not from ſun-ſet, but from about mid-twilight, when the *Ave Maria* is ſaid; which corrects the difference that would otherwiſe be betwcen the clock and the dial.

The improvements which have been made in all ſorts of inſtruments and machines for meaſuring time, have rendered ſuch dials of little acconnt. Yet, as the theory of them is ingenious, and they are really, in ſome reſpects, the beſt contrived of any for vulgar uſe, a general idea of their deſcription may not be unacceptable.

Let fig. 5. repreſent an erect ſouth wall, on which a *Babylonian dial* is to be drawn, ſhewing the hours from ſun-riſing; the latitude of the place, whoſe horizon is parallel to the wall, being equal to the angle KCR. Make, as for a common dial, $KG=KR$ (which is perpendicular to CR) the radius of the equinoctial $Æ\mathcal{Q}$, and draw RS perpendicular to $C\ K$ for the ſtile of the dial; the ſhadow of whoſe point R is to mark the hours, when $S\ R$ is ſet upright on the plane of the dial.

Then it is evident, that, in the contingent line $Æ\mathcal{Q}$, the ſpaces K 1, K 2, K 3, &c. being taken equal to the tangents of the hour-diſtances from the meridian, to the radius KG, one, two, three, &c. hours after ſun-riſing, on the equinoctial day; the ſhadow of the point R will be found, at theſe times, reſpectively in the points, 1, 2, 3, &c.

Draw, for the like hours after ſun-riſing, when the ſun is in the tropic of Capricorn ♑ V, the like common lines CD, CE, CF, &c. and at theſe hours the ſhadow of the point R will be found in thoſe lines reſpectively. Find the ſun's altitudes above the plane of the dial at theſe hours, and with their co-tangents $S\ d$, $S\ e$, $S\ f$, &c. to radius $S\ R$, deſcribe arcs interſecting the hour-lines in the points d, e, f, &c. ſo ſhall the right lines 1 d, 2 e, 3 f, &c. be the lines of I, II, III, &c. hours after ſun-riſing.

The conſtruction is the ſame in every other caſe, due regard being had to the difference of longitude of the place at which the dial would be horizontal, and the place for which it is to ſerve: And likewiſe, taking care to draw no lines but what are neceſſary; which may be done partly by the rules already given for determining the time that the ſun ſhines on any plane; and partly from this, that on the tropical days, the hyperbola deſcribed by the ſhadow of the point R limits the extent of all the hour-lines.

Of the right placing of dials, and having a true meridian line for the regulating of clocks and watches.

The plane on which the dial is to reſt being duly prepared, and every thing neceſſary for fixing it, you may find the hour tolerably exact by a large equinoctial ring-dial, and ſet your watch to it. And then the dial may be fixed by the watch at your leiſure.

If you would be more exact, take the ſun's altitude by a good quadrant, noting the preciſe time of obſervation by a clock or watch. Then compute the time for the altitude obſerved, and ſet the watch to agree with that time, according to the ſun. A *Hadley*'s quadrant is very convenient for this purpoſe; for, by it you may take the angle between the ſun and his image reflected from a baſon of water; the half of which angle, ſubtracting the refraction, is the altitude required. This is beſt done in ſummer, and the nearer the ſun is to the prime vertical (the eaſt or weſt azimuth) when the obſervation is made, ſo much the better.

Or, in ſummer, take two equal altitudes of the ſun in the ſame day; one any time between 7 and 10 in the morning, the other between 2 and 5 in the afternoon; noting the moments of theſe two obſervations by a clock or watch: and if the watch ſhews the obſervations to be at equal diſtances from noon, it agrees exactly with the ſun: if not, the watch muſt be corrected by half the difference of the forenoon and afternoon intervals; and then the dial may be ſet true by the watch.

Thus, for example, ſuppoſe you had taken the ſun's altitude when it was 20 minutes paſt VIII in the morning by the watch; and found, by obſerving in the afternoon, that the ſun had the ſame altitude 10 minutes before IIII; then it is plain, that the watch was 5 minutes too faſt for the ſun: for 5 minutes after XII is the middle time between VIII h. 20 m. in the morning, and III h. 50 m. in the afternoon; and therefore, to make the watch agree with the ſun, it muſt be ſet back five minutes.

A good *meridian line*, for regulating clocks or watches, may be had by the following method.

Make a round hole, almoſt a quarter of an inch diameter, in a thin plate of metal; and fix the plate in the top of a ſouth window, in ſuch a manner, that it may recline from the zenith at an angle equal to the co-latitude of your place, as nearly as you can gueſs: for then the

the plate will face the sun directly at noon on the equinoctial days. Let the sun shine freely through the hole into the room; and hang a plumb-line to the cieling of the room, at least five or six feet from the window, in such a place as that the sun's rays, transmitted through the hole, may fall upon the line when it is noon by the clock; and having marked the said place on the cieling, take away the line.

Having adjusted a sliding bar to a dove-tail groove, in a piece of wood about 18 inches long, and fixed a hook into the middle of the bar, nail the wood to the above-mentioned place on the cieling, parallel to the side of the room in which the window is; the groove and bar being towards the floor. Then, hang the plumb-line upon the hook in the bar, the weight or plummet reaching almost to the floor; and the whole will be prepared for farther and proper adjustment.

This done, find the true solar time by either of the two last methods, and thereby regulate your clock. Then, at the moment of next noon by the clock, when the sun shines, move the sliding-bar in the groove, until the shadow of the plumb-line bisects the image of the sun (made by his rays transmitted through the hole) on the floor, wall, or on a white screen placed on the north side of the line; the plummet or weight at the end of the line hanging freely in a pail of water placed below it on the floor.—But because this may not be quite correct for the first time, on account that the plummet will not settle immediately, even in water; it may be farther corrected on the following days, by the above method, with the sun and clock; and so brought to a very great exactness.

N.B. The rays transmitted through the hole, will cast but a faint image of the sun, even on a white screen, unless the room be so darkened that no sunshine may be allowed to enter, but what comes through the small hole in the plate. And always, for some time before the observation is made, the plummet ought to be immersed in a jar of water, where it may hang freely; by which means the line will soon become steady, which otherwise would be apt to continue swinging.

An universal dial, shewing the hours of the day by a terrestrial globe, and by the shadows of several gnomons, at the same time: together with all the places of the earth which are then enlightened by the sun; and those to which the sun is then rising, or on the meridian, or setting.

This dial (see Plate LXXII.) is made of a thick square piece of wood, or hollow metal. The sides are cut into semicircular hollows, in which the hours are placed; the stile of each hollow coming out from the bottom thereof, as far as the ends of the hollows project. The corners are cut out into angles, in the insides of which the hours are also marked; and the edge of the end of each side of the angle serves as a stile for casting a shadow on the hours marked on the other side.

In the middle of the uppermost side, or plane, there is an equinoctial dial; in the centre whereof an upright wire is fixt, for casting a shadow on the hours of that dial, and supporting a small terrestrial globe on its top.

The whole dial stands on a pillar, in the middle of a round horizontal board, in which there is a compass and magnetic needle, for placing the *meridian* stile toward the south. The pillar has a joint with a quadrant upon it, divided into 90 degrees (supposed to be hid from sight under the dial in the figure) for setting it to the latitude of any given place; the same way as already described in the dial on the cross.

The equator of the globe is divided into 24 equal parts, and the hours are laid down upon it at these parts. The time of the day may be known by these hours, when the sun shines upon the globe.

To rectify and use this dial, set it on a level table, or sole of the window, where the sun shines, placing the meridian stile due south, by means of the needle; which will be, when the needle points as far from the north fleur-de-lis toward the west, as it declines westward, at your place. Then bend the pillar in the joint, till the black line on the pillar comes to the latitude of your place in the quadrant.

The machine being thus rectified, the plane of its dial-part will be parallel to the equator, the wire or axis that supports the globe will be parallel to the earth's axis, and the north pole of the globe will point toward the north pole of the heavens.

The same hour will then be shewn in several of the hollows, by the ends of the shadows of their respective stiles: the axis of the globe will cast a shadow on the same hour of the day, in the equinoctial dial, in the centre of which it is placed, from the 20th of March to the 23d of September; and, if the meridian of your place on the globe be set even with the meridian stile, all the parts of the globe that the sun shines upon, will answer to those places of the real earth which are then enlightened by the sun. The places where the shade is just coming upon the globe, answer to all those places of the earth to which the sun is then setting; as the places where it is going off, and the light coming on, answer to all the places of the earth where the sun is then rising. And lastly, if the hour of VI be marked on the equator in the meridian of your place (as it is marked on the meridian of London in the figure) the division of the light and shade on the globe will shew the time of the day.

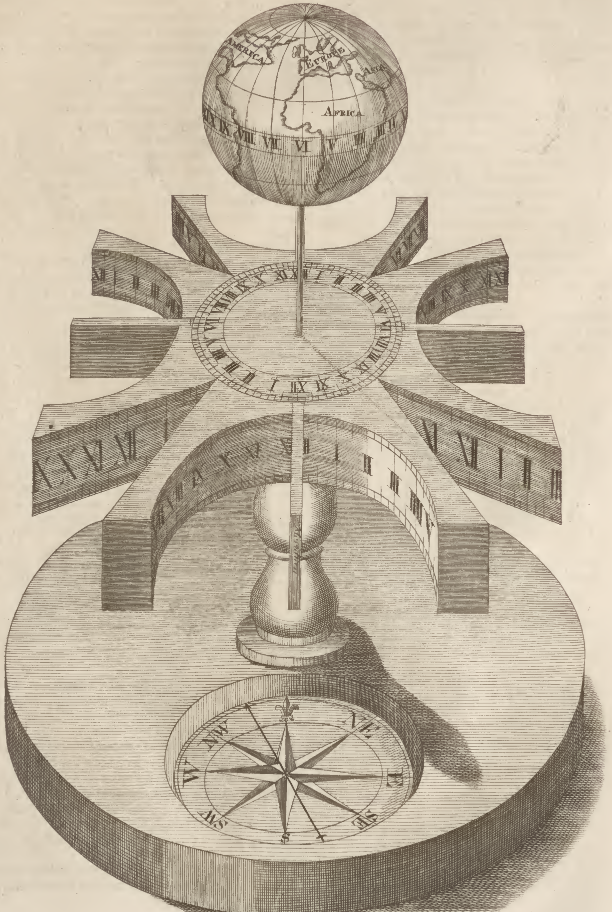
The northern stile of the dial (opposite to the southern or meridian one) is hid from sight in the figure, by the axis of the globe. The hours in the hollow to which that stile belongs, are also supposed to be hid by the oblique view of the figure: but they are the same as the hours in the front-hollow. Those also in the right and left hand semicircular hollows are mostly hid from sight; and so also are all those on the sides next the eye of the four acute angles.

The construction of this dial is as follows: (See Plate LXXI. fig. 4.)

On a thick square piece of wood, or metal, draw the lines *a c* and *b d*, as far from each other as you intend for the thickness of the stile *a b c d*; and in the same manner, draw the like thickness of the other three stiles, *e f g h*, *i k l m*, and *n o p q*, all standing outright as from the centre.

With any convenient opening of the compasses, as *a A* (so as to leave proper strength of stuff when *K I* is equal to

Plate LXXII.



A. Bell. sc.

to $a\ A$) ſet one foot in a, as a centre, and with the other foot deſcribe the quadrantal arc Ac. Then, without altering the compaſſes, ſet one foot in b as a centre, and with the other foot deſcribe the quadrant dB. All the other quadrants in the figure muſt be deſcribed in the ſame manner, and with the ſame opening of the compaſſes, on their centres e, f; i, k; and n, o: and each quadrant divided into ſix equal parts, for ſo many hours, as in the figure; each of which parts muſt be ſubdivided into 4, for the half hours and quarters.

At equal diſtances from each corner, draw the right lines Ip and Kp, Lq and Mq, Nr and Or, Ps and Qs; to form the four angular hollows IpK, LqM, NrO, and PsQ; making the diſtances between the tips of theſe hollows, as IK, LM, NO, and PQ, each equal to the radius of the quadrants; and leaving ſufficient room within the angular points $p\ q\ r$ and s, for the equinoctial dial in the middle.

To divide the inſides of theſe angles properly, for the hour-ſpaces thereon; take the following method.

Set one foot of the compaſſes in the point I, as a centre, and open the other to K; and with that opening deſcribe the arc Kt: then, without altering the compaſſes, ſet one foot in K, and with the other foot deſcribe the arc It. Divide each of theſe arcs, from I and K to their interſection at t, into four equal parts; and from their centres I and K, through the points of diviſion, draw the right lines $I3$, $I4$, $I5$, $I6$, $I7$; and $K2$, $K1$, $K12$, $K11$; and they will meet the ſides Kp and Ip of the angle IpK where the hours thereon muſt be placed. And theſe hour-ſpaces in the arcs muſt be ſubdivided into four equal parts, for the half-hours and quarters.—Do the like for the other three angles, and draw the dotted lines, and ſet the hours in the inſides where thoſe lines meet them, as in the figure: and the like hour-lines will be parallel to each other in all the quadrants and in all the angles.

Mark points for all theſe hours on the upper ſide; and cut out all the angular hollows, and the quadrantal ones quite through the places where their four gnomons muſt ſtand; and lay down the hours on their inſides, as in Plate LXXII. and then ſet in their gnomons, which muſt be as broad as the dial is thick; and this breadth and thickneſs muſt be large enough to keep the ſhadows of the gnomons from ever falling quite out at the ſides of the hollows, even when the ſun's declination is at the greateſt.

Laſtly, draw the equinoctial dial in the middle, all the hours of which are equidiſtant from each other: and the dial will be finiſhed.

As the ſun goes round, the broad end of the ſhadow of the ſtile *acbd* will ſhew the hours in the quadrant Ac, from ſun-riſe till VI in the morning; the ſhadow from the end M will ſhew the hours on the ſide Lq from V to IX in the morning; the ſhadow of the ſtile *egfh* in the quadrant Dg (in the the long days) will ſhow the hours from ſun-riſe till VI in the morning; and the ſhadow of the end N will ſhew the morning hours, on the ſide Or, from III to VII.

Juſt as the ſhadow of the northern ſtile *abcd* goes off the quadrant Ac, the ſhadow of the ſouthern ſtile *iklm* begins to fall within the quadrant Fl, at VI in the morning; and ſhews the time, in that quadrant, from VI till XII at noon; and from noon till VI in the evening in the quadrant mE. And the ſhadow of the end O, ſhews the time from XI in the forenoon till III in the afternoon, on the ſide rN; as the ſhadow of the end P ſhews the time from IX in the morning till I o'clock in the afternoon, on the ſide Qs.

At noon, when the ſhadow of the eaſtern ſtile *efgh* goes off the quadrant hC (in which it ſhewed the time from VI in the morning till noon, as it did in the quadrant gD from ſun-riſe till VI in the morning) the ſhadow of the weſtern ſtile *nopq* begins to enter the quadrant Hp; and ſhews the hours thereon from XII at noon till VI in the evening; and after *that* till ſun-ſet, in the quadrant qG:, and the end Q caſts a ſhadow on the ſide Ps from V in the evening till IX at night, if the ſun be not ſet before that time.

The ſhadow of the end I ſhews the time on the ſide Kp from III till VII in the afternoon; and the ſhadow of the ſtile *abcd* ſhews the time from VI in the evening till the ſun ſets.

The ſhadow of the upright central wire, that ſupports the globe at top, ſhews the time of the day, in the middle or equinoctial dial, all the ſummer half year, when the ſun is on the north ſide of the equator.

DIALECT, an appellation given to the language of a province, in ſo far as it differs from that of the whole kingdom. The term, however, is more particularly uſed in ſpeaking of the ancient Greek, whereof there were four dialects, the Attic, Ionic, Æolic, and Doric, each of which was a perfect language in its kind, that took place in certain countries, and had peculiar beauties.

DIALOGISM, in rhetoric, is uſed for the ſoliloquy of perſons deliberating with themſelves. See SOLILOQUY.

DIALOGUE, in matters of literature, a converſation between two or more perſons, either by writing or by word of mouth.

Dialogue appears to be the moſt ancient form of writing, and is greatly recommended by ſeveral authors. The archbiſhop of Cambray, at the head of his paſtoral inſtruction, gives an account of the advantages of dialogue.

DIALTHÆA, in pharmacy, an unguent much uſed as a reſolvent, ſo called from althæa, or marſh-mallows, which is the principal ingredient in it. See ALTHÆA.

DIALYSIS, in grammar, a mark or character, conſiſting of two points, ¨, placed over two vowels of a word, in order to ſeparate them, becauſe otherwiſe they would make a diphthong, as Moſaïc, *&c.* See DIÆRESIS.

DIAMETER, in geometry, a right line paſſing through the center of a circle, and terminated at each ſide by the circumference thereof. See GEOMETRY.

DIAMOND, in natural hiſtory, a genus of precious ſtones, of a fine pellucid ſubſtance, of great hardneſs, never fouled by any admixture of earthy or any other coarſe matter, ſuſceptible of elegant tinges from metal-line

line particles, giving fire with ſteel, not fermenting with acid menſtruums, ſcarcely calcinable by any degree of fire, and of one ſimple and permanent appearance in all lights.

This is the moſt valuable and hardeſt of all gems; and though found of different ſhapes, and ſometimes accidentally tinged to ſeveral colours, yet ever carries the ſame diſtinguiſhing characters, and is very evidently in all thoſe ſtates the ſame body. It is, when pure, perfectly clear and pellucid as the pureſt water, and is eminently diſtinguiſhed from all other ſubſtances, by its vivid ſplendor, and the brightneſs of its reflections. It is extremely various in ſhape and ſize, being found in the greateſt quantity very ſmall, and the larger ones extremely ſeldom met with; the largeſt diamond certainly known ever to have been found is that in the poſſeſſion of the Great Mogul, which weighs 279 carats, and is computed to be worth 779,244 l.

The diamond has certainly one proper and determinate figure, into which it naturally muſt concrete, when in a ſtate of reſt and impeded by no other accident in its formation: the true figure then is an equilateral octohedron; and where ever it has concreted in a perfect manner, and without any interrupting accidents, it has always formed itſelf into this figure; and often in this its ſeveral ſurfaces are as bright as if poliſhed by art: but, as in common ſalt, though its figure be pyramidal, yet very eaſy accidents can determine it into cubes and parallellopipeds; ſo the diamond has often, in the ſtate of formation, been thrown into two other figures, both alſo ſeeming regular ones; the one a priſmatic columnar one of ſix angles ſomewhat emulating the figure of cryſtal, the other an oblong quadrilateral column with two truncated ends: theſe ſeem the only regular figures of this gem; but beſides theſe, it is every day found in numberleſs other misſhapen forms, often roundiſh, emulating the ſhape of pebbles, but full of ſmall flat planes or faces; frequently oblong, very often flat, and as often tapering, either from one end to the other, or elſe from the middle to both ends. A diamond bears the force of the ſtrongeſt fire, except the concentrated ſolar rays, without hurt; and even that infinitely fierceſt of all fires does it no injury, unleſs directed to its weaker parts.

It is a common thing for diamonds to be too thick or deep for the extent of their ſurface, and there is a certain proportion of depth, beyond which the gem ſhould not be allowed: in this caſe two diamonds are often made, by the regularly dividing one: this, when the maſs is of an angular figure, is done by cutting it through with a wire, wetted with oil, and covered with diamond-powder; but in the flat or more common maſſes, it is done much more expeditiouſly by finding the grain of the ſtone, and introducing the point of a fine flat chiſſel between them. This is not the only uſe of the ſplitting; for when a diamond has a flaw or blemiſh in it, which greatly debaſes its value, the plates may be ſeparated at a proper breadth, and the flaw removed; in which caſe the thinner cruſt, ſtruck off, is of value in proportion to its ſize, and the remainder, being now freed from its flaw, is of much more value than it was at firſt. The places whence we have the diamonds are the Eaſt-Indies, in the iſland of Borneo, and in the kingdoms of Viſapour, Golconda, Bengal; and the Brazils in the Weſt-Indies. They are not unfrequently found yellowiſh, blueiſh, and reddiſh, but more rarely greeniſh.

Valuation of DIAMONDS, among jewellers, is thus calculated: they ſuppoſe the value of a rough diamond to be 2 l. per carat; then to find the value of thoſe of greater weight, they multiply the ſquare of their weight by 2, and this laſt product is the value of the diamonds in their rough ſtate: thus, the value of a rough diamond weighing 4 carats, is equal $4\times4\times2=16\times2=32$ l. and ſo in other caſes. Again, to find the value of wrought diamonds, they ſuppoſe half their weight loſt in the manufacturing them, and therefore multiply the ſquare of double their weight by 2; thus the value of a wrought diamond, weighing 3 carrats, is equal $6\times6\times2=36\times2=72$ l.

Roſe-DIAMOND is that quite flat underneath, with its upper part cut in divers little faces, uſually triangles, the uppermoſt of which terminate in a point.

Table-DIAMOND is that which has a large ſquare face at top, encompaſſed with four leſſer.

Brilliant DIAMOND is that cut in faces both at top and bottom; and whoſe table, or principal face at top, is flat.

DIAMOND, in the glaſs-trade, an inſtrument uſed for ſquaring the large plates or pieces; and, among glaziers, for cuting their glaſs.

Theſe ſort of diamonds are differently fitted up; that uſed for large pieces, as looking-glaſſes, *&c.* is ſet in an iron ferril, about two inches long, and a quarter of an inch in diameter; the cavity of the ferril being filled up with lead, to keep the diamond firm: there is alſo a handle of box, or ebony, fitted to the ferril, for holding it by.

DIAMOND, in heraldry, a term uſed for expreſſing the black colour in the atchievements of peerage.

Guillim does not approve of blazoning the coats of peers by precious ſtones inſtead of metals and colours; but the Engliſh practice allows it. Morgan ſays the diamond is an emblem of fortitude.

DIANÆ ARBOR, or ARBOR LUNÆ, in chemiſtry, the beautiful cryſtallizations of ſilver, diſſolved in aqua fortis, to which ſome quickſilver is added: and ſo called from their reſembling the trunk, branches, leaves, *&c.* of a tree. See CHEMISTRY.

DIANDRIA, in the Linnæan ſyſtem of botany. See BOTANY, p. 635.

DIANO, a town of the Genoeſe, about three miles from the ſea. The country about produces great numbers of olives.

DIANTHERA, in botany, a genus of the diandria monogynia claſs. The corolla is ringent; and the capſule has two elaſtic valves. There are two ſpecies, both natives of America.

DIANTHUS, in botany, a genus of the decandria digynia claſs. The calix is cylindrical, and conſiſts of one leaf, with four ſcales at the baſe; the corolla conſiſts of five clawed petals; and the capſule is cylindrical,

and

and has but one cell. There are feventeen fpecies, five of which are natives of Britain, *viz.* the armeria, or Deptford pink; the prolifer, or limewort; the deltoides, or maiden pinks; the glaucus, or mountain pink; and the arenarius, or ftone pink.

DIAPASON, in mufic, a mufical interval, by which moft authors, who have wrote upon the theory of mufic, ufe to exprefs the octave of the Greeks. See OCTAVE.

DIAPASON, among the mufical-inftrument makers, a kind of rule or fcale, whereby they adjuft the pipes of their organs, and cut the holes in their flutes, hautboys, *&c.* in due proportion, for performing the tones, femitones, and concords juft.

DAPASON DIAEX, in mufic, a kind of compound concord, whereof there are two forts; the greater, which is in the proportion of 10 : 3; and the leffer, in that of 16 : 5.

DIAPASON DIAPENTE, in mufic, a compound confonance in a triple ratio, as 3 : 9. This interval, fays Martianus Capella, confifts of nine tones and a femitone, nineteen femitones, and thirty eight diefes. It is a fymphony made when the voice proceeds from the firft to the twelfth found.

DIAPASON DIATESSARON, in mufic, a compound concord, founded on the proportion of 8 : 3. To this interval Martianus Capella allows eight tones and a femitone, feventeen femitones, and thirty-four diefes.

This is when the voice proceeds from its firft to its eleventh found. The moderns would rather call it the eleventh.

DIAPASON DITONE, in mufic, a compound concord, whofe terms are as 10 : 4, or 5 : 2.

DIAPASON SEMIDITONE, in mufic, a compound concord, whofe terms are in the proportion of 12 : 5.

DIAPEDESIS, in medicine, a tranfudation of the fluids through the fides of the veffels that contain them, occafioned by the blood's becoming too much attenuated, or the pores becoming too patent.

DIAPENSIA, in botany, a genus of the pentandria-monogynia clafs. The calix confifts of five leaves, imbricated with three fmaller ones; the ftamina arife from the tube of the corolla; and the capfule has three cells; there are three fpecies, none of them natives of Britain.

DIAPENTE, in the ancient mufic, an interval marking the fecond of the concords; and with the diateffaron, an octave. This is what in the modern mufic is called a fifth.

DIAPHANOUS, an appellation given to all tranfparent bodies, or fuch as tranfmit the rays of light. See OPTICS.

DIAPHOENICUM, in pharmacy, a fort of medicine or electuary chiefly made of dates. It purges ferofities, and excites the menfes. It is alfo ufed in dropfies, lethargies, apoplexies, and palfies.

DIAPHORESIS, in medicine, an elimination of the humours in any part of the body through the pores of the fkin. See PERSPIRATION.

DIAPHORETICS, among phyficians, all medicines which promote perfpiration.

DIAPHRAGM, in anatomy. See Vol. I. p. 213.

DIAPORESIS, in rhetoric, a figure of oratory, expreffing the uncertainty of the fpeaker how he fhall proceed in his difcourfe.

DIARBEC, or DIARBECK, the capital of a province of the fame name, anfwering to the ancient Mefopotamia: it is fituated on the river Tigris, near its fource, in 42° E. long. and 37° 30′ N. lat.

DIARRHOEA, or LOOSENESS, in medicine, is a frequent and copious evacuation of liquid excrement, by ftool. See MEDICINE.

DIARTHROSIS, in anatomy. See Vol. I. p. 148.

DIARY, among traders, denotes a day-book containing the proceedings of one day.

DIACHISM, among muficians, denotes the difference between the comma and enharmonic diefis, commonly called the leffer comma.

DIASCORDIUM, in pharmacy, a celebrated compofition, fo called from fcordium, one of its ingredients. It is otherwife termed *confectio fracaftorii*, and is thus directed by the college.

Take of cinnamon and caffia-wood, of each half an ounce; of true fcordium, one ounce; of Cretan dittany, tormentil, biftort, galbanum, and gum-arabic, of each half an ounce; of ftorax, four drams and an half; of opium, and feeds of forrel, of each one dram and an half; of gentian, half an ounce; of American bole, one ounce and an half; of Lemnian fealed earth, half an ounce; of long pepper and ginger, of each two drams; of clarified honey, two pounds and an half; of fugar of rofes, one pound; of generous canary, eight ounces; make into an electuary. It is excellent in all kinds of fluxes, and a great ftrengthener both of the ftomach and bowels.

DIASEBESTEN, in pharmacy, a foft purgative electuary, whereof febeftens are the principal ingredients. The other ingredients are prunes, tamarinds, juices of iris, anguria and mercurialis, penidies, fimple diaprunum, violet feeds, and diagrydium. It is good in remitting and continued fevers, *&c.*

DIASENNA, in pharmacy, the name of a medicine in which fenna is the principal ingredient.

The other ingredients are fugar-candy, cinnamon, lapis lazuli, filk, cloves, galanga minor, black pepper, nardus indica, feed of bafilicum, flowers of cloves, cardamoms, faffron, ginger, zedoary, *&c.*

This electuary is taken againft melancholy and fpleen, and againft difeafes arifing from an atrabilis.

DIASTOLE, among phyficians, fignifies the dilatation of the heart, auricles and arteries; and ftands oppofed to the fyftole, or contraction of the fame parts. See CIRCULATION.

DIASTOLE, in grammar, a figure of profody, whereby a fyllable naturally fhort is made long: fuch is the firft fyllable of Priamides, in the following verfe of Virgil.

Atque hic Priamides! nihil ô tibi, amice, relictum.

DIASYRMUS, in rhetoric, a kind of hyperbole, being an exaggeration of fome low ridiculous thing.

DIATESSARON, among ancient muficians, a concord, or harmonical interval, compofed of a greater tone, a lefs

lefs tone, and one greater femi-tone: its proportion in numbers is as 4 : 3.

Diatessaron, in pharmacy, the name of a compofition fo called, from the four ingredients it comprehends: it is prepared thus.

Take of gentian root, bay-berries, myrrh, and roots of birthwort, of each two ounces; of honey, two pounds; mix them into an electuary. This, with the addition of the fhavings of ivory, two ounces, is entitled diapente, or a compofition of five ingredients

DIATONIC, an epithet given to mufic, as it proceeds by tones and femi-tones, both afcending and defcending. See Music.

DIATRAGACANTH, in pharmacy, a name applied to certain powders, whereof gum tragacanth is the principal ingredient; of which there are two kinds, the cold and the hot: the cold is directed thus: take of gum tragacanth, two ounces; of gum arabic, an ounce and two drams; of ftarch, half an ounce; of liquorice, and the feeds of melons and white poppies, of each two drams; of fugar-candy, three ounces; mix them into a powder. This is frequently prefcribed in hectical heats, in choleric conftitutions, in diftempers of the breaft, in ftranguries, heat of urine, and the pungency of venereal gleets.

Powder of hot diatragacanth is compofed of gum tragacanth, cinnamon, hyffop, almonds, linfeed, fenugreek, liquorice, and ginger, It is good againft afthmas, to promote expectoration, ftrengthen the ftomach, and affift digeftion.

DIAUGOPHRAGMIA, in natural hiftory, a genus of foffils of the order of feptariæ, whofe partitions, or fepta, confift of fpar with an admixture of cryftal. Of this genus there are three fpecies. 1. A red kind, with brownifh yellow partitions. 2. A brownifh yellow kind, with whitifh partitions. 3. A bluifh-white kind, with ftraw-coloured partitions.

DICE, among gamfters, certain cubical pieces of bone or ivory, marked with dots on each of their faces, from one to fix, according to the number of faces.

Sharpers have feveral ways of falfifying dice. 1. By fticking a hog's briftle in them, fo as to make them run high or low, as they pleafe. 2. By drilling and loading them with quickfilver; which cheat is found out by holding them gently by two diagonal corners; for if falfe, the heavy fides will turn always down. 3. By filling and rounding them. But all thefe ways fall far fhort of the art of the dice-makers; fome of whom are fo dextrous this way, that your fharping gamfters will give any money for them.

Dice formerly paid 5 s. every pair imported, with an additional duty of 4 s. $9\frac{45}{100}$d. for every 20 s. value upon oath; but are now prohibited to be imported.

DICHOTOMY, a term ufed by aftronomers for that phafis, or appearance of the moon, wherein fhe is biffected, or fhews juft half her difk. In this fituation the moon is faid to be in a quadrate afpect, or to be in her quadrature.

Dichotomy, in botany. See Botany, p. 641.

DICHOTOPHYLLUM, it botany. See Ceratophyllum.

DICKER, in old writers, denotes the quantity of ten hides of fkins, whereof twenty made a laft: alfo ten pair of gloves, ten bars of iron, and the like, are fometimes expreffed by the term dicker.

DICTAMUS, dittany, in botany, a genus of the decandria monogynia clafs. The calix confifts of five leaves, and the corolla of five open petals; the filaments have many glandular points; and the five capfules are united. There is but one fpecies, *viz.* the oblus, a native of Italy. The root is faid to be alexipharmic, but is not regarded in practice.

DICTATOR, in the policy of the ancient Romans, a magiftrate invefted with fovereign and even arbitrary power.

He had power of life and death; alfo to raife and difband troops, make war or peace, and that without the confent either of the fenate or people, or being accountable for his proceedings. He was elected by one of the confuls in the night-time, on the frontiers of the commonwealth, and nowhere elfe; and the ordinary duration of his office was only for fix months, during which time all other magiftracies ceafed, the tribunefhip excepted. Whenever he appeared in public, he was attended by twenty-four lictors, or double the number allowed a conful. However, notwithftanding all this power, he could not go out of Italy, or even ride on horfeback during a march, without leave from the people.

This office was accounted the fafeguard of the commonwealth for four hundred years together, till Sylla and Cæfar, by affuming the title of perpetual dictators, converted it into tyranny, and rendered the very name odious.

DICTION, the phrafe, elocution, or ftyle of a writer or fpeaker. See Composition,

DICTIONARY, in its original acceptation, is the arranging all the words of a language according to the order of the alphabet, and annexing a definition or explanation to each word. When arts and fciences began to be improved and extended, the multiplicity of technical terms rendered it neceffary to compile dictionaries either of fcience in general, or of particular fciences, according to the views of the compiler. For further particulars concerning dictionaries of this kind, fee the *Preface.*

Dictionary *of the Englifh language.* The only attempt which has hitherto been made towards forming a regular dictionary of the Englifh language, is that of the learned Dr Samuel Johnfon. But although it is executed in a mafterly manner, yet as it cannot be expected that an undertaking of this nature could be brought to perfection by one man, we fhall venture to fuggeft a few circumftances which, if duely attended to, may perhaps be of fome utility.

The defign of every dictionary of language, is to explain in the moft accurate manner, the meaning of every word, and to fhow the various ways in which it can be combined with others, in as far as this tends to alter its meaning. The dictionary which does

this

this in the moſt accurate manner, is the moſt complete. Therefore the principal ſtudy of a lexicographer ought to be, to diſcover a method which will be beſt adapted for that purpoſe. Dr Johnſon, with great labour, has collected the various meanings of every word, and quoted the authorities: But, would it not have been an improvement if he had given an accurate definition of the preciſe meaning of every word; pointed out the way in which it ought to be employed with the greateſt propriety; ſhewed the various deviations from that original meaning, which cuſtom had ſo far eſtabliſhed as to render allowable; and fixed the preciſe limits beyond which it could not be employed without becoming a vicious expreſſion? With this view, it would have been neceſſary to exhibit the nice diſtinctions that take place between words which are nearly ſynonymous. Without this, many words can only be defined in ſuch a manner, as that they muſt be conſidered as exactly ſynonymous. We omit giving any quotations from Johnſon to point out theſe defects; but ſhall content ourſelves with giving a few examples, to ſhew how, according to our idea, a dictionary of the Engliſh language ought to be compiled.

IMMEDIATELY. *adv. of time.*

1. Inſtantly, without delay. Always employed to denote future time, and never paſt. Thus, we may ſay, *I will come immediately*; but not, *I am immediately come from ſuch a place.* See PRESENTLY.
2. Without the intervention of any cauſe or event; as oppoſed to mediately.

PRESENTLY. *adj. of time.*

1. Inſtantly, without delay. Exactly ſynonymous with *immediately*; being never with propriety employed to denote any thing but future time.
2. Formerly it was employed to expreſs preſent time: Thus, *The houſe preſently poſſeſſed by ſuch a one*, was often uſed; but this is now become a vicious expreſſion and we ought to ſay, *The houſe poſſeſſed at preſent.* It differs from *immediately*, in this, that even in the moſt corrupt phraſes it never can denote paſt time.

FORM. *ſubſt.* The external appearance of any object, when conſidered only with reſpect to ſhape or figure. This term therefore, in the literal ſenſe, can only be applied to the objects of the ſight and touch; and is nearly ſynonymous with figure; but they differ in ſome reſpects. *Form* may be employed to denote more rude and unfiniſhed ſhapes; *figure*, thoſe which are more perfect and regular. *Form* can never be employed without denoting matter; whereas *figure* may be employed in the abſtract: Thus, we ſay a ſquare or a triangular *figure*; but not a ſquare or triangular *form.* And in the ſame manner we ſay, the *figure* of a houſe: but we muſt denote the ſubſtance which forms that figure, if we uſe the word *form*; as, *a cloud of the form of a houſe, &c.* See FIGURE.

2. In contraſt to irregularity, or confuſion. As beauty cannot exiſt without order, it is by a figure of ſpeech employed to denote beauty, order, *&c.*
3. As *form* regards only the external appearance of bodies, without regard to their internal qualities, it is by a figure of ſpeech, employed in contraſt to theſe qualities, to denote empty ſhew, without eſſential qualities. In this ſenſe it is often taken when applied to religious ceremonies, *&c.*
4. As *form* is employed to denote the external appearance of bodies; ſo, in a figurative ſenſe it is applied to reaſoning, denoting the particular mode or manner in which this is conducted; as, *the form of a ſyllogiſm*, &c.
5. In the ſame manner it is employed to denote the particular mode of procedure eſtabliſhed in courts of law; as. *the forms of law, religion*, &c.
6. *Form* is ſometimes, although improperly, uſed to denote the different circumſtances of the ſame body; as, *water in a fluid or a ſolid form.* But as this phraſe regards the internal qualities rather than the external figure, it is improper, and ought to be, *water in a fluid, or a ſolid ſtate.*
7. But when bodies of different kinds are compared with one another, this term may be employed to denote other circumſtances than ſhape or figure; for we may ſay, *a juice exſuding from a tree in in the form of wax or reſin*; although, in this caſe, the conſiſtence, colour, *&c.* and not the external arrangement of parts, conſtitutes the reſemblance.
8. From the regular appearance of a number of perſons arranged in one long ſeat, ſuch perſons ſo arranged are ſometimes called a *form*; as, *a form of ſtudents*, &c. And,
9. By an eaſy tranſition, the ſeat itſelf has alſo acquired that name.

GREAT. *adj.* A relative term, denoting largeneſs of quantity, number, *&c.* ſerving to augment the value of thoſe terms with which it is combined, and oppoſed to *ſmall* or *little.* The principal circumſtances in which this term can be employed, are the following:

1. When merely inanimate objects are conſidered with regard to quantity, *great* is with propriety employed, to denote that the quantity is conſiderable; as, *a great mountain, a great houſe*, &c. and it is here contraſted with *ſmall.* When *great* is thus employed, we have no other word that is exactly ſynonymous.
2. When inanimate objects are conſidered with regard to their extent, this term is ſometimes employed, although with leſs propriety; as, *a great plain, a great field*, &c. and in this ſenſe it is nearly ſynonymous with *large*; and they are often uſed indiſcriminately, but with ſome difference of meaning: for, as *large* is a term chiefly employed to denote extent of ſuperficies, and as *great* more particularly regards the quantity of matter; therefore, when *large* is applied to any object which is not merely ſuperficial, it denotes that it is the extent of ſurface that is there meant to be conſidered, without regard to the other dimenſions; whereas when the term *great* is employed, it has a reference to the whole contents. If, therefore, we ſay, *a large houſe*, or *a large river*, we expreſs that the houſe, the river, have

have a furface of great extent, without having any neceffary connection with the fize in other refpects. But if we fay, *a great houfe*, or *a great river*, it at once denotes that they have not only a large furface, but are alfo of great fize in every refpect.

3. *Great*, when applied to the human fpecies, never denotes the fize or largenefs of body, but is applied folely to the qualities of the mind. Thus, when we fay, that *Socrates was a great man*, we do not mean that he was a man of great fize, but that he was a man who excelled in the endowments of the mind. The terms which denote largenefs of fize in the human body are, *big*, *bulky*, *huge*, &c.

4. *Great* is fometimes applied to the human fpecies, as denoting high rank. In this cafe it is oftener ufed in the plural number than otherwife. Thus we fay fimply, *the great*, meaning the whole body of men in high ftation, as oppofed to *mean*. It fhould feldom be employed in this fenfe, as it tends to confound dignity of rank with elevation of mind.

5. As this is a general term of augmentation, it may be joined with all nouns which denote *quantity*, *quality*, *number*, *excellence*, or *defects*; or fuch as imply *praife*, *blame*, *anger*, *contempt*, or any other affection of the mind.

6. It is employed to denote every ftep of afcending or defcending confanguinity; as, *great-grandfather*, *great-grandfon*, &c.

HIGH. *adj*. Exalted in a perpendicular direction at a diftance from the furface of the earth. Oppofed to *low*.

1. *High* is a term altogether indefinite, and is employed to exprefs the degree of elevation of any inanimate body. Thus, we fay, *a high mountain*, *a high houfe*, *fteeple*, *tower*, *pillar*, &c. nor is there any other word that can here be confidered as fynonymous; *lofty* being employed only to denote a very eminent degree of elevation.

2. To exprefs the perpendicular elevation of vegetables, either *high* or *tall* may be employed, as being in this cafe nearly fynonymous, we may therefore fay, a *high* or *tall tree*, a *high* or *tall maft*, &c. but with this difference between thefe two expreffions, that *tall* can be more properly applied to thofe that are much elevated and of fmall dimenfions; and *high*, to fuch as are more bulky, and of greater fize.

3. The perpendicular height of man can never be expreffed by the word *high*; *tall* being here the proper expreffion. And although *high* is fometimes ufed to exprefs the height of other animals, yet it feems to be an improper expreffion. See TALL.

4. *High*, when applied to the human fpecies, always refers to the mind; and denotes *haughtinefs*, *ftatelinefs*, *pride*, &c.; and, when combined with the expreffions of any energy of the mind, it denotes that in a higher degree. In this fenfe, it is oppofed to *meannefs*, *abjectnefs*, and *humility*.

5. As this is an indefinite term, tending to denote any thing that is elevated above us, it may be combined with almoft every noun which admits of this elevation. And as objects high above us are always out of our reach, it is in a metaphorical fenfe ufed to denote any thing that feems to be above the ordinary condition of mankind; or thofe qualities or endowments of mind that are not eafily acquired; as, *dignity* or *elevation of fentiment*; *dignity of rank*; *acutenefs in reafoning on difficult fubjects*; *pride*, *haughtinefs*, or any other quality which feems beyond the ordinary level of mankind; *dearnefs of price*, &c.

6. In the fame manner we employ this term to time; which having a metaphorical refemblance to a river, flowing on with an unceafing current through all fucceffive ages, any thing of remote antiquity is denoted by the term *high*.

7. Likewife thofe degrees of latitude far removed from the line, where the pole becomes more elevated.

8. And to fome particular crimes, as being attended with peculiar degrees of guilt; as, *high treafon*.

TALL. *adj*. Something elevated to a confiderable degree in a perpendicular direction. Oppofed to *low*

1. This term is chiefly employed to exprefs the height of man, and other animals; and is applied to denote the height of the body only, without having any reference to the mind. When applied to man, no other word can be fubftituted in its ftead: when applied to other animals, *high* is fometimes confidered as nearly fynonymous. See HIGH.

2. It is likewife employed to denote the perpendicular height of vegetables; and in this cafe it is nearly fynonymous with *high*. See HIGH.

3. It can in no cafe be employed to exprefs the height of merely inanimate objects; as we can never fay a *tall fteeple*, *tower*, or *pillar*, but a *high fteeple*, &c. For the diftinctions in thefe cafes, fee HIGH.

LONG. *adj*. A relative term, denoting the diftance between the extremes of any body, which is extended more in one of its geometrical dimenfions than another. Oppofed to *fhort*.

1. This term may be applied to all inanimate objects, of whatever kind, whofe dimenfions in one way exceeds the other, and when not in an erect pofture, whatever be the other circumftances attending them; whether it relates to fuperficies alone, or to folid bodies; whether thefe be bounded or open, ftraight or crooked, flexible or rigid, or in any other circumftances whatever; thus we fay *a long* or *fhort line*, *a long* or *fhort ridge*, *ftreet*, *ditch*, *rope*, *chain*, *ftaff*, &c. But it is to be obferved, that although *long* is, in the ftrict fenfe only, oppofed to *fhort*; yet as it expreffes the extenfion of matter in one of its geometrical proportions, it is often contrafted by thofe words which exprefs the other proportions when we mean only to defcribe the feveral proportions; as, *a table long and broad*: and as thefe feveral dimenfions are expreffed by different words, according to the various forms, modifications, and circumftances, in which bodies are found; therefore it is in this fenfe contrafted by a great diverfity of terms; as, *a long*

and

and broad, or *wide*, *narrow*, or *ſtrait ſtreet* or *lane*, *a long and thick*, or *ſmall rope*, *chain*, *ſtaff*, &c. For the diſtinctions in theſe caſes, ſee Broad, Wide, *&c.*

2. Objects neceſſarily fixed in an erect poſition can never have this term applied to them; and therefore we cannot ſay *a long*, but *a high tower* or *ſteeple*. And for the ſame reaſon, while trees are growing and fixed in an erect poſition, we cannot apply this term to them; but when they are felled and laid upon the ground, it is quite proper and neceſſary. Thus, we do not ſay *a long*, but *a tall* or *high tree*, while it is growing; but we ſay *a long*, not *a tall log of wood:* and in the ſame manner we ſay *a tall maſt*, when it is fixed in the ſhip; but *a long maſt*, while it lies upon the beech. See Tall and High.
3. Thoſe vegetables which are of a tender pliant nature, or ſo weak as not to be able to retain a fixt poſition, being conſidered as of a middle nature between erect and proſtrate bodies, admit of either of the terms *long*, *tall*, or *high;* as, *a long* or *tall ruſh* or *willow wand*, or *a long*, *tall*, or *high ſtalk of corn*. See High and Tall.
4. The parts of vegetables, when conſidered as diſtinct from the whole, even when growing and erect, aſſume the term *long*: for we no not ſay *a tall*, but *a long ſhoot of a tree;* and *a tree with a long ſtem*, in preference to *a tree with a high ſtem*.
5. For the ſame reaſon, a ſtaff, and pole, even when fixed in a perpendicular direction, aſſume the word *long*, in preference to *tall* or *high*.
6. With regard to animals, the general rule is applied, without any exceptions; *tall*, and not *long*, being employed to denote the height of the human body, when in an erect poſture; and *long* and not *tall*, to denote its length when in an incumbent ſituation. *Long*, applied to all other animals which do not walk erect, always denotes their greateſt length in a horizontal poſition from head to tail.
7. In a figurative ſenſe, it denotes, with regard to time, any thing at a great diſtance from us.
8. As alſo, any thing that takes up much time before it is finiſhed; as, *a long diſcourſe*, *a protracted note in muſic*, &c.

BROAD. *adj*. The diſtance between the two neareſt ſides of any body, whoſe geometrical dimenſions are larger in one direction than in another; and has a reference to ſuperficies only, and never to the ſolid contents. Oppoſed to *narrow*.

1. *Broad*, in the ſtricteſt acceptation, is applied to denote thoſe bodies only whoſe ſides are altogether open and unconfined; as, *a broad table*, *a broad wheel*, &c and in theſe caſes it is invariably contraſted by the word *narrow;* nor is there any other word which in theſe caſes can be conſidered as ſynonymous with it, or uſed in its ſtead.
2. When any object is in ſome ſort bounded on the ſides, although not quite cloſed up, as a road, ſtreet, ditch, *&c.* either *broad* or *wide* may be employed, but with ſome difference of ſignification; *broad* being moſt properly uſed for thoſe that are more open, and *wide* to thoſe which are more confined; nor can this term be ever applied to ſuch objects as are cloſe bounded all around, as a houſe, church, &c. *wide* being here employed. For the more accurate diſtinctions in theſe caſes, ſee the article Wide.

WIDE. *adj*. A term employed to denote relative extent in certain circumſtances. Oppoſed to *narrow* and *ſtrait*.

1. This term is in its proper ſenſe applied only to denote the ſpace contained within any body cloſed all round on every ſide, as a houſe, gait, *&c.* and differs from *broad* in this, that it never relates to the ſuperficies of ſolid objects, but is employed to expreſs the capaciouſneſs of any body which containeth vacant ſpace; nor can capaciouſneſs in this ſenſe be expreſſed by any other word but *wide*.
2. As many bodies may be conſidered either with reſpect to their capaciouſneſs, or ſuperficial extent; in all theſe caſes, either the term *broad* or *wide* may be uſed; as, *a broad* or *wide ſtreet* or *ditch*, *&c.* but with a greater or leſs degree of propriety, according to the circumſtances of the object, or the idea we wiſh to convey. In a ſtreet where the houſes are low, and the boundaries open, or in a ditch of ſmall depth and large ſuperficies, as this largeneſs of ſuperficies bears the principal proportion, *broad* would be more proper; but if the houſes are of great height, or the ditch of great depth, and capaciouſneſs is the principal property that affects the mind, we would naturally ſay *a wide ſtreet* or *ditch*; and the ſame may be ſaid of all ſimilar caſes: but there are ſome caſes in which both theſe terms are applied, with a greater difference of meaning; thus we ſay, *a broad*, or *a wide gate*; but as the gate is employed to denote either the aperture in the wall, or the matter which cloſes that aperture, theſe terms are each of them uſed to denote that particular quality to which they are generally applied: and as the opening itſelf can never be conſidered as a ſuperficies, the term *wide*, in this caſe, denotes the diſtance between the ſides of the aperture; while, on the contrary, *broad* denotes the extent of matter fitted to cloſe that aperture; nor can theſe two terms in any caſe be ſubſtituted for one another.
3. As a figurative expreſſion, it is uſed as a cant phraſe for a miſtake; as, *you are wide of the mark*; that is, not near the truth.

NARROW. *adj*. A relative term, denoting a proportional ſmallneſs of diſtance between the ſides of the ſuperficies of plain bodies. Oppoſed to *broad*.

1. As this is only applied to ſuperficies, it is exactly contraſted by *broad*, and is applied in all caſes where the term *broad* can be uſed, (ſee Broad); and in no other caſe but as a contraſt to it, except the following.
2. It ſometimes is employed to deſcribe the ſmallneſs of ſpace circumſcribed between certain boundaries, as oppoſed to *wide*, and nearly ſynonymous with *ſtrait*;

ſtrait ; as we ſay *a wide* or *a narrow houſe*, *church*, &c. For the neceſſary diſtinctions here, ſee the article STRAIT.

3. In a figurative ſenſe it dénotes *parſimony*, *poverty*, *confined ſentiments*, &c.

STRAIT. *adj.* A relative term, denoting the extent of ſpace in certain circumſtances. Oppoſed to *wide*, ſee WIDE.

1. This term is employed, in its proper ſenſe, to denote only ſpace, as contained between ſurrounding bodies in ſuch circumſtances as to denote ſome degree of confinement; and is exactly oppoſed to *wide;* as, *a wide* or *a ſtrait gate*, &c. See WIDE.

2. So neceſſary is it that the idea of confinement ſhould be connected with this word, that in all thoſe caſes where the ſpace contained is large, as in a church or houſe, we cannot expreſs a ſmaller proportional width by this term. And as we have no other word to expreſs ſpace in theſe circumſtances, we have been obliged to force the word *narrow* from its natural ſignification, and make it expreſs this. See NARROW.

3. In ſome particular caſes *narrow* or *ſtrait* may be employed to the ſame object; as, *a narrow* or *a ſtrait lane :* but here *ſtrait* is never employed but where an idea of confinement is ſuggeſted, and where it is exactly contraſted to *wide*; nor can *narrow* be employed but in ſuch circumſtances where *broad* would be a perfect contraſt to it. Therefore theſe two terms may be always employed in the ſame circumſtances as thoſe which contraſt them may be. For an account of which, ſee WIDE.

3. The term *ſtrait* is likewiſe in a peculiar manner uſed to denote the ſmallneſs of the internal diameter of thoſe ſmall bodies which are fitted to receive or contain others as, any kind of bag, tube, body-cloaths, mortoiſes, and others of the ſame kind ; and in all theſe caſes this term may be employed to denote the ſmallneſs of their leſſer diameter, and never the term *narrow*. But in certain circumſtances the word *tight* may be ſubſtituted for it. See TIGHT.

4. *Strait*, in a figurative ſenſe, denotes any ſort of confinement of ſentiment or diſpoſition.

TIGHT. *adj.* A term employed in certain circumſtances to denote the internal capacity of particular bodies. Nearly ſynonymous with *ſtrait*.

This term is confined entirely to denote the ſmallneſs of the internal dimenſions of ſuch objects as are formed to cover or to receive or contain other ſolid bodies, and can be employed in no other caſe. And although it agrees with *ſtrait*, in always denoting confinement, and by being applicable to the ſame ſpecies of objects, yet it differs in the the following reſpects : 1. If there be any difference of the diameter of the objects to which the term *ſtrait* can be employed, it always has reference to the ſmaller; yet *tight* may be employed to any ſort of confinement, whether it regards the length or breadth. 2. *Strait* can be applied to all bodies of capacity when of ſmall diameter, without any ſort of reference to the nature of the ſubſtance which it may be capable of containing. For we can ſay *a ſtrait bag*, *a ſtrait ſleeve*, *a ſtrait mortoiſe*, *a ſtrait gate*, &c. whereas *tight* can only be applied to any body when it is conſidered as having reference to another body which is intended to be contained in it and is pinched for want of room. Thus, we ſay, *the ſleeve of a coat is too tight for the arm*, *the mortoiſe is too tight for the tenon*, &c. but we cannot ſay, *the bag*, *or the gate is too tight*, becauſe theſe are fitted to receive any ſort of objects. And hence it happens, that, in many caſes, the dimenſions of the ſame body may be expreſſed by *tight* or *ſtrait* when conſidered in different circumſtances. Thus, we may ſay, *this ſleeve is too ſtrait*, when we look at a coat when lying on the table, and conſider its proportions ; but it is not till we have tried it upon the arm that it is intended to cover, that we call it *tight*. And we may ſay, *a gate is too ſtrait*, or *too tight*; but in the firſt caſe we conſider it as being too confined for admitting objects to paſs through it, and in the laſt as being too confined with reſpect to the leaves that are to ſhut the aperture, not allowing them ſpace to move with freedom.

Theſe examples may ſerve to give ſome idea of the plan of an Engliſh dictionary compoſed upon philoſophical principles: But, beſides the circumſtances above enumerated, there are many others which would require particular attention in the execution of a work of this kind. In the Engliſh language, a great variety of terms occur, which denote matter under certain general forms or circumſtances, without regarding the minute diverſities that may take place; as the word *cloth*, which denotes matter as manufactured into a particular form, including under it all the variety of ſtuffs manufactured in that particular way, of whatever materials, colours, texture, or fineneſs they may be. The ſame may be ſaid of *wood*, *iron*, *yarn*, and a great variety of terms of the ſame nature, ſome of which cannot aſſume any plural; while others admit of it in all caſes; and others admit or refuſe it according to the different circumſtances in which they are conſidered. In a dictionary, therefore, all this variety of caſes ought to be clearly and diſtinctly pointed out under each particular article : this is the more neceſſary, as ſome of theſe words have others formed from them, which might be readily miſtaken for their plurals, although they have a very different ſignification; as *cloaths* which does not denote any number of pieces or different kinds of *cloth*, but *wearing apparel*. The following example will illuſtrate this head.

WOOD. *ſub.* A ſolid ſubſtance of which the trunks and branches of trees conſiſt.

1. This term is allowed to denote the ſolid parts of vegetables of all kinds, in whatever form or circumſtances they are found. Nor does this term admit of plural with propriety, unleſs in the circumſtances after mentioned : for we ſay, *many different kinds of wood*, in preference to *many kinds of woods*; or, we ſay, *oak*, *aſh*, or *elm wood ;* not *woods*.

2. But where we want to contraſt *wood* of one quality,

lity or country with that of another, it admits of a plural; for we ſay, *white woods are in general ſofter than red*; or *Weſt-Indian woods are in general of greater ſpecific gravity than the European woods*: But unleſs where the colour, or ſome quality which diſtinguiſhes it from growing wood, is mentioned, this plural ought as much as poſſible to be avoided, as it always ſuggeſts an idea of growing wood.

3. *Wood* likewiſe denotes a number of trees growing near one another; being nearly ſynonymous with *foreſt*: See FOREST. In this ſenſe it always admits of a plural; as, *Ye woods and wilds whoſe ſolitary gloom*, &c.

A dictionary cannot be reckoned complete without explaining obſolete words; and if the terms of the ſeveral provincial provincial dialects were likewiſe given, it would be of great utility: nor would this take much time; becauſe a number of theſe words need no other explanation than to mark along with them the words which had come in their place, when there happened to be one perfectly ſynonymous: and in theſe caſes where the ſame idea could not be expreſſed in modern language without a periphraſis, it would be of uſe to explain them diſtinctly; ſo that, when a writer found himſelf at a loſs for a term, and obliged to ſearch for one beyond the bounds of our own language, he might take one of theſe, when he found that it was expreſſive and energetic, in preference to another drawn from a foreign language. This would at leaſt have one good effect: it would make our language more fixed and ſtable; not to ſay more accurate and preciſe, than by borrowing from foreign languages. The following examples may ſerve to give ſome idea of the manner of treating this part of the work.

MOE, or MO. *adj*. An obſolete term ſtill employed in the Scotch dialect, and by them pronounced *mae*: denoting a greater number, and nearly ſynonymous with *more*; but it differs in this reſpect, that, in the Scotch dialect, *mae* and *mair* (Engliſh, *more*) are each employed in their diſtinct ſphere, without encroaching upon one another; *mae* being employed to denote number, but never quantity or quality; and *mair*, to denote quantity and quality, but never number: thus they ſay *mae*, not *mair apples*, *men*, &c. and they ſay *mair*, not *mae cloth*, *earth*, *courage*, &c. See MAIR. Both of theſe terms are ſupplied by the word *more*; which, in the Engliſh language, is applied indiſcriminately to denote quantity, quality, and number. See MORE.

THIR. *pron*. Obſolete; ſtill employed in the Scotch dialect: the plural of *this*; and contraſted to *theſe*, in the ſame manner as *that* is to *this*.

As there is no word in the Engliſh language equivalent to this, we thus ſhew the manner in which it is employed. In the Engliſh language we ſay, *that ſtone* or *houſe*, pointing at one at a diſtance, *is larger or more commodious than this ſtone* or *this houſe*, which is ſuppoſed to be at hand. In the ſame manner, in the Scotch dialect, they ſay, *theſe* (or as it is pronounced, *thae*) *ſtones are whiter than thir ſtones*; denoting, that the former are at a diſtance, and the latter at hand. And, in the ſame manner, it is invariably applied to denote any preſent object in the plural number, as oppoſed to *theſe*; as *theſe* or *thir apples*, as at hand or at a diſtance; *theſe* or *thir trees*, &c.; but never in the ſingular number, as it is always *this* or *that tree*, *hoſe*, &c.

As the Engliſh language is ſo exceedingly irregular in the pronunciation, the ſame letter in the ſame ſituation often aſſuming ſounds totally different in different words, it is impoſſible to eſtabliſh any general rules on this ſubject, which do not admit of many exceptions: therefore, a dictionary is the beſt means of aſcertaining and pointing out the proper pronunciation of words. For, if the writer firſt pointed out all the different ſounds that the ſame letter could ever be made to expreſs, and aſſigned to every particular ſound which each letter could be made to aſſume, a particular mark, which was appropriated to denote that particular ſound of the letter whenever it occurred; by placing theſe particular marks above the letters in the dictionary, the ſound of each letter would be pointed out in all caſes with the utmoſt certainty. It would be impoſſible for us to illuſtrate this by examples, without firſt aſcertaining all the ſounds of each letter; which would lead us into a diſcuſſion too long for this place; and this is at preſent the more unneceſſary, as the public have been long in expectation of a dictionary, by a very able hand, in which this particular will be attended to.

We ſhall only further obſerve, that, beſides having the accented ſyllable of every word *properly* diſtinguiſhed in a dictionary to aſſiſt in the pronunciation, the Engliſh language requires another eſſential improvement, *viz*. the uſe of accents to diſtinguiſh the meaning of *words* and *phraſes*; which, although it is not ſo properly confined to a lexicographer, yet it is not quite without his ſphere. Thus the word *as* admits of two very different ſounds, as well as different ſignifications; as in this example, "Cicero was nearly *as* eloquent *as* Demoſthenes:" in which the firſt *as* is pronounced *aſs*, and the laſt is pronounced *az*. Now, it often happens, that, in reading, the particular way in which it ought to be underſtood is not pointed out by the context, till after the word itſelf is pronounced, which has an equal chance at leaſt of being pronounced wrong; whereas, if it were always accented when employed in the one ſenſe, and not in the other, it would free the reader from this perplexity. There are other caſes in which the uſe of proper accents in writing would be of great conſequence; as at the beginning of a ſentence, when it was put as a queſtion, or uſed ironically, *&c*. the want of which every one muſt have obſerved. But as this does not ſo properly belong to the lexicographer as the grammarian, we ſhall here take no further notice of it.

The above examples, we hope, will be ſufficient to give the reader ſome idea of the plan that we would propoſe; and enable him to determine, whether or not a dictionary, executed upon this plan, would convey to his mind a more perfect knowledge of the Engliſh language, than thoſe dictionaries that have been hitherto publiſhed.

Theſe

Theſe examples were given rather with a view to ſhew the manner in which a work of this kind might be conducted, than as perfect and unexceptionable explanations of the ſeveral articles there enumerated; and therefore we did not think it neceſſary to produce any authorities, although we are ſenſible that they would be neceſſary in a work of this kind.

DIDACTIC, in the ſchools, ſignifies the manner of ſpeaking, or writing, adapted to teach or explain the nature of things.

DIDAPPER, in ornithology, See COLYMBUS.

DIDELPHIS, in zoology, a genus of quadrupeds belonging to the order of feræ, the characters of which are theſe: they have ten foreteeth in the upper-jaw, and eight in the under one; the dog-teeth are long; the tongue is ſomewhat ciliated; and they have a pocket, formed by a duplicature of the ſkin of the belly, in which the dugs are included. There are five ſpecies, *viz.* 1. The marſupialis, with eight dugs incloſed in the abdominal pocket. He is about ſixteen inches long from the ſnout to the root of the tail, which is about twelves inches long: he has five toes on the fore-feet, with crooked claws and five toes on the hind-feet, only four of them furniſhed with claws; the fifth, which is a kind of thumb, is at a diſtance from the others, and has no claw; the tail is bare from a little below the root: The ears and legs are likewiſe bare; the eyes are ſmall, prominent, of a black colour, and very lively. The body is of a greyiſh colour, with ſome ſmall tufts of black and white hairs upon the back and ſides. Under the belly of the female there is a large bag or pocket, formed by a remarkable duplicature of the ſkin, in which the dugs are contained. This pocket the animal can ſhut or open at pleaſure, by means of a couple of muſcles and two bones which are placed before the os pubis, and are peculiar to the didelphis. The interior ſide of this pocket is full of ſmall glands, which ſecrete a yellowiſh ſtinking ſubſtance, which diffuſes its odour through the whole body of the animal: but this ſubſtance, when dried, loſes its diſagreeable odour, and acquires a ſmell like that of muſk.—This animal is originally a native of South America. Moſt authors affirm that they bring forth five or ſix young ones at a time. As ſoon as they are brought forth, they creep into the pocket of the mother, where the dugs are ſituate, and continue there ſucking till they be able to run about. When alarmed or frightened, they run into the mother's pocket, and ſhe makes off with them in this ſituation. The didelphis is an animal of ſlow motion; a man can eaſily out run him; but then, he takes to a tree, which he mounts with great facility, and conceals himſelf among the leaves, or ſuſpends himſelf by twiſting his tail round a branch. Although a carnivorous animal, he is fond of the ſugar cane, potatoes, *&c.* See Plate LXVIII fig. 3.

The ſecond ſpecies is the philander, with four dugs, pendulous ears, and a tail buſhy at the baſe. 3. The opoſſum, with two dugs, and a leſs buſhy tail. 4. The murina, with ſix dugs. 5. The dorſigera, with the tail buſhy at the baſe, and longer than the body. The females of this ſpecies carry their young on their backs, the young having their tails twiſted about the tail of the mother. The above four are natives of America.

DIDUS, in ornithology, a genus belonging to the order of gallinæ. The bill is contracted in the middle by two tranſverſe rugæ; each mandible is inflected at the point; and the face is bare behind the eyes. The body is blackiſh and cloudy; the tail is very ſhort; and the upper part of the bill is red. It is a native of India, and is incapable of flying, becauſe the wings are not furniſhed with feathers ſufficient for that purpoſe.

DIDYNAMIA, in the Linnæan ſyſtem of botany. See OTANY, p. 635.

DIE, in geography, a town of France, in the province of Dauphiny, ſituated on the river Drome, twenty-two miles ſouth of Grenoble: E. long. 5° 20′, N. lat. 44°. 50′.

DIEGEM, a town of the Auſtrian Netherlands, in the province of Brabant, about three miles north of Bruſſels: E. long. 4° 20′, and N. lat. 51°.

DIEPE, a port-town of France, ſituated on the Britiſh channel, about thirty miles north of Rouen, and oppoſite to port Rye in England: E. long. 1° 15′, and N. lat. 49° 55′.

DIEPHOLT, a city of Weſtphalia in Germany, ſituated at the north end of the Dummer-lake, thirty-five miles ſouth of Bremen: E. long. 8°, N. lat 53°.

It is ſubject to the king of Great Britain, as elector of Hanover.

DIERVILLA, in botany. See LANICERA.

DIES MARCHIÆ, was the day of congreſs, or meeting of the Engliſh and Scotch, annually appointed to be held on the marches, or borders, in order to adjuſt all differences between them.

DIESIS, in muſic, is the diviſion of a tone leſs than a ſemi-tone; or an interval conſiſting of a leſs or imperfect ſemi-tone.

Dieſis is the ſmalleſt and ſofteſt change or inflexion of the voice imaginable: it is called a faint, expreſſed thus X, by a St Andrew's croſs, or ſaltier.

DIET, in medicine, according to ſome, comprehends the whole regimen, or rule of life, with regard to the ſix non-naturals, air, meats and drinks, ſleep and watching, motion and reſt, paſſions of the mind, retentions and excretions.

The more accurate writers, however, reſtrain the term of diet to what regards eating and drinking, or ſolid aliments and drinks. See MEDICINE.

DIET-DRINKS, a form in phyſic, including all the medicated wines, ales, and wheys, uſed in chronic caſes. They require a courſe or continuation to anſwer any intention of moment.

DIET *of appearance*, in Scots law, the day to which a defender is cited to appear in court, and every other day to which the court ſhall afterwards adjourn the conſideration of the queſtion.

DIET, or DYET, in matters of policy, is uſed for the general

general aſſembly of the ſtates, or circles of the empire of Germany, and of Poland, to deliberate and concert meaſures proper to be taken for the good of the public.

The general diet of the empire is uſually held at Ratiſbon: it conſiſts of the emperor, the nine electors, and the eccleſiaſtical princes; *viz.* the archbiſhops, biſhops, abbots, and abbeſſes; the ſecular princes, who are dukes, marquiſſes, counts, viſcounts, or barons; and the repreſentatives of the imperial cities. It meets on the emperor's ſummons, and any of the princes may ſend their deputies thither in their ſtead. The diet makes laws, raiſes taxes, determines differences between the ſeveral princes and ſtates, and can relieve the ſubjects from the oppreſſions of their ſovereigns.

The diet of Poland, or the aſſembly of the ſtates, conſiſts of the ſenate and deputies, or repreſentative of every palatinate or county and city, and meet uſually every two years, and oftener upon extraordinary occaſions, if ſummoned by the king, or, in his abſence, by the archbiſhop of Gneſna. The general diet of Poland ſits but ſix weeks, and often breaks up in a tumult much ſooner: for one diſſenting voice prevents their paſſing any laws, or coming to any reſolutions on what is propoſed to them from the throne. Switzerland has alſo a general diet, which is uſually held every year at Baden, and repreſents the whole Helvetic body: it ſeldom laſts longer than a month. Beſides this general diet, there are diets of the proteſtant cantons, and diets of the catholic ones; the firſt aſſemble at Araw, and are convoked by the canton of Zurich; the ſecond at Lucern, convoked by the canton of that name.

DIETETIC, denotes ſomething belonging to diet, but particularly that part of phyſic which treats of this ſubject.

DIETS, a town in the circle of the Upper Rhine in Germany, ſituated on the river Lohn, twenty miles north of Mentz, and ſubject to the houſe of Naſſau-Orange: E. long. 7° 40′, and N. lat. 50 28′.

DIEU ET MON DROIT, i. e. *God and my right*, the motto of the royal arms of England, firſt aſſumed by king Richard I. to intimate that he did not hold his empire in vaſſalage of any mortal.

It was afterwards taken up by Edward III. and was continued without interruption to the time of the late king William, who uſed the motto *Je main-tiendray*, though the former was ſtill retained upon the great ſeal. After him queen Anne uſed the motto *Semper eadem*, which had been before uſed by queen Elizabeth; but ever ſince queen Anne, *Dieu et mon droit* continues to be the royal motto.

DIEXAHEDRIA, in natural hiſtory, a genus of pellucid and cryſtalliform ſpars, compoſed of two pyramids, joined baſe to baſe, without any intermediate column: the diexahedria are dodecahedral, or compoſed of two hexangular pyramids.

DIFFUSE, an epithet applied to ſuch writings as are wrote in a prolix manner. Among hiſtorians, Salluſt is reckoned ſententious, and Livy diffuſe. Thus alſo among the orators, Demoſthenes is cloſe and conciſe; Cicero, on the other hand, is diffuſe.

DIFFUSION, the diſperſion of the ſubtile effluvia of bodies into a kind of atmoſphere all round them. Thus the light diffuſed by the rays of the ſun, iſſues all round from that amazing body of fire.

DIGASTRICUS, in anatomy. See Vol. I. p. 222.

DIGEST, in matters of literature, a collection of the deciſions of the Roman lawyers properly digeſted, or arranged under diſtinct heads, by order of the emperor Juſtinian. It conſtitutes the firſt part or volume of the civil law.

DIGESTION, in medicine, is the diſſolution of the aliments into ſuch minute parts as are fit to enter the lacteal veſſels, and circulate with the maſs of blood.

Various are the ſyſtems and hypotheſes framed by phyſicians and philoſophers to account for digeſtion. Some contend, that it is done by a kind of elixation of the ſolid and groſſer parts of the food in the liquid by the heat of the ſtomach, and of the adjacent parts, the liver, ſpleen, *&c.* Others will have it done by attrition, as if the ſtomach, by thoſe repeated motions, which are the effects of reſpiration, rubbed off the minuter particles from the groſſer matters, and agitating the reſt againſt each other, attenuated and diſſolved them.

Others think the bilious juice, others the ſpirits, chiefly concerned in digeſtion.

Others will have the food diſſolved by a menſtruum; but then they are greatly divided as to the nature and origin of this menſtruum; ſome ſuppoſing it an acid furniſhed by the glands of the ſtomach; others, a nitro-aerial ſpirit, which, by penetrating the maſs of food, breaks the connexion of the moſt ſolid parts: and others, a ſaline juice, which divides and volatilizes the parts of the food. Others, again, ſuppoſe digeſtion to be performed by means of a ferment or leaven, which mixing with the aliment, excites an inteſtine motion in the parts thereof, by which means the parts are attenuated and diſſolved. But theſe likewiſe differ in their opinion of this ferment; ſome taking it to be the remains of the food laſt digeſted, which, by its continuance in the ſtomach, has contracted an acid quality and become a ferment: others take the principles of fermentation to be contained in the aliment itſelf, which when incloſed in the ſtomach, heated there, and put in motion, enters on its office of fermentation: others ſuppoſe the matter of the ferment ſupplied by the glands of the ſtomach; and laſtly, others contend for the ſaliva, and make that the ferment ſerving principally for the digeſtion of the food.

Some ſuppoſe digeſtion owing to gentle heat and motion. By this heat and motion, ſay they, the texture of the nouriſhment is changed in the bodies of animals; and then the conſtituent ſolid parts are indued with peculiar attractive powers of certain magnitudes, by which they draw, out of the fluids moving through them, like parts in certain quantities, and thereby preſerve their forms and juſt magnitudes.

 And,

And, to mention no more, Boerhaave afcribes digeftion to the joint action of feveral of the above-mentioned caufes, aided by the expanfion of the air contained in the aliments.

Want of DIGESTION, a difeafe attended with pain, and a fenfe of weight, with eructations and copious flatulences from corrupt humours in the ftomach.

DIGESTIVE, in medicine, fuch remedies as ftrengthen and increafe the tone of the ftomach, and affift in the digeftion of foods. To this clafs belong all ftomachics and ftrengtheners, or corroborants.

DIGIT, in aftronomy, the twelfth part of the diameter of the fun or moon, is ufed to exprefs the quantity of an eclipfe. Thus an eclipfe is faid to be of fix digits, when fix of thefe parts are hid.

DIGITS, or MONADES, in arithmetic, fignify any integer under 10; as 1, 2, 3, 4, 5, 6, 7, 8, 9.

DIGIT is alfo a meafure taken from the breadth of the finger. It is properly $\frac{3}{4}$ of an inch, and contains the meafure of four barley-corns laid breadth-wife.

DIGITALIS, or FOX-GLOVE, in botany, a genus of the didynamia angiofpermia clafs. The calix is divided into five fegments; the corolla is bell-fhaped, ventricofe, and has five divifions; and the capfule is oval, and has two cells. There are fix fpecies, only one of which, *viz.* the purpurea, or purple fox-glove, is a native of Britain. The leaves are faid to be emetic and vulnerary, but are little ufed.

DIGITATED, among botanifts. See Vol. I. p. 640.

DIGITUS, in anatomy. See Vol. I. p. 181.

DIGLYPH, in architecture, a kind of imperfect triglyph, confole, or the like, with two channels or engravings, either circular or angular.

DIGNE, a city and bifhop's fee of Provence in France, fifty-five miles north of Toulon: E. long. 6° 5′, and N. lat. 44° 6′.

DIGNITARY, in the canon law, a perfon who holds a dignity, that is, a benefice which gives him fome pre-eminence over mere priefts and canons. Such is a bifhop, dean, arch-deacon, prebendary, *&c.*

DIGNITY, as applied to the titles of noblemen, fignifies honour and authority.

DIJON, the capital of the province of Burgundy, in France, fituated on the river Ouche, 140 miles fouth-eaft of Paris: E. long. 5° 5′, and N. lat. 47° 15′.

DILATATION, in phyfics, a motion of the parts of any body, by which it is fo expanded as to occupy a greater fpace. This expanfive motion depends upon the elaftic power of the body, whence it appears that dilatation is different from rarefaction, this laft being produced by the means of heat. See MECHANICS.

DILATATORES, in anatomy, a name given to feveral mufcles in the human body. See ANATOMY, Part II.

DILEMMA, in logic, an argument confifting of two or more propofitions, which divides the whole into all its parts, or members, by a disjunctive propofition, and then infers fomething concerning each part, which is finally referred to concerning the whole. See LOGIC.

DILIGENCE, in Scots law, fignifies either that care and attention which parties are bound to give, in implementing certain contracts or trufts, and which varies according to the nature of the contract; as to which, fee SCOTS LAW, title 7. 20. and 28.: Or it fignifies certain forms of law, whereby the creditor endeavours to operate his payment, either by affecting the perfon or eftate of the debtor; fee title 18.

DILL, in botany. See ANETHUM.

DILLEMBURG, a city of the circle of the Upper Rhine in Germany, about forty miles north of Francfort, and fubject to the houfe of Naffau: E. long. 8° 8′, and N. lat. 50° 45′.

DILLENGEN, a city of Swabia, in Germany, fituated on the Danube, about twenty miles north-eaft of Ulm: E. long. 10° 20′, and N. lat. 48° 40′.

DILLENIA, in botany, a genus of the polyandria polygynia clafs. The calix confifts of five leaves, and the corolla of five petals; and the capfule contains many feeds. There is but one fpecies, a native of Malabar.

DILUTE. To dilute a body is to render it liquid; or, if it were liquid before, to render it more fo, by the addition of a thinner thereto. Thefe things thus added, are called diluents, or dilutors.

DIMENSION, in geometry, is either length, breadth, or thicknefs; hence, a line hath one dimenfion, *viz.* length; a fuperficies two, *viz.* length and breadth; and a body, or folid, has three, *viz.* length, breadth, and thicknefs.

DIMINUTIVE, in grammar, a word formed from fome other, to foften or diminifh the force of it, or to fignify a thing is little in its kind. Thus, cellule is a diminutive of cell, globule of globe, hillock of hill.

DIMORPHOTHECA, in botany. See CALENDULA.

DINANT, a town of Germany in the bifhopric of Liege, fituated on the river Maefe, about twelve miles fouth of Namur: E. long. 4° 50′, and N. lat. 50° 18′.

DINGWEL, or DINGWAL, a parliament-town of Scotland, fituated at the weft end of the Cromarty-bay, in the county of Rofs: W long. 4° 15′, and N. lat. 57° 56′. It claffes with Dornock, Wick, and Kirkwall.

DINKELSPIEL, a city of Swabia, about forty miles north of Ulm, E. long. 10° 12′, and N. lat. 49°.

DIOCESE, denotes a particular diftrict, or divifion, under the direction and government of a bifhop.

DIOCTAHEDRIA, in natural hiftory, a genus of pellucid and cryftalliform fpars, compofed of two octangular pyramids, joined bafe to bafe, without any intermediate column. Of thefe fome have long pyramids, others fhort and fharp-pointed ones, and others fhort and obtufe pointed ones; the two former fpecies being found in the hartz-foreft, and the laft in the mines of Cornwall.

DIODIA, in botany, a genus of the tetrandria monogynia clafs. The corolla confifts of one tunnel-fhaped petal; and the capfule has two cells, containing as many feeds. There is but one fpecies, a native of Virginia.

DIODON, in ichthyology, a genus belonging to the order of amphibia nantes. The jaws are bony, ftretched out, and undivided; the aperture or mouth is a

tranfverfe

transverse line. The body is every way beset with sharp moveable prickles. It has no belly-fins. There are two species, *viz.* 1. The atringa, which is spherical, and has triangular prickles. It is a native of India. 2. The trystrix, which is oblong, with cylindrical prickles, and is a native of the Cape of Good Hope.

DIOMEDEA, in ornithology, a genus belonging to the order of anseres. The bill is strait; the superior mandible is crooked at the point, and the lower one is truncated; the nostrils are oval, open, a little prominent, and placed on the sides. There are two species, *viz.* 1. The exulans, has pennated wings, and three toes on each foot. It is the abbatros of Edwards, and is found in the ocean betwixt the tropics, and at the Cape of Good Hope. It flies pretty high, feeds upon flying fish, and is about the size of a pelican. 2. The demersa, has no quill-feathers on the wings; and the feet have four toes, connected together by a membrane. It is the black penguin of Edwards, about the size of a goose, and is found at the Cape of Good Hope.

DIONYSIA, in Grecian antiquity, solemnities in honour of Bacchus, sometimes called by the general name of orgia; and by the Romans bacchanalia, and liberalia. See BACCHANALIA.

DIOECIA, in the Linnæan system of botany. See Vol. I. p. 635.

DIOMEDIS AVIS, in ornithology. See PROCELLARIA.

DIOPTRICS, the science of refractive vision. See OPTICS.

DIOSCOREA, in botany, a genus of the dioecia hexandria class. The calix both of the male and female consists of six segments, and they have no corolla. The female has three styli; the capsule is compressed, has three cells, and contains two membranaceous seeds. There are eight species, none of them natives of Britain.

DIOSMA, in botany, a genus of the pentandria monogynia class. The corolla has five petals; and the nectarium is shaped like a crown, is divided into five segments, and situate above the germen; it has five united capsules; and the seeds are furnished with calyptræ. There are nine species, none of them natives of Britain.

DIOSPYROS, in botany, a genus of the polygamia dioecia class. The calix of the hermaphrodite has four segments, and the corolla is unceolated, and has four segments; it has eight stamina, and a quadrifid stylus; and the berry contains eight seeds. The calix, *&c.* of the male are the same with the above. There are two species, none of them natives of Britain.

DIOTOTHECA, in botany. See MORINA.

DIPHTHONG, in grammar, a double vowel, or the mixture of two vowels pronounced together, so as to make one syllable. See GRAMMAR.

DIPHYES, among natural historians, an appellation given to stones resembling the male and female parts of generation in mankind.

DIPLOE, in anatomy, the soft meditullium, or medullary substance, which lies between the two laminæ of the bones of the cranium. See ANATOMY, Part I.

DIPLOMA, an instrument or licence given by colleges, societies, *&c.* to a clergyman to exercise the ministerial function, or to a physician to practise the profession, *&c.* after passing examination, or admitting him to a degree.

DIPLOMA, in chemistry, *&c.* a double vessel. To boil in diplomate, is to set one vessel, containing the ingredients intended to be acted upon, in another larger vessel full of water, and to this last the fire is to be applied.

DIPONDIUS, in the scripture-language, is used by St Luke to signify a certain coin, which was of very little value: our translation of the passage is, *Are not two sparrows sold for two farthings?* In St Matthew, who relates the same thing, we read, *Are not two sparrows sold for a farthing?*

DIPPING, among miners, signifies the interruption, or breaking off, of the veins of ore; an accident that gives them a great deal of trouble before they can discover the ore again.

DIPSACUS, or TEASEL, in botany, a genus of the tetrandria monogynia class. The common calix consists of many leaves, and the proper one is above the fruit; and the receptacle is paleaceous. There are three species, all natives of Britain, *viz.* the fullonum, or manured teasel; the sylvestris, or wild teasel; and the pilosus, or small wild teasel.

DIPSAS, in zoology. See COLUBER.

DIPTOTES, in grammar, are such nouns as have only two cases, as *suppetiæ*, *suppetias*, &c.

DIPTYCHS, in antiquity, a public register, in which were written the names of the consuls and other magistrates among the heathens; and among the Christians, they were a sort of tablets, on one of which were written the names of the deceased, and on the other those of the living patriarchs, bishops, *&c.* or those who had done any service to the church, for whom prayers were offered, the deacon reading the names at mass.

DIRECTION, in mechanics, signifies the line or path of a body's motion, along which it endeavours to proceed, according to the force impressed upon it. See MECHANICS.

DIRECTOR, in commercial polity, a person who has the management of the affairs of a trading company: thus we say, the directors of the India-company, South-sea-company, *&c.* See COMPANY.

The directors are considerable proprietors in the stocks of their respective companies, being chosen by plurality of votes from among the body of proprietors. The Dutch East-India company have sixty such directors; that of France, twenty-one; the British East-India company has twenty-four, including the chairman, who may be re-elected for four years successively. These last have salaries of 150l. a-year each, and the chairman 200l. They meet at least once a week, and commonly oftener, being summoned as occasion requires.

DIRECTOR, in surgery, a grooved probe, to direct the edge

edge of the knife or ſciſſars, in opening ſinuſes, or fiſtulæ, that by this means the adjacent veſſels, nerves, and tendons may remain unhurt. See SURGERY.

DIRIGENT, or DIRECTRIX, a term in geometry, ſignifying the line of motion, along which the deſcribent line or ſurface is carried in the geneſis of any plane or ſolid figure.

DIS, an inſeparable article prefixed to divers words, the effect whereof is either to give them a ſignification contrary to what the ſimple words have, as *diſoblige*, *diſobey*, &c. or to ſignify a ſeparation, detachment, &c. as *diſpoſing*, *diſtributing*.

DISC, in antiquity, a quoit made of ſtone, iron, or copper, five or ſix fingers broad, and more than a foot long, inclining to an oval figure, which they hurled in form of a bowl, to a vaſt diſtance, by the help of a leathern thong tied round the perſon's hand who threw it, and put through a hole in the middle. Homer has made Ajax and Ulyſſes great artiſts at this ſport.

DISC, in aſtronomy, the body and face of the ſun and moon, ſuch as it appears to us on the earth; or the body or face of the earth, ſuch as it appears to a ſpectator in the moon.

DISC, in optics, is the width of the aperture of teleſcopic glaſſes, whatever their form be, whether plain, convex, concave, *&c.*

DISCERNING, or DISCERNMENT, among logicians, a faculty of the mind, whereby it diſtinguiſhes between ideas.

DISCIPLE, one who learns any thing from another: thus, the followers of any teacher, philoſopher, *&c.* are called diſciples. In the Chriſtian ſenſe, they were followers of Jeſus Chriſt, in general; but in a more reſtrained ſenſe, the diſciples denote thoſe alone who were the immediate followers and attendants on his perſon, of which there were ſeventy or ſeventy-two. The names *diſciple* and *apoſtle* are often ſynonymouſly uſed in the goſpel-hiſtory; but ſometimes the apoſtles are diſtinguiſhed from diſciples, as perſons ſelected out of the number of diſciples, to be the principal miniſters of his religion; of theſe there were only twelve. The Latins kept the feſtival of the ſeventy or ſeventy-two diſciples on July 15th, and the Greeks on January 4th.

DISCIPLINE, in a general ſenſe, denotes inſtruction and government; as military diſcipline, eccleſiaſtical diſcipline, *&c.*

DISCLAMATION, in Scots law, is that caſualty whereby a vaſſal forfeited his feu to his ſuperior, by diſowning or diſclaiming him as ſuch without ſufficient reaſon. See SCOTS LAW, title 12.

DISCORD, in muſic, the relation of two ſounds which are always and of themſelves diſagreeable, whether applied in ſucceſſion or conſonance.

DISCOUNT, in commerce, a term among traders, merchants, and bankers. It is uſed by the two former on occaſion of their buying commodities on the uſual time of credit, with a condition that the ſeller ſhall allow the buyer a certain diſcount at the rate of ſo much *per cent. per annum*, for the time for which the credit is generally given, upon condition that the buyer pays ready money for ſuch commodities, inſtead of taking the time of credit.

DISCRETE, or DISJUNCT PROPORTION, is when the ratio of two or more pairs of numbers or quantities is the ſame, but there is not the ſame proportion between all the four numbers. Thus if the numbers 3 : 6 : : 8 : 16 be conſidered, the ratio between 3 : 6, is the ſame as that between 8 : 16, and therefore the numbers are proportional; but it is only diſcretely or diſjunctly, for 3 is not to 6 as 6 to 8; that is, the proportion is broken off between 8 and 3, and is not continued as in the following continual proportionals, 3 : 6 : : 12 : 24.

DISCUS, in antiquity. See DISC.

DISCUSSION, in matters of literature, ſignifies the clear treating or handling of any particular point, or problem, ſo as to ſhake off the difficulties with which it is embaraſſed: thus we ſay, ſuch a point was well diſcuſſed, when it was well treated of and cleared up.

DISCUTIENTS, in medicine, are ſuch remedies, as, by their ſubtilty, diſſolve a ſtagnating or coagulated fluid, and diſſipate the ſame without an external ſolution of continuity.

DISDIAPASON, or BISDIAPASON, in muſic, a compound concord, deſcribed by F. Parran, in the quadruple ratio of 4 : 1, or 8 : 2.

DISDIAPASON-DIAPENTE, a concord in a ſextuple ratio of 1 : 6.

DISDIAPASON-SEMI-DIAPENTE, a compound concord in the proportion of 16 : 3.

DISDIAPASON-DITONE, a compound conſonance in the proportion of 10 : 2.

DISDIAPASON-SEMI-DITONE, a compound concord in the proportion of 24 : 5.

DISEASE, in medicine, that ſtate of a living body, wherein it is deprived of the exerciſe of any of its functions, whether vital, natural, or animal. See MEDICINE.

DISFRANCHISING, among civilians, ſignifies the depriving a perſon of the rights and privileges of a free citizen or ſubject.

DISJUNCTIVE, ſomething that ſeparates or disjoins. Thus, *or*, *neither*, *&c.* which in connecting a diſcourſe yet ſeparates the parts of it, are called disjunctive conjunctions.

DISLOCATION, in ſurgery. See LUXATION.

DISMA, a town of Japan, ſeparated from Nanqueſacque, only by a narrow canal. The Dutch have a very fine magazine there.

DISPENSARY, or DISPENSATORY, denotes a book containing the method of preparing the various kinds of medicines uſed in pharmacy. Such are thoſe of Bauderon, Quercetan, Zwelfer, Charas, Bates, Meſue, Salmon, Lemery, Quincy, *&c.* but the lateſt and moſt eſteemed are the Edinburgh and London Diſpenſatories.

DISPENSARY, or DISPENSATORY, is likewiſe a magazine or office for ſelling medicines at prime coſt to the poor.

DISPENSATION, in law, the granting a licenſe of doing ſome certain action that otherwiſe is not permitted.

DISPLAYED, in heraldry, is underſtood of the poſition of an eagle, or any other bird, when it is erect, with its wings expanded or ſpread forth. See Plate LXVIII. fig. 8.

DISPONDEE, in the Greek and Latin poetry, a double ſpondee or foot, conſiſting of four long ſyllables, as māēcēnātēs cōnclūdēntēs.

DISPOSITION, in Scots law, is that deed or writing which contains the ſale or grant of any ſubject: when applied to herit•ble ſubjects, it in ſome caſes gets the name of charter, which differs from a diſpoſition in nothing elſe than a few immaterial forms. See CHARTER.

DISPOSITION, in rhetoric, the placing words in ſuch an order as contributes moſt to the beauty and ſometimes even to the ſtrength of a diſcourſe.

DISQUISITION, a ſerious and exact examination into the circumſtances of any affair, in order to diſcourſe clearly about it.

DISS, a market-town of Norfolk, on the river Wavency, ſixteen miles ſouth of Norwich.

DISSECTION, in anatomy, the cutting up a body, with a view of examining the ſtructure and uſe of the parts. See ANATOMY.

DISSEISIN, in law, an unlawful diſpoſſeſſing a perſon of his lands or tenements.

DISSENTERS, ſeparatiſts from the ſervice and worſhip of any eſtabliſhed church.

DISSIPATION, in phyſics, an inſenſible loſs or conſumption of the minute parts of the body; or, that flux whereby they fly off, and are loſt.

Circle of DISSIPATION, in optics, is uſed for that circular ſpace upon the retina, which is taken up by one of the extreme pencils or rays iſſuing from an object. See OPTICS.

DISSOLVENT, in general, whatever diſſolves or reduces a ſolid body into ſuch minute parts as to be ſuſtained in a fluid. See CHEMISTRY.

DISSONANCE, in muſic. See DISCORD.

DISSYLLABLE, among grammarians, a word conſiſting only of two ſyllables: ſuch are nature, ſcience, *&c.*

DISTAFF, an inſtrument about which flax is tied in order to be ſpun.

DISTANCE, in general, an interval between two things, either with regard to time or place.

Acceſſible DISTANCES, in geometry, are ſuch as may be meaſured by the chain, *&c.* See GEOMETRY.

Inacceſſible DISTANCES, are ſuch as cannot be meaſured by the chain, *&c.* by reaſon of ſome river, or the like, which obſtructs our paſſing from one object to another. See GEOMETRY.

DISTASTE properly ſignifies an averſion or diſlike to certain foods; and may be either conſtitutional, or owing to ſome diſorder of the ſtomach.

DISTEMPER, among phyſicians, the ſame with diſeaſe. See DISEASE.

DISTEMPER, in painting, a term uſed for the working up of colours with ſomething beſides water or oil. If the colours are prepared with water, that kind of painting is called limning; and if with oil, it is called painting in oil, and ſimply painting. If the colours are mixed with ſize, whites of eggs, or any ſuch proper glutinous or unctuous matter, and not with oil, then they ſay it is done in diſtemper.

DISTENSION, in general, ſignifies the ſtretching or extending a thing to its full length or breadth.

DISTICH, a couplet of verſes making a complete ſenſe. Thus hexameter and pentameter verſes are diſpoſed in diſtichs.

DISTICHIASIS, in ſurgery, a diſeaſe of the eye-lids, when under the ordinary eye-laſhes there grows another extraordinary row of hair, which frequently eradicates the former, and pricking the membrane of the eye, excites pain, and brings on a defluxion.

DISTILLATION, in chemiſtry, the act of drawing off the ſpiritous, aqueous, oleaginous, or ſaline parts of a mixed body from the groſſer and more terreſtrial parts by means of fire, and collecting and condenſing them again by cold. The end of diſtillation is of two kinds: the firſt, and by far the moſt general, is for the ſeparation of ſome acquired bodies from others with which they were mixed, as in the caſe of vinous and volatile ſpirits, and eſſential oils: the other is for the quicker and more effectual combination of ſuch bodies, whoſe mixture is aſſiſted by a boiling heat, as in the caſe of ſpir. nitr. dulc. See CHEMISTRY.

The method of diſtilling malt-waſh, or a fermented mixture of meal and malt, for ſpirit. Fill two thirds of a ſtill, firſt moiſtened by the ſteam of boiling water, with malt-waſh; immediately clap on the head, and lute it down; there will ſoon run a ſpirituous inflammable liquor. Thus is obtained what the malt-diſtillers call a malt low-wine; what comes over after the ſpirit falls off from being proof, is called faints. This experiment may be rendered general, with ſlight variation; for if any wine, beer, or fermented liquor from ſugar, treacle, or fruits, *&c.* be thus treated, it affords a ſpirit differing only according to the nature of the ſubject; but none of them will afford the leaſt inflammable ſpirit without a previous fermentation. The requiſite cautions for ſucceſs are, 1. That the fermentation be well performed. 2. That it be gently diſtilled, with a ſoft well regulated fire. 3. That the groſſer oil, apt to riſe along with the ſpirit, be let out by flannel under the noſe of the worm. Theſe cautions obſerved, the low-wines will be pure and vinous.

The method of diſtilling the lower wines into proof ſpirits for ſale. The lower wines of the laſt proceſs, diſtilled in a bath-heat, give a higher rectified ſpirit than before, which being let down with fair water to a certain ſize or ſtandard, called proof, is what the malt-diſtillers underſtand by proof-goods, or their rectified malt-ſpirit.

The inconveniencies of this art, on account of the many large veſſels required, which increaſe the labour and price of the commodity, might perhaps be remedied by the introduction of a new art, ſubſervient to the malt-diſtillers, and confined to the boiling down the malt-wort to a rob; wherefore it were to be wiſhed, that thoſe who were ſkilled in this branch of diſtil-

lation would try whether a ſpirit ſuperior to that of treacle may not be procured from the rob of malt, prudently prepared and fermented. See CHEMISTRY.

DISTINCT BASE, in optics, is that diſtance from the pole of a convex glaſs, in which objects beheld through it appear diſtinct and well deſcribed; ſo that it is the ſame with the focus. See OPTICS.

DISTINCTION, in logic, is an aſſemblage of two or more words, whereby diſparate things, or their conceptions, are denoted.

DISTORTION, in medicine, a contraction of one ſide of the mouth, occaſioned by a convulſion of the muſcles of one ſide of the face: and it is likewiſe uſed to denote any part of an animal body when it is ill placed or ill favoured.

DISTRESS, in Scots law. When a perſon makes payment of a debt not voluntarily, but in obedience to legal diligence, he is ſaid to have paid in diſtreſs.

DISTRIBUTION, in printing, the taking a form aſunder, ſeparating the letters, and diſpoſing them in the caſes again, each in its proper box. See PRINTING.

DISTRICT, in geography, a part of a province, diſtinguiſhed by peculiar magiſtrates, or certain privileges, in which ſenſe it is ſynonymous with hundred. See HUNDRED.

DISTRINGAS, in law, a writ commanding the ſheriff, or other officer, that he diſtrain a perſon for debt to the king, &c. or for his appearance at a certain day.

DISTRINGAS JURATORES, a writ directed to the ſheriff, whereby he is commanded to diſtrain upon a jury to appear, and to return iſſues on their lands, &c. for non-appearance. This writ of diſtringas juratores iſſues for the ſheriff to have their bodies in court, &c. at the return of the writ.

DITHYRAMBUS, in ancient poetry, a hymn in honour of Bacchus, full of tranſport and poetical rage.

DITONE, in muſic, an interval comprehending two tones. The proportion of the ſounds that form the ditone is 4 : 5, and that of the ſemiditone is 5 : 6.

DITRIHEDRIA, in mineralogy, a genus of ſpars with twice three ſides, or ſix planes, being formed of two trigonal pyramids joined baſe to baſe, without any intermediate column. See SPAR.

The ſpecies of ditrihedria are diſtinguiſhed by the different figures of theſe pyramids.

DITTANY, in botany. See DICTAMNUS.

DITTO, uſually written D°, in books of accounts, an Italian word, ſignifying *the aforementioned.*

DIVAL, in heraldry, the herb nightſhade, uſed by ſuch as blazon by flowers and herbs, inſtead of colours and metals, for ſable, or black.

DIVALLIA. See ANGERONALIA.

DIU, a little iſland and town on the coaſt of Guzurat, in the hither India, and ſubject to Portugal: E. long. 69°, N. lat. 21° 15′.

DIU is alſo a town of Bulgaria, upon the Danube.

DIVAN, a council-chamber, or court of juſtice, among the eaſtern nations, particularly the Turks.

DIVAN-BEGHI, the ſuperintendant of juſtice in Perſia, whoſe place is the laſt of the ſix miniſters of the ſecond rank, who are all under the athemadauler, or firſt miniſter. To this tribunal of the divan-beghi he appeals from ſentences paſſed by the governors: he has a fixed ſtipend of 50,000 crowns for adminiſtring juſtice: all the ſerjeants, uſhers, &c. of the court, are in his ſervice: he takes cognizance of the criminal cauſes of the chams, governors, and other great lords of Perſia, when accuſed of any fault. There are divan-beghis not only at court and in the capital, but alſo in the provinces and other cities of the empire. The alcoran is the ſole rule of his adminiſtration of juſtice, which alſo he interprets at pleaſure. He takes no cognizance of civil cauſes, but all differences ariſing between the officers of the king's houſhold, and between foreign miniſters, are determined by him.

DIVANDUROW, the name of ſeven iſlands which lie a league north of the Maldives, and twenty-four from the coaſt of Malabar, almoſt oppoſite to Cananor.

DIVER, in ornithology. See COLYMBUS.

DIVERGENT, or DIVERGING LINES, in geometry, are thoſe which conſtantly recede from each other.

DIVERGENT RAYS, in optics, are thoſe which going from a point of the viſible object, are diſperſed, and continually depart one from another, in proportion as they are removed from the object: in which ſenſe it is oppoſed to convergent. See OPTICS.

DIVERSION, in military affairs, is, when an enemy is attacked in one place where they are weak and unprovided, in order to draw off their forces from another place where they have made or intend to make an irruption. Thus the Romans had no other way in their power of driving Hanibal out of Italy, but by making a diverſion in attacking Carthage.

DIVESTING, or DIVESTITURE, in law, is uſed for the act of ſurrendering one's effects.

DIVIDEND, in arithmetic, the number propoſed to be divided into equal parts. See ARITHMETIC.

DIVIDEND *of ſtocks*, is a ſhare or proportion of the intereſt of ſtocks erected on public funds, as the ſouth-ſea, &c. divided among and paid to the adventurers half yearly.

DIVINATION, the knowledge of things obſcure, or future, which cannot be attained by any natural means.

It was a received opinion among the heathens, that the gods were wont to converſe familiarly with ſome men, whom they endowed with extraordinary powers, and admitted to the knowledge of their councils and deſigns. Plato, Ariſtotle, Plutarch, Cicero, and others, divide divination into two ſorts or ſpecies, *viz.* natural and artificial. The former was ſo called, becauſe not attained by any rules or precepts of art, but infuſed or inſpired into the diviner, without his taking any further care about it, than to purify and prepare himſelf for the reception of the divine afflatus. Of this kind were all thoſe who delivered oracles, and foretold future events by inſpiration, without obſerving external ſigns or accidents. The ſecond ſpecies of divination was called artificial, becauſe it was not obtained by immediate inſpiration, but was the effect of experience and obſervation.

obſervation. Such was ſouthſaying, as depending upon human art and invention, which however was ſuppoſed not to be altogether deſtitute of divine direction and concurrence, and ſuch was divination by lots. Of this ſort there were various kinds, as by ſacrifices, entrails, flame, cakes, flour, wine, water, augury, birds, lots, verſes, omens, *&c.*

DIVINE, ſomething relating to God.

DIVING, the art of deſcending under water, to conſiderable depths, and abiding there a competent time; the uſes of which are conſiderable, particularly in fiſhing for pearls, corals, ſponges, wrecks of ſhips, *&c.* See PNEUMATICS.

DIVINITY, properly ſignifies the nature, quality, and eſſence of God.

DIVINITY is alſo uſed in the ſame ſenſe with theology.

DIVISIBILITY, that property by which the particles of matter in all bodies are capable of ſeparation or diſunion from each other. See MECHANICS.

DIVISION, in general, is the ſeparating a thing into two or more parts.

DIVISION, in arithmetic. See Vol. I. p. 376.

DIVISION, in algebra. See Vol. I. p. 82.

DIVISOR, in arithmetic. See Vol. I. p. 376.

DIUL, a port-town of Aſia, ſituated on the Indian ocean, weſtward of the river Indus, and ſixty miles weſt of the city of Tatta: E. long. 67°, and N. lat. 25° 15′.

DIVORCE, is the legal diſſolution of a marriage which can be obtained at the ſuit of the injured party, upon the grounds of adultery or wilful deſertion proved againſt the other. See SCOTS LAW, title 6.

DIURESIS, in medicine, an excretion of urine: whence,

DIURETICS, in pharmacy, ſuch ſimples as increaſe the diſcharge of urine; or which are ſuppoſed to have a power of removing obſtructions in the urinary paſſages.

DIURNAL, in aſtronomy, ſomething relating to the day; in oppoſition to nocturnal, which regards the night.

DIZIER, or St DIZIER, a city of Champaign in France, ſituated on the river Marne, about forty-five miles north-eaſt of Troyes: E. long. 5°, and N. lat. 48° 32′.

DIZOSTOS, in botany. See EUPHORBIA.

DIZZINESS, in medicine, See VERTIGO.

DO, in muſic, a note of the Italian ſcale, correſponding to *ut* of the common gamut. See MUSIC.

DOB-CHICK, in ornithology. See COLYMBUS.

DOBLAC, a town of the Tyroleſe, in Germany, ſituated at the foot of the Alps, about two miles north of the frontiers of the ſtate of Venice.

DOCIMASIA, in Greek antiquity, a probation of the magiſtrates and perſons employed in public buſineſs at Athens. It was performed publicly in the forum, where they were obliged to give account of themſelves and their paſt life before certain judges. Among ſeveral queſtions propoſed to them, we find the following, whether they had been dutiful to their parents, had ſerved in the wars, and had a competent eſtate.

DOCK, in botany. See LAPATHUM.

DOCK, in maritime affairs, is a pit, great pond, or creek, by the ſide of an harbour, made convenient either for the building or repairing of ſhips.

DOCK-YARDS, in ſhip-building, are magazines of all ſorts of naval ſtores. The principal ones in England are thoſe of Chatham, Portſmouth, Plymouth, Woolwich, Deptford, and Sheerneſs. In time of peace, ſhips of war are laid up in theſe docks; thoſe of the firſt-rates moſtly at Chatham, where, and at other yards, they receive from time to time ſuch repairs as are neceſſary. Theſe yards are generally ſupplied from the northern crowns with hemp, pitch, tar, roſin, *&c.* but as for maſts, particularly thoſe of the larger ſize, they are brought from New England.

DOCTOR, a perſon who has paſſed all the degrees of a faculty, and is impowered to teach or practiſe the ſame: thus we ſay, doctor in divinity, doctor in phyſic, doctor of laws.

The title of doctor ſeems to have been created in the XIIth century, inſtead of *maſter*, and eſtabliſhed with the other ſcholaſtic degrees of batchelors and licentiates, by Peter Lombard and Gilbert Porreus, then the chief divines of the univerſity of Paris. Gratian did the ſame thing, at the ſame time, in the univerſity of Bologna.

DOCTOR *of the law*, a title of honour among the Jews. The inveſtiture, if we may ſo ſay, of this order was performed by putting a key and table book in their hands, which is what ſome authors imagine our Saviour had in view, Luke xi. 52. when ſpeaking of the doctors of the law, he ſays, "Wo unto you, doctors of the law, for you have taken away the key of knowledge: you entered not in yourſelves, and them that were entering you hindered."

DOCTORS-COMMONS. See COLLEGE *of civilians*.

DOCUMENT, in law, ſome written monument produced in proof of any thing aſſerted.

DODARTIA, in botany, a genus of the didynamia angioſpermia claſs. The calix has five teeth; the inferior labium is much leſs than the ſuperior; and the capſule is roundiſh, and has two cells. There are two ſpecies, none of them natives of Britain.

DODDER, in botany. See CUSCUTA.

DODECAGON, in geometry, a regular polygon conſiſting of twelve equal ſides and angles.

DODECAHEDRON, in geometry, one of the platonic bodies, or regular ſolids, contained under twelve equal and regular pentagons.

DODECANDRIA, in the Linnæan ſyſtem of botany. See Vol. I. p. 635.

DODO, in ornithology. See DIDUS.

DODONÆA, in botany. See PTELEA.

DODRANS, in antiquity, three fourths of the as. See AS.

DOESBURG, a town of the United Netherlands, in the province of Guelderland, ſituated on the river Yſſel, about nine miles ſouth of Zutphen: E. long. 6°, and N. lat. 52°.

DOG, in zoology. See CANIS.

DOG'S BANE, in botany. See APOCYNUM.

DOG-DAYS. See CANICULAR.

DOG'S FENNEL, in botany. See COTULA.

DOG'S MERCURY, in botany. See MERCURIALIS.

DOG'S ROSE. See ROSA.

DOG'S STONES, in botany. See ORCHIS.

DOG'S TAIL, in botany. See CYNOSURUS.

DOG'S TONGUE, in botany. See CYNOGLOSSUM.

DOG'S TOOTH, in botany. See ERYTHRONIUM.

DOGE, the chief magiſtrate in the republics of Venice and Genoa.

This dignity is elective in both places; at Venice it continues for life; at Genoa, it is only for two years. His title is Serenity: he is chief of the council, and mouth of the republic, he being to anſwer for her. The Venetians do not go into mourning at his death, being only the phantom of majeſty, as all the authority is veſted in the republic; the doge only lends his name to the ſenate; the power is diffuſed through the whole body; though anſwers to foreign ambaſſadors, *&c.* are made in the name of the doge. The money is ſtruck in his name, but does not bear his arms. All the magiſtrates riſe and ſalute him when he comes into the council: but he riſes to none but foreign ambaſſadors. He muſt not ſtir out of Venice, without leave of the counſellors, *&c.*

DOGGERS, a name uſed for fiſhing veſſels; whence, in ſome of our old ſtatutes, we meet with dogger-men, denoting the fiſhermen of thoſe veſſels.

DOGMA, a principle, maxim, tenet, or ſettled opinion, particularly with regard to matters of faith and philoſophy.

DOGMATICAL, ſomething belonging to a doctrine or opinion. A dogmatical philoſopher is one who aſſerts things poſitively; in oppoſition to a ſceptic, who doubts of every thing.

DOGMATISTS, a ſect of ancient phyſicians, of which Hippocrates was the firſt author. They are alſo called *logici*, logicians, from their uſing the rules of logic in ſubjects of their profeſſion. They laid down definitions and diviſions reducing diſeaſes to certain genera, and thoſe genera to ſpecies, and furniſhing remedies for them all; ſuppoſing principles, drawing concluſions, and applying thoſe principles and concluſions to particular diſeaſes under conſideration: in which ſenſe the dogmatiſts ſtand contradiſtinguiſhed from empirics and methodiſts. They reject all medicinal virtues that they think not reducible to manifeſt qualities: but Galen hath long ago obſerved of ſuch men, that they muſt either deny plain matter of fact, or aſſign but very poor reaſons and cauſes of many effects they pretend to explain.

DOLE, in our ancient cuſtoms, ſignified a part or portion, moſt commonly of a meadow, where ſeveral perſons have ſhares. It alſo ſtill ſignifies a diſtribution or dealing of alms, or a liberal gift made by a great man to the people.

DOLE, in Scots law, ſignifies a malevolent intention. It is eſſential in all crimes that it be committed intentionally, or by an act of the will; hence the rule, *Crimen dolo contrahitur.* See SCOTS LAW, title 33.

DOLICHOS, in botany, a genus of the diadelphia decandria claſs of plants, the corolla of which is papilionaceous; the vexillum is roundiſh, large, emarginated, and wholly reflected; the fruit is a large, acuminated, oblong pod, compoſed of two valves, and containing two cells; the ſeeds are numerous, elliptical, and frequently compreſſed. There are twenty-five ſpecies, none of them natives of Britain.

DOLLAR, a ſilver coin current in ſeveral parts of Germany and Holland. There are various ſpecies of dollars, as the rix-dollar, the ſemi-dollar, the quarter-dollar, *&c.*

DOLPHIN, in ichthyology. See DELPHINUS.

DOM, or DON, a title of honour, invented and chiefly uſed by the Spaniards, ſignifying, ſir, or lord.

This title, it ſeems, was firſt given to Pelayo, in the beginning of the VIIIth century. In Portugal no perſon can aſſume the title of don, without the permiſſion of the king, ſince it is looked upon as a mark of honour and nobility.

DOMAIN, the inheritance, eſtate, or poſſeſſion of any one. See DEMESNE.

DOME, in architecture, a ſpherical roof, or a roof of a ſpherical form, raiſed over the middle of a building, as a church, hall, pavillion, veſtible, ſtair-caſe, *&c.* by way of crowning.

DOME, or DOOM, ſignifies alſo a ſentence, judgment, or decree.

DOMESDAY, or DOOMSDAY-BOOK, a very ancient record made in the time of William the Conqueror, which now remains in the exchequer, and conſiſts of two volumes, a greater and a leſs; the greater contains a ſurvey of all the lands in moſt of the counties in England, and the leſs comprehends ſome counties that were then ſurveyed. The book of domeſday was begun by five juſtices, aſſigned for that purpoſe in each county, in the year 1081, and finiſhed in 1086. It was of that authority, that the conqueror himſelf ſubmitted, in ſome caſes wherein he was concerned, to be determined by it. Camden calls this book the tax-book of king William; and it was farther called Magna rolla.

There is likewiſe a third book of Domeſday, made by command of the conqueror; and alſo a fourth, being an abridgment of the other books.

DOMESTIC, any man who acts under another, ſerving to compoſe his family; in which he lives, or is ſuppoſed to live, as a chaplain, ſecretary, *&c.* Sometimes domeſtic is applied to the wife and children, but very ſeldom to ſervants, ſuch as footmen, lacquies, porters, *&c.*

DOMICILE, in Scots law, is the dwelling place where a perſon lives with an intention to remain. See SCOTS LAW, title 2.

DOMIFYING, in aſtrology, the dividing or diſtributing the heavens into twelve houſes, in order to erect a theme, or horoſcope, by means of ſix great circles, called circles of poſition.

There are various ways of domifying: that of regiomontanus, which is the moſt common, makes the circles

circles of poſition paſs through the interſections of the meridian and the horizon; others make them paſs through the poles of the zodiac.

DOMINATION, in theology, the fourth order of angels, or bleſſed ſpirits, in the hierarchy, reckoning from the ſeraphim.

DOMINGO, or ST DOMINGO, the capital of the iſland of Hiſpaniola, the ſee of an archbiſhop, and the moſt ancient royal audience in America: W. long. 70°, N. lat. 18° 20′.

DOMINICA, one of the Caribbee-iſlands, ſubject to Britain: W. long. 61° 20′, N. lat. 16°.

DOMINICAL LETTER. See ASTRONOMY, p. 495.

DOMINICANS, an order of religious, called in France Jacobins, and in England Black-friers, or preaching-friers. This order founded by St Dominic, a native of Spain, was approved of by Innocent III. in 1215, and confirmed by a bull of Honorius III. in 1216. The deſign of their inſtitution was to preach the goſpel, convert heretics, defend the faith, and propagate Chriſtianity. They embraced the rule of St Auguſtine, to which they added ſtatutes and conſtitutions, which had formerly been obſerved either by the Carthuſian or Præmonſtratenſes. The principal articles enjoined perpetual ſilence, abſtinence from fleſh at all times, wearing of woollen, rigorous poverty, and ſeveral other auſterities. This order has ſpread into all the parts of the world. It has produced a great number of martyrs, confeſſors, biſhops; and they reckon three popes, ſixty cardinals, 150 archbiſhops, and 800 biſhops of their order, beſides the maſters of the ſacred palace, who have always been Dominicans. They are inquiſitors in many places.

DOMINION, in the civil law, ſignifies the power to uſe or diſpoſe of a thing as we pleaſe.

DOMINIUM *eminens*, in Scots law, that power which the ſtate or ſovereign has over private property, by which the proprietor may be compelled to ſell it for an adequate price where public utility requires. See SCOTS LAW, title 8.

DOMINIUM *directum*, in Scots law, the right which a ſuperior retains in the lands, notwithſtanding the feudal grant to his vaſſal. See SCOTS LAW, title 12.

DOMINIUM *utile*, in Scots law, the right which the vaſſal acquires in the lands by the feudal grant from his ſuperior. See SCOTS LAW, title 13.

DON, the name of two rivers; one very large, which, after dividing Aſia from Europe, falls into the Palus Meotis; the other in the county of Aberdeen in Scotland.

DONATION, in Scots law, ſignifies a voluntary gift. Donation betwixt huſband and wife; ſee SCOTS LAW, title 6.—When revocable; Not preſumed *in dubio*;—Donations *mortis cauſa*: See title 22.

DONATISTS, Chriſtian ſchiſmatics in Africa, who took their name from their leader Donatus. A ſecret hatred againſt Cæcilian, elected biſhop of Carthage about the year 311, excited Donatus to form this ſect. He accuſed Cæcilian of having delivered up the ſacred books to the Pagans, and pretended that his election was void, and all his adherents heretics. He taught that baptiſm adminiſtered by heretics was null, that every church but the African was become proſtituted, and that he was to be the reſtorer of religion. Some accuſe the Donatiſts of Arianiſm. Conſtantius and Honorius made laws for their baniſhment, and Theodoſius and Honorius condemned them to grievous mulcts.

DONATIVE, a gratuity, or preſent made to any perſon.

Donative among the Romans was properly a gift made to the ſoldiers, as congiarium was that made to the people.

DONATORY, in Scots law, that perſon to whom the king beſtows his right to any forfeiture that has fallen to the crown.

DONAWERT, a city of Bavaria in Germany, forty miles north-weſt of Ulm: E. long. 10° 40′, N. lat. 48° 40′.

DONAX, a genus of inſects belonging to the order of vermes teſtacea. It is an animal of the oyſter kind; and the ſhell has two valves, with a very obtuſe margin in the fore part. There are ten ſpecies, principally diſtinguiſhed by the figure of their ſhells.

DONCASTER a market-town of Yorkſhire, thirty miles ſouth of York. See YORK.

DONOR, in law, the perſon who gives lands or tenements to another in tail, *&c.* as he to whom ſuch lands, *&c.* are given is the donee.

DONZY, a town of France in the Orleannois: E. long. 3° 16′, N. lat. 47° 17′.

DOOR, in architecture. See ARCHITECTURE, p. 356.

DORCHESTER, the capital of Dorſetſhire, ſituated on the river Froom, ſix miles north of Weymouth: W. long. 2° 35′, and N. lat 50° 40′. It gives the title of marquis to the noble family of Pierpoint, dukes of Kingſton, and ſends two members to parliament.

DORDONNE, a river of France, which runs through the province of Guienne, and falls into the Garonne, twelve miles below Bourdeaux.

DOREE, or JOHN DOREE, in ichthyology. See ZEUS.

DORIA, in botany. See SOLIDAGO.

DORIC, in general, any thing belonging to the Dorians, an ancient people of Greece, inhabiting near mount Parnaſſus.

DORIC ORDER in architecture. See Vol. I. p. 351.

DORIC DIALECT, one of the five dialects, or manners of ſpeaking which were principally in uſe among the Greeks.

It was firſt uſed by the Lacedemonians, particularly thoſe of Argos; afterwards it paſſed into Epirus, Lybia, Sicily, and the iſlands of Rhodes, Crete, *&c.*

DORIC MODE, in muſic, the firſt of the authentic modes of the ancients; its character is to be ſevere, tempered with gravity and joy; and is proper upon religious occaſions, as alſo to be uſed in war. It begins *D, la, ſol, re.* Plato admires the muſic of the doric mode, and judges it proper to preſerve good manners, as being

ing mafculine; and on this account allows it in his commonwealth. The ancients had likewife their fubdoric or hypodoric mode, which was one of the plagal modes. Its character was to be very grave and folemn: it began with *re*, a fourth lower than the doric.

DORMANT, in heraldry, is ufed for the pofture of a lion, or any other beaft, lying along in a fleeping attitude, with the head on the fore-paws; by which it is diftinguifhed from the couchant, where though the beaft be lying, yet he holds up his head.

DORMER, in architecture, fignifies a window made in the roof of an houfe, or above the entablature, being raifed upon the rafters.

DORMITORY, a gallery in convents or religious houfes, divided into feveral cells, in which the religious fleep or lodge.

DORONICIS AFFINIS, in botany. See GERBERA.

DORONICUM, LEOPARD'S BANE, in botany, a genus of the fyngenefia polygamia fuperflua clafs. The receptacle is naked; the pappus is fimple; the fcales of the calix are equal, and longer than the difc; and the feeds in the radius are naked, and have no pappus. There are three fpecies, none of them natives of Britain.

DORPT, or DORPAT, a city of Livonia, about fifty miles fouth of Narva: E. long. 27° 25′, and N. lat. 58°.

DORSAL, an appellation given to whatever belongs to the back. See DORSUM.

DORSAL MUSCLES. See ANAT. Part. II.

DORSIFEROUS PLANTS, among botanifts, fuch as are of the capillary kind, without ftalks, and which bear their feeds on the back-fide of their leaves.

DORSTENIA, in botany, a genus of the tetrandria monogynia clafs. The common receptacle confifts of one flefhy leaf, in which the folitary feeds are contained. There are four fpecies, none of them natives of Britain.

DORSUM, BACK, in anatomy, comprehends all the pofterior part of the trunk of the body, from the neck to the buttocks. See ANATOMY.

DORT, a city of the United Provinces, fituated in that of Holland, on an ifland in the river Maefe, about ten miles eaft of Rotterdam: E. long. 4° 40′, and N. lat. 51° 47′.

DORTMONT, a city of Weftphalia in Germany, about thirty miles north-eaft of Dufeldorp: E. long 6° 50′, and N. lat. 51° 25′. It is an imperial city, and conftitutes a fovereign ftate.

DORTMANNA, in botany. See LOBELIA.

DORYCNIUM, in botany. See CONVOLVULUS.

DORYPHORI, in antiquity, an appellation given to the life guard men of the Roman emperors.

DOSITHEANS, in church-hiftory, a fect among the Hebrews, being one of the branches of the Samaritans. See SAMARITANS.

They abftained from eating any creature that had life, and were fo fuperftitious in keeping the fabbath, that they remained in the fame place and pofture wherein that day furprifed them, without ftirring till the next day. They married but once, and a great number never married. Dofitheus, their founder, being diffatiffied among the Jews, retired to the Samaritans, who were reputed heretics, and invented another fect; and to make it more authentic, he went into a cave, where, by too long abftinence, he killed himfelf. The name of Dofitheans was alfo given to fome of the difciples of Simon Magus.

DOTTEREL, in ornithology. See CHARADRIUS.

DOUAY, a fortified city of the French Netherlands, fituated on the river Scrape, about fifteen miles fouth of Lifle: E. lon. 3°, and N. lat. 50° 25′.

DOUBLE FICHY, or FICHE′, in heraldry, the denomination of a crofs, when the extremity has two points, in contradiftinction to fiché, where the extremity is fharpened away to one point. See Plate LXVIII. fig. 8.

DOUBLETS, a game on dice within tables: the men, which are only fifteen, being placed thus; upon the fice, cinque, and quater points, there ftand three men a-piece; and upon the trey, duce, and ace, only two. He that throws higheft hath the benefit of throwing firft, and what he throws he lays down, and fo doth the other: what the one throws, and hath not, the other lays down for him, but on his own account; and thus they do till all the men are down, and then they bear. He that is down firft bears firft, and will doubtlefs win the game, if the other throws not doublets to overtake him; which he is fure to do, fince he advances or bears as many as the doublets make, *viz*. eight for two fours.

DOUBLING, in the military art, is the putting two ranks or files of foldiers into one. Thus, when the word of command is, *double your ranks*, the fecond, fourth, and fixth ranks march into the firft, third, and fifth, fo that the fix ranks are reduced to three, and the intervals between the ranks become double what they were before.

DOUBLING, among hunters, who fay that a hare doubles, when fhe keeps in plain fields, and winds about to deceive the hounds.

DOUBLING, in the menage, a term ufed of a horfe, who is faid to double his reins, when he leaps feveral times together, to throw his rider: thus we fay, the ramingue doubles his reins, and makes pontlevis.

DOUBLING *a cape or point*, in navigation, fignifies the coming up with it, paffing by it, and leaving it behind the fhip.

DOUBLINGS, in heraldry, the linings of robes and mantles of ftate, or of the mantlings in atchievments.

DOUBLON, or DUBLOON, a Spanifh and Portuguefe coin, being the double of a piftole. See PISTOLE.

DOUBTING, the act of with-holding our affent from any propofition, on fufpicion that we are not thoroughly apprifed of the merits thereof; or from not being able peremptorily to decide between the reafons for and againft it.

DOUCINE, in architecture, a moulding concave above and convex below, ferving commonly as a cymatium to a delicate corniche. It is likewife called gula.

DOVE, in ornithology. See COLUMBA.

DOVE, in geography, the name of a river dividing Derbyfhire

byſhire from Staffordſhire: alſo of a town of the Orleanois, in France, about twenty miles ſouth-eaſt of Angers.

DOVE-TAILING, in carpentry, is the manner of faſtening boards together by letting one piece into another, in the form of the tail of a dove. The dove-tail is the ſtrongeſt of the aſſemblages or jointings, becauſe the tenon, or piece of wood which is put into the other, goes widening to the extreme, ſo that it cannot be drawn out again, by reaſon the extreme or tip is bigger than the hole.

DOVER, a borough and port-town of Kent, ſituated on a rock, oppoſite to Calais in France, with a ſtrong caſtle: E. long. 25′, and N. lat. 51° 10′.

Dover gives the title of duke to the dukes of Queenſbury, a branch of the noble family of Douglas; and ſends two members to parliament, ſtyled barons of the cinque ports, whereof Dover is the chief.

DOUGLAS, a port-town, and the beſt harbour in the Iſle of Man: W. long. 4° 25′, and N. lat. 54° 7′.

DOWAGER, a widow endowed, is a title applied to the widows of princes, dukes, earls, and perſons of high rank only.

DOWER, that portion which the law allows a widow out of the lands of her huſband, after his deceaſe.

DOWN, in geography, the capital of a county of the ſame name in the province of Ulſter, in Ireland: W. long. 5° 50′, and N. lat. 54° 23′.

DOWNETON, or DUNKTON, a borough-town of Wiltſhire, five miles ſouth of Saliſbury. It ſends two members to parliament.

DOWNHAM, a market-town of Norfolk, ten miles ſouth of Lynn, famous for its good butter; there being a thouſand, and ſometimes two thouſand firkins bought here every Monday, and ſent up the river Ouſe to Cambridge, from whence it is conveyed to London, in the Cambridge waggons.

DOWNS, a famous road near Deal, in Kent, where both the outward and homeward bound ſhips frequently make ſome ſtay; and ſquadrons of men of war rendezvous in time of war.

It affords excellent anchorage, and is defended by the caſtles of Deal, Dover, and Sandwich.

DOWRY, the money or fortune which the wife brings her huſband in marriage: It is otherwiſe called *maritagium*, marriage-goods, and differs from dower.

DOXOLOGY, an hymn uſed in praiſe of the Almighty, diſtinguiſhed by the title of greater and leſſer.

The leſſer doxology was anciently only a ſingle ſentence, without reſponſe, running in theſe words, *Glory be to the Father, and to the Son, and to the Holy Ghoſt, world without end, amen.* Part of the latter clauſe, *As it was in the beginning, is now, and ever ſhall be,* was inſerted ſome time after the firſt compoſition. Some read this ancient hymn, *Glory be to the Father, and to the Son with the Holy Ghoſt.* Others, *Glory be to the Father in or by the Son, and by the Holy Ghoſt.* This difference of expreſſion occaſioned no diſputes in the church, till the riſe of the Arian hereſy; but when the followers of Arius began to make uſe of the latter as a diſtinguiſhing character of their party, it was entirely laid aſide by the catholics, and the uſe of it was enough to bring any one under ſuſpicion of heterodoxy. The doxology was uſed at the cloſe of every ſolemn office. The weſtern church repeated it at the end of every pſalm, and the eaſtern church at the end of the laſt pſalm. Many of their prayers were alſo concluded with it, particularly the ſolemn thankſgiving, or conſecration prayer at the euchariſt. It was alſo the ordinary concluſion of their ſermons.

The greater doxology, or angelic hymn, was likewiſe of great note in the ancient church. It began with theſe words, which the angels ſung at our Saviour's birth, *Glory be to God on high*, &c. It was chiefly uſed in communion ſervice, and in mens private devotions. Both the doxologies have a place in the church of England, the former being repeated after every pſalm, and the latter uſed in the communion ſervice.

DRABA, in botany, a genus of the tetradynamia ſiliculoſa claſs. The pod is entire and ſomewhat oval, with plain valves, and a parallel diſſepimentum; it has no ſtylus. There are ſix ſpecies, three of them natives of Britain, *viz.* the verna, or common whitlow-graſs; the muralis, or ſpeedwell-leaved whitlow-graſs; and the incana, or wreathen-poded whitlow-graſs.

DRABS, in the ſalt-works, a kind of wooden boxes for holding the ſalt when taken out of the boiling pan, the bottoms of which are made ſhelving or inclining forwards, that the briny moiſture of the ſalt may drain off.

DRACHM, a Grecian coin of the value of ſeven-pence three-farthings.

DRACO, the DRAGON, in zoology, a genus belonging to the order of amphibia reptilia. The characters of which are theſe: It has four legs, a cylindrical tail, and two membranaceous wings, radiated like the fins of a fiſh, by which he is enabled to fly, but not to any great diſtance at a time There are two ſpecies, 1. The volans, or flying dragon, with the wings entirely diſtinct from the fore-legs; it is found in Africa and the Eaſt Indies. 2. The præpos, with the wings fixed to the fore-legs; it is a native of America. They are both harmleſs creatures, and feed upon flies, ants, and ſmall inſects.

DRACO VOLANS, in meteorology, a fiery exhalation, frequent in marſhy and cold countries.

It is moſt common in ſummer, and though principally ſeen playing near the banks of rivers, or in boggy places, yet ſometimes mounts up to a conſiderable height in the air, to the no ſmall terror of the amazed beholders; its appearance being that of an oblong, ſometimes roundiſh, fiery body, with a long tail. It is entirely harmleſs, frequently ſticking to the hands and cloaths of people without injuring them in the leaſt.

DRACO, in aſtronomy, a conſtellation of the northern hemiſphere. See ASTRONOMY, p 486.

DRACOCEPHALUM, DRAGON'S HEAD, in botany, a genus of the didynamia gymnoſpermia claſs. The

faux of the corolla is inflated, and the fuperior labium is concave. There are 13 fpecies, none of them natives of Britain.

DRACONTIC MONTH, the time of one revolution of the moon, from her afcending node, called caput draconis, to her return thither.

DRACONTIUM, DRAGONS, in botany, a genus of the gynandria polyandria clafs. The fpatha is fhaped like a boat; the fpadix is covered; it has no calix; the corolla confifts of five petals; and the berry contains many feeds There are five fpecies, all natives of the Indies.

DRACUNCULI, in medicine, fmall long worms, which breed in the mufcular parts of the arms and legs, called Guinea worms See MEDICINE.

DRACUNCULUS, in botany. See ARUM.

DRACUNCULUS, in ichthyology. See CALLIONYMUS.

DRAGOMAN, DROGMAN, or DRUGGERMAN, a name given in the Levant to the interpreters kept by the ambaffadors of Chriftian nations, refiding at the Porte, to affift them in treating of their mafter's affairs.

DRAGON, in zoology. See DRACO.

DRAGON'S BLOOD, in pharmacy, a refin brought from the Eaft-Indies, either in oval drops, wrapped up in flag leaves, or in large maffes compofed of fmaller tears. The fine dragon's blood of either fort breaks fmooth, free from any vifible impurities, of a dark red colour, which changes upon being powdered into an elegant bright crimfon. It diffolves in pure fpirit, and tinges a large quantity of the menftruum of a deep red colour; it is alfo foluble in oils. It is ufually looked upon as a gentle aftringent, and is fometimes prefcribed againft feminal gleets, the fluor albus, and other fluxes.

DRAGON-FLY. See LIBELLA.

DRAGON-SHELL. See PATELLA.

DRAGONS, in botany. See DRACONTIUM.

DRAGONNE'E, in heraldry; a lion dragonnée is where the upper half refembles a lion, the other half going off like the hinder part of a dragon. The fame may be faid of any other beaft as well as a lion.

DRAGOON, in military affairs, a mufqueteer, mounted on horfeback, who fometimes fights or marches on foot, as occafion requires.

Dragoons are divided into brigades, as the cavalry, and each regiment into troops; each troop having a captain, lieutenant, cornet, quarter-mafter, two ferjeants, three corporals, and two drums. Some regiments have hautboys: they are very ufeful on any expedition that requires difpatch, for they can keep pace with the cavalry, and do the duty of infantry: they encamp generally on the wings of the army, or at the paffes leading to the camp; and fometimes they are brought to cover the general's quarters: they do duty on the generals of horfe and dragoons, and march in the front and rear of the army.

DRAGS, in the fea-language, are whatever hangs over the fhip in the fea, as fhirts, coats, or the like; and boats, when towed, or whatever elfe that, after this manner, may hinder the fhip's way when fhe fails, are called drags.

DRAINS, a name given, in the fen countries, to certain large cuts or ditchesof twenty, thirty, nay fometimes forty foot wide, carried through the marfhy ground to fome river or other place capable of difcharging the water they carry out of the fen-lands. See AGRICULTURE.

DRAKE, in ornithology, the male of the duck-kind. See ANAS.

DRAMA, a poem containing fome certain action, and reprefenting a true picture of human life, for the delight and improvement of mankind.

The principal fpecies of the drama are two, comedy and tragedy. Some others there are of lefs note, as paftoral, fatire, tragi-comedy, opera, *&c.* See COMPOSITION.

DRAMATIC, an epithet given to pieces written for the ftage. See COMPOSITION.

DRANK, among farmers, a term ufed to denote wild oats, which never fail to infeft worn-out lands; fo that when plowed lands run to thefe weeds and thiftles, the farmer knows it is high time to fallow them, or elfe to fow them with hay-feed, and make pafture of them.

DRAPERY, in fculpture and painting, fignifies the reprefentation of the clothing of human figures, and alfo hangings, tapeftry, curtains, and moft other things that are not carnations or landfcapes. See PAINTING.

DRAUGHT, in trade, called alfo CLOFF or CLOUCH, is a fmall allowance on weighable goods, made by the king to the importer, or by the feller to the buyer, that the weight may hold out when the goods are weighed again.

The king allows 1 ℔ draught for goods weighing no lefs than 1 Cwt. 2 ℔ for goods weighing between 1 and 2 Cwt. 3 ℔ for goods weighing between 2 and 3 Cwt. 4 ℔ from 3 to 10 cwt. 7 ℔ from 10 to 18 Cwt. 9 ℔ from 18 to 30, or upwards.

DRAUGT HOOKS, are large hooks of iron, fixed on the cheeks of a cannon-carriage, two on each fide, one near the trunnion hole, and the other at the train, diftinguifhed by the name of fore and hind draught-hooks. Large guns have draught-hooks near the middle tranfom, to which are fixed the chains that ferve to keep the fhafts of the limbers on a march. The fore and hind hooks are ufed for drawing a gun backwards or forwards, by men with ftrong ropes, called draught-ropes, fixed to thefe hooks.

DRAUGHT-HORSE, in farming, a fort of coarfe-made horfe, deftined for the fervice of a cart or plough. See EQUUS.

DRAW, in the fea-language. A fhip is faid to draw fo much water, according to the number of feet fhe finks into it; fo that if a fhip fink into the water eighteen feet perpendicularly, fhe is faid to draw eighteen feet water; and according as fhe draws more or lefs, fhe is faid to be of more or lefs draught.

DRAW-BACK, in commerce, certain duties, either of the cuftoms or of the excife, allowed upon the exportation of fome of our own manufactures; or upon certain foreign merchandife, that have paid duty on importation.

The

The oaths of the merchants importing and exporting are required to obtain the drawback of foreign goods, affirming the truth of the officer's certificate of the entry, and the due payment of the duties: and theſe may be made by the agent or huſband of any corporation or company; or by the known ſervant of any merchant uſually employed in making his entries and paying his cuſtoms. In regard to foreign goods entered outward, if leſs quantity or value be fraudulently ſhipped out than is expreſſed in the exporter's certificate, the goods therein mentioned, or their value, are forfeited, and no drawback to be allowed for the ſame. Foreign goods exported by certificate, in order to obtain the drawback, not ſhipped or exported, or re-landed in Great Britain, unleſs in caſe of diſtreſs, to ſave them from periſhing, are to loſe the benefit of the drawback, and are forfeited, or their value, with the veſſels, horſes, carriages, *&c.* employed in the re-landing thereof; and the perſons employed in the re-landing them, or by whoſe privity they are re-landed, or into whoſe hands they ſhall knowingly come, are to forfeit double the amount of the drawback. Officers of the cuſtoms conniving at, or aſſiſting in any fraud relating to certificate-goods, beſides other penalties, are to forfeit their office, and to ſuffer ſix months impriſonment, without bail or mainprize; as are alſo maſters, or perſons belonging to the ſhips employed therein. Bonds given for the exportation of certificate-goods to Ireland, muſt not be delivered up, nor drawback allowed for any goods, till a certificate under the hands and ſeals of the collector or comptroller, *&c.* of the cuſtoms be produced, teſtifying the landing.

The computation of what is to be drawn back upon the exportation of foreign goods, may be ſeen under their reſpective heads.

Draw-bridge, a bridge made after the manner of a floor, to draw up, or let down, as occaſion ſerves, before the gate of a town or caſtle.

DRAWING, in general, denotes the action of pulling out, or haling along: thus, we read of tooth-drawing, wire-drawing, *&c.*

Drawing, the art of repreſenting the appearances of objects by imitation, or copying without the aſſiſtance of mathematical rules.

The general precepts for drawing are as follow: 1. Begin with plain geometrical figures, as lines, angles, triangles, polygons, arches, circles, ovals, cones, cylinders, and the like, being the foundation of all other proportions. The circle is of uſe in the ſeveral orbicular forms, as the ſun, moon, globes, *&c.* the oval, in giving a juſt proportion to the face and mouth; and the ſquare confines a picture you are to copy, *&c.* the triangle is of uſe in drawing a ſide or half face; angles and arches, in perſpective; and the polygon, in ground-plots, fortifications, *&c.* the cone, in ſpires, ſteeples, tops of towers, *&c.* the cylinder, in columns, pillars, pilaſters, *&c.* See Perspective.

2. Having brought your hand to be fit and ready in general proportions, accuſtom yourſelf to give every object its due ſhade, according to its concavity or convexity, and to elevate or depreſs the ſame, as the object appears either nearer or farther off the light.

3. The ſecond practice of drawing, conſiſts in forming fruits, as apples, pears, cherries, *&c.* with their leaves; the imitation of flowers, as roſes, tulips, carnations, *&c.* herbs, trees, *&c.* of different kinds.

4. The third, in the imitation of beaſts, fowls, fiſhes, *&c.*

5. The fourth practice of drawing conſiſts in the imitation of the body of man, with all its lineaments, as head, noſe, eyes, ears, cheeks, arms, and ſhadows, all exactly proportioned both to the whole and to one another.

6. The fifth is in the drapery, in the imitation of cloathing, and artificially ſetting off the outward coverings, habit, and ornaments of the body, either of cloth, ſtuff, ſilk, or linen, in their natural and proper folds.

7. In drawing of all the forms before-mentioned, it is requiſite to be firſt perfect in the laying down the exact proportions; ſecondly, in the general or outward lines, before you proceed to ſhadowing, or trimming the work within.

8. In mixed and uncertain forms, where the circle, ſquare, *&c.* will be of no uſe, but only in the idea thereof in your own fancy, as horſes, oxen, and the like, you muſt do it by judgment, and ſo gain the true proportions by aſſiduous practice: thus having the ſhape of the thing in your mind, firſt draw it rudely with a coal; then, with more exactneſs, with a lead or pencil; then peruſe it well, and mend it in thoſe parts you have erred in, according to the idea you carry in your mind. When it is mended by your own judgment, compare it with ſome good pattern of the ſame kind, and amend it by that.

9. Having good copies to draw after, learn to reduce them to other proportions, either larger or ſmaller; and this by frequent practice.

10. Let a perfection in drawing be attained by diligent exerciſe, and the inſtruction of a good maſter, before there be any attempts as to colouring and painting; for the former being attained, the reſt will be eaſily underſtood, and gained by frequent practice.

Particular obſervations with regard to Drawing, *are as follows.* 1. If you draw after a print or picture, place it in ſuch a light, that the gloſs of the colours may not interrupt your light, and that the light and your eye may equally and obliquely fall upon the piece, which ſhould be placed at ſuch a diſtance, that, upon opening your eye, you may view it at once: the larger the picture is, the greater diſtance off it ſhould be placed: it ſhould alſo be right before you, and a little reclining.

2. Draw your out-lines at firſt very faint, and with a coal; and let them be drawn agreeable to the pattern, before you begin to ſhadow any part of it. When you have drawn one feature, it ſhould, in ſome meaſure, be a direction for you to draw the other, by obſerving the diſtance from that to the next feature; making a ſmall mark at the place with your coal, then draw it, and ſo to the next, till you have drawn the whole figure.

3. Then obſerve the middle of the picture you would copy, and touch upon the paper with the point of your coal: afterwards, obſerve the more conſpicuous and uppermoſt figures, if there are more than one, which you are to touch lightly in their proper places: thus, running over the whole draught, you will ſee, as it were, the ſkeleton of the piece to draw.

4. Having made out theſe ſketches, view them diligently, if they anſwer your pattern or not; for the geſtures of the life ought to ſhew themſelves eminently in the firſt and rudeſt draughts thereof: correct and mend whatever you perceive amiſs, adding and diminiſhing as it varies from the pattern; by which method it will be brought nearer and nearer to the life.

5. Obſerve the diſtance of one limb, joint, or muſcle, from another, and the ſame in all other accidents of the figure, their length, breadth, turnings, *&c.* ſhadow next to the light very faintly; and where you ſee bold and free touches, be not timorous in expreſſing the ſame. In drawing a head by the life, or otherwiſe, take care to place the features exactly right upon the croſs-lines, whether it be a full face, or three-quarter face. In fore-ſhortening you muſt make the croſs-lines to fly upwards, where they look upwards; but where the aſpect is downwards, they muſt be made downwards, in a circular manner. Having drawn the out-lines true, with a coal, you are to proceed to trace the ſame lines again with a pen, Indian ink, *&c.* drawing them with more exactneſs, and by imitating all the hatches with their exact diſtances one from another, their croſſings, turnings and windings, with more boldneſs and freedom perfect your deſign.

6. In drawing after a naked body, all the muſcles are not to be ſo plainly expreſſed as in anatomical figures: but that ſide whoſe parts are moſt apparent, and of ſignification in the performance of any action, muſt be made to appear more or leſs, according to the force of that action.

7. In drawing young perſons, the muſcles muſt not appear manifeſtly ſo hard as in older and full-grown perſons: the ſame is to be obſerved as to fat and fleſhy perſons, and ſuch as are very delicate and beautiful; and in women, ſcarce any muſcles at all are to be expreſſed, or but very little, unleſs it be in ſome very terrible action, and then too they are to be repreſented very faintly; the like is alſo to be obſerved as to little children.

8. The motion of the whole body muſt be conſidered in drawing of the muſcles; as in the riſing and falling of the arms, the muſcles of the breaſt do appear more or leſs; the hips do the like according as they are bent outward or inward; and it is the ſame chiefly in the ſhoulders, ſides, and neck, according to the ſeveral actions of the body.

9. The proportion of the figure ought to be multiplied by degrees, in proportion of one to two, three, four, *&c.* for herein the chief ſkill conſiſts: the diameter of the biggeſt place, between the knee and the foot, is double to the leaſt; and the largeſt part of the thigh, triple.

DRAY, a kind of cart uſed by brewers, for carrying barrels of beer, or ale; alſo a ſledge drawn without wheels.

Dray, among ſportſmen, denotes ſquirrel-neſts, built in the tops of trees.

DRYATON, a market-town of Shropſhire, fourteen miles north-eaſt of Shrewſbury.

DREDGE, or Dreg, among farmers, denotes oats and barley mingled together.

DREDGERS, the term uſed in the admiralty-court for the oiſter-fiſhers.

DREIN, in the military art, a trench made to draw the water out of a moat, which is afterwards filled with hurdles and earth, or with faſcines or bundles of ruſhes and planks, to facilitate the paſſage over the mud. See Trench.

DRENCH, among farriers, a phyſical potion for horſes. The ingredients for this purpoſe are to be beat coarſely, and either mingled with a decoction, or with wine. Then let all infuſe about a quarter of an hour, and give it to the horſe with a horn, after he has been tied up two hours to the rack.

DRESDEN, the capital of Upper Saxony, in Germany, ſituated on the river Elbe, ſixty-five miles north-weſt of Prague, and eighty-five ſouth of Berlin: E. long. 13° 36′, N. lat. 51°.

It is one of the largeſt and ſtrongeſt towns in Germany, and is the uſual reſidence of the elector of Saxony.

DREUX, a town of Orleanois, in France, ſeventeen miles north of Chartres, and thirty-five weſt of Paris.

DRIFT, a term uſed at ſea. Thus, any thing that floats upon the water, is ſaid to run a-drift.

Drift-sail, a ſail uſed under water, veered out right a-head by ſheets, as other ſails are. It ſerves to keep the ſhip's head right upon the ſea in a ſtorm, and to hinder her driving too faſt in a current.

DRILL, in mechanics, a ſmall inſtrument for making ſuch holes as punches will not conveniently ſerve for. Drills are of various ſizes, and are chiefly uſed by ſmiths and turners.

Drill, or Drill-box, a name given to an inſtrument for ſowing land in the new method of horſe-hoeing huſbandry. See Ariculture.

DRINK, a part of our ordinary food in a liquid form, ſerving to dilute and moiſten the dry meat.

The drinks in different countries are different. The common drink in England is either water, malt liquor, wine, or mixtures of theſe.

The firſt drinks of mankind were certainly water and milk, but the love of luxury and debauchery ſoon introduced the art of preparing intoxicating and inebriating drinks out of vegetables. The vine gave the firſt of theſe liquors; after this, wheat, barley, millet, oats, rice, apples, pears, and pomegranates; and after thoſe the juices drained from the pine, ſycamore, and mapple, were brought to this uſe: in latter times, roots, berries, and the pith of the ſugar-cane, have been employed for the ſame purpoſes.

DRIVERS, among ſportſmen, a machine for driving pheaſant-powts, conſiſting of good ſtrong ozier-wands, ſuch

ſuch as the baſket-makers uſe; theſe are to be ſet in a handle, and twiſted or bound with ſmall oziers in two or three places.

With this inſtrument, the ſportſman drives whole eyes of young powts into his nets. See the next article.

DRIVING, among ſportſmen, a method of taking pheaſant-powts. It is thus: the ſportſman finds out the haunts of theſe birds; and having fixed his nets there, he calls them together by a pheaſant-call, imitating the voice of the dam: after this he makes a noiſe with his driver, which will make them run a little way forward in a cluſter; and this he is to repeat till he has made ſure of them, which an expert ſportſman never fails to do, by driving them into his nets.

DRIVING, in metallurgy, is ſaid of ſilver, when in the operation of refining, the lead being burnt away, the remaining copper riſes upon its ſurface in red fiery bubbles.

DRIVING, in the ſea-language, is ſaid of a ſhip when an anchor being let fall will not hold her faſt, nor prevent her ſailing away with the tide or wind. The beſt help in this caſe is to let fall more anchors, or to veer out more cable; for the more cable ſhe has out, the ſafer ſhe rides. When a ſhip is a-hull, or a-try, they ſay ſhe drives to leeward.

DROGHEDA, a port-town of Ireland, twenty-three miles north of Dublin.

DROGMAN. See DRAGOMAN.

DROITWICH, a borough ſix miles north of Worceſter, which ſends two members to parliament.

DROMEDARY. See CAMELUS.

DRONE, in the hiſtory of inſects. See APIS.

DRONE-FLY, a two-winged inſect, extremely like the common drone-bee, whence alſo the name.

DROPS, in meteorology, ſmall ſpherical bodies which the particles of fluids ſpontaneouſly form themſelves into when let fall from any height.

DROPS, in medicine, a liquid remedy, the doſe of which is eſtimated by a certain number of drops.

DROPSY, in medicine, an unnatural collection of watry humours in any part of the body. See MEDICINE.

DROP-WORT, in botany. See FILIPENDULA.

Water DROP-WORT, in botany. See OENANTHE.

DROSERA, SUN-DEW, in botany, a genus of the pentandria pentagynia claſs of plants, with a funnel-faſhioned flower, conſiſting of five obtuſely-ovated petals: the fruit is an unilocular ſuboval capſule, containing a great many very ſmall ſeeds.

DROWNING, the act of ſuffocating, or being ſuffocated, by water.

Naturaliſts and phyſicians furniſh us with divers well atteſted inſtances of ſurpriſing recoveries of perſons drowned. It is certain from repeated diſſections made on perſons drowned, that they generally have leſs water in their ſtomachs than if they had voluntarily drunk a conſiderable quantity: whence it does not ſeem expedient to hang the drowned perſon by the heels, a poſition that muſt prove uneaſy as ſoon as the humours of the body ſhould reſume their ordinary motion. In order to know whether the perſon has ſwallowed too much water or not, and to make him vomit it up if he has, it is proper to put him in a tun, open at both ends, which is to be rolled in different directions: or the bearded end of a feather ſhould be introduced into the œſophagus. After taking off the cloaths of the drowned perſon, we ought, with the utmoſt expedition, to ſhelter him from the impreſſions of the cold air, and begin to warm him, by wrapping him up with cloaths and coverings: to do this more effectually, he is afterwards to be put into a pretty warm bed, applying alſo to his body hot napkins and cloths. A hot ſcorching ſun, to which drowned perſons have been expoſed, and hot baths, have produced the ſame happy effects.

The great intention to be purſued is, to put the ſolid parts of the machine in action, that thus they may reſtore the motion of the fluids: in order to this, the drowned perſon ſhould be agitated in various directions, in a bed, in the arms of perſons of ſufficient ſtrength.

Spirituous liquors ſhould be poured into his mouth, or warm urine; and ſome perſons preſcribe a decoction of pepper and vinegar, as a gargariſm: we muſt alſo attempt to irritate the internal fibres of the noſe, either by volatile ſpirits, and by the liquors uſed in apoplectic caſes; or by tickling the nerves of the noſtrils with a bearded feather; or by blowing, through a quill, ſnuff, or ſome other more powerful ſternutatory. One of the means frequently uſed with ſucceſs, is to blow warm air, by means of a pipe, into their mouths; or to introduce it by a pair of bellows; or, by injecting warm clyſters, to irritate the inteſtines: the ſmoke of tobacco conveyed into the inteſtines, by means of a tobacco pipe, is much recommended. Venæſection is by no means to be neglected; and perhaps moſt ſucceſsfully in the jugular vein.

DRUG, a general term for goods of the druggiſt and grocery kinds, eſpecially for thoſe uſed in medicine and dying.

DRUGGET, in commerce, a ſtuff ſometimes all wool, and ſometimes half wool half thread, ſometimes corded, but uſually plain.

Thoſe that have the woof of wool, and the warp of thread, are called threaded-druggets; and thoſe wrought with the ſhuttle on a loom of four marches, as the ſerges of Moui, Beauvois, and other like ſtuffs corded, are called corded druggets. As to the plain, they are wrought on a loom of two marches, with the ſhuttle, in the ſame manner as cloth, camlets, and other like ſtuffs not corded.

DRUIDS, the prieſts or miniſters of religion of the ancient Britons and Gauls. The druids were choſen out of the beſt families; and were held, both by the honours of their birth, and their office, in the greateſt veneration. They are ſaid to have underſtood aſtrology, geometry, natural hiſtory, politics, and geography: they had the adminiſtration of all ſacred things, were the interpreters of religion, and the judges of all affairs indifferently.

Whoever refuſed obedience to them, was declared impious and accurſed: they held the immortality of the

the ſoul, and the tranſmigration of ſouls. They are divided by ſome into ſeveral claſſes, as the vaceni, bardi, bubagis, ſemothii. They had a chief, or arch-druid, in every nation: he was a ſort of high-prieſt, having an abſolute authority over the reſt, and was ſucceeded by the moſt conſiderable among his ſurvivors. The youth uſed to be inſtructed by them, retiring with them to caves and deſolate foreſts, where they were ſometimes kept twenty years. They preſerved the memory and actions of great men by their verſes; but are ſaid to have ſacrificed men to Mercury. Cæſar imagined that the druids came from Britain into Gaul, but ſeveral among the modern writers are of a different opinion.

DRUM, is a martial muſical inſtrument in form of a cylinder, hollow within, and covered at the two ends with vellum, which is ſtretched or ſlackened at pleaſure by the means of ſmall cords or ſliding knots: It is beat upon with ſticks. Some drums are made of braſs, but they are commonly of wood.

Kettle DRUMS, are two ſorts of large baſons of copper or braſs, rounded in the bottom, and covered with vellum, or goat-ſkin, which is kept faſt by a circle of iron, and ſeveral holes faſtened to the body of the drum, and a like number ſcrews to ſcrew up and down. They are much uſed among the horſe, as alſo in operas, oratorios, concerts, *&c.*

DRUM, or DRUMMER, he that beats the drum; of whom each company of foot has one, and ſometimes two. Every regiment has a drum-major, who has the command over the other drums. They are diſtinguiſhed from the ſoldiers, by cloaths of a different faſhion: their poſt, when a battalion is drawn up, is on the flanks, and on a márch it is betwixt the diviſions.

DRUM *of the ear*, in anatomy. See Vol. I. p. 299.

DRUMLANERK, a town of Scotland, fifteen miles north of Dumfries.

DRUNKENNESS, a well known diſorder in the brain, occaſioned by drinking too freely of ſpirituous liquors. Drunkenneſs appears in different ſhapes, in different conſtitutions: ſome it makes gay, ſome ſullen, and ſome furious.

DRUPE, among botaniſts. See Vol. I. p. 637.

DRUSENHEIM, a town of Alſace, in Germany, four miles ſouth-eaſt of Hagenau.

DRYADÆA, in botany. See DRYAS.

DRYADS, in the heathen theology, a ſort of deities, or nymphs, which the ancients thought inhabited groves and woods. They differed from the Hamadryades, theſe latter being attached to ſome particular tree, with which they were born, and with which they died; whereas the Dryades were goddeſſes of trees and woods in general.

DRYAS, in botany, a genus of the icoſandria polygynia claſs. The calix conſiſts of eight ſegments, and the corolla of eight petals; and the ſeeds are tailed and hairy. There are two ſpecies, both natives of Britain, *viz.* the pentapetula, or cinquefoil avens; and the octopetala, or mountain avens.

DUBLIN, the capital of the province of Leinſter, and of all Ireland, ſituated at the mouth of the river Liffee, ſixty miles weſt of Holyhead in Wales: W. lon. 6° 25′, N. lat. 53° 16′.

It is a large and beautiful city, pleaſantly ſituated; having a view of the ſea on one ſide, and of a fine country on the other. It is the ſeat of the courts of juſtice, and an archbiſhop's ſee; and has a noble college, which is an univerſity of itſelf.

DUCAL, in general, ſomething belonging to a duke. See DUKE.

DUCAT, a coin current in Germany and other countries abroad, of different values.

DUCATOON, a ſilver coin, likewiſe frequent in ſeveral parts of Europe.

DUCENARIUS, in Roman antiquity, a military officer who had the command of two hundred men.

DUCK, in ornithology. See ANAS.

DUCKER. See COLYMBUS.

DUCKING, plunging in water, a diverſion anciently practiſed among the Goths, by way of exerciſe; but among the Celtæ, Franks, and ancient Germans, it was a ſort of puniſhment for perſons of ſcandalous lives.

They were ſhut up, naked to the ſhift, in an iron cage, faſtened to the yard of a ſhaloop, and ducked ſeveral times.

DUCKING *at the main-yard*, among ſeamen, is a way of puniſhing offenders on board a ſhip; and is performed by binding the malefactor, by a rope, to the end of the yard, from whence he is violently let down into the ſea, once, twice, or three times, according to his offence: and if the offence be very great, he is drawn underneath the keel of the ſhip, which they call keel-haling.

DUCKUP, at ſea, is a term uſed by the ſteer's-man, when the main-ſail, fore-ſail, or ſprit-ſail, hinders his ſeeing to ſteer by a land-mark: upon which he calls out, *Duckup the clew-lines of theſe ſails*, that is, hale the ſails out of the way. Alſo when a ſhot is made by a chace-piece, if the clew of the ſprit-ſail hinders the ſight, they call out, *Duckup*, &c.

DUCT, in general, denotes any tube or canal. It is a term much uſed by anatomiſts.

Air-DUCT, among ichthyologiſts, a canal reaching from the air-bladder in fiſhes to their ſtomach.

DUCTILITY, in phyſics, a property of certain bodies, whereby they are capable of being expanded, or ſtretched forth, by means of a hammer, preſs, *&c.* See CHEMISTRY, and MECHANICS.

DUDERSTAT, a town of Upper Saxony, thirty-five miles north-eaſt of Caſſel.

DUEL, a ſingle combat, at a time and place appointed, in conſequence of a challenge. This cuſtom came originally from the northern nations, among whom it was uſual to decide all their controverſies by arms. Both the accuſer and the accuſed gave pledges to the judges on their reſpective behalf; and the cuſtom prevailed ſo far amongſt the Germans, Danes, and Franks, that none were excuſed from it but women, ſick people, cripples, and ſuch as were under twenty-one years of age, or above ſixty. Even eccleſiaſtics, prieſts, and monks, were obliged to find champions

to

to fight in their ftead. The punifhment of the vanquifhed was either death, by hanging or beheading; or, mutilation of members, according to the circumftances of the cafe. Duels were at firft admitted not only on criminal occafions, but on fome civil ones for the maintenance of rights to eftates, and the like: in latter times, however, before they were intirely abolifhed, they were reftrained to thefe four cafes. 1. That the crime fhould be capital. 2. That it fhould be certain the crime was perpetrated. 3. The accufed muft, by common fame, be fuppofed guilty. And, 4. The matter not capable of proof by witneffes. At prefent it is ufed for a fingle combat on fome private quarrel, and muft be premeditated, otherwife it is called a rencounter. If a perfon be killed in a duel, both the principals and feconds are guilty of murder, whether the feconds engage or not. It is alfo a very high offence to challenge a perfon, either by word or letter, or to be the meffenger of a challenge. The fevere edicts made by Lewis XIV. againft duels have, in a great meafure, put a ftop to the cuftom in France.

DUELLING, in Scots law. See title 33.

DUERO, or DURO, a large river, which, rifing in Old Caftile in Spain, runs from eaft to weft, croffes the province of Leon, and, after dividing Portugal from Spain by a foutherly courfe, turns weftward, croffes Portugal, and falls into the Atlantic Ocean at Porto-Port.

DUKE is either the title of a fovereign prince, as the duke of Savoy, Parma, *&c.* the grand duke of Tufcany, Mufcovy, *&c.* or it is the title of honour and nobility next below princes. The commanders of armies in time of war, the governors of provinces and wardens of marches in times of peace, were called *duces* under the later emperors. The Goths and Vandals divided all Gaul into dutchies and counties, the governors of which they fometimes call *duces*, and fometimes *comites*. In France, under the fecond race of kings, though they retained the name and form of ducal government, there were fcarce any dukes except thofe of Burgundy, Aquitain, and France. In England, among the Saxons, the commanders of armies, *&c.* were called dukes, *duces*, without any addition, till Edward III. made his fon, the Black Prince, duke of Cornwal; after whom there were more made in the fame manner, the title defcending to their pofterity. Duke then, at prefent, is a mere title of dignity, without giving any domain, territory, or jurifdiction over the place from whence the title is taken. A duke is created by patent, cincture of fword, mantle of ftate, impofition of a cap and coronet of gold on his head, and a verge of gold put into his hand. His title is Grace; and, in the ftyle of the heralds, Moft high, potent, high-born, and noble prince.

DULCIFYING, in chemiftry, is the fweetening any matter impregnated with falts, by frequently wafhing it in pure water.

DULL, in the menage. The marks of a dull horfe, called by the French marquis de ladre, are white fpots round the eye and on the tip of the nofe, upon any general colour whatfoever. Though the vulgar take thefe fpots for figns of ftupidity, it is certain they are great marks of the goodnefs of a horfe; and the horfes that have them are very fenfible and quick upon the fpur.

DULWICH, a village near London, remarkable for its mineral waters, which are faid to contain a bitter cathartic falt, but no iron.

DUMBLAIN, a town of Scotland, about five miles north of Stirling.

DUMBNESS, the privation of the faculty of fpeech. The moft general, or rather the fole caufe of dumbnefs, is the want of the fenfe of hearing. The ufe of language is originally acquired by imitating articulate founds. From this fource of intelligence, deaf people are intirely excluded: they cannot acquire articulate founds by the ear: unlefs, therefore, articulation be communicated to them by fome other medium, thefe unhappy people muft for ever be deprived of the ufe of language; and as language is the principal fource of knowledge, whoever has the misfortune to want the fenfe of hearing, muft remain in a ftate little fuperior to that of the brute creation. Deafnefs has in all ages been confidered as fuch a total obftruction to fpeech, or written language, that an attempt to teach the deaf to fpeak or read has been uniformly regarded as impracticable, till Dr Wallis and fome others have of late fhewn, that although deaf people cannot learn to fpeak or read by the direction of the ear, there are other fources of imitation, by which the fame effect may be produced. The organs of hearing and of fpeech have little or no connection. Perfons deprived of the former generally poffefs the latter in fuch perfection, that nothing further is neceffary, in order to make them articulate, than to teach them how to ufe thefe organs. This indeed is no eafy tafk; but experience fhews that it is practicable. Mr THOMAS BRAIDWOOD, of Edinburgh, is perhaps the firft who ever brought this furprifing art to any degree of perfection. For thefe fome years paft, he has taught many people born beaf, to fpeak diftinctly, to read, to write, to underftand figures, the principles of religion and morality, *&c.* This, at firft fight, may appear to be altogether incredible; but the fact is certain. Mr Braidwood has, at prefent, ten or a dozen of deaf pupils, fome of them above twenty years of age, all making a rapid and amazing progrefs in thofe ufeful branches of education.

Mr Braidwood's principal difficulty, after he had difcovered this art, was to make people believe in the practicability of it. He advertifed in the public papers; he exhibited his pupils to many noblemen and gentlemen; ftill he found the generality of mankind unwilling to believe him. A remarkable inftance of this incredulity occurred fome years ago. A gentleman in England fent a deaf girl of his to Mr Braidwood's care. A year or two afterwards, Mr Braidwood wrote to the father, that his daughter could fpeak, read, and write diftinctly. The father returned an anfwer, begging Mr Braidwood's excufe, as he could not believe it; however, he defired a friend of his, who was oc-

cafionally going to Edinburgh, to call at Mr Braidwood, and inquire into the truth of what he had wrote him: he did fo; converfed with Mr Braidwood, faw the young lady, heard her read, fpeak, and anfwer any queftions he put to her. On his return, he told the father the furprifing progrefs his child had made; but ftill the father thought the whole an impofition: the girl herfelf wrote to her father, but he looked upon the letter as a forgery. About this time the father died, and the mother fent an uncle and coufin of the deaf lady's from Shrewfbury, in order to be fatisfied of the truth. When they arrived, Mr Braidwood told the girl her uncle and coufin were in the parlour, and defired her to go and afk them how they did, and how her mother and other friends did. The friends were aftonifhed, and could hardly credit their own ears and eyes.

We have converfed with Mr Braidwood, concerning the nature and method of teaching this wonderful art: he feems to be very defirous of communicating and tranfmitting his difcovery to pofterity: but fays, and, from the nature of the thing, we believe it to be true, that he cannot communicate it fo fully in writing as to enable any other perfon to teach it. The firft thing in the method is, to teach the pupil to pronounce the fimple founds of the vowels and confonants. We have even feen him performing this operation; but are unable to give a clear idea of it. He pronounces the found of *a* flowly, pointing out the figure of the letter at the fame time; makes his pupil obferve the motion of his mouth and throat; he then puts his finger into the pupil's mouth, depreffes or elevates the tongue, and makes him keep the parts in that pofition; then he lays hold of the outfide of the windpipe, and gives it fome kind of fqueeze, which it is impoffible to defcribe: all the while he is pronouncing *a*, the pupil is anxioufly imitating him, but at firft feems not to underftand what he would have him to do. In this manner he proceeds, till the pupil has learned to pronounce the founds of the letters. He goes on in the fame manner to join a vowel and a confonant, till at length the pupil is enabled both to fpeak and read.

It is altogether in vain for us to attempt to fay any more concerning the mode of operation. Mr Braidwood undertakes every deaf perfon, who is not at the fame time foolifh or idiotical. The greateft misfortune is, that this art is confined to a fingle man, and that his pupils muft live in the houfe with him for fome years. The expence neceffarily attending education of this kind, excludes all but people in opulent circumftances from deriving any advantage from it. Mr Braidwood fays, that the only way for preferving the art, and communicating it to a number, is to take people in the way of apprentices: this he is unable to do at his own expence. What a pity, that fuch a curious and ufeful art fhould live and die with a fingle man! There are many fums mortified in this kingdom, both by government and private perfons, for lefs important purpofes, than the prefervation and extenfion of the art of raifing a great number of our fellow-creatures from the rank of brutes, to that of reafonable beings, and ufeful members of fociety.

DUMFERMLINE, a parliament-town of Scotland, fituated in the county of Fife, fifteen miles north-weft of Edinburgh: W. long. 30° 20′, and N. lat. 56° 15′. Here was formerly a magnificent abbey and palace of the kings of Scotland, in which the princefs Elizabeth, daughter of king James VI. and mother of the princefs Sophia, from whom the prefent royal family are defcended, was born.

DUMFRIES, the capital of a county of the fame name, in Scotland, lying northwards of the Solway frith: W. long. 3° 20′, and N. lat. 54° 45′.

DUNBAR, a parliament and port-town of Scotland, about twenty-five miles eaft of Edinburgh.

DUNBARTON, the capital of a county of the fame name in Scotland, called by fome Lenox: it is a parliament town, fituated at the confluence of the rivers Clyde and Leven; fixteen miles north-weft of Glafgow.

DUNCANNON, a town of the county of Wexford, in Ireland, fix miles eaft of Waterford.

DUNDALK, a port-town of Ireland, eighteen miles north of Drogheda.

DUNDEE, a large parliament-town of Angus, in Scotland, fituated on the north fide of the frith of Tay, fourteen miles north-weft of St Andrews: W. lon. 2° 42′, and N. lat. 56° 32′.

DUNG, in hufbandry, is of feveral forts, as that of horfes, cows, fheep, hogs, pigeons, geefe, hens, &c. See AGRICULTURE.

DUNGANNON, a town of Ireland, eleven miles north of Armaugh.

DUNGING of lands. See AGRICULTURE.

DUNKELD, a town of Perthfhire in Scotland, formerly a bifhop's fee, fituated about twelve miles north of Perth.

DUNG-MEERS, in hufbandry, places where foils and dungs are mixed and digefted together. For this purpofe it is ufual to dig a pit fufficient to hold the ftock of foil the hufbandman is capable of making; and to prepare it at the bottom with ftone and clay, that it may hold water, or the moifture of the dung; and befides, it fhould be fo fituated that the finks and drips of the houfes and barns may run into it. Into this pit they caft refufe fodder, litter, dung, weeds, &c. where they lie and rot together, till the farmer have occafion for it.

DUNKIRK, a port-town of the French Netherlands: E. lon. 2° 28′, and N. lat. 51°.

DUNNEGAL, the capital of a county of the fame name in Ireland, fituated on a bay, to which it likewife gives name: W. lon. 8° 22′, and N. lat. 54° 35′.

DUNNINGTON, a market-town of Lincolnfhire, about twenty-three miles fouth-eaft of Lincoln.

DUNS, a market-town of Scotland, twelve miles weft of Berwick upon Tweed.

DUNSTABLE, a market-town, fifteen miles fouth of Bedford, and thirty north-weft of London.

DUNWICH, a borough of Suffolk, forty miles eaſt of Bury. It ſends two members to parliament.

DUO, in muſic, a ſong or compoſition to be performed in two parts only, one ſung, the other played on an inſtrument, or by two voices.

Duo is alſo when two voices ſing different parts, as accompanied with a third, which is a thorough baſe. It is ſeldom that uniſons and octaves are uſed in duos, except at the beginning and end.

DUODECIMA, in muſic, is the twelfth or the fifth doubled. See Fifth.

DUODENUM, in anatomy. See Vol. I. p. 259.

DUPLE, among mathematicians, denotes the ratio of 2 to 1. Thus the ratio of 8 to 4 is duple, or as 2 to 1.

Sub-Duple ratio is juſt the reverſe of the former, or as 1 to 2. Such is 4 to 8, or 6 to 12.

DUPLICATE, among lawyers, denotes a copy of any deed, writing, or account. It is alſo uſed for the ſecond letters patent, granted by the lord chancellor in a caſe wherein he had before done the ſame. Alſo a ſecond letter written and ſent to the ſame party and purpoſe as a former, for fear of the firſt's miſcarrying, is called a duplicate.

Duplicate proportion, or ratio. See Algebra and Arithmetic.

DUPLICATION, in general, ſignifies the doubling of any thing, or multiplying of it by 2: alſo the folding of any thing back again on itſelf.

DUPLICATURE, among anatomiſts, a term uſed to denote the folds of any membrane, or veſſel: thus we ſay, the duplicatures of the inteſtines, peritonæum, *&c.*

DUPONDUS, in antiquity, the weight of two pounds: alſo a piece of money equal to two aſes in value.

DURA mater, in anatomy. See Vol. I. p. 284.

DURANCE, a river of France, which falls into the Rhone, a little below Avignon.

DURANTA, in botany, a genus of the didynamia angioſpermia claſs. The calix is above the fruit, and divided into five ſegments; and the berry contains four ſeeds. There are two ſpecies, both natives of America.

DURATION, an idea which we get by attending to the fleeting and perpetually periſhing part of ſucceſſion; the idea of ſucceſſion being acquired by reflecting on that train of ideas which conſtantly follow one another in our minds, as long as we are awake. The ſimple modes of duration are any different lengths of it whereof we have diſtinct ideas, as hours, days, years, time, eternity, *&c.*

Duration, as marked by certain periods amd meaſures, is what we moſt properly call time. See Time.

Duration *of action*, according to Ariſtotle, is confined to a natural day in tragedy; but the epopea, according to the ſame critic, has no fixed time.

DURESSE, in law, is where a perſon is wrongfully impriſoned, or reſtrained of his liberty, contrary to law; or is threatened to be killed, wounded, or beaten, till he executes a bond, or other writing.

DURHAM, a city and county, in the north of England, ſituated on the river Were, fourteen miles ſouth of Newcaſtle: W. lon. 1° 12′, and N. lat. 54° 50′. It is the ſee of a biſhop, and ſends two members to parliament.

DUSSELDORP, a city of Germany, ſituated on the eaſtern ſhore of the Rhine, twenty miles north of Cologn: E. lon. 6° 20′, and N. lat. 51° 15′.

DUTCHY, in geography, an appellation given to the dominions of a duke.

Dutchy-court, a court of the dutchy-chamber of Lancaſter, held at Weſtminſter, before the chancellor of the ſame, for matters concerning the lands and franchiſes of that dutchy.

DUTY, in general, denotes any thing that one is obliged to perform.

Duty, in polity and commerce, ſignifies the impoſt laid on merchandizes, at importation or exportation, commonly called the duties of cuſtoms; alſo the taxes of exciſe, ſtamp-duties, *&c.* See Customs, Excise, *&c.*

The principles on which all duties and cuſtoms ſhould be laid on foreign merchandizes, which are imported into theſe kingdoms, are ſuch as tend to cement a mutual friendſhip and traffic between one nation and another; and therefore due care ſhould be taken in the laying of them, that they may anſwer ſo good an end, and be reciprocal in both countries: they ſhould be ſo laid as to make the exports of this nation at leaſt equal to our imports from thoſe nations wherewith we trade, ſo that a balance in money ſhould not be iſſued out of Great Britain, to pay for the goods and merchandizes of other countries: to the end that no greater number of our landholders and manufacturers ſhould be deprived of their revenues ariſing from the product of the lands, and the labour of the people, by foreign importations, than are maintained by exportations to ſuch countries. Theſe are the national principles on which all our treaties of commerce with other countries are to be grounded.

DUTY, in the military art, is the exerciſe of thoſe functions that belong to a ſoldier; with this diſtinction, that mounting guards and the like, where there is no enemy directly to be engaged, is called duty; but their marching to meet and fight an enemy is called going on ſervice.

DUUMVIRATE, the office or dignity of the duumviri. See the next article.

The duumvirate laſted till the year of Rome 388, when it was changed into a decemvirate.

DUUMVIRI, in Roman antiquity, a general appellation given to magiſtrates, commiſſioners, and officers, where two were joined together in the ſame functions.

Duumviri capitales were the judges in criminal cauſes: from their ſentence it was lawful to appeal to the people, who only had the power of condemning a citizen to death. Theſe judges were taken from the body of

of the decuriones; they had great power and authority, were members of the public council, and had two lictors to walk before them.

Duumviri municipales, were two magiftrates in fome cities of the empire, anfwering to what the confuls were at Rome: they were chofen out of the body of the decuriones; their office lafted commonly five years, upon which account they were frequently termed *quinquinales magiftratus*. Their jurifdiction was of great extent: they had officers walking before them, carrying a fmall fwitch in their hands; and fome of them affumed the privilege of having lictors, carrying axes and the fafces, or bundles of rods, before them.

Duumviri navales were the commiffaries of the fleet, firft created at the requeft of M. Decius, tribune of the people, in the time of the war with the Samnites. The duty of their office confifted in giving orders for the fitting of fhips, and giving their commiffions to the marine officers, *&c.*

Duumviri sacrorum were magiftrates created by Tarquinius Superbus, for the performance of the facrifice, and keeping of the fybils books. They were chofen from among the patricians, and held their office for life: they were exempted from ferving in the wars, and from the offices impofed on the other citizens, and without them the oracles of the fybils could not be confulted.

DUYVELAND, or Diveland, one of the iflands of Zealand, in the United Provinces, lying eaftward of Schonen, from which it is only feparated by a narrow channel.

DWAL, in heraldry, the herb nightfhade ufed by fuch as blazon with flowers and herbs, inftead of metals and colours, for fable or black.

DWARF, in general, an appellation given to things greatly inferior in fize to that which is ufual in their feveral kinds: thus there are dwarfs of the human fpecies, dwarf-dogs, dwarf-trees, *&c.*

The Romans were fo paffionately fond of dwarfs, that they often ufed artificial methods to prevent the growth of boys defigned for dwarfs, by inclofing them in boxes, or by the ufe of tight bandages. In Italy, even at prefent, they wafh young puppies every day with aftringent liquors, in order to prevent their growth by hardening the parts.

DWINA, the name of two large rivers, one of which rifes in Lithuania, and, dividing Livonia from Courland, falls into the Baltic fea a little below Riga: the other gives name to the province of Dwina, in Ruffia, difcharging itfelf into the White fea, a little below Archangel.

DYE, in architecture, any fquare body, as the trunk or notched part of a pedeftal: or it is the middle of the pedeftal, or that part included between the bafe and the corniche, fo called becaufe it is often made in the form of a cube or dye. See Architecture.

DYER, a perfon who profeffes the art of dyeing all manner of colours. See Dyeing.

Dyer's weed, in botany. See Reseda.

DYEING, the art of giving a lafting colour to filks, cloths, and other fubftances, whereby their beauty is much improved, and value enhanced.

This art depends chiefly on three things, *viz.* 1. Difpofing the furface of the ftuffs to receive and retain the colours; which is performed by wafhing them in different lyes, digefting, beating them, *&c.* in which human urine putrified, a fharp falt of afhes, divers foaps, and galls of animals, are of principal ufe; by means whereof the vifcous gluten of the filk worms naturally adhering to their threads, is wafhed and cleanfed from them, and thus they become fitted gradually to imbibe the colours. By thefe alfo the greafy foulnefs adhering to wool and flax is fcoured off.

2. To grind the colours, as that they may enter the body duly prepared, and preferve their brightnefs undiminifhed.

3. The third confifts in having beautiful colours.

According to Sir W. Petty's account of what is done in particular trades by the art of dyeing, 1. There is a whitening of wax, and feveral forts of linen and cotton cloths, by the fun, air, and reciprocal effufions of water. 2. Colouring of wood and leather, by lime, falt and liquors, as in ftoves, canes, and marble leathers. 3. Colouring of paper, *viz.* the marbled paper, by diftempering the colours with ox-gall, and applying them upon a ftiff gummed liquor. 4. Colouring, or rather difcolouring, the colours of filks, tiffanies, *&c.* by brimftone. 5. Colouring of feveral iron and copper-works into black with oil. 6. Colouring of leather into gold colour, or rather filver-leaves into gold by varnifhes, and in other cafes by urine and fulphur. 7. Dyeing of marble and alabafter, with heat and coloured oils. 8. Colouring filver into the brafs-colour, with brimftone or urine. 9. Colouring the barrels and locks of guns into blue and purple, with the temper of fmall-coal heat. 10. Colouring of glafs (made of fands, flints, *&c.*) as alfo of cryftals and earthen ware, with the rufts and folutions of metals. 11. The colouring of live hair, as in Poland, horfe and man's hair: as alfo the colouring of furs. 12. Enameling and annealing. 13. Applying colours, as in the printing of books and pictures, and as in making of playing cards, being each of them performed in a different way. 14. Gilding and tinning with mercury, block-tin, fal armoniac. 15. Colouring of metals, as copper with calamy, into brafs, and with zinc or fpelter into a golden colour, or into a filver one with arfenic; and of iron into a refemblance of copper with Hungarian vitriol. 16. Making painters colours by preparing of earth, chalk, and flates; as in umber, ochre, cullen-earth, *&c.* as alfo out of calces of lead, as cerufe and minium; by fublimates of mercury and brimftone, as in vermilion; by tinging whole earths varioufly, as in verdeter, and fome of the lakes; by concrete juices, or fæculæ, as in gambogium, indigo, pinks, fap-green, and lakes; as alfo by rufts, as in verdigreafe, *&c.* 17. The applying thefe colours by the adhefion of ox-gall, as in the marbled paper aforefaid; or by gum-water, as by limning; or by clammy drying oils, fuch as the oils of lintfeed, nuts, *&c.* 18. The watering of tabbies. 19. The colouring of wool, linen, cotton, filk, hair, feathers, horn, leather, and the threads

threads and webs of them with woods, roots, herbs, ſeeds, leaves, ſalts, limes, lixiviums, waters, heats, fermentations, macerations, and other great variety of management: an account of all which is a ſhort hiſtory of dyeing.

The materials uſed in the art of Dyeing, are iron and ſteel, or what is produced from them in all true blacks, called Spaniſh blacks, though not in Flanders blacks, *viz.* they uſe copperas, ſteel-filings, and ſlippe; they alſo uſe pewter for Bow-dye ſcarlet, *viz.* they diſſolve bars of pewter in aquafortis; litharge is alſo uſed by ſome, though acknowledged by few to add weight to dyed ſilk. Antimony is much uſed to the ſame purpoſe. Arſenic is uſed in crimſon upon pretence of giving luſtre, although thoſe who pretend not to be wanting in giving luſtre to their ſilks diſown its uſe. Verdigreaſe is alſo uſed by linen dyers in their yellow and greeniſh colours; though, of itſelf, it ſtrikes no deeper colour than that of a pale ſtraw. Of mineral ſalts uſed in dyeing, the chief is alum; the true uſe whereof ſeems to be in regard to the fixation of colours. The next mineral ſalt is ſaltpetre, not uſed by ancient dyers, and but by few of the modern: nor is it yet uſed but to brighten colours, by back-boiling of them, for which argol is more commonly uſed: lime is much uſed in working blue vats.

Of the animal tribes are uſed cochineal, urine of labouring men kept till it be ſtale and ſtinking, honey, yolks of eggs, and ox gall; the uſe of the urine is to ſcour, and help the fermenting and heating of woad; and is uſed alſo in blue-vats inſtead of lime: it diſchargeth the yellow, and therefore is uſed to ſpend weld withal.

Dyers uſe two ſorts of water, *viz.* river and well-water; the laſt, which is harſh, they uſe in reds and other colours wanting reſtringency, and in dyeing materials of the ſlacker contextures, as in callicoe, fuſtian, and the ſeveral ſpecies of cotton-works; but is not good for blues, and makes yellows and greens look ruſty. River-w ter is more fat and oily, and is therefore uſed in moſt caſes, and muſt be had in great quantities for waſhing and rinſing their cloths after dyeing. Water is called by dyers white liquor; but a mixture of one part bran, and five of river-water, boiled an hour and put into leaden ciſterns to ſettle, is what they call liquor abſolutely.

Gums have been uſed by dyers about ſilk, *viz.* gum arabic, tragacanth, maſtic, dragon's blood. Theſe tend little to the tincture, any more than gum in writing-ink, which only gives it a conſiſtence; ſo gum may give the ſilk a gloſſineſs; and, laſtly, to increaſe the weight.

The three peculiar ingredients for black are copperas, ſilings of ſteel, and ſlippe: the reſtringent binding materials are alder-bark, pomegranate-peels, walnut-rinds and roots, oakenſapling bark, and ſaw-duſt of the ſame, crab-tree bark, galls, and ſumac.

The ſalts are alum, ſalt-petre, ſal armoniac, pot-aſhes, and ſtone-lime; among which urine may be enumerated as a liquid ſalt.

The liquors are well and river water, urine, aquavitæ, vinegar, lemon juice, aquafortis, honey, and molaſſes.

Ingredients of another claſs are bran, wheaten-flour, yokes of eggs, leaven, cummin ſeed, fenugreek ſeed, agaric, and ſenna.

The ſmectics, or abſterſives, are fuller's earth, ſoap, linſeed-oil, and ox gall.

The metals and minerals are pewter, verdigreaſe, antimony, litharge, and arſenic.

The colourings are of three ſorts, *viz.* blue, yellow, and red; of which logwood, old fuſtic, indigo, and madder, are the chief.

General obſervations upon Dyeing.

1. All materials which of themſelves do give colour are either red, yellow, or blue; ſo that out of them, and the primitive fundamental colour white, all that great variety which we ſee in dyed ſtuffs doth ariſe.

2. That few of the colouring materials, as cochineal, ſoot, wood-wax, woad, *&c.* are in their outward and firſt appearance of the ſame colour, which by the ſlighteſt diſtempers and ſolutions in the weakeſt menſtrua, they dye upon cloth, ſilk, *&c.*

3. That many of them will not yield their colours without much grinding, ſteeping, boiling and fermenting, or corroſion by powerful menſtrua, as redwood, weld, woad, arnotto, *&c.*

4. That many of them will of themſelves give no colouring at all, as copperas or galls, or with much diſadvantage, unleſs the cloth or other ſtuff to be dyed be as it were firſt covered, or incruſtated with ſome other matter, though colourleſs aforehand, as madder, weld, brazil, with alum.

5. That ſome of them, by the help of other colourleſs ingredients, do ſtrike different colours from what they would of themſelves, as cochineal, brazil, *&c.*

6. That ſome colours, as madder, indigo, and woad, by reiterated tinctures, will at laſt become black.

7. That although green be the moſt frequent and the moſt common of natural colours, yet there is no ſimple ingredient now uſed alone to dye green with upon any material; ſap-green being the neareſt, which is uſed by country people.

8. There is no black thing in uſe which dyes black, though both the coal and ſoot of moſt things burnt or ſcorched be of that colour, and the blacker, by how much the matter before being burnt was whiter, as in ivory black.

9. The tincture of ſome dyeing ſtuffs will fade even with lying, or with the air, or will ſtain with water only, but very much with urine, vinegar, *&c.*

10. Some of the dyeing materials are uſed to bind and ſtrengthen a colour; ſome to brighten it; ſome to give luſtre to the ſtuff; ſome to diſcharge and take off the colour, either in whole or in part; and ſome out of fraud, to made the material dyed, if coſtly, heavier.

11. That ſome dyeing ingredients, or drugs, by the coarſeneſs of their bodies, make the thread of the dyed ſtuff ſeem coarſer; and ſome, by ſhrinking them, ſmaller; and ſome, by ſmoothing them, finer.

12. Many of the ſame colours are dyed upon ſeveral ſtuffs with ſeveral materials, as red-wood is uſed in cloth, not in ſilks; arnotto in ſilks, not in cloth, and may be dyed at ſeveral prices.

13. That ſcouring and waſhing of ſtuffs to be dyed, is done with ſpecial materials, as ſometimes with ox-galls, ſometimes with fullers-earth, and ſometimes ſoap; this latter being, in ſome caſes, pernicious, where pot-aſhes will ſtain, or alter the colour.

14. Where great quantities of ſtuffs are to be dyed together, or where they are to be done with any ſpeed, and where the pieces are very long, broad, thick, or otherwiſe, they are to be differently handled, both in reſpect to the veſſels and ingredients.

15. In ſome colours and ſtuffs the tingent liquor muſt be boiling, in other caſes blood-warm, and in ſome it may be cold.

16 Some tingent liquors are fitted for uſe by long keeping, and in ſome the virtues wear away by the keeping.

17. Some colours or ſtuffs are beſt dyed by reiterated dippings in the ſame liquor, ſome by continuing longer, and others a leſſer time therein.

18. In ſome caſes, the matter of the veſſel wherein the liquors are heated, and the tincture prepared, muſt be regarded, as the kettles muſt be pewter for Bow-dye.

19. There is little reckoning made how much liquor is uſed in proportion to the dyeing drugs, it being rather adjuſted to the bulk of the ſtuffs, as the veſſels are to their breadth; the quantity of dyeing drugs being proportioned both to the colour, higher or lower, and to the ſtuffs; as likewiſe the ſalts are to the dyeing drugs. Concerning the weight that colours give to ſilk, (in which it is moſt taken notice of, being ſold by weight, and a commodity of great price) it is obſerved, that one pound of raw ſilk loſeth four ounces by waſhing out the gums and the natural ſordes; that the ſame ſcoured ſilk may be raiſed to above thirty ounces from the remaining twelve, if it be dyed black with ſome materials.

Of a thing very uſeful in dyeing, eſpecially of black, nothing increaſes weight ſo much as galls, by which black ſilks are reſtored to as much weight as they loſt by waſhing out their gum: nor is it counted extraordinary that blacks ſhould gain about four or ſix ounces in the dyeing upon each pound. Next to the galls, old fuſtic increaſes the weight about $1\frac{1}{2}$ in 12; madder, about one ounce; weld, half an ounce. The blue vats in deep blues of the fifth ſtall, give no conſiderable weight; neither doth logwood, cochineal, nor even copperas, where galls are not: ſlippe adds much to the weight, and giveth a deeper black than copperas itſelf, which is a good excuſe for the dyers that uſe it.

DYEING *of wooll and woollen manufactures.*

For black in woollen manufactures, it is begun with a ſtrong decoction of woad and indigo, that communicate a deep blue; after which the ſtuffs being boiled with alum and tartar, or pot-aſh, are to be maddered with common madder, then dyed black with Aleppo galls, copperas, and ſumac, and finiſhed by back-boiling in weld. Woolls for tapeſtry are only to be woaded, and then put in black. For ſcarlet, wooll and woollen manufactures are dyed with kermes and cochineal, with which may alſo be uſed agaric and arſenic. Crimſon ſcarlet is dyed with cochineal, maſtic, aquafortis, ſal armoniac, ſublimate, and ſpirit of wine. Violet ſcarlet, purple, amaranth, and panſy-ſcarlets, are given wth woad, cochineal, indigo, braziletto, brazil, and orchal. Common reds are given with pure madder, without any other ingredient. Crimſon reds, carnations, flame and peach-colours, are given, according to their ſeveral hues, with cochineal, maſtic, without madder, or the like. Crimſon-red is prepared with Roman alum, with cochineal. Orange aurora, brick-colour, and onion-peel colour, are dyed with woad and madder, mixed according to their ſeveral ſhades. For blues, the dark are dyed with a ſtrong tincture of woad; the brighter with the ſame liquor, as it weakens in working. Dark browns, minims, and tan colours, are given with woad, weaker in decoction than for black, with alum and pot-aſhes, after which they are maddered higher than black: for tan-colours, a little cochineal is added. Pearl-colours are given with galls and copperas; ſome are begun with walnut-tree roots, and finiſhed with the former; though to make them more uſeful, they generally dip them in a weak tincture of cochineal. Greens are begun with woad, and finiſhed with weld. Pale-yellows, lemon-colour, and ſulphur colour, are given with weld alone. Olive colours of all degrees are firſt put in green, and taken down with ſoot, more or leſs, according to the ſhade that is required. Feulemort, hair-colour, muſk, and cinnamon colour, are dyed with weld and madder. Nacaret, or bright orange, is given with weld and goats-hair boiled with pot-aſhes.

DYEING *of ſilks*, is begun by boiling them in ſoap, *&c.* then ſcouring and waſhing them in water, and ſteeping them in cold alum-water. For crimſon, they are ſcoured a ſecond time, before they are put into the cochineal vat. Red crimſon is given with pure cochineal, maſtic, adding galls, turmeric, arſenic, and tartar, all mixed in a copper of fair water, almoſt boiling: with theſe the ſilk is to be boiled an hour and a half, after which it is allowed to ſtand in the liquor till next day. Violet crimſon is given with pure cochineal, arſenic, tartar, and galls; but the galls in leſs proportion than in the former: when taken out, it is waſhed and put in a vat of indigo. Cinnamon crimſon is begun like the violet, but finiſhed by back-boiling; if too bright, with copperas; and if dark, with a dip of indigo. Light blues are given in a back of indigo. Sky-blues are begun with orchal, and finiſhed with indigo. For citron colours, the ſilk is firſt alumed, then welded with indigo. Pale yellows, after aluming, are dyed in weld alone. Pale and brown aurora's, after aluming, are welded ſtrongly, then taken down with rocou and diſſolved with pot-aſhes. Flame-colour is begun with rocou, then alumed, and afterwards dipped

ped in a vat or two of brazil. Carnation and rose colours are first alumed, then dipt in brazil. Cinnamon colour, after aluming, is dipt in brazil and braziletto. Lead colour is given with fustic, or with weld, braziletto, galls and copperas. Black silks of the coarser sort, are begun by scouring them with soap, as for other colours; after which they are washed out, wrung, and boiled an hour in old galls, where they are suffered to stand a day or two: then they are washed again with fair water, wrung, and put into another vat of new galls: afterwards washed again, and wrung, and finished in a vat of black. Fine black silks are only put once into galls of the new and fine sort, that has only boiled an hour: then the silks are washed, wrung out, and dipped thrice in black, and afterwards taken down by back-boiling with soap.

The dyeing of thread is begun by scouring it in a lye of good ashes: afterwards it is wrung, rinsed out in river water, and wrung again. A bright blue is given with braziletto and indigo: bright green is first dyed blue, then back-boiled with braziletto and verdeter, and lastly woaded. A dark green is given like the former, only darkening more before woading. Lemon and pale yellow is given with weld mixed with rocou. Orange isabella, with fustic, weld, and rocou. Red, both bright and dark, with flame-colour, *&c.* are given with brazil, either alone, or with a mixture of rocou. Violet, dry-rose, and amaranth, are given with brazil, taken down with indigo. Feulemort and olive colour are given with galls and copperas, taken down with weld, rocou, or fustic. Black is given with galls and copperas, taken down and finished with braziletto wood.

DYNASTY, among ancient historians, signifies a race or succession of kings of the same line or family: such were the dynasties of Egypt.

The Egyptians reckon thirty dynasties within the space of 36525 years; but the generality of chronologers look upon them as fabulous. And it is very certain, that these dynasties are not continually successive, but collateral.

DYSCRACY, among physicians denotes an ill habit or state of the humours, as in the scurvy, jaundice, *&c.*

DYSENTERY, in medicine, a diarrhœa or flux, wherein the stools are mixed with blood, and the bowels miserably tormented with gripes. See MEDICINE.

DYSERT, a parliament-town of Scotland, in the county of Fife, situated on the northern shore of the frith of Forth, about eleven miles north of Edinburgh.

DYSOREXY, among physicians, denotes a want of appetite, proceeding from a weakly stomach.

DYSPEPSY, a difficulty of digestion.

DYSPNOEA, a difficulty of breathing, usually called asthma.

DYSURY, in medicine, a difficulty of making urine, attended with a sensation of heat and pain. See MEDICINE.

DYTISCUS, WATER-BEETLE, in zoology, a genus of insects of the order of the coleoptera; the antennæ of which are slender and setaceous, and the hind feet are hairy, and formed for swimming. There are twenty-three species, distinguished by their antennæ, the colour of the elytra, *&c.*

DYVOUR'S HABIT, in Scots law, a party-coloured habit which fradulent bankrupts, or bankrupts who have been dealers in illicite trades, are directed to wear, as a mark of ignominy, upon their being liberate from prison on a cessio bonorum. See SCOTS LAW, title 32.

E

EAGLE, in ornithology. See FALCO.

EAGLE, in heraldry, is accounted one of the most noble bearings in armoury, and, according to the learned in this science, ought to be given to none but such as greatly excel in the virtues of generosity and courage, or for having done singular services to their sovereigns; in which cases they may be allowed a whole eagle, or an eagle naissant, or only the head or other parts thereof, as may be most agreeable to their exploits.

EAGLE, in astronomy. Vol. I. p. 487.

EAGLE OWL. See BUBO.

EAGLE-STONE. See ÆTITES.

Black EAGLE, an order of knighthood, instituted by the elector of Brandenburgh, in 1701, on his being crowned king of Prussia.

The knights of this order wear an orange-coloured ribband suspending a black eagle.

White EAGLE, a like order in Poland, instituted in 1325, by Uladislaus V. on occasion of the marriage of his son Casimir to the daughter of the great duke of Lithuania.

The knights of this order wear a chain of gold, suspending a silver eagle crowned.

EAGLET, a diminutive of eagle, properly signifying a young eagle. In heraldry, when there are several eagles on the same escutcheon, they are termed eaglets.

EAR,

EAR, in anatomy. See Vol. I. p. 295.

Ear-wig, in zoology. See Forficula.

EARING, in the ſea language, is that part of the bolt-rope which at the four corners of the ſail is left open, in the ſhape of a ring. The two uppermoſt parts are put over the ends of the yard-arms, and ſo the ſail is made faſt to the yard; and into the lowermoſt earings, the ſheets and tacks are ſeized or bent at the clew.

EARL, a Britiſh title of nobility, next below a marquis, and above a viſcount. Earls were anciently called comites, becauſe they were wont *comitari regem*, to wait upon the king for council and advice. The Germans call them graves, as landgrave, margrave, palſgrave, rheingrave: the Saxons ealdormen, unleſs that title might be more properly applied to our dukes; the Danes, eolras; and the Engliſh, earls. The title, originally, died with the man. William the conqueror firſt made it hereditary, giving it in fee to his nobles, and allotting them for the ſupport of their ſtate the third penny out of the ſheriff's court, iſſuing out of all pleas of the ſhire whence they had their title. But now the matter is quite otherwiſe; for whereas heretofore *comes* and *comitatus* were correlatives, and there was no comes or earl but had a county or ſhire for his earldom, of later years the number of earls increaſing, and no more counties being left, divers have made choice of ſome eminent part of a county, as Lindſey, Holland, Cleveland, *&c.* ſome of a leſſer part, as Stafford, *&c.* others have choſen for their title ſome eminent town, as Marlborough, Exeter, Briſtol, *&c.* and ſome have taken for their title the name of a ſmall village; their own ſeat or park, as Godolphin, Clarendon, *&c.* An earl is created by cincture of ſword, mantle of ſtate put upon him by the king himſelf, a cap and a coronet put upon his head, and a charter in his hand. All the earls of England are denominated from ſome ſhire, town or place, except three; two of whom, *viz.* earl Rivers, and earl Paulet, take their denomination from illuſtrious families: the third is not only honorary, as all the reſt, but alſo officiary, as the earl-marſhal of England.

Earl-*marſhal of England*, is a great officer who had anciently ſeveral courts under his juriſdiction, as the court of chivalry, and the court of honour. Under him is alſo the herald's office or college of arms. He hath ſome pre-eminence in the court of Marſhalſea, where he may ſit in judgment againſt thoſe who offend within the verge of the king's court. This office is of great antiquity in England, and anciently of greater power than now; and has been for ſeveral ages hereditary in the moſt noble family of Howard.

EARNEST, in Scots law, a piece of money ſometimes given by a buyer, in evidence that the ſale or contract is compleated. See tit. 22.

EARTH, a foſſile, or terreſtrial matter, whereof our globe partly conſiſts. See Vol. I. p 67.

Earth, in aſtronomy and geography, one of the primary planets, being this terraqueous globe whereon we inhabit. See Astronomy and Geography.

EARTHQUAKE, in natural hiſtory, a violent agitation or trembling of ſome conſiderable part of the earth generally attended with a terrible noiſe like thunder, and ſometimes with an eruption of fire, water, wind, *&c.* See Pneumatics.

EASEL-pieces, a denomination given by painters to ſuch pieces as are contained in frames, in contradiſtinction from thoſe painted on cielings, *&c.*

EASEMENT, in law, a privilege or convenience which one neighbour has of another, whether by charter or preſcription, without profit: ſuch are a way through his lands, a ſink, or the like. Theſe, in many caſes, may be claimed.

EASING, in the ſea-language, ſignifies the ſlackening a rope, or the like: thus, to eaſe the bow-line or ſheet, is to let them go ſlacker; to eaſe the helm, is to let the ſhip go more large, more before the wind, or more larboard.

EASLOW, a borough of Cornwal, twenty-two miles ſouth of Launceſton, which ſends two members to parliament.

EAST, one of the four cardinal points of the world; being that point of the horizon, where the ſun is ſeen to riſe when in the equinoctial.

EASTER, a feſtival of the chriſtian church, obſerved in memory of our Saviour's reſurrection.

The Greeks call it *paſga*, the Latins *paſcha*, an Hebrew word ſignifying *paſſage*, applied to the Jewiſh feaſt of the paſſover. It is called eaſter in the Engliſh, from the goddeſs Eoſtre, worſhipped by the Saxons with peculiar ceremonies in the month of April.

The Aſiatic churches kept their eaſter upon the very ſame day the Jews obſerved their paſſover; and others, on the firſt Sunday after the firſt full moon in the new year. This controverſy was determined in the council of Nice, when it was ordained that eaſter ſhould be kept upon one and the ſame day, which ſhould always be a Sunday, in all chriſtian Churches in the world. For the method of finding eaſter by calculation, ſee Vol. I p. 492.

EASTERN, an appellation given to whatever relates to the eaſt: thus we ſay, eaſtern amplitude, eaſtern church, *&c.*

EATON, a town of Buckinghamſhire, ſituated on the north ſide of the Thames, oppoſite to Windſor, and famous for its collegial ſchool, founded by king Henry VI being a ſeminary for king's college Cambridge, the fellows of which are all from this ſchool.

EAVES, in architecture, the margin or edge of the roof of an houſe; being the loweſt tiles, ſlates, or the like, that hang over the walls, to throw off water to a diſtance from the wall.

EBBING *of the tides*. See Vol. I. p. 473.

EBDOMARIUS, in eccleſiaſtical writers, an officer formerly appointed weekly to ſuperintend the performance of divine ſervice in cathedrals, and preſcribe the duties of each perſon attending in the choir, as to reading, ſinging, praying, *&c.*

EBENUS, the Ebony-tree, in botany, a genus of the diadelphia decandria claſs. The calix has a number of ſmall hairy teeth, as long as the corolla; the

corolla

corolla has hardly any wings; and the pod is hairy, and contains but one feed. There is but one fpecies, a native of Crete.

EBIONITES, in church-hiftory, heretics of the firft century, fo called from their leader Ebion.

They held the fame errors with the Nazarenes, united the ceremony of the Mofaic inftitution with the precepts of the gofpel, obferved both the Jewifh fabbath and Chriftian Sunday, and in celebrating the eucharift made ufe of unleavened bread. They abftained from the flefh of animals, and even from milk. In relation to Jefus Chrift, fome of them held, that he was born like other men, of Jofeph and Mary, and acquired fanctification only by his good works. Others of them allowed, that he was born of a virgin, but denied that he was the Word of God, or had any exiftence before his human generation. They faid, he was indeed the only true Prophet; but yet a mere man, who, by his virtue, had arrived at being called Chrift, and the Son of God. They alfo fuppofed, that Chrift and the devil were two principles, which God had oppofed to each other. Of the New Teftament they only received the gofpel of St Matthew, which they called the gofpel according to the Hebrews.

EBRO, anciently Iberus, a large river of Spain, which taking its rife in Old Caftile, runs through Bifcay and Arragon, paffes by Saragofa, and, continuing its courfe through Catalonia, difcharges itfelf with great rapidity into the Mediterranean, about twenty miles below the city of Tortofa.

EBULLITION. See Boiling.

EBULUS, in botany. See Symbucus.

ECBOLIUM, in botany. See Adhatoda.

ECCHYMOSIS, in furgery, an extravafation of the blood from a vein in the arm betwixt the flefh and fkin.

ECCLESIASTES, a canonical book of the Old Teftament, the defign of which is to fhew the vanity of all fublunary things.

It was compofed by Solomon, who enumerates the feveral objects on which men place their happinefs, and then fhews the infufficiency of all worldly enjoyments.

The Talmudifts make king Hezekiah to be the author of it; Grotius afcribes it to Zorobabel, and others to Ifaiah; but the generality of commentators believe this book to be the produce of Solomon's repentance, after having experienced all the follies and pleafures of life.

ECCLESIASTICAL, an appellation given to whatever belongs to the church: thus we fay, ecclefiaftical polity, jurifdiction, hiftory, *&c.*

ECCLESIASTICUS, an apocryphal book, generally bound up with the fcriptures, fo called, from its being read in the church, *ecclefia*, as a book of piety and inftruction, but not of infallible authority.

The author of this book was a Jew, called Jefus the fon of Sirach. The Greeks call it the wifdom of the fon of Sirach.

ECCOPE, in furgery. See Amputation.

ECCOPROTICS, in pharmacy. See Cathartics, and Evacuants.

ECHAPE, in the menage, a horfe begot between a ftallion and a mare of different breeds and countries.

ECHAPER, in the menage, a gallicifm ufed in the academies, implying to give a horfe head, or to put on at full fpeed.

ECHENEIS, in ichthyology, a genus belonging to the order of thoracici. The head is fat, naked, depreffed, and marked with a number of tranfverfe ridges: it has ten rays in the branchioftege membrane; and the body is naked. There are two fpecies, *viz.* 1. the remora, with a forked tail, and eighteen ftriæ on the head. It is found in the Indian ocean. 2. The peucrates, with an undivided tail, and twenty-four ftriæ on the head. It is likewife a native of the Indian ocean.

ECHEVIN, in the French and Dutch polity, a magiftrate elected by the inhabitants of a city or town, to take care of their common concerns, and the decoration and cleanlinefs of the city.

At Paris, there is a prevôt, and four echevins; in other towns, a mayor and echevins. At Amfterdam, there are nine echevins; and, at Rotterdam, feven.

In France, the echevins take cognizance of rents, taxes, and the navigation of rivers, *&c.* In Holland, they judge of civil and criminal caufes; and if the criminal confeffes himfelf guilty, they can fee their fentence executed without appeal.

ECHINATE, or Echinated, an appellation given to whatever is prickly, thereby refembling the hedgehog.

ECHINITES, in natural hiftory, the name by which authors call the foffile centronia, frequently found in our chalk-pits. See Centronia.

ECHINOPHORA, in botany, a genus of the pentandria digynia clafs. The fruit has funk peduncles. There are two fpecies, one of which, *viz.* the fpinofa, or prickly famphire, is a native of Britain.

ECHINOPS, Glove-thistle, in botany, a genus of the fyngenefia polygamia fegregata clafs. The proper calix is erect, imbricated, and contains but a fingle flower. There are three fpecies, none of them natives of Britain.

ECHINUS, in zoology, a genus of infects belonging to the order of vermes mollufca. The body is roundifh, covered with a bony cruft, and often befet with moveable prickles; and the mouth is below, and confifts of five valves. There are feventeen fpecies, all natives of the fea.

Echinus, in architecture, a member or ornament near the bottom of the Ionic, Corinthian, and compofite capitals.

ECHIUM, Viper's bugloss, in botany, a genus of the pentandria monogynia clafs. The corolla is irregular, with a naked faux. There are feven fpecies, three of which are natives of Britain, *viz.* the vulgare, or viper's buglofs; the anglicum, or Englifh viper's buglofs; and the italicum, or wall-viper's buglofs.

ECHO, a found reverberated or reflected to the ear from fome folid body. See Pneumatics.

Echo, in architecture, a term applied to certain kinds of

of vaults and arches, moſt commonly of elliptical and parabolical figures, uſed to redouble ſounds, and produce artificial echos.

ECHOMETER, among muſicians, a kind of ſcale or rule, with ſeveral lines thereon, ſerving to meaſure the duration and length of ſounds, and to find their intervals and ratios.

ECLECTICS, ancient philoſophers, who, without attaching themſelves to any particular ſect, ſelected whatever appeared to them the beſt and moſt rational, from each.

Potamon of Alexandria was the firſt of the eclectics: he lived in the reigns of Auguſtus and Tiberius; and being tired with the ſcepticiſm of the Pyrrhonians, he reſolved upon a ſcheme that would allow him to believe ſomething, but without being ſo implicit as to ſwallow any entire hypotheſis.

ECLECTOS. See LINCTUS.

ECLIPSE, in aſtronomy, the deprivation of the light of the ſun, or of ſome heavenly body, by the interpoſition of another heavenly body between our ſight and it. See Vol. I. p. 476

ECLIPTIC, in aſtronomy, a great circle of the ſphere, ſuppoſed to be drawn through the middle of the zodiac, making an angle with the equinoctial of about 23° 30′, which is the ſun's greateſt declination; or, more ſtrictly ſpeaking, it is that path or way among the fixed ſtars, that the earth appears to deſcribe to an eye placed in the ſun. See ASTRONOMY, and GEOGRAPHY.

ECLOGUE, in poetry, a kind of paſtoral compoſition, or a ſmall elegant poem, in a natural ſimple ſtyle.

The models in this ſort of poetry are Theocritus and Virgil.

ECOUTE′, in the menage, a pace or motion of a horſe, when he rides well upon the hands and the heels, is compactly put upon his haunches, and hears or liſtens to the heels or ſpurs, and continues duly balanced between the heels, without throwing to either ſide. This happens when a horſe has a fine ſenſe of the aids of the hand and heel.

ECPHRACTICS, in medicine, remedies which attenuate and remove obſtructions. See ATTENUANTS, and DEOBSRUENTS.

ECPIESMA, in ſurgery, a ſort of fracture of the cranium, when the bones are much ſhattered, and, preſſing inwardly, affect the membranes of the brain.

ECPIESMA, in pharmacy, ſignifies the maſs remaining after the juices of vegetables have been preſſed out: and, in this ſenſe, is the ſame as magma. It ſometimes further imports the juice preſſed out.

ECPIESMUS, in the ancient writers of medicine, a word uſed to expreſs a diſtemperature of the eye, conſiſting in a very great prominence of the entire globe of the eye, which is, as it were, thruſt out of its ſocket or orbit, by a great flux of humours, or an inflammation.

ECPUCTICA, in pharmacy. See INCRASSANTS.

ECTHESIS, in church-hiſtory, a confeſſion of faith, in the form of an edict, publiſhed in the year 639, by the emperor Heraclius, with a view to pacify the troubles occaſioned by the Eutychian hereſy in the eaſtern church. However, the ſame prince revoked it, on being informed that pope Severinus had condemned it, as favouring the Monothelites; declaring at the ſame time, that Sergius, patriarch of Conſtantinople, was the author of it.

ECTHLIPSIS, among Latin grammarians, a figure of proſody whereby the *m* at the end of a word, when the following word begins with a vowel, is elided, or cut off, together with the vowel preceding it, for the ſake of the meaſure of the verſe: thus they read *mult' ille*, for *multum ille*.

ECTROPIUM, in ſurgery, is when the eye-lids are inverted, or retracted ſo as to ſhew their internal or red ſurface, and cannot ſufficiently cover the eye.

ECTYLOTICS, in pharmacy, remedies proper for conſuming calloſities.

ECU, or ESCU, a French crown, for the value of which, ſee MONEY.

EDDISH, or EADISH, the latter paſture, or graſs that comes after mowing or reaping; otherwiſe called eagraſs, or earſh, and etch.

EDDY TIDE, or EDDY-WATER, among ſeamen, is where the water runs back contrary to the tide; or that which hinders the free paſſage of the ſtream, and ſo cauſes it to return again.

EDDY-WIND is that which returns, or is beat back from a ſail, mountain, or any thing that may hinder its paſſage.

EDESSA. See ORFA.

EDICT, in matters of polity, an order or inſtrument, ſigned and ſealed by a prince, to ſerve as a law to his ſubjects. We find frequent mention of the edicts of the prætor, the ordinances of that officer in the Roman law. In the French law, the edicts are of ſeveral kinds; ſome importing a new law or regulation; others, the erection of new offices; eſtabliſhments of duties, rents, *&c.* and ſometimes articles of pacification. In France, edicts are much the ſame as a proclamation is with us; but with this difference, that the former have the authority of a law in themſelves, from the power which iſſues them forth; whereas the latter are only declarations of a law, to which they refer, and have no power in themſelves

EDINBURGH, the capital city of the kingdom of Scotland, ſituated W. long. 3°, and N. lat. 56°.

We ſhall not ſpend time in fruitleſs inquiries into the antiquity of this city, or the etymology of its name; both of which ſeem to be fabulous and uncertain. It is conjectured by ſome to have owed its origin and name to Edwin king of Northumberland, about the year 600; is taken notice of by authors in the 854 as a ſmall and inconſiderable village, and only about the middle of the 14th century as the capital of Scotland.

Edinburgh is ſituated upon a ſteep hill, riſing from eaſt to weſt, and terminating in a high and inacceſſible rock, upon which the caſtle ſtands. At the eaſt end, or lower extremity of this hill, ſtands the abbey of Holyrood-houſe, or king's palace, diſtant from the caſtle upwards of a mile; and betwixt which, along the top of the ridge, and almoſt in a ſtrait line, runs the high-ſtreet of Edinburgh. On each ſide, and parallel

rallel to this ridge or hill, is another ridge of ground lower than that in the middle, and which does not extend ſo far to the eaſt; that on the ſouth being intercepted by Saliſbury-rocks, and Arthur's-ſeat, a hill of about 650 feet of perpendicular height; and that on the north by the Calton-hill, conſiderably lower than Arthur's-ſeat: ſo that the ſituation of this city is moſt ſingular and romantic; the eaſt or lower part of the town lying between two high hills; and the weſt or higher part riſing up towards a third hill, little inferior in height to the higheſt of the other two, upon which, as has been obſerved, the caſtle is built, and overlooks the town.

The buildings of the town terminate at the diſtance of about 200 yards from the caſtle-gate; which ſpace affords a moſt delightful as well as convenient and healthful walk to the inhabitants. The proſpect from this ſpot is perhaps the fineſt any where to be met with, for extent, beauty, and variety.

In the valley or hollow betwixt the mid and ſouth ridge, and nearly parallel to the high-ſtreet, is another ſtreet called the Cowgate; and the town has now extended itſelf over moſt part of that ſouth ridge alſo. Betwixt the mid and north ridge was a loch, which, till of very late, terminated the town on that ſide. From the high-ſtreet towards the loch on the north, and Cowgate on the ſouth, run narrow croſs ſtreets or lanes, called wynds and cloſſes, which grow ſteeper and ſteeper the farther weſt or nearer the caſtle; ſo that, were it not for the cloſeneſs and great height of the buildings, this city, from its ſituation and plan, might naturally be expected to be the beſt aired, as well as the cleanlieſt in Europe. The firſt, notwithſtanding theſe diſadvantages, it enjoys in an eminent degree; but we cannot compliment it upon the latter, notwithſtanding every poſſible means has been uſed by the magiſtrates for that purpoſe.

The ſteepneſs of the aſcent makes the acceſs to the high-ſtreet from the north and ſouth very difficult; and has no doubt greatly retarded the enlargement of this city. To remedy this inconvenience on the north, and with a view to extend the town on that quarter, a moſt elegant bridge is preſently throwing over the north-loch, which will join the north ridge to the middle of the high-ſtreet, by ſo eaſy an aſcent as one in ſixteen; and in purſuance of this deſign a plan of a new town to the north is fixed upon, and is actually carrying into execution with ſurpriſing rapidity, and with an elegance and taſte that does honour to this country.

The principal public buildings in Edinburgh may be reduced to four, *viz.* St Giles's church, the palace of Holyrood houſe, Herriot's hoſpital, and the Royal Infirmary.——St Giles's church is the moſt ancient church in Edinburgh, in ſo much that it is not known when or by whom it was founded. It ſtands on the ſouth-ſide of the high-ſtreet, about a quarter of a mile below the caſtle. It is a very large, irregular, and heavy building, except the ſteeple, which runs with a ſquare ſtalk from the middle of the ſtructure, and terminates in the form of an imperial crown, and is reckoned the fineſt in Britain for elegance and ſymmetry.

The abbey of Holyrood-houſe was erected by David I. *anno* 1128, in memory, as is ſaid, of his deliverance from the horns of an enraged hart, by the interpoſition of heaven in the form of a croſs. It was firſt made a royal palace by James V. about the year 1528, who built the north wing of the preſent front, which evidently appears older than the reſt. It was completed in the preſent form by Charles II. in the year 1674; and is juſtly reckoned a moſt magnificent and elegant building.

Herriot's hoſpital was founded, July 1. 1628, by the magiſtrates of Edinburgh, in virtue of a donation of *L.* 43,608 : 11 : 3, bequeathed to them by George Herriot, goldſmith and jeweller to James VI. "for the "maintenance, relief, bringing up, and education of "ſo many poor fatherleſs boys, freemens ſons of the "town of Edinburgh," as the above ſum ſhould be ſufficient for. This hoſpital contains at preſent about a hundred and forty boys, who are well educated and taken care of. It has, notwithſtanding the large ſum laid out in building the houſe, a great annual revenue; which, as it conſiſts moſtly of lands, muſt always keep pace with the nominal value of money. This hoſpital is finely ſituated on the weſt end of the ſouth ridge, almoſt oppoſite to the caſtle; and is perhaps the moſt magnificent building of that kind in Britain.

The Royal Infirmary was founded in Auguſt 1738, by the magiſtrates of Edinburgh, in virtue of a charter from the crown, for the reception of poor diſeaſed perſons; and by conduct in the management of its funds, which aroſe moſtly from the public contributions, and were but very ſcanty, has proved an ineſtimable bleſſing to this country. This hoſpital ſtands near the eaſt end of the ſouth ridge; and is thought by ſome to be rather too magnificent, conſidering the purpoſe for which it is deſigned, and the narrowneſs of the original funds.

Edinburgh, as not being properly a ſea-port town, has never been remarkable for trade. The chief advantages it enjoys ariſe from the ſupreme courts of juſtice, which are there held; and from its college, which has become famous over Europe, particularly for phyſic.

EDITOR, a perſon of learning, who has the care of an impreſſion of any work, particularly that of an ancient author: thus Eraſmus was a great editor; the louvain doctors, Scaliger, Petavius, F. Sirmond, biſhop Walton, Mr Hearne, Mr Ruddiman, *&c.* are likewiſe famous editors.

EDUCATION, the inſtructing children, and youth in general, in ſuch branches of knowledge and polite exerciſes, as are ſuitable to their genius and ſtation.

Education is a very extenſive ſubject, that has employed the thoughts and pens of the greateſt men: Locke, the archbiſhop of Cambray, Tanaquil Faber, M. Crouſaz, Rollin, and Rouſſeau, may be conſulted on this head.

The principal aim of parents ſhould be, to know what ſphere of life their children are deſigned to act

in;

in; what education is really suitable to them; what will be the consequence of neglecting that; and what chance a superior education will give them, for their advancement in the world. Their chief study should be to give their children such a degree of knowledge, as will qualify them to fill some certain post or station in life: in short, to fit them for an employment suited to their condition and capacity, such as will make them happy in themselves and useful to society.

EDULCORATION, in chemistry, the separating, by a washing or solution in water, the salt that any body may be impregnated with, or those that may be left adhering to a body after any operation. See CHEMISTRY.

EEL, in ichthyology, a species of muræna. See MURÆNA.

EEL SPEAR, a forked instrument with three or four jagged teeth, used for catching of eels: that with the four teeth is best, which they strike into the mud at the bottom of the river, and if it strike against any eels it never fails to bring them up.

EFFARE', or EFFRAYE', in heraldry, a term applied to a beast rearing on its hind-legs, as if it were frighted or provoked.

EFFECT, in a general sense, is that which results from, or is produced by, any cause. See CAUSE.

EFFECTS, in commerce, law, &c. the goods possessed by any person, whether moveable or immoveable.

EFFERDING, a town of Upper Austria, about ten miles west of Lintz.

EFFERVESCENCE, in a general sense, signifies a slight degree of ebullition in liquors exposed to a due degree of heat: but the chemists apply it to that intestine motion excited in various fluids, either by the mixture of fluids with others of a different nature; or by dropping salts or powders of various kinds into fluids. See POWDERS.

EFFIGY, the portrait, figure, or exact representation of a person.

EFFLORESCENCE, among physicians, the same with exanthema. See EXANTHEMA.

EFFLUVIUM, in physiology, a term much used by philosophers and physicians, to express the minute particles which exhale from most, if not all, terrestrial bodies in form of insensible vapours.

EFFUSION, in a general sense, the pouring out of any thing liquid, and that with some violence.

EFT, in zoology, the English name of the common lizard. See LACERTUS.

EGERMOND, a market-town of Cumberland, ten miles south of Cockermouth.

EGG, in physiology, a body formed in certain females, in which is contained an embryo, or fœtus of the same species, under a cortical surface or shell. The exterior part of an egg is the shell, which in a hen, for instance, is a white, thin, and friable cortex, including all the other parts. The shell becomes more brittle by being exposed to a dry heat. It is lined every where with a very thin but a pretty tough membrane, which dividing at, or very near, the obtuse end of the egg, forms a small bag, where only air is contained. In new laid eggs this folliculus appears very little, but becomes larger when the egg is kept.

Within this are contained the albumen or white, and the vitellus or yelk; each of which have their different virtues.

The albumen is a cold, viscuous, white liquor in the egg, different in consistence in its different parts. It is observed, that there are two distinct albumens, each of which are inclosed in its proper membrane; of these, one is very thin and liquid, and the other more dense and viscuous, and of a somewhat whiter colour; but, in old and stale eggs, after some days incubation, inclining to a yellow. As this second albumen covers the yelk on all sides, so it is itself surrounded by the other external liquid. The albumen of a fecundated egg, is as sweet and free from corruption, during all the time of incubation, as it is in new-laid eggs; as is also the vitellus. As the eggs of hens consist of two liquors separated one from another, and distinguished by two branches of umbilical veins, one of which goes to the vitellus, and the other to the albumen; so it is very probable that they are of different natures, and consequently appointed for different purposes.

When the vitellus grows warm with incubation, it becomes more humid, and like melting wax, or fat; whence it takes up more space; for as the fœtus increases, the albumen insensibly wastes away, and condenses: the vitellus, on the contrary, seems to lose little or nothing of its bulk when the fœtus is perfected, and only appears more liquid and humid when the abdomen of the fœtus begins to be formed.

The chick in the egg is first nourished by the albumen; and when this is consumed, by the vitellus, as with milk. If we compare the chalazæ to the extremities of an axis passing through the vitellus, which is of a spherical form, this sphere will be composed of two unequal portions, its axis not passing through its centre; consequently, since it is heavier than the white, its smaller portion must always be uppermost in all positions of the egg.

The yellowish white round spot, called cicatricula, is placed on the middle of the smaller portion of the yelk; and therefore, from what has been said in the last paragraph, must always appear on the superior part of the vitellus.

Not long before the exclusion of the chick, the whole yelk is taken into its abdomen; and the shell, at the obtuse end of the egg, frequently appears cracked some time before the exclusion of the chick. The chick is sometimes observed to perforate the shell with its beak. After exclusion, the yolk is gradually wasted, being conveyed into the small guts by a small duct.

Eggs differ very much according to the birds that lay them, according to their colour, form, bigness, age, and the different way of dressing them: those most used in food are hens eggs: of these, such as are new-laid are best.

As to the preservation of eggs, it is observed that the

the egg is always quite full when it is firſt laid by the hen, but from that time it gradually becomes leſs and leſs ſo, to its decay; and however compact and cloſe its ſhell may appear, it is nevertheleſs perforated with a multitude of ſmall holes, though too minute for the diſcernment of our eyes, the effect of which is a daily decreaſe of matter within the egg, from the time of its being laid; and the perſpiration is much quicker in hot weather than in cold.

To preſerve the egg freſh, there needs no more than to preſerve it full, and ſtop its tranſpiration; the method of doing which is, by ſtopping up thoſe pores with matter which is not ſoluble in watery fluids; and on this principle it is, that all kinds of varniſh, prepared with ſpirit of wine, will preſerve eggs freſh for a long time, if they are carefully rubbed all over the ſhell: tallow, or mutton fat, is alſo good for this purpoſe, for ſuch as are rubbed over with this will keep as long as thoſe coated over with varniſh.

Artificial method of hatching EGGS. See HATCHING.

EGLANTINE, in botany. See ROSA.

EGRA, a city of Bohemia, ſituated on a river of the ſame name, about ſeventy-five miles weſt of Prague: E. long. 12° 22′, N. lat. 50° 10′.

EGYPT, an extenſive country of Africa, lying between 30° and 36° of eaſt longitude, and between 21° and 31° of north latitude; and bounded by the Mediterranean on the north; by the Red-ſea and Iſthmus of Suez, which divide it from Arabia, on the eaſt; by Abyſſinia or Ethiopia, on the ſouth; and by the deſarts of Barca and Nubia, on the weſt; being ſix hundred miles in length from north to ſouth, and from one hundred to two hundred in breadth from eaſt to weſt. Egypt is ſubject to the grand ſignior, and governed by a baſhaw, or viceroy. It owes its fertility to the annual overflowing of the Nile, which it begins to do in the months of May and June, and is uſually at its height in September, from which time the waters decreaſe till May or June again. By this ſupply of water, Egypt is rendered ſo fruitful, as to ſerve Conſtantinople and other places with corn, as it did Rome and Italy of old. They only harrow their grain into the mud, on the retiring of the water, and in March following uſually have a plentiful harveſt; and the lands, not ſown, yield good crops of graſs for the uſe of the cattle. According to Mr. Sandys, no country in the world is better furniſhed with grain, fleſh, fiſh, ſugar, fruits, melons, roots, and other garden ſtuff, than the lower Egypt.

EGYPTEN, a town of Courland, ſeventy miles ſouth-eaſt of Mittau.

EGYPTIANS, or GYPSIES, in Scots law, a band of robbers originally from Egypt, which infeſted Scotland about the end of the 16th century.

EJACULATOR, a muſcle of the penis. See Vol. I. p. 170.

EICHTERNAC, a town of Luxemburg, ſeven miles north weſt of Treves.

EJECTA, a term uſed, by lawyers, for a woman deflowered, or caſt from the virtuous.

EJECTION, in the animal oeconomy, evacuation, or the diſcharging any thing through ſome of the emunctories, as by ſtool, vomit, &c.

EJECTION, in Scots law, is the turning out the poſſeſſor of any heritable ſubject by force; and is either *legal* or *illegal*.—Legal ejection is where a perſon having no title to poſſeſs, is turned out by the authority of law: See REMOVING. Illegal ejection, is one perſon's violently turning another out of poſſeſſion without lawful authority. See LAW, title 29.

EIENHOVFN, a town of Dutch Brabant, fifteen miles ſouth of Boiſleduc.

EIFIELD, or ELFIELD, a town of lower Saxony, ſix miles north-weſt of Mentz.

EIGHT, or PIECE OF EIGHT. See MONEY.

EIMBECK, a town of lower Saxony, belonging to the elector of Hanover, twenty-five miles ſouth of Hildeſheim.

EISLEBEA, a town of Upper Saxony, five miles eaſt of Mansfield, remarkable for being the birth-place of Luther.

ELÆAGNUS, DUTCH MYRTLE, in botany, a genus of the tetrandria-monogynia claſs. It has no corolla; the calix is bell-ſhaped above the fruit, and has four ſegments; and the drupa is bell-ſhaped, and below the calix. There are three ſpecies, none of them natives of Britain.

ELÆOTHESIUM, in antiquity, the anointing room, or place where thoſe who were to wreſtle, or had bathed, anointed themſelves. See GYMNASIUM.

ELAPHEBOLIUM, in Grecian antiquity, the ninth month of the Athenian year, anſwering to the latter part of February and beginning of March. It conſiſted of thirty days, and took its name from the feſtival elaphebolia, kept in this month, in honour of Diana the huntreſs; on which occaſion, a cake made in the form of a deer, was offered to her.

ELASMIS, in natural hiſtory, a genus of talcs, compoſed of ſmall plates in form of ſpangles; and either ſingle, and not farther fiſſile; or, if complex, only fiſſile to a certain degree, and that in ſomewhat thick laminæ.

Of theſe talcs there are ſeveral varieties, ſome with large and others with ſmall ſpangles, which differ alſo in colour and other peculiarities.

ELASTIC, in natural philoſophy, an appellation given to all bodies endowed with the property of elaſticity. See the next article.

ELASTICITY, or ELASTIC FORCE, that property of bodies wherewith they reſtore themſelves to their former figure, after any external preſſure. See MECHANICS.

ELATER, in zoology, a genus of inſects belonging to the order of coleoptera. The feelers are ſetaceous. There are 38 ſpecies, diſtinguiſhed by their colour, &c.

ELATERIUM, in pharmacy, imports, in general, any purging medicine; but is particularly applied to thoſe which operate with violence.

ELATINE, in botany, a genus of the octandria-tetragynia claſs. The calix conſiſts of four leaves, and the corolla of four petals; the capſule has four cells and four

four depreſſed valves. There are two ſpecies, one of which, *viz.* the alſinaſtrum or water-wort, is a native of Britain.

ELBE, a large river in Germany, which, riſing on the confines of Sileſia, runs through Bohemia, Saxony, and Brandenburg; and afterwards dividing the dutchy of Lunenburg from that of Mecklenburg, as alſo the dutchy of Bremen from Holſtein, it falls into the German ocean, about ſeventy miles below Hamburgh.

It is navigable for great ſhips higher than any river in Europe.

ELBOW, in anatomy, the juncture of the cubitus and radius; or the outer angle made by the flexure or bend of the arm. See ANATOMY.

ELCESAITES, in church-hiſtory, ancient heretics, who made their appearance in the reign of the emperor Trajan, and took their name from their leader Elceſai. The elceſaites kept a mean between the Jews, Chriſtians, and Pagans; they worſhipped but one God, obſerved the Jewiſh ſabbath, circumciſion, and the other ceremonies of the law. They rejected the pentateuch, and the prophets; nor had they more reſpect for the writings of the apoſtles, particularly thoſe of St. Paul.

ELDERS, or SENIORS, in Jewiſh hiſtory, were perſons the moſt conſiderable for age, experience, and wiſdom. Of this ſort were the ſeventy men whom Moſes aſſociated to himſelf in the government of his people; ſuch, likewiſe, afterwards were thoſe who held the firſt rank in the ſynagogue, as preſidents.

In the firſt aſſemblies of the primitive Chriſtians, thoſe who held the firſt place were called elders. The word preſbyter, often uſed in the New Teſtament, is of the ſame ſignification: hence the firſt councils of Chriſtians were called preſbyteria, or councils of elders.

ELDER is alſo a denomination ſtill preſerved in the preſbyterian diſcipline. See PRESBYTERIAN.

ELDER, or ALDER, in botany. See ALNUS.

ELECAMPANE, in botany. See INULA.

ELECT, among eccleſiaſtical writers, thoſe whom God has choſen, or predeſtinated to be ſaved.

ELECTION, the choice that is made of a perſon, or thing, in preference of any other; as in the election of an emperor, of a pope, of a biſhop, of members of parliament, *&c.*

ELECTION, in theology, ſignifies the choice which God makes of angels and men for the objects of his grace and mercy. See GRACE, and PREDESTINATION.

ELECTOR, a perſon who has a right to elect or chuſe another to an office, honour, *&c.*

Elector is particularly, and by way of eminence, applied to thoſe princes of Germany in whom lies the right of electing the emperor: being all ſovereign princes, and the principal members of the empire.

The electoral college, conſiſting of all the electors of the empire, is the moſt illuſtrious and auguſt body in Europe. Bellarmine and Baronius atribute the inſtitution of it to pope Gregory V. and the emperor Otho III. in the tenth century; of which opinion are the generality of hiſtorians, and particularly the canoniſts: however, the number of electors was unſettled, at leaſt, till the thirteenth century. In 1356 Charles IV. by the golden bull, fixed the number of electors to ſeven; three eccleſiaſtics, *viz.* the archbiſhops of Mentz, Treves, and Cologne; and four ſeculars, *viz.* the king of Bohemia, count Palatine of the Rhine, duke of Saxony, and marquis of Brandenburg. In 1648 this order was changed, the duke of Bavaria being put in the place of the count Palatine, who having accepted the crown of Bohemia was outlawed by the emperor; but being at length reſtored, an eighth electorate was erected for the duke of Bavaria. In 1692, a ninth electorate was created, by the emperor Leopold, in favour of the duke of Hanover, of the houſe of Brunſwic Lunenburg.

There is this difference between the ſecular and eccleſiaſtic electors, that the firſt have an active and paſſive voice, that is, may chuſe and be choſen; the laſt, an active only. The three archbiſhops are to be thirty years old, before they can be advanced to the dignity; the ſeculars, eighteen, before they can perform the office themſelves. Theſe laſt have each their vicars, who officiate in their abſence.

Beſides the power of chuſing an emperor, the electors have alſo that of capitulating with, and depoſing him; ſo that, if there be one ſuffrage wanting, a proteſt may be entered againſt the proceedings. By the right of capitulation, they attribute to themſelves great privileges, as making of war, coining, and taking care of the public intereſt and ſecurity of the ſtates; and the emperor promiſes, upon oath, to receive the empire upon theſe conditions.

The electors have precedence of all other princes of the empire, even of cardinals and kings; and are addreſſed under the title of electoral highneſs.

Their ſeveral functions are as follow: the elector of Mentz is chancellor of Germany, convokes the ſtates, and gives his vote before any of the reſt. The elector of Cologne is grand chancellor of Italy, and conſecrates the emperor. The elector of Treves is chancellor of the Gauls, and confers impoſition of hands upon the emperor. The count Palatine of the Rhine is great treaſurer of the empire, and preſents the emperor with a globe at his coronation. The elector of Bavaria is great maſter of the imperial palace, and carries the golden apple. The marquis of Brandenburg is grand chamberlain, and puts the ring on the emperor's finger. The elector of Saxony is grand marſhal, and gives the ſword to the emperor. The king of Bohemia is grand butler, and puts Charlemaign's crown on the emperor's head. Laſtly, the elector of Hanover, now king of Great Britain, is arch-treaſurer, though firſt erected under the title of ſtandard-bearer of the empire.

ELECTORATE, a term uſed as well to ſignify the dignity of, as the territories belonging to, any of the electors of Germany; ſuch are Bavaria, Saxony, *&c.*

E L E C T R I C I T Y.

THE word ELECTRICITY fignifies, in general, the effects of a very fubtile fluid matter, different in its properties from every other fluid we are acquainted with. This fluid is capable of uniting with almoft every body, but unites more readily with fome particular bodies than with others: its motion is amazingly quick, is regulated by peculiar laws, and produces a vaft variety of fingular phenomena, the principal of which fhall be enumerated in this article.

As we are entirely ignorant of the nature of the electrical fluid, it is impoffible to define it but by its principal properties: that of repelling and attracting light bodies, is one of the moft remarkable. The ancients were only acquainted with this property in amber. William Gilbert, a native of Colchefter, and phyfician at London, in his treatife *De Magnete*, in the year 1600, was the firft perfon who difcovered, that fulphur, wax, refinous fubftances, glafs, and precious ftones, when dried and rubbed a little, were endowed with the fame property of attracting and repelling ftraws and other light fubftances. Sir Francis Bacon, in his phyfiological remains, gives a catalogue of electrical bodies; but it differs in nothing worth mentioning from that of Gilbert. Mr Boyle, about the year 1670, made fome addition to the catalogue of electric fubftances; but all his experiments on this fubject relate only to a few circumftances attending the fimple property of electric attraction: he had never feen the electric light, and little imagined what aftonifhing effects would be afterwards produced by this wonderful power.

Cotemporary with Mr Boyle was Otto Guericke, burgomafter of Magdeburg, and inventor of the air-pump, who was likewife one of the firft improvers of electricity. He made his experiments with a globe of fulphur, which he mounted on an axis, and whirled it in a wooden frame, rubbing it at the fame time with his hand. He firft difcovered, that a body once attracted by an excited electric was repelled by it, and not attracted again till it had been touched by fome other body: that bodies immerged in electric atmofpheres are themfelves electrified: that threads fufpended within a fmall diftance of his excited globe, were often repelled by his finger brought near them: that a feather, repelled by the globe, always turned the fame face towards it, like the moon with refpect to the earth; and that the excitation of his globe produced both light and found, though in a very inconfiderable degree. A much finer electric light was afterwards obferved by Dr Wall, and an account of it was publifhed in the Philofophical Tranfactions: Dr Wall likewife compares the light and the crackling of his excited amber to thunder and lightening.

Sir Ifaac Newton, in 1675, was the firft who difcovered that excited glafs attracted light bodies on the fide oppofite to that on which it was rubbed.

After Gilbert, Boyle, and Otto Guericke, Mr Hawkefbee, in his Phyfico-mechanical Experiments, publifhed in the year 1709, diftinguifhed himfelf by his experiments and difcoveries in electricity. He firft difcovered the electric power of glafs, the light proceeding from it, and the noife occafioned by it, together with a variety of phænomena relating to electric attraction and repulfion: Indeed little was added to his obfervations, till the difcovery of a plus and minus electricity by Dr Watfon and Dr Franklin about the year 1746, and the farther illuftration of that doctrine by Mr Canton.

From the year 1730 to the 1746, the writers on electricity are fo numerous, and their experiments fo many and various, that a volume would be infufficient for their hiftory. We fhall therefore endeavour, in the *firft* place, To give a fhort and connected view of the nature and principles of electricity, fo far as they have hitherto been unfolded, without mentioning the perfons to whom we are indebted for any particular difcovery: And, in the *fecond* place, Give a defcription of electrical machines; with a felection of a few of the moft curious and ufeful experiments, which the reader may eafily underftand after having made himfelf acquainted with the general principles.

It has been afferted, that all bodies, provided they be heated to a certain degree, and rubbed for a long time, will difcover themfelves to be poffeffed of the property of attracting and repelling light fubftances. However, metals of all kinds, although ever fo much heated, or rubbed, or polifhed, never difcover the leaft figns of electrical attraction; and confequently are excepted from the general rule, as well as water and other fluids, which cannot be fubjected to the neceffary treatment. Although moft bodies, by being heated and rubbed, difcover more or lefs of electrical attraction; yet, as fome of them poffefs this property in a more eminent degree, and with lefs labour, this circumftance has fuggefted a divifion of bodies into two claffes, according as they are more or lefs fufceptible of electricity.

The firft clafs comprehends thofe bodies which receive and collect the electrical matter moft eafily, and in greateft quantity, after being a little rubbed and heated: thefe bodies are called *electrics*, or *non conductors*; fuch as,

1. Diamonds of all kinds; the ruby, the fapphire, the emerald, the opal, the amethyft, the topaz, the beryl, the granat, rock cryftal, *&c.*

2. Glafs, and all vitrified bodies, enamels of all colours, porcelain, glafs of antimony, of lead, *&c.*

3. Balfams, refins of all kinds, wax, *&c.*

4. Bituminous bodies, fulphur, amber, afphaltum, *&c.*

5. Certain animal productions; as filk, feathers, wool, hairs, and briftles, *&c.*

The fecond clafs comprehends thofe bodies which either do not at all collect the electrical matter by friction, or

or in a very inconfiderable degree: fuch bodies are called *non-electrics*, or *conductors*, viz.

1. Water, and all aqueous and fpirituous liquors, which are incapable of being thickened, and fubjected to friction.

2 All metals, perfect and imperfect, and the greateft part of minerals; as, the load-ftone, antimony, zinc, bifmuth, the agat, the jafper, marble, free-ftone, flate, *&c.*

3. All living creatures, excepting their hair. To which may be added moft animal-fuftances; as leather, parchment, bone, ivory, horn, fhells, *&c.*

4. Trees and plants of all kinds; thread, ropes, linen-cloth, paper, *&c.*

Thefe two claffes of bodies have been called by the name of *electrics* and *non-electrics:* but as the electrical matter is not contained in the electrical bodies themfelves, but collected by them from the earth; and as non-electric allow the electrical matter to penetrate and flow through them, or to fpread equally on their furfaces, the terms *conductor* and *non-conductor* are more proper. Metals and water are the only perfect conductors; other bodies conducting only as they contain a mixture of thefe, without more or lefs of which they will not conduct at all.

Although conductors cannot be electrified by heat or friction, they may be charged with electricity, or made non-conductors, by an eafy operation; but then they retain this property no longer than they are kept from communicating with other conductors. A bar of iron will become an electric or non-conductor, by being fufpended by a filk cord, or laid upon a piece of rofin or other non-conductor, and at the fame time having one end of it in contact with a well-rubbed glafs tube, or globe. In the fame manner, water and metals of all kinds may be charged with electricity.

It is abfolutely neceffary, in exciting electricity by friction, that the glafs, or other body, be perfectly dry; the leaft moifture deftroys, or at leaft diminifhes the effect. A moift atmofphere, a burning candle, *&c.* are extremely unfavourable in making electrical experiments.

Hollow glafs globes, of about a foot diameter, and the 16th part of an inch thick, are now ufed in place of tubes, becaufe it leffens the labour of friction, and accumulates a greater quantity of electrical matter. This globe is turned rapidly by a large wheel like thofe ufed by the cutlers. When the globe is rubbed, it foon acquires a confiderable degree of electrical virtue, which is difcovered by light bodies, at the diftance of two or three feet, flying towards it. In approaching the globe with the hand or face, you will likewife feel the electric matter furrounding it like a gentle breeze of wind. Thefe fubtile emanations continue to be diffufed round the globe as long as the friction is continued; and, when the friction is ftopped, they gradually diminifh, till they are no longer perceptible. The application of non-conductors to the globe does not diminifh the electrical matter: on the contrary, the application of conductors almoft inftantly annihilates the whole quantity previoufly collected by the friction. But this effect is not produced, unlefs when the conductor at the fame time has a communication with the floor or earth where the machine ftands. For, as above obferved, if the conductor has no communication with the earth, it charges with electricity, and becomes a non-conductor. But non-conductors, as a piece of glafs, fulphur, or wax, though they do not diminifh the virtue of the globe, yet they do not acquire, like iron, *&c.* the property of attraction or repulfion. Hence it appears, that the electrical matter paffes freely along conductors, and diffipates in the earth; but, on the contrary, that non-conductors do not receive any matter from the globe, and are incapable of tranfmitting it. The following experiments will make this more plain.

1. If a piece of iron be placed on a glafs ftandard, and unconnected with any other body, as foon as the electrical matter is communicated to it, it attracts and repels pieces of gold leaf or other light bodies, and preferves this virtue even for fome minutes after its communication with the globe is cut off. But, if a piece of glafs, rofin, or any other non-conductor, be placed in the fame circumftances, they do not difcover any fuch effect.

2. If a perfon touches the piece of iron above mentioned with his hand, no friction is capable of making it attract or repel, or exhibit any marks of electricity. The fame thing happens, if a chain of any metal touch the iron, and at the fame time has a communication with the ground. In both thefe cafes, the electrical matter paffes along the iron, and diffipates in the earth.

3. In place of touching the piece of iron with the finger, if a piece of amber, wax, or any other non-conductor be applied to it, the communication with the earth being interrupted by the non-conductor, the iron, in that cafe, retains the electrical matter as before.

From thefe experiments we learn, that metals and other conductors receive the electrical matter, and tranfmit it to other conductors till it diffufes and is loft in the earth; but that, if wax, glafs, or any other non-conductor, be applied to the conductor, the motions of the matter is inftantly ftopt, and accumulates and charges the conductor, at the fame time that the non-conductor itfelf is not all affected. It is for this reafon that conductors, as filk-cords, hair-ropes, *&c.* are always employed to fufpend or fupport fuch bodies as we want to charge with electricity.

The following experiments will throw further light on this fubject.

I. If a man ftands upon a piece of rofin about five inches in diameter, and feven or eight inches thick, touching foftly the globe, while the operator is rubbing it, his whole body, in a few feconds, will be charged with electrical matter; and the following phænomena will take place.

1. His loofe hand, and indeed every part of his body, will mutually attract and repel light bodies at the diftance of three or four feet.

2. All conductors which he takes in his hand, will become electrified in the fame manner with himfelf, provided they touch nothing elfe, or be fupported upon non-conductors: and this communication to other conductors, let

let their number and extension be ever so great, instead of diminishing the electrical virtue in the body of the man, will rather augment its strength and quantity.

3. If this person gives his hand to another likewise standing on a similar piece of rosin, he too will be charged with electrical matter; and the same thing will happen to any number of persons, provided they stand upon rosin, and communicate with one another by an iron chain or other conductor. But the whole company will instantaneously lose the whole of their electrical virtue, if any non-electrified person touch a single man, or if there be any communication between one of them and a conducting substance.

4. If the first man removes his hand from the globe, and at the same time keep his former station, he and all the rest will preserve the power of attracting and repelling light substances for some time; but it gradually diminishes, till its effects totally disappear.

5. If a non-electrified person puts his hand near the first man's face, he will feel a kind of atmosphere surrounding the electrified person; if he advances his hand still nearer any part of the face, for example the nose, both the point of the finger and the nose will appear luminous in the dark: Lastly, if he touches the nose, a spark of fire instantly explodes with a crack, and strikes both parties equally with a shock more or less painful in proportion as the electrified person was charged. It is by the explosion of this spark, that the electrical matter instantly transmits itself from one body to another.

6. When we approach near an electrified person, we perceive an extraordinary smell proceeding from his body, similar to that of the phosphorus of urine.

II. An iron wire, 12,000 feet in length, was suspended about five feet from the ground by silk cords; one end of it was connected to the globe of an electrical machine, and at the other a lead ball was hung in order to perceive when the matter reached it.

1. After five or six turns of the wheel, the matter had passed along the whole wire, and communicated its virtue to the ball, which instantly attracted and repelled light bodies.

2. As this ball was equally electrified with every part of the wire, it is probable that the electric matter would instantly pervade a wire of a still greater length, provided we had a proper apparatus for the purpose.

3. Several metals and other conductors were substituted in place of the ball, and all received the electricity in the same manner.

4. The ball and other non-conductors, when touched with the finger, gave a luminous spark and as smart a shock, as when the end of the wire next the globe was touched.

5. All these effects instantly ceased whenever any person not electrified touched any part of the wire, and commenced again a few seconds after his hand was withdrawn.

6. The same effects are produced, though with more difficulty, when hair or woolen ropes were substituted in place of the silk ones: But they were entirely stopt by hemp-ropes, or when the silk ones were wetted.

7. When a hempen rope was substituted in place of the wire, the ball at the end of it was electrified with greater difficulty than when it hung at the wire, especially when the rope was dry; but when the rope was wet, the matter passed with more ease.

8. When, in place of the wire, a dry silk cord, or long glass tube, were used, they received but a very small quantity of the matter, which was not perceivable in the glass tube above 12 feet, nor in the cord above 25, beyond the globe.

9. When the wire was cut in several places, and the cut ends kept at the distance of somewhat less than a foot from each, the electrical matter darted through all these interruptions, and appeared in the ball at the furthest end. A strong blast made by a bellows across one of the interruptions, did not obstruct the passage of the matter; neither did the interposition of a piece of glass, wax, and other non-conductors: but all conductors, as the hand of a man, the point of a sword, and even a moist vapour, obstructed its course towards the ball.

10. When a man stood on a piece of rosin, and put a point of a sword in one of the interruptions, he was instantly filled with the matter, although neither he nor the sword touched the wire: neither was the course of the matter towards the ball obstructed by the interposition of the sword.

11. When a ring of brass wire, about three feet in diameter, was suspended in a vertical direction, and the iron wire was made to pass nearly through its centre, without touching any part of the circumference, the ring, in whatever part of the wire it was tried, was sensibly electrified. This shows that the electrical matter expands to a considerable distance on all sides of the electrified body.

12. The same iron wire suspended by silk cords was extended 6000 feet, (just one half of its length), in a straight line; the other half was turned back in a parallel direction towards the globe, leaving about nine or ten inches of interval between the two halves of the wire: Each extremity of the wire was supported by a dry silk cord about seven or eight feet from the globe, and the lead ball was hung at one of them. An iron chain was then fixed with another silk cord above the globe, in order to receive the matter at one of its extremities; the other end of the chain was fixed to a rod of glass about five feet long, in such a manner that the matter received from the globe might be transmitted at pleasure to the wire, by applying the end of the fixed chain to the glass rod. Matters being thus prepared, after five or six turns of the wheel, the chain was applied to one end of the wire; at the same instant the ball at the other end attracted and repelled bits of gold-leaf. The same experiment was repeated, and a finger applied to the ball, and a spark issued out, and a shock was received at the very instant that the chain was applied to the other end of the wire: A spark likewise proceeded from the chain, which afforded an easy opportunity of discovering that the two sparks were perfectly synchronous.

From these experiments it appears,

1. That the electrical matter communicates itself to all non-electrics, or conductors, whatever be their bulk or extension.

2. That the quantity of this matter diffufed is always in proportion to the magnitude and extenfion of the bodies into which it paffes; and that it is uniformly diffufed, no part of the body retaining more than any other part.

3. That, after being thus communicated to any body, it efcapes with equal facility, as foon as it finds a communication with the earth.

4. That fmall interruptions in the continuity of electrified bodies do not interrupt the motion of the electrical matter.

5. That the motion of the electrical matter is fo amazingly fwift, that it runs over a fpace of 12,000 feet in an undefinable inftant of time.

6. That it moves with equal rapidity either backward or forward, upon the application of a conductor.

7. Laftly, That an indefinitely large quantity of this matter may be accumulated by applying the globe or tube to conducting bodies of very large dimenfions. Of late other methods of condenfing a large quantity of electrical matter into a fmall fpace have been invented, as will afterwards appear when we come to treat of the Leyden phial.

The attraction and repulfion of light bodies, is the firft thing that difcovers to us the prefence of the electrical matter. This motion is always reciprocal: If the electrified body be lighter than the conductor, and both are at liberty, the motion of the former is quicker than that of the latter; if the one be fixed, and the other at liberty, the unfixed one conftantly goes to the one that is fixed, and, at the fame, takes the fhorteft road. The following experiments will illuftrate thefe motions.

1. Prefent an electrified tube to fmall pieces of gold-leaf placed on a well-polifhed plate of copper, they will inftantly fly towards the tube.

2. Sufpend an electrified tube by two filk cords; take a piece of gold-leaf, and, holding it firm betwixt your fingers, bring it near the tube; and the tube will be attracted and move toward the leaf.

3. If an electrified perfon, ftanding on a piece of rofin, holds in his hand a plate of copper, upon which pieces of gold-leaf are placed; and another perfon, who is not electrified, holds his finger above the plate; the gold-leaf will inftantly rife from the plate, and fly towards his finger.

4. Laftly, If two balls of gilt paper be fufpended fix inches afunder, the one by a filk thread three feet in length, and the other by a fmall filver wire of the fame length; when the ball fufpended by the filk thread is electrified by the tube, both balls advance with equal quicknefs towards one another, though only one of them was electrified.

The moft favourable circumftances for exhibiting the attraction of light bodies are the following:

1. They fhould be perfect conductors.

2. They ought to be of a fmall fize.

3. They fhould be fupported by a non-conductor, and raifed four or five feet from the ground.

4. No other non-conductor fhould be nearer the bodies than the tube with which the experiments are making; otherwife the attraction will be difturbed.

Repulfion generally fucceeds attraction; that is, a piece of gold leaf is no fooner attracted by the tube than it is repelled and driven off from it. This repulfion is not very perceptible when the tube is flightly electrified: but, when the electricity is brifk, the gold leaf never fails to be repelled as foon as it has touched the tube. Again, if the electricity be very ftrong, the gold-leaf, though ftrongly attracted by the tube, never touches it; the repulfive power beginning to operate two or three inches before the leaf reaches the tube: from that inftant the leaf is electrified; and, when it begins to be repelled, it has acquired as denfe an electrical atmofphere as the tube: it then flies off, and remains fufpended above the tube until it lofes the electric virtue it had acquired, either by the moift vapours in the air, or till it lofes it fuddenly by touching fome conductor. Hence it appears, that attraction precedes repulfion, only becaufe it is neceffary that the pieces of gold-leaf fhould acquire as denfe an atmofphere as that of the globe before they can be repelled by it.

When the tube has repelled a piece of gold leaf, if another tube, nearly equally electrified, be fuddenly fubftituted in place of the former tube, the leaf will continue to be repelled at an equal diftance. But if the fubftituted tube be much lefs electrified than the original one, the leaf will be attracted by that tube.

When two or more pieces of gold leaf are prefented at the fame time to a well electrified tube, they are all equally attracted and repelled; but then they mutually repel one another, fo that it is impoffible to make any two of them join; and the diftance at which they repel one another is equal to the diftance to which each of them were repelled from the tube.

If a circular piece of gold-leaf, cut into fmall fringes to near the centre of the leaf, be prefented to an electrified tube, it will firft be attracted, and then repelled: in the time of repulfion, all the fringes repel each other, and diverge more or lefs in proportion to the ftrength of electricity in the tube.

If a fmall metal veffel filled with water, and furnifhed with a capillary fiphon, having the longer leg hanging over the outfide of the veffel, be touched with an electrified iron rod; the water, which could not run out of the fiphon but drop by drop, will inftantly fly out a tone jet, and divide itfelf into very fine threads; and thefe threads continue fometimes fufpended in the air, repelled from each other to a confiderable diftance.

From thefe inftances of attraction and repulfion it appears,

1. That light bodies are attracted by electrified fubftances until they be equally electrified by communication, and until they acquire as denfe an atmofphere as the electrified fubftances themfelves.

2. That, from the moment they acquire this atmofphere, attraction ceafes and repulfion begins.

3. That no repulfion takes place but betwixt bodies electrified.

4. That repulfion continues only as long as the denfity of the two atmofpheres are equal; that it ceafes whenever the one or the other is diminifhed; that a new attraction

Plate. LXXIII

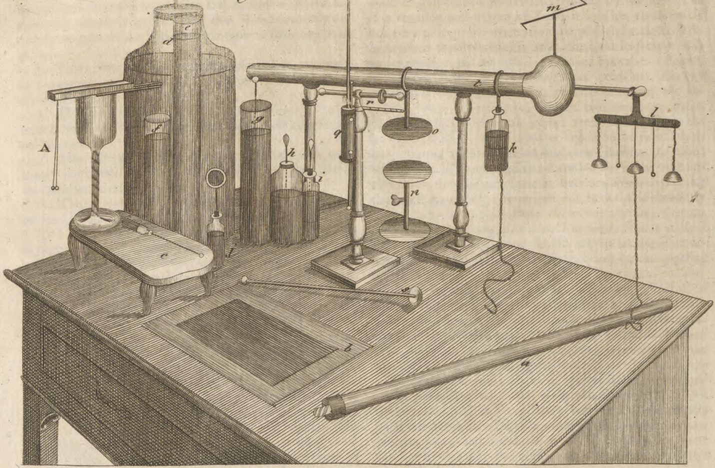

Fig. 2.

PRIESTLY'S ELECTRICAL MACHINE

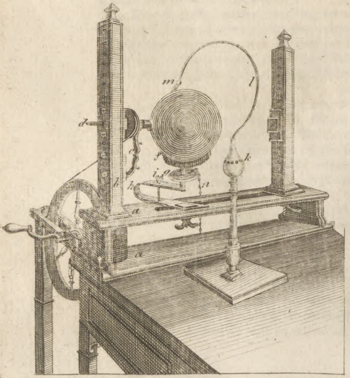

Fig. 3.

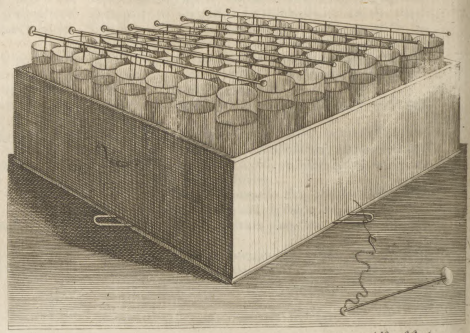
THE BATTERY



A Bell Sc.

traction commences, and continues till an equality in the atmospheres is again restored; and that, immediately upon this, a new repulsion takes place.

5. That repulsion may subsist betwixt two bodies which have never mutually been attracted, provided their atmospheres be equally dense.

6. That the distance to which bodies are repelled is always in proportion to the strength of the electricity they contain. This fact first suggested the notion of an electrometer, or a machine for measuring the different degrees of electricity.

Of Electrical Machines and Apparatus.

The improvement of electrical machines has kept pace with the improvements in the science. While nothing more than electrical attraction and repulsion was known, every phænomenon might be exhibited by means of a piece of amber, sealing wax, or glass, which the philosopher rubbed against his coat, and presented to bits of paper, feathers, and other light bodies.

To give a greater degree of friction to electric substances, Otto Guericke and Mr Hawkesbee contrived to whirl sulphur and glass in a spherical form. The first conductors were nothing more than hempen-cords supported by silken lines. In place of these, bars of metal, or gun-barrels, were soon substituted; and a rubber was employed to supply the place of a human hand. The discovery of the Leyden bottle, (to be afterwards described) occasioned more additions to the electrical apparatus; and the discoveries of Dr Franklin have made proportional additions necessary. No philosopher can now be satisfied, if he be not able to supply a conductor from the clouds, as well as from the friction of his glass globes or tubes.

Although globes or cylinders are now of the most extensive use in electrical experiments, glass-tubes are still most convenient for several purposes; they should be about three feet long, and as wide as a person can conveniently grasp, (Plate LXXIII. fig. 1 *a*.) The thickness of the glass is not material; perhaps the thinner they are the better, if they can bear sufficient friction.

The best rubber for a smooth glass is the rough side of black oiled silk, especially when a little amalgam of mercury or other metal is put upon it.

Glass-globes are in general preferable to cylinders. The globe should have its neck inclosed in a pretty deep brass cap, ending in a dilated brim, of about half an inch broad, if the globe be a large one. It has not been determined what kind of glass is the best; but flint is commonly used. Perhaps globes of twelve or thirteen inches diameter are the best size.

The best rubbers for globes are made of red basil skins, particularly the neck-part of them, where the grain is more open, and the surface somewhat rougher. That the rubber may press the globe equally, it should be put upon a plate of metal bent to the shape of the globe, and stuffed with any thing that is pretty soft: bran is good; and if the stuffing be a conductor, as flax, it will be better than if it be a non-conductor, as hair or wool. It should rest upon a spring, to favour any inequality there may be in the form of the globe. There should be no sharp edges or angles about the rubber; for that would make the insulation of it ineffectual. By the insulation of the rubber every electrical experiment may be performed with the twofold variety of *positive* and *negative*, and a conductor be made to give and take fire at pleasure. This insulation is best made by means of baked wood, in the form of a plate, five or six inches in diameter, (*g*, fig. 2.) interposed between the metallic part of the rubber and the steel spring that supports it. When positive electricity is intended to be produced, a chain (*n*, fig. 2.) must connect the rubber with the floor; but, when negative electricity is wanted, the chain must be removed, and hung upon the common conductor, while another prime conductor must be connected with the rubber; which will therefore be electrified negatively.

The best method of collecting the electric fire from the globe seems to be by three or four pointed wires, (*m*, fig. 2.) two or three inches long, hanging lightly upon the globe, and suspended on an open metallic ring.

The prime conductor should be fixed very steady: Whatever be the size of the prime conductor, the extremity of it, or that part which is most remote from the globe, should be much larger and rounder than the rest, (*k*, fig. 2); for the effort of the electric matter to fly off is always greatest at the greatest distance from the globe.

The electrician should be provided with Metallic Rods (*s*, fig. 1.) to take sparks from his conductor for various uses. These should have knobs, larger or smaller in proportion to the curvature of the conductor. If the knob be too small, it will not discharge the conductor at once, but by degrees, and with a less sensible effect; whereas the spark between broad surfaces is thick and strong.

The most formidable part of an electrical apparatus consists in the coated glass that is used for the Leyden experiment. The form of the plate is immaterial with respect to the shock; and, for different experiments, both plates of glass, and jars of various forms and sizes, must be used. For common uses, the most commodious form is that of a jar, as wide as a person can conveniently hold in his hand by grasping, and as tall as it will stand without any danger of falling; perhaps about $3\frac{1}{2}$ inches in diameter, and 8 inches in height. The mouth should be pretty open, that it may be the more conveniently coated on the inside, as well as the outside, with tinfoil. A considerable variety of these jars may be seen in the above Plate, fig. 1. *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*.

The method of coating is much preferable to that of putting water or brass-shavings into the jars, which both makes them heavy, and likewise incapable of being inverted, which is requisite in many experiments. Brass-dust, however, or leaden-shot, is very convenient for small phials. The tinfoil may be put on either with paste, gum water, or bees-wax. To coat the insides of vessels which have narrow mouths, moisten the inside with gum-water, and then pour some brass-dust upon it: Enough will stick to make an exceeding good coating.

In the construction of an electrical battery, a number

number of fmall jars are preferable to large ones. If one of them fhould break by an explofion or any other accident, the lofs is lefs confiderable; befides, by means of narrow jars, a greater force (that is, a greater quantity of coated furface) may be contained in lefs room. The largeft jars are about 17 inches in height, and fhould not be more than 3 in diameter, and of the fame width throughout. Thus they may be eafily coated both within and without, and a box of a moderate fize will contain a prodigious force; for the jars being coated within two inches of the top, each will contain a fquare foot of coated glafs The battery (Plate LXXIII. fig. 3.) confifts of 64 jars, each 8 inches long, and $2\frac{1}{2}$ in diameter, coated within an inch and a half of the top. The coated part of each is half a fquare foot; fo that the whole battery contains 32 fquare feet. The wire of each jar has a piece of very fmall wire twifted about the lower end of it, to touch the infide coating in feveral places; and it is put through a pretty large piece of cork within the jar, to prevent any part of it from touching the fide, which would tend to promote a fpontaneous difcharge. Each wire is turned round, fo as to make a hole or ring at the upper end; and through thefe rings a pretty thick brafs rod with knobs is put, one rod ferving for one row of the jars. The communication between thefe rods is made by laying a chain over them all: this chain is not reprefented in the plate, left the figure fhould appear confufed. When only a part of the battery is to be ufed, the chain fhould be laid over as many rods as you want rows of jars. The bottom of the box in which all the jars ftand is covered with tinfoil and brafs-duft; and a bent wire touching this tinfoil is put through the box, and appears on the outfide, as in the plate. To this wire is faftened whatever is intended to communicate with the outfide of the battery, as the piece of fmall wire in the figure; and the difcharge is made by bringing the brafs knob to any of the knobs of the battery.

To difcover the kind and degree of electricity, many forms of Electrometers have been thought of. Mr Canton's balls A, reprefented on a glafs ftanding on the ftool *c*, (Plate LXXIII. fig. 1.) ferve to difcover fmall degrees of electricity, to obferve the changes of it from pofitive to negative, and to eftimate the force of a fhock before the difcharge. Thefe balls are two pieces of cork, or pith of elder, nicely turned in a lath to about the fize of a fmall pea, and fufpended on fmall linen threads. Thefe balls repell one another to diftances exactly proportioned to the quantity of electricity contained in the veffel or other fubftance with which they are connected; and by this work the operator knows pretty exactly the force of the charge, and the fhock that will be given.

In order to repeat the experiment tending to fhew that the electric fluid is the fame with the matter of lightning, and to make obfervations on the electricity of the atmofphere, the electrician fhould be provided with A machine for drawing electricity from the clouds. The beft conftruction of which is the following: On the top of any building erect a pole *a*, (Plate LXXIV. fig. 2.) as tall as a man can well manage, having on the top of it a folid piece of glafs, or baked wood, a foot in length. Let this be covered with a tin or copper veffel (*b*) fhaped like a funnel, to prevent its ever being wetted; above this, let there rife a long flender rod *c*, terminating in a pointed wire, and having a fmall wire twifted round its whole length, the better to conduct the electricity to the funnel. From the funnel make a wire (*d*) defcend along the building, about a foot diftance from it, and conducted through an open fafh into any room that fhall be moft convenient for making the experiment. In this room, let a proper conductor be infulated, and connected with the wire coming in at the window. This wire and conductor, being completely infulated, will be electrified whenever there is a confiderable quantity of electricity in the air. And notice will be given when it is properly charged, either by Mr Canton's balls hung to it, or by a fet of bells difpofed in the following manner. Take three bells; fufpend the two outermoft from the conductor by chains, and that in the middle by a filken ftring, while a chain connects it with the floor; and hang two fmall knobs of brafs by filken ftrings, one between each two bells, to ferve inftead of clappers. In confequence of this difpofition, when the two outermoft bells, communicating with the conductor, are electrified, they will attract the clappers, and be ftruck by them. The clappers being thus loaded with electricity, will be repelled, and fly to difcharge themfelves upon the middle bell. After this, the clappers will be again attracted by the outermoft bells; and thus, by ftriking the bells alternately, a continual ringing may be kept up as long as the operator pleafes. In the dark a continual flafhing of light will be feen between the clappers and the bells. But when the electrification is very ftrong, thefe flafhes of light will be fo large, that they will be tranfmitted by the clapper from one bell to the other, without its ever coming to actual contact with either of them, and the ringing will confequently ceafe.

With regard to the conftruction of machines for electrical experiments in general, that of Dr Prieftly, reprefented on Plate LXXIII. fig. 2. is perhaps the beft. The Frame confifts of two ftrong boards of mahogany, (*a a*), of the fame length, parallel to one another, about four inches afunder, and the lower one is an inch on each fide broader than the upper: in the upper board is a groove reaching almoft its whole length. One of the pillars *b*, which are of baked wood, is immoveable, being let through the upper board, and firmly fixed in the lower; while the other pillar flides in the groove abovementioned, in order to receive globes or cylinders of different fizes; but it is only wanted when an axis is ufed; Both the pillars are perforated with holes at equal diftances from the top to the bottom; by means of which, globes may be mounted higher or lower according to their fize; and they are made tall, to admit the ufe of two or more globes at a time, one above another. Four of a moderate fize may be ufed, if two be fixed on one axis; and the wheel has feveral grooves for that purpofe.

If a globe with only one neck be ufed, as in the Plate, a brafs arm, with an open focket *c*, is neceffary to fupport the axis beyond the pulley; and this part is alfo contrived to be put higher or lower, together with the brafs focket in which the axis ftands. The axis *d* let

is made to come quite through the pillar, that it may be turned by another handle without the wheel, if the operator chuſes. The frame, being ſcrewed to the table, may be placed nearer to, or farther from, the wheel, as the length of the ſtring requires in different ſtates of the weather. The WHEEL is fixed in a frame by itſelf *e*, by which it may have any ſituation with reſpect to the pulley, and be turned to one ſide, ſo as to prevent the ſtring from cutting itſelf.

The RUBBER (*f*) conſiſts of a hollow piece of copper, filled with horſe-hair, and covered with a bazil-ſkin. It is ſupported by a ſocket, which receives the cylindrical axis, of a round and flat piece of baked wood *g*, the oppoſite part of which is inſerted into the ſocket of a bent ſteel-ſpring *h*. Theſe parts are eaſily ſeparated; ſo that the rubber, or piece of wood that ſerves to inſulate it, may be changed at pleaſure. The ſpring may be either ſlipped along the groove, or moved in the contrary direction, ſo as to give it every deſirable poſition with reſpect to the globe. It is beſides furniſhed with a ſcrew *i*, which makes it preſs harder or lighter on the globe, as the operator chuſes.

The PRIME CONDUCTOR (*k*) is a hollow veſſel of poliſhed copper in the form of a pear, ſupported by a pillar and a firm baſis of baked wood; and it receives the electrical matter by means of a long arched wire or rod of very ſoft braſs *l*, eaſily bent into any ſhape, and raiſed higher or lower as the globe requires. It is terminated by an open ring, in which are hung ſome ſharp-pointed wires *m*, playing lightly on the globe when it is in motion. The body of the conductor is furniſhed with holes and ſockets for the inſertion of metallic rods to convey the fire where-ever it is wanted.

When poſitive electricity is required, a wire or chain, as repreſented in the plate (*n*), connects the rubber with the table or the floor. When negative electricity is wanted, that wire is connected with another conductor, ſuch as that repreſented, in fig. 1. *t*; where the conductor in fig. 2. is connected with the table by another wire or chain. If the rubber be made tolerably free from points, the negative power will be as ſtrong as the poſitive.

The machine, repreſented Plate LXXV. fig. 1. was a contrivance of Dr Watſon's, to whirl four large globes at a time, and unite the power of them all. The conſtruction is ſo ſimple, that we need not give any particular deſcription of it, eſpecially after having ſo fully deſcribed that of Dr Prieſtly.

Of poſitive and negative Electricity, and the Leyden Phial.

DR WATSON and Dr Franklin firſt ſuggeſted the notion of *poſitive* and *negative*, or *plus* and *minus* electricity: ſeveral experiments led them to conclude, that every body in nature, and particularly all conducting bodies, poſſeſſed a certain quantity of electric matter, and that this natural quantity might be augmented or diminiſhed by being placed in particular circumſtances. When a body receives a larger quantity than the natural one, it is ſaid to be electrified *plus*, or *poſitively*; when the natural quantity is diminiſhed, it is ſaid to be electrified *minus*, or *negatively*. The following experiments will ſhew the different circumſtances requiſite to produce theſe two kinds of electricity.

1. A perſon ſtanding on wax, and rubbing the tube, and another perſon on wax drawing the fire, they will both appear to be electrified by a perſon ſtanding on the floor; that is, he will perceive a ſpark on approaching each of them with his knuckle.

2. But, if the perſons on wax touch one another during the exciting of the tube, neither of them will appear to be electrified.

3. If they touch one another after exciting the tube, and drawing the fire as before, there will be a ſtronger ſpark between them, than happens between either of them and the perſon on the floor.

4. After ſuch ſtrong ſpark, neither of them diſcover any electricity.

Theſe appearances are explained in the following manner: the electrical fire is ſuppoſed to be a common element, of which each of the three perſons above-mentioned has his equal ſhare, before any operation is begun with the tube. A, who ſtands on wax and rubs the tube, collects the electrical fire from himſelf into the glaſs; and his communication with all conductors being cut off by the wax, his body is not again immediately ſupplied. B, who ſtands likewiſe on wax, paſſing his knuckle along near the tube, receives the fire which was collected by the glaſs from A; and his communication with conductors, or the common ſtock of electrical matter, being likewiſe cut off, he retains the additional quantity received. To C, ſtanding on the floor, both appear to be electrified: for he having only the middle quantity of electrical fire, receives a ſpark upon approaching B who has an over quantity, but gives one to A who has an under quantity. If A and B approach to touch each other, the ſpark is ſtronger, becauſe the diſtance betwixt them is greater: after ſuch touch, there is no ſpark between either of them and C, becauſe the electrical fire in all is reduced to the original equality. If they touch while electrifying, the equality is never deſtroyed, the fire only circulating. Hence we ſay, B is electrified *poſitively*, A *negatively*; or rather B is electrified *plus*, A *minus*: and in experimenting, it is common to electrify bodies *plus* or *minus* at pleaſure. To electrify *plus* or *minus*, it is ſufficient to know, that the parts of the tube or ſphere that are rubbed, do, in the inſtant of the friction, attract the electrical fire, and therefore take it from the thing rubbing: the ſame parts immediately, as the friction upon them ceaſes, are diſpoſed to give the fire they have received to any body that has leſs. Thus you may circulate it or accumulate it upon, or ſubſtract it from any body, as you connect that body with the rubber, or the receiver, the communication in the common ſtock being cut off.

The great ſhock from what is called the LEYDEN PHIAL, was firſt diſcovered by Mr Cunæus, a native of Leyden; but was never ſo thoroughly underſtood till Dr Franklin publiſhed his experiments with regard to it. A glaſs phial or jar, filled, till within an inch of the top, with water, braſs duſt, or other non-conducting ſubſtances, was firſt uſed; but coating the veſſel with tin-foil, or

or brafs-duft, as mentioned above in the fection concerning the electrical apparatus, was found to anfwer better.

We fhall here give Dr Franklin's account of this phial nearly in his own words, together with the experiments confirming it.

1. While the wire and infide of the bottle are electrified *pofitively* or *plus*, the outfide of the bottle is electrified *negatively* or *minus*, in exact proportion; *i. e.* whatever quantity of electrical fire is thrown into the infide, an equal quantity goes out of the outfide. To underftand this, fuppofe the natural quantity of electricity in the whole bottle, before the operation begins, is equal to 20; and, at every ftroke of the tube, or turn of the globe, fuppofe a quantity equal to 1 is thrown in; then, after the firft ftroke, the quantity contained in the wire and infide of the bottle will be 21, and in the outfide 19; after the fecond ftroke, the infide will have 22, and the outfide 18; and fo on, till, after 20 ftrokes, the infide will have a quantity of electrical fire equal to 40, and the outfide none at all; and then the operation ends: for no more can be thrown into the infide, when no more can be driven out of the outfide. If more is attempted to be thrown in, it is fpued back through the wire, or flies out in loud cracks through the fides of the bottle.

2. The equilibrium of electric matter in the bottle being thus loft, it cannot be reftored by any *inward* communication or contact of the parts: but this muft be done by a communication formed *without* the bottle between the infide and the outfide, by fome conductor touching or approaching both fides at the fame time; in which cafe the equilibrium is reftored with an inexpreffible violence and quicknefs: or, it may be done by touching each fide alternately; in which cafe, the equilibrium is reftored by degrees.

3. As no more electrical fire can be thrown into the infide of the bottle, when all is driven from the outfide; fo, in a bottle not yet electrified, none can be thrown into the infide, when none can get out at the outfide; which happens, either when the glafs is too thick or when the bottle is placed in a non-conductor. Again, when the bottle is electrified, but little of the electrical fire can be drawn out from the infide by touching the wire, unlefs an equal quantity can, at the fame time, get in at the outfide. Thus place an electrified bottle on clean glafs, or dry wax, and you will not, by touching the wire, get out the fire from the infide: place it on a conductor, and touch the wire, then you will get it out in a fhort time; but fooneft when you form a direct communication as above.

4. The fhock to the nerves, or rather convulfion, is occafioned by the fudden paffage of the fire through the body, in its way from the infide to the outfide of the bottle. The fire takes the fhorteft courfe; but it does not appear, that, in order to receive a fhock, a communication with the floor is neceffary; for he that holds the bottle with one hand, and touches the wire with the other, will be fhocked as much, though his fhoes be dry, or even ftanding on wax. And on the touch of the wire (or of the prime conductor, which is the fame thing,) the fire does not proceed from the touching finger to the wire, but from the wire to the finger, and paffes through the body to the other hand, and fo into the outfide of the bottle.

The following experiments will confirm this account of the Leyden phial.

1. Place an electrified phial on wax; a fmall cork-ball held in your hand, fufpended by a dry filk thread, and brought near to the wire, will firft be attracted and then repelled: When in a repelled ftate, fink your hand, that the ball may be brought towards the outfide of the bottle; it will be inftantly attracted till it has parted with its fire.

If the outfide of the bottle had a pofitive electrical atmofphere, as well as the infide and the wire, an electrified cork would be repelled from the one as well as the other.

2. From a bent wire fticking in the table, let a fmall linen thread hang down within half an inch of the electrified phial; touch the wire of the phial repeatedly with your finger; and, at every touch, you will fee the thread inftantly attracted by the outfide of the bottle. As foon as you draw any fire from the infide by touching the wire, the outfide draws in an equal quantity by the thread.

3. Fix a wire in the outfide coating of the bottle, fo as that bending upwards its ring-end may be level with the top or ring-end of the wire in the cork of the bottle, and at three or four inches diftance. Then electrify the bottle, and place it on wax. If a cork, fufpended by a filk thread, hang between thefe two wires, it will play inceffantly from the one to the other, till the equilibrium betweed the infide and the outfide of the bottle is reftored.

4. Place a man on a cake of wax, and prefent him the wire of the electrified phial to touch, you ftanding on the floor and holding it in your hand. As often as he touches it, he will be electrified *plus*; and any one ftanding on the floor may draw a fpark from him. The fire, in this experiment, paffes out of the wire into him: and, at the fame time, out of your hand into the outfide of the bottle. Give him the electrical phial to hold, and touch the wire; as often as you touch it, he will be electrified *minus*, and may draw a fpark from any one ftanding in the floor. The fire in this cafe paffes from the wire to you, and from him into the outfide of the bottle.

5. Lay two books, or two glaffes, back to back, two two or three inches diftant, place the electrified phial; on one of them, and then touch the wire; that book will be electrified *minus*, the electrical fire being drawn out of it by the outfide of the bottle. Take off the bottle, and, holding it in your hand, touch the other with the wire; that book will be electrified *plus*, the fire paffing into it from the wire, and the outfide of the bottle is at the fame time fupplied from your hand.

The fame explofion and fhock happens, if the electrified phial is held in one hand by the hook of the wire, and the coating touched with the other, as when held by the coating and touched at the hook. To take the charged phial fafely by the hook, and not at the fame time diminifh its force; it muft firft be fet down on a con conductor. The phial will be electrified as ftrongly, if held by the hook, and the coating applied to the globe or tube,

tube, as when held by the coating and the hook applied: but the *direction* of the electrical fire, being different in the charging, will also be different in the explosion; the bottle charged through the hook will be discharged thro' the hook; the bottle charged thro' the coating will be discharged thro' the coating; because the fire must come out the same way it went in.

6. To prove this, take two bottles that were equally charged thro' the hooks, one in each hand; bring their hooks near each other, and no spark or shock will follow; because each hook is disposed to give fire, and neither to receive it. Set one of the bottles on glass, take it up by the hook, and apply its coating to the hook of the other; then there will be an explosion and shock, and both bottles will be discharged. [*N. B.* To charge a bottle commodiously thro' the coating; place it on a glass-stand; form a communication from the prime conductor to the coating, and another from the hook to the wall or floor; when it is charged, remove the latter communication before you take hold of the bottle, otherwise great part of the fire will escape by it.]

When the terms of *charging* or *discharging* the phial are used, it is in compliance with custom, and for want of better ones; since there is really no *more* electrical fire in the phial after what is called its *charging* than before, nor *less* after its *discharging*. Besides, the phial will not suffer what is called a *charging*, unless as much fire can go out of it one way as is thrown in by another. A phial cannot be charged standing on wax or glass, or hanging on the prime conductor, unless a communication be formed between its coating and the floor. But suspend two or more phials on the prime conductor, one hanging to the tail of the other, and a wire from the last to the floor, an equal number of turns of the wheel will charge them all equally, and each as strongly as a single one would have been.

When a bottle is charged in the common way, its *inside* and *outside* surfaces stand ready, the one to give fire by the hook, the other to receive it by the coating: yet as the first will not give out, unless the other can at the same instant receive in; so neither will the latter receive in, unless the first can at the same instant give out. When both can be done at once, it is done with inconceivable quickness and violence.

Glass has within its substance the same quantity of electrical fire at all times, and that quantity is very great in proportion to the mass of glass. This quantity it obstinately retains; and will have neither more nor less, though it will allow a change to be made in its parts and situation; that is, we may take away part from one of the sides, provided we throw an equal quantity into the other. Yet when the situation of the electrical fire is thus altered in the glass, it will not be at rest, or in its natural state, till it be restored to its original equality; and this restitution cannot be made through the substance of the glass, but must be done by a conducting communication formed without from surface to surface. Thus the whole force of the bottle, and power of giving a shock, resides in the GLASS itself; the coatings, or conducting substances in contact with the two surfaces, serving only to give and receive to and from the several parts of the glass; that is, to give in one side, and take away from the other. This was discovered by Dr Franklin, and proved by the following experiment: 'Purposing, '(says he,) to analize the electrified bottle, in order to 'find wherein its strength lay, we placed it on glass; and 'drew out the cork and wire, which for that purpose had 'been loosely put in. Then taking the bottle in one 'hand, and bringing a finger of the other near its mouth, 'a strong spark came from the water, and the shock was 'as violent as if the wire had remained in it, which shewed that the force did not lie in the wire. Then to find 'if it resided in the water, being crowded into and condensed in it, as confined by the glass, which had been 'our former opinion, we electrified the bottle again, and 'placing it on glass drew out the wire and cork as before; then taking up the bottle, we decanted all its 'water into an empty bottle, which likewise stood on 'glass; and taking up that other bottle, we expected, if 'the force resided in the water, to find a shock from it; 'but there was none. We judged then that it must either 'be lost in decanting, or remain in the first bottle. The 'latter we found to be true; for that bottle on trial gave 'the shock, though filled up as it stood with fresh unelectrified water from a tea-pot.——To find, then, whether glass had this property merely as glass, or whether 'the form contributed any thing to it; we took a pane 'of sash-glass, and laying it on the hand, placed a plate 'of lead on its upper surface; then electrified that plate, 'and bringing a finger to it, there was a spark and 'shock. We then took two plates of lead of equal dimensions, but less than the glass by two inches every 'way, and electrified the glass between them, by electrifying the uppermost lead; then separated the glass 'from the lead; in doing which, what little fire might be 'in the lead was taken out, and the glass being touched 'in the electrified parts with a finger, afforded only very 'small pricking sparks, but a great number of them might 'be taken from different places. Then dexterously placing it again between the leaden plates, and compleating 'a circle between the two surfaces, a violent shock ensued.——Which demonstrated the power to reside in 'glass as glass; and that the non-electrics in contact served only, like the armature of a loadstone, to unite the 'force of the several parts, and bring them at once to 'any point desired: it being the property of a non-electric, that the whole body instantly receives or gives 'what electrical fire is given to or taken from any one of 'its parts.——

'It is amazing to observe in how small a portion of 'glass a great electrical force may lie. A thin glass 'bubble about an inch diameter, weighing only six grains, 'being half filled with water, partly gilt on the outside, 'and furnished with a wire hook, gives, when electrified, 'as great a shock as a man can well bear. As the glass 'is thickest near the orifice, I suppose the lower half, 'which being gilt was electrified and gave the shock, did 'not exceed two grains; for it appeared, when broke, 'much thinner than the upper half.——If one of these 'thin bottles be electrified by the coating, and the spark

taken

'taken out through the gilding, it will break the glass 'inwards, at the same time that it breaks the gilding out-'wards. And since there is no more electrical fire in a 'bottle after charging than before, how great must be the 'quantity in this small portion of glass! It seems as if it 'were of its very substance and essence. Perhaps if that 'due quantity of electrical fire so obstinately retained by 'glass, could be separated from it, it would no longer 'be glass; it might lose its transparency, or its brittle-'ness, or its elasticity.——Experiments may possibly be 'invented hereafter to discover this.'

Of the Similarity between Lightning and Elec-*tricity.*

1. Flashes of lightning are generally seen crooked, and waving in the air. The electric spark has always the same direction when it is drawn from an irregular body at some distance, or through a space in which the best conductors are disposed in an irregular manner, which is always the case in the heterogeneous atmosphere of our globe.

2. Lightning strikes the highest and most pointed objects in its way preferable to others, as high hills, and trees, towers, spires, masts of ships, points of spears, *&c.* In like manner, all pointed conductors receive or throw off the electric fluid more readily than those which are terminated by flat surfaces.

3. Lightning is observed to take the readiest and best conductor. So does electricity in the discharge of the Leyden phial. For this reason, it would be safer, during a thunder-storm, to have one's cloaths wet than dry, as the lightning might then, in a great measure, be transmitted to the ground, by the water, on the outside of the body. It is found, that a wet rat cannot be killed by the explosion of the electrical bottle, but that a dry rat may.

4. Lightning burns. So does electricity. It will kindle hard dry rosin, spirits unwarmed, and even wood. It will fire gunpowder, by only ramming it hard in a cartridge, into each end of which pointed wires are introduced, and brought within half an inch of one another, and discharging a shock through them.

5. Lightning sometimes dissolves metals. So does electricity. The method in which Dr Franklin made electricity melt metals, was by putting thin pieces of them between two panes of glass, bound fast together, and sending an electric shock through them. Sometimes the pieces of glass, by which they were confined, would be shattered to pieces by the discharge, and be broken into a kind of coarse sand, which once happened with pieces of thick looking-glass; but if they remained whole, the pieces of metal would be missing in several places where it had lain between them, and instead of it a metallic stain would be seen on both the glasses, the stains on the under and upper glass being exactly similar in the minutest stroke.

6. Lightning rends some bodies. So does electricity. The electric spark will strike a hole through a quire of paper.—When wood, bricks, stone, *&c.* are rent by lightning, the splinters will fly off on that side where there is the least resistance. In like manner, when a hole is struck through a piece of pasteboard by an electrified jar, if the surfaces of the pasteboard are not confined and compressed, there will be a bur raised all round the hole on both sides of the pasteboard; but if one side be confined, so that the bur cannot be raised on that side, it will all be raised on the other side, which way soever the fluid was directed. For the bur round the outside of the hole is the effect of the explosion, which is made every way from the center of the electric stream, and not an effect of its direction.

7. Lightning has often been known to strike people blind. And a pigeon, after a violent shock of electricity, by which it was intended to be killed, was struck blind likewise.

8. In a thunder-storm at Stretham, described by Dr Miles, the lightning stripped off some paint which had covered a gilded moulding of a pannel of wainscot, without hurting the rest of the paint. Dr Franklin imitated this, by pasting a slip of paper over the filleting of gold on the cover of a book, and sending an electric flash through it. The paper was torn off from end to end, with such force, that it was broken in several places; and in others there was brought away part of the grain of the Turkey leather in which the book was bound. This convinced the doctor, that if it had been paint, it would have been stripped off in the same manner with that on the wainscot at Stretham.

9. Lightning destroys animal-life. Animals have likewise been killed by the shock of electricity. The largest animals which Dr Franklin and his friends had been able to kill were a hen, and a turkey which weighed about ten pounds.

10. Magnets have been observed to lose their virtue, or to have their poles reversed, by lightning. Dr Franklin did the same by electricity. By electricity he frequently gave polarity to needles, and reversed them at pleasure. A shock from four large jars, sent through a fine sewing needle, gave it polarity, so that it would traverse when laid on water. What is most remarkable in these electrical experiments upon magnets is, that if the needle, when it was struck, lay east and west, the end which was entered by the electric blast pointed north; but that if it lay north and south, the end which lay towards the north would continue to point north, whether the fire entered at that end or the contrary. He also observed, that the polarity was strongest when the needle was struck lying north and south, and weakest when it lay east and west. He takes notice, that, in these experiments, the needle, in some cases, would be finely blued, like the spring of a watch, by the electric flame; in which case the colour given by a flash from two jars only might be wiped off, but that a flash from four jars fixed it, and frequently melted the needles. The jars which the doctor used held seven or eight gallons, and were coated and lined with tinfoil.

To demonstrate, in the completest manner possible, the sameness of the electric fluid with the matter of lightning, Dr Franklin contrived to bring lightning from the heavens, by means of an electrical kite, which he raised when a storm of thunder was perceived to be coming on. This kite

kite had a pointed wire fixed upon it, by which it drew the lightning from the clouds. This lightning defcended by the hempen ftring, and was received by a key tied to the extremity of it; that part of the ftring which was held in the hand being of filk, that the electric virtue might ftop when it came to the key. He found that the ftring would conduct electricity even when nearly dry, but that when it was wet it would conduct it quite freely; fo that it would ftream out plentifully from the key at the approach of a perfon's finger.

At this key he charged phials, and from electric fire thus obtained he kindled fpirits, and performed all other electrical experiments which are ufually exhibited by an excited globe or tube.

The firft appearance of a thunder-ftorm (which generally happens when there is little or no wind) is one denfe cloud, or more, increafing very faft in fize, and rifing into the higher regions of the air. The lower furface is black, and nearly level; but the upper finely arched, and well defined. Many of thefe clouds often feem piled one upon another, all arched in the fame manner; but they keep continually uniting, fwelling, and extending their arches.

At the time of the rifing of this cloud, the atmofphere is generally full of a great number of feparate clouds, motionlefs, and of odd and whimfical fhapes. All thefe, upon the appearance of the thunder-cloud, draw towards it, and become more uniform in their fhapes as they approach; till, coming very near the thunder-cloud, their limbs mutually ftretch towards one another; they immediately coalefce, and together make one uniform mafs. Thefe are called *adfcititious* clouds, from their coming in, to enlarge the fize of the thunder-cloud. But, fometimes the thunder-cloud will fwell, and increafe very faft without the conjunction of any adfcititious clouds, the vapours in the atmofphere forming themfelves into clouds where-ever it paffes. Some of the adfcititious clouds appear like white fringes, at the fkirts of the thunder-cloud, or under the body of it; but they keep continually growing darker and darker, as they approach to unite with it.

When the thunder-cloud is grown to a great fize, its lower furface is often ragged, particular parts being detached towards the earth, but ftill connected with the reft. Sometimes the lower furface fwells into various large protuberances, bending uniformly towards the earth. And fometimes one whole fide of the cloud will have an inclination to the earth, and the extremity of it will nearly touch the earth. When the eye is under the thunder-cloud, after it is grown large, and well formed, it is feen to fink lower, and to darken prodigioufly; at the fame time that a number of fmall adfcititious clouds (the origin of which can never be perceived) are feen in a rapid motion, driving about in very uncertain directions under it. While thefe clouds are agitated with the moft rapid motions, the rain generally falls in the greateft plenty; and if the agitation be exceeding great, it commonly hails.

When the thunder-cloud is fwelling, and extending its branches over a large tract of country, the lightning is feen to dart from one part of it to another, and often to illuminate its whole mafs. When the cloud has acquired a fufficient extent, the lightning ftrikes between the cloud and the earth, in two oppofite places, the path of the lightning lying through the whole body of the cloud and its branches. The longer this lightning continues, the rarer does the cloud grow, and the lefs dark is its appearance; till, at length, it breaks in different places, and fhows a clear fky. When the thunder-cloud is thus difperfed, thofe parts which occupy the upper regions of the atmofphere are equally fpread, and very thin; and thofe that are underneath are black, but thin too; and they vanifh gradually, without being driven away with any wind.

That thunder-clouds were fometimes in a pofitive as well as negative ftate of electricity, Signior Beccaria had difcovered, before he heard of its having been obferved by Dr Franklin or any other perfon. The fame cloud, in paffing over his obfervatory, electrified his apparatus fometimes pofitively, and fometimes negatively. The electricity continued longer of the fame kind, in proportion as the thunder-cloud was fimple, and uniform in its direction; but when the lightning changed its place, there commonly happened a change in the electricity of his apparatus. It would change fuddenly after a very violent flafh of lightning, but the change would be gradual when the lightning was moderate, and the progrefs of the thunder-cloud flow.

It was an immediate inference from his obfervations of the lightning abroad, and his apparatus within, that the quantity of electric matter, in an ufual ftorm of thunder, is almoft inconceivably great; confidering how many pointed bodies, as trees, fpires, &c. are perpetually drawing it off, and what a prodigious quantity is repeatedly difcharged to or from the earth.

Confidering the vaft quantity of electric fire that appears in the moft fimple thunder-ftorms, he thinks it impoffible that any cloud, or number of clouds, fhould ever contain it all, fo as either to difcharge or receive it. Befides, during the progrefs and increafe of the ftorm, though the lightning frequently ftruck to the earth, the fame clouds were the next moment ready to make a ftill greater difcharge, and his apparatus continued to be as much affected as ever. The clouds muft, confequently, have received at one place, the moment that a difcharge was made from them in another. In many cafes, the electricity of his apparatus, and confequently of the clouds, would inftantly change from one kind to another feveral times; an effect which cannot be accounted for by any fimple difcharge or recruit. Both muft have taken place in a very quick fucceffion.

The extent of the clouds doth not leffen this difficulty: for, be it ever fo great, ftill the quantity ought to be leffened by every difcharge: and befides, the points by which the filent difcharges are made are in propotion to the extent of the clouds. Nor is the difficulty leffened by fuppofing that frefh clouds bring recruits; for befides that the clouds are not ripe for the principal ftorm, till all the clouds, to a great diftance, have actually coalefced, and formed one uniform mafs, thofe recruits bear no fort of proportion to the difcharge, and whatever it was, it would foon be exhaufted.

The

The fact, therefore, muft be, that the electric matter is continually darting from the clouds in one place, at the fame time that it is difcharged from the earth in another. And it is a neceffary confequence from the whole, that the clouds ferve as conductors to convey the electric fluid from thofe places of the earth which are overloaded with it, to thofe which are exhaufted of it.

That great quantities of electric matter do fometimes rufh out of particular parts of the earth, and rife through the air into the higher regions of the atmofphere, he thinks is evident from the great quantities of fand, afhes, and other light fubftances, which have often been carried up into the air, and fcattered uniformly over a large tract of country. No other known efficient caufe of this phenomenon can be affigned, except the wind; and it has been obferved when there was no wind ftirring; and the light bodies have even been carried againft the wind. He fuppofes, therefore, that thefe light bodies are raifed by a large quantity of electric matter, iffuing out of the earth, where it was overcharged with it, and attracting and carrying with it every fubftance that could ferve as a conductor in its paffage. All thefe bodies, being poffeffed of an equal quantity of the electric fluid, will be difperfed equally in the air, and confequently over that part of the earth where the fluid was wanting, and whither they ferve to convey it. Had thefe bodies been raifed by the wind, they would have been difperfed at random, and in heaps.

This comparatively rare phenomenon, he thinks, exhibits both a perfect image, and demonftration, of the manner in which the vapours of the atmofphere are raifed to form thunder-clouds. The fame electric matter, wherever it iffues, attracts to it, and carries up into the higher regions of the air, the watery particles that are difperfed in the atmofphere. The electric matter afcends to the higher regions of the atmofphere, being folicited by the lefs refiftance it finds there than in the common mafs of the earth; which, at thofe times, is generally very dry, and confequently highly electric. The uniformity with which thunder-clouds fpread themfelves, and fwell into arches, muft be owing to their being affected by fome caufe which, like the electric matter, diffufes itfelf uniformly where-ever it acts, and to the refiftance they meet with in afcending through the air. As a proof of this, fteam, rifing from an electrified eolipile, diffufes itfelf with the fame uniformity, and in fimilar arches, extending itfelf towards any conducting fubftance.

The fame caufe which firft raifed a cloud, from vapours difperfed in the atmofphere, draws it to thofe that are already formed, and continues to form new ones; till the whole collected mafs extends fo far, as to reach a part of the earth where there is a deficiency of the electric fluid. Thither too, will thofe clouds, replete with electricity, be ftrongly attracted, and there will the electric matter difcharge itfelf upon the earth. A channel of communication being, in this manner, found, a frefh fupply of electric matter will be raifed from the overloaded part, and will continue to be conveyed by the medium of the clouds, till the equilibrium of the fluid, between the two places of the earth be reftored. When the clouds are attracted in their paffage by thofe parts of the earth where there is a deficiency of the fluid, thofe detached fragments are formed, and alfo thofe uniform depending protuberances, which, in fome cafes, are the caufe of water-fpouts, and hurricanes.

That the electric matter, which forms and animates the thunder-clouds, iffues from places far below the furface of the earth; and that it buries itfelf there, is probable from the deep holes that have, in many places, been made by lightning. Flafhes of lightning have, alfo, been feen to arife from fubterraneous cavities, and from wells. Violent inundations have accompanied thunder-ftorms, not occafioned by rain, but by water burfting from the bowels of the earth, from which it muft have been diflodged by fome internal concuffion. Deep wells have been known to fill fafter in thunder-ftorms, and others have conftantly grown turbid at the approach of thunder.

This very rife, as well as the whole progrefs of thunder-clouds, has fometimes been in a manner vifible. Exhalations have been frequently feen to rife from particular caverns, attended with a rumbling noife, and to afcend into the higher regions of the air, with all the phenomena of thunder-ftorms defcribed above, according to the defcription of perfons who lived long before the connection between electricity and lightning was fufpected.

The greateft difficulty attending this theory of the origin of thunder-ftorms relates to the collection and infulation of electric matter within the body of the earth. With refpect to the former, he has nothing particular to fay. Some operations in nature are certainly attended with a lofs of the equilibrium in the electric fluid, but no perfon has yet affigned a more probable caufe of the redundancy of electric matter which, in fact, often abounds in the clouds, than what we may fuppofe poffible to take place in the bowels of the earth. And fuppofing the lofs of the equilibrium poffible, the fame caufe that produced the effect would prevent the reftoring of it; fo that not being able to force a way, at leaft one fufficiently ready, through the body of the earth, it would iffue at the moft convenient vent into the higher regions of the air, as the better paffage. His electrical apparatus, though communicating with the earth, has frequently, in violent thunder-ftorms, given evident fparks to his finger.

In the enumeration of the effects of thunder-ftorms, he obferves that a wind always blows from the place from which the thunder-cloud proceeds; that this is agreeable to the obfervations of all mariners, and that the wind is more or lefs violent in proportion to the fuddennefs of the appearance of the thunder-cloud, the rapidity of its expanfion, and the velocity with which the adfcititious clouds join it. The fudden condenfation of fuch a prodigious quantity of vapours muft difplace the air, and repel it on all fides.

He, in fome meafure, imitated even this effect of thunder, at leaft produced a circulation of all the air in his room, by the continued electrification of his chain.

Among other effects of lightning, he mentions the cafe of a man rendered exceeding ftiff, prefently after he was ftruck dead in a ftorm of thunder. But the moft remarkable circumftance, in this cafe, was the lightning (chu-

ſing the beſt conductor) having ſtruck one particular vein, near his neck, and followed it through its minuteſt ramifications; ſo that the figure of it appeared through the ſkin, finer than any pencil could have drawn it.

He cautions perſons not to depend upon the neighbourhood of a higher, or, in all caſes, a better conductor than their own body; ſince, according to his repeated obſervations, the lightning by no means deſcends in one undivided track, but bodies of various kinds conduct their ſhare of it, at the ſame time, in proportion to their quantity and conducting power.

A great number of obſervations, relating to the deſcent of lightning, confirm his theory of the manner of its aſcent: for, in many caſes, it throws before it the parts of conducting bodies, and diſtributes them along the reſiſting medium through which it muſt force its paſſage.

Upon this principle it is, that the longeſt flaſhes of lightning ſeem to be made by its forcing into its way part of the vapours in the air. One of the principal reaſons why thoſe flaſhes make ſo long a rumbling, is their being occaſioned by the vaſt length of a vacuum, made by the paſſage of the electric matter. For though the air collapſes the moment after it has paſſed, and the vibration (on which the ſound depends) commences at the ſame moment, through the whole length of the track; yet, if the flaſh was directed towards the perſon who hears the report, the vibrations excited at the nearer end of the track will reach his ear much ſooner than thoſe excited at the more remote end; and the ſound will, without any repercuſſion or echo, continue till all the vibrations have ſucceſſively reached him.

He thinks that the Aurora Borealis may be this electric matter performing its circulation, in ſuch a ſtate of the atmoſphere as renders it viſible, or approaching nearer to the earth than uſual.

Stones and bricks ſtruck by lightning are often vitrified. He ſuppoſes that ſome ſtones in the earth having been ſtruck in this manner firſt gave occaſion to the vulgar opinion of the thunder-bolt.

Signior Beccaria was very ſenſible that heat contributes much to the phenomena of thunder, lightning, and rain; but he could not find, by any experiment, that it tended to promote electricity. He therefore rather thought that heat operated, in this caſe, by exhaling the moiſture of the air, and thereby cutting off the communication of the electric fluid between one place and another, particularly between the earth and the higher regions of the air, whereby its effects were more viſible.

Method of ſecuring buildings and perſons from the effects of lightning.

EXPERIMENTS made in electricity firſt gave philoſophers a ſuſpicion that the matter of lightning was the ſame with the electric matter. Experiments afterwards made on lightning obtained from the clouds by pointed rods, received into bottles, and ſubjected to every trial, have ſince proved this ſuſpicion to be perfectly well founded; and that whatever properties we find in electricity, are alſo the properties of lightning.

This matter of lightning, or of electricity, is an extreme ſubtile fluid, penetrating other bodies, and ſubſiſting in them equally diffuſed.

When by any operation of art or nature, there happens to be a greater proportion of this fluid in one body than in another, the body which has moſt, will communicate to that which has leaſt, till the proportion becomes equal; provided the diſtance between them be not too great; or, if it is too great, till there be proper conductors to convey it from one to the other.

If the communication be through the air without any conductor, a bright light is ſeen between the bodies, and a ſound is heard. In our ſmall experiments we call this light and ſound the electric ſpark and ſnap; but in the great operations of nature, the light is what we call *lightning*, and the ſound (produced at the ſame time, though generally arriving later at our ears than the light does to our eyes) is, with its echoes, called *thunder*.

If the communication of this fluid is by a conductor, it may be without either light or ſound, the ſubtile fluid paſſing in the ſubſtance of the conductor.

If the conductor be good and of ſufficient bigneſs, the fluid paſſes through it without hurting it. If otherwiſe, it is damaged or deſtroyed.

All metals, and water, are good conductors.—Other bodies may become conductors by having ſome quantity of water in them, as wood, and other materials uſed in building, but not having much water in them, they are not good conductors, and therefore are often damaged in the operation by lightning.

Glaſs, wax, ſilk, wool, hair, feathers, and even wood, perfectly dry, are non-conductors: that is, they reſiſt inſtead of facilitating the paſſage of this ſubtile fluid.

When this fluid has an opportunity of paſſing through two conductors, one good and ſufficient, as of metal, the other not ſo good, it paſſes in the beſt, and will follow it in any direction.

The diſtance at which a body charged with this fluid will diſcharge itſelf ſuddenly, ſtriking through the air into another body that is not charged, or not ſo highly charged, is different according to the quantity of the fluid, the dimenſions and form of the bodies themſelves, and the ſtate of the air between them.——This diſtance, whatever it happens to be between any two bodies, is called their *ſtriking diſtance*, as till they come within that diſtance of each other, no ſtroke will be made.

The clouds have often more of this fluid in proportion than the earth; in which caſe as ſoon as they come near enough (that is, within the ſtriking diſtance) or meet with a conductor, the fluid quits them and ſtrikes into the earth. A cloud fully charged with this fluid, if ſo high as to be beyond the ſtriking diſtance from the earth, paſſes quietly without making any noiſe or giving light; unleſs it meets with other clouds that have leſs.

Tall trees, and lofty buildings, as the towers and ſpires of churches, become ſometimes conductors between the clouds and the earth; but not being good ones, that is, not conveying the fluid freely, they are often damaged.

Buildings that have their roofs covered with lead, or other metal, and ſpouts of metal continued from the roof

into

in to the ground to carry off the water, are never hurt by lightning, as whenever it falls on fuch a building, it paffes in the metals and not in the walls.

When other buildings happen to be within the ftriking diftance from fuch clouds, the fluid paffes in the walls, whether of wood, brick or ftone, quitting the walls only when it can find better conductors near them, as metal rods, bolts, and hinges of windows or doors, gilding on wainfcot, or frames of pictures; the filvering on the backs of looking-glaffes; the wires for bells; and the bodies of animals, as containing watry fluids. And in paffing thro' the houfe it follows the direction of thefe conductors, taking as many in its way as can affift it in its paffage, whether in a ftrait or crooked line, leaping from one to the other, if not far diftant from each other, only rending the wall in the fpaces where thefe partial good conductors are too diftant from each other.

An iron rod being placed on the outfide of a building, from the higheft part continued down into the moift earth, in any direction ftrait or crooked, following the form of the roof or other parts of the building, will receive the lightning at its upper end, attracting it fo as to prevent its ftriking any other part; and, affording it a good conveyance into the earth, will prevent its damaging any part of the building.

A fmall quantity of metal is found able to conduct a great quantity of this fluid. A wire no bigger than a goofe quill has been known to conduct (with fafety to the building as far as the wire was continued) a quantity of lightning that did prodigious damage both above and below it; and probably larger rods are not neceffary, tho' it is common to make them of half an inch, fome of three quarters, or an inch diameter.

The rod may be faftened to the wall, chimney, *&c.* with ftaples of iron.—The lightning will not leave the rod (a good conductor) to pafs into the wall (a bad conductor) through thofe ftaples.—It would rather, if any were in the wall, pafs out of it into the rod to get more readily by that conductor into the earth.

If the building be very large and extenfive, two or more rods may be placed at different parts, for greater fecurity.

Small ragged parts of clouds fufpended in the air between the great body of clouds and the earth (like leafgold in electrical experiments), often ferve as partial conductors for the lightning, which proceeds from one of them to another, and by their help comes within the ftriking diftance to the earth or a building. It therefore ftrikes through thofe conductors a building that would otherwife be out of the ftriking diftance.

Long fharp points communicating with the earth, and prefented to fuch parts of clouds, drawing filently from them the fluid they are charged with, they are then attracted to the cloud, and may leave the diftance fo great as to be beyond the reach of ftriking.

It is therefore that we elevate the upper end of the rod fix or eight feet above the higheft part of the building, tapering it gradually to a fine fharp point, which is gilt to prevent its rufting.

Thus the pointed rod either prevents a ftroke from the cloud, or, if a ftroke is made, conducts it to the earth with fafety to the building.

The lower end of the rod fhould enter the earth fo deep as to come at the moift part, perhaps two or three feet; and if bent when under the furface fo as to go in a horizontal line fix or eight feet from the wall, and then bent again downwards three or four feet, it will prevent damage to any of the ftones of the foundation.

A perfon apprehenfive of danger from lightning, happening during the time of thunder to be in a houfe not fo fecured, will do well to avoid fitting near the chimney, near a looking-glafs, or any gilt pictures or wainfcot; the fafeft place is in the middle of the room, (fo it be not under a metal luftre fufpended by a chain), fitting in one chair and laying the feet up in another. It is ftill fafer to bring two or three matraffes or beds into the middle of the room, and folding them up double, place the chair upon them; for they not being fo good conductors as the walls, the lightning will not chufe an interrupted courfe through the air of the room and the bedding, when it can go thro' a continued better conductor, the wall. But where it can be had, a hamock or fwinging bed, fufpended by filk cords equally diftant from the walls on every fide, and from the cieling and floor above and below, affords the fafeft fituation a perfon can have in any room whatever; and what indeed may be deemed quite free from danger of any ftroke by lightning.

In order to fecure fhips from fuftaining damage by lightning, a copper road, about the thicknefs of a goofe quill, fhould be connected with the fpindles and iron work of the mafts continued down to the deck, and from thence, in the moft convenient direction, till the end of the rod be always in contact with the fea-water.

With regard to powder-mills and magazines, the apparatus to conduct the lightning from them fhould be detached from the buildings themfelves, and conveyed to the neareft water.

Of Medical Electricity.

The firft application of electricity to the cure of difeafes was made by M. Jallabert, profeffor of philofophy at Geneva, on a lockfmith whofe right arm had been paralytic fifteen years. He was brought to M. Jallabert on the 26th of December 1747, and was compleatly cured by the 28th of February 1748. In this interval he was frequently electrified, fparks being taken from the arm, and fometimes the electrical fhock fent through it.

The report of this cure at Geneva, engaged Mr Sauvages of the academy in Montpelier to attempt the cure of paralytics, in which he had confiderable fuccefs.

In the year 1757, Mr Patrick Bryden, in a few days, performed a compleat cure of a hemiplegia, and indeed an almoft univerfal paralytic affection of two years continuance.

Dr Hart, Dr Wilfon, Mr Lovet, Mr Wefley, and many others, relate a number of cafes wherein the palfy was either cured or mitigated by electricity.

Dr Watfon cured an univerfal tetanus, in the year 1762, by electrifying the patient, at proper intervals, for three months.

Dr

Dr Franklin and others mention ſome paralytic caſes, in which electricity ſeemed rather to make the patient worſe than better.

Mr Wilſon cured a woman of a deafneſs of ſeventeen years ſtanding.—And Mr Lovet conſiders electricity as a ſpecific in all caſes of violent pains, obſtinate headachs, the ſciatica, and the cramp. The toothach, he ſays, is generally cured by it in an inſtant. He relates a caſe, from Mr Floyer ſurgeon at Dorcheſter, of a compleat cure of a gutta ſerena; and another of obſtinate obſtructions in two young women.

De Haen ſays, that he never failed to cure St Vitus's dance by electricity; and found it of uſe in ſome caſes of deafneſs.

Hitherto electricity has been generally applied to the human body either in the method of drawing ſparks, as it is called, or of giving ſhocks. But theſe operations are both violent, and though the ſtrong concuſſion may ſuit ſome caſes, it may be of diſſervice in others, where a moderate ſimple electrification might have been of uſe.

The great objection to this method is the tediouſneſs and expence of the application. But an electrical machine might be contrived to go by wind or water, and a convenient room might be annexed to it; in which a floor might be raiſed upon electrics, a perſon might ſit down, read, ſleep, or even walk about during the electrification. It were to be wiſhed, that ſome phyſician of underſtanding and ſpirit would provide himſelf with ſuch a machine and room. No harm could poſſibly be apprehended from electricity, applied in this gentle and inſenſible manner, and good effects are at leaſt poſſible, if not highly probable.

ELECTRUM, in natural hiſtory. See AMBER.

ELECTUARY, in pharmacy, a form in which both officinal and extemporaneous medicines are frequently made.

It may be conſidered as a number of boluſes united together, but is made ſomewhat ſofter by an addition of a due proportion of preſerves or ſyrups. When the conſiſtence is very ſoft, it is called ſometimes by the name of opiata.

The principal conſideration in preſcribing officinal electuaries is, that ſuch things only be put together as will not, by any oppoſite qualities, deſtroy one another, or loſe their natural properties by lying long in this manner; and likewiſe that the whole be of a conſiſtence that will hold ingredients of different gravities in equal mixture.

ELEEMOSYNÆ, and ELEEMOSYNARIUS. See ALMS, and ALMONER.

ELEGANCE, or ELEGANCY, an ornament of politeneſs and agreeableneſs ſhewn in any diſcourſe, with ſuch a choice of rich and happy expreſſions, as to riſe politely above the common manners, ſo as to ſtrike people of a delicate taſte.

It is obſerved that elegance, though irregular, is preferable to regularity without elegance: that is, by being ſo ſcrupulous of grammatical conſtruction, we loſe certain licences wherein the elegance of language conſiſts.

ELEGIAC, in ancient poetry, any thing belonging to elegy. See ELEGY.

Elegiac verſes are alternately hexameter and pentameter, as in the following verſes of Ovid. See HEXAMETER.

Flebilis indignos, elegeia, ſolve capillos:
Ah nimis ex vero nunc tibi nomen erit.

Who was the inventor of elegiac poetry is not known. Horace profeſſes himſelf quite ignorant of it. The principal writers of elegiac verſe, among the Latins, were Propertius, Ovid, and Tibullus, the latter whereof Quinctilian eſteems the beſt elegiac poet; but Pliny the younger gives the preference to the firſt: the chief writers of elegy among the Greeks were Callimachus, Parthenius, and Euphorion.

ELEGIT, in law, a writ of execution, which lies for a perſon who has recovered debt or damages; or upon a recognizance in any court, againſt a defendant that is not able to ſatisfy the ſame in his goods.

ELEGY, a mournful and plaintive kind of poem. See ELEGIAC.

As elegy, at its firſt inſtitution, was intended for tears, it expreſſed no other ſentiments, it breathed no other accents but thoſe of ſorrow: with the negligence natural to affliction, it ſought leſs to pleaſe than to move; and aimed at exciting pity, not admiration. By degrees, however, elegy degenerated from its original intention, and was employed upon all ſorts of ſubjects, gay or ſad, and eſpecially upon love. Ovid's book of Love, the poems of Tibullus and Propertius, notwithſtanding they are termed elegies, are ſometimes ſo far from being ſad, that they are ſcarce ſerious. The chief ſubjects then to which elegy owes its riſe, are death and love: that elegy therefore ought to be eſteemed the moſt perfect in its kind which has ſomewhat of both at once; ſuch, for inſtance, where the poet bewails the death of ſome youth or damſel falling a martyr to love.

ELEMENT, a term uſed by philoſophers to denote the original component parts of bodies, or thoſe into which they are ultimately reſolvable. See CHEMISTRY, Vol II. p. 66.

ELEMENT, in a figurative ſenſe, is uſed for the principles and foundations of any art or ſcience, as Euclid's Elements, &c.

ELEMI, or ELEMY, in the materia medica, a kind of reſin, very improperly called gum-elemi. There are two ſorts of it kept in the ſhops; the one genuine, and brought from Ethiopia; the other ſpurious, and the produce of America. The true kind is a yellowiſh reſin, with a caſt of green and white; its ſmell is acrid and pleaſant, and its taſte acrid and bitter. It is very inflammable, and readily diſſolves in oil and other fat ſubſtances over the fire; which two characters alone

lone sufficiently distinguish it from the gums: but this genuine elemi is very rare in Europe.

The spurious elemi is a whitish resin, produced from a tall tree, with pinnated leaves, not unlike those of the pear-tree. It is in some degree pellucid, and of a fragrant smell. It is only used externally, being greatly recommended for resolving tumours, deterging ulcers, wounds, *&c.*

ELENCHUS, in logic, a sophism, or fallacious argument, which deceives the hearer under the appearance of truth. See SOPHISM.

ELEPHANT, in zoology. See ELEPHAS.

Knights of the ELEPHANT, an order of knighthood in Denmark, conferred upon none but persons of the first quality and merit. It is also called the order of St Mary. Its institution is said to have been owing to a gentleman among the Danish croisees having killed an elephant, in an expedition against the Saracens, in 1184; in memory of which king Canutus instituted this order, the badge of which is a towered elephant, with an image of the holy virgin encircled with rays, and hung on a watered sky-coloured ribbon, like the George in England.

ELEPHANTIASIS, called also the lepra of the Arabians, in medicine, a chronical disease, one of the two species of leprosy, which affects the whole body, where even the bones as well as the skin are covered with spots and tumours, which being red, at last turn black. See MEDICINE.

ELEPHANTINE, in Roman antiquity, an appellation given to the books wherein were registered the transactions of the senate and magistrates of Rome, of the emperors or generals of armies, and even of the provincial magistrates; the births and classes of the people, and other things relating to the census.

They are supposed to have been so called as being made of ivory; though some will have them to have been written on the intestines of elephants.

ELEPHANTOPUS, in botany, a genus of the syngenesia polygamia segregata class. The receptacle is naked; the corolla is divided into five segments; the calix is imbricated; and the pappus has several aristæ. There are two species, both natives of the Indies.

ELEPHAS, or the ELEPHANT, in zoology, a genus of quadrupeds belonging to the order of bruta. The characters are these: The elephant has no foreteeth in either jaw, and the dog-teeth are very long: The probofcis, or trunk, is long, and capable of laying hold of any thing; and the body is somewhat naked.

The elephant is the largest of all land-animals. From the front to the origin of the tail he is generally about 16 feet long, from the end of the trunk 25 feet, and about 14 feet high. The circumference of the neck is 17 feet, and the circumference of the body at the grossest part 25 feet 10 inches; the tail is about 6 feet long, and $2\frac{1}{2}$ in circumference. The circumference of the legs is about 6 feet. The eyes are small in proportion to the size of the animal. The muzzle is very different from that of any other quadruped; it is nothing but the origin of a long trunk which hangs between the two large tusks; the mouth appears behind the trunk, which serves in place of an upper lip, and the under lip terminates in a point. The tail is short, and small in comparison of the trunk, which has the appearance of a long thick tail placed before. The feet are short, round, clumsy, and only distinguishable by the toes. The trunk is, properly speaking, the nose extended, and terminated by a couple of nostrils. But, besides serving as an organ of smell, the trunk performs all the functions of a strong and dextrous arm. The trunk of an elephant is about 8 feet long, $5\frac{1}{2}$ feet in circumference near the mouth, and one foot and a half near the extremity: It is a pipe of an irregular conical figure, and widened at the end: The superior side of the trunk is convex, and furrowed transversely; and the inferior side is flat, and has two longitudinal rows of small protuberances resembling the tentacula of the silk-worm and most other caterpillars. The upper part of the trunk corresponds with the extremity of the nose in other quadrupeds, and answers the same intention; the inferior part serves as an upper lip, including the nostrils at the same time; for the trunk is a continued canal, divided into two cavities by a longitudinal partition; these cavities ascend along the forepart of the upper jaw, where they make a turn inward and descend into the palate, and then terminate in two separate orifices; they have likewise each a separate orifice at the end of the trunk. At the place where these cavities make a turn, and before they enter into the bones of the head, there is a moveable cartilaginous plate situate in such a manner as enables the elephant to shut the canal, and to prevent the water with which it occasionally fills the trunk from entering into the passage of the nose where the organs serving for the sensation of smell are placed. The elephant can move the trunk in all directions; he can extend or shorten it at pleasure, without altering the diameters of the two canals within. By this means respiration is not interrupted, whatever be the situation of the trunk; and the water is allowed to remain till the animal chuses to throw it out by an expiration. Each canal is lined with a smooth strong membrane, and the surface of the trunk is covered with another strong membrane or skin. The substance contained between the exterior and interior membranes, is a composition of longitudinal and transverse muscles, which serve to extend and contract the length of the trunk. At the extremity of the trunk there is a concave protuberance, in the bottom of which are the two passages of the nostrils. The inferior part of the protuberance is thicker than the sides, and the superior part is stretched out like a finger about five inches long; which, together with the edges of the whole extremity of the trunk, takes on different figures according to the necessities of the animal. It is by this organ that the animal lays hold of food, or other substances, which he manages with as much dexterity as a man does his hand, taking up grains of corn, or the smallest piles of grass, and conveying them to his mouth. When he drinks, he thrusts his trunk into the water, and fills it by drawing in his breath, and exhausting the air:

When the trunk is thus filled with water, he can either throw it out to a great diſtance, or drink it by putting the end of the trunk in his mouth.

The two large tuſks, which ſome call the horns of the elephant, are of a yellowiſh colour, and extremely hard. The bony ſubſtance of which they are compoſed is known by the name of ivory, and much uſed in different branches of manufacture.

The ears are very large, and reſemble thoſe of an ape. The ſkin of the elephant has but few hairs on it, and placed at great diſtances from each other. It is full of wrinkles, like thoſe on the palm of a man's hand, beſides many chaped and greaſy ridges. The female has two dugs, one on each ſide of the breaſt. The parts of generation are ſmall in proportion to thoſe of other animals. The penis reſembles that of a horſe. The female organ is ſituate near the middle of the belly, more than two feet diſtant from the uſual ſituation in other quadrupeds: When they copulate, the female lies down on her back.

Elephants, even in a ſavage ſtate, are peaceable and gentle creatures. They never uſe their weapons but in defence of themſelves or companions. Their ſocial diſpoſitions are ſo ſtrong, that they are ſeldom found alone, but march always in large troops; the oldeſt and moſt experienced lead the van; the younger, or lame ones, keep in the middle; and thoſe of a ſecond rate, as to age, walk in the rear. The females carry their young on their tuſks, embracing them at the ſame time with their trunk. They ſeldom march in this regular order but when they reckon the journey dangerous, ſuch as an expedition to cultivated lands, where they expect to meet with reſiſtance. On other occaſions they are leſs cautious, ſome of them falling behind or ſeparating from the reſt, but ſeldom ſo far as to be without the reach of aſſiſtance by alarming and aſſembling their companions. It is only theſe wanderers that the hunters dare attack; for it would require a whole army to aſſail a troop of them; and even an army would be unable to conquer them without loſing a number of lives. It is dangerous to offer them the leaſt injury; for they run ſtraight upon the offender; and, although the weight of their body be great, their ſteps are ſo large, that they eaſily outrun the ſwifteſt man, whom they either pierce with their tuſks or ſeize with their trunk, dart him in the air like a ſtone, and then trample him under their feet. But they never attack any perſon, unleſs when provoked. However, as they are extremely ſenſible and delicate with regard to injuries, it is always prudent to keep out of their way. Travellers who frequent theſe countries kindle large fires, and beat drums during the night, in order to prevent their approach. After being once attacked by men, or falling into any ambuſh, they are ſaid never to forget the injury, but ſearch for every opportunity of getting revenge. As they are endowed perhaps with a more exquiſite ſenſation of ſmell than any other animal, owing to the great extent of their noſe, they can ſcent a man at a very great diſtance, and trace him by his footſteps.

Elephants are peculiarly fond of the banks of rivers, deep valleys, and marſhy grounds, eſpecially when well ſhaded with trees. They delight in drawing up water into their trunks, even when they do not drink it, and amuſe themſelves in daſhing the water around. They cannot endure cold, and are equally averſe to an exceſs of heat: In order to avoid the ſcorching heat of the ſun, they retire to the thickeſt and moſt ſhady parts of the foreſt. The bulk of their bodies is ſo enormous, that they do not chuſe to go into deep waters ſo frequently as ſome other quadrupeds; although the length of their trunk, which they raiſe ſtraight up, and by which they reſpire, is a great advantage in ſwimming.

The ordinary food of elephants is roots, herbs, leaves, the tender branches of trees, fruits, and grains: but they abhor fleſh or fiſh. When any of them diſcovers a fine paſture, he immediately calls and invites his companions to come and eat with him. As they devour a large quantity of food in a ſhort time, they are always ſhifting their paſture; when they meet with cultivated grounds, they make a prodigious deſolation, and deſtroy more plants by their feet than they uſe for nouriſhment, which is very conſiderable, amounting to 150 pounds of herbage every day: by this means, as they conſtantly graze in large troops, they lay waſte whole fields in an hour. The Indians and negroes employ every art to prevent them from viſiting their cultivated lands, making great noiſe, and burning large fires round their fields. However, theſe precautions are not always ſufficient to prevent the elephants from viſiting them. They chaſe away the domeſtic animals, put the men to flight, and ſometimes even throw down their limber huts. Elephants are hardly ſuſceptible of fear; the only things which can ſurpriſe them, or ſtop their courſe, are artificial fires, ſuch as ſquibs, crackers, *&c.* the effects of which are ſo ſudden and ſo quickly repeated, that the elephants frequently turn back; and when one runs, all the reſt inſtantly follow his example.

Although the ſocial diſpoſition in the elephant be exceeding ſtrong; yet whenever the females come in ſeaſon, it immediately gives place to the ſtronger and more intereſting paſſion of love. They obſerve the greateſt delicacy in their amours, abhorring nothing ſo much as to be ſeen by their companions. The troop divide themſelves into couples, ſteal off into the moſt ſecret places of the foreſt, and then give way to all the impulſes of nature, which are lively and laſting in proportion to the long period of abſtinence; for the female goes with young two years, and it is only once in three years that the ſeaſon of love returns. They bring forth but one at a time, which, as ſoon as it comes into the world, is as large as a wild boar, and is furniſhed with teeth; however, the large tuſks do not make their appearance till ſome time after, and at the age of ſix months they are ſeveral inches long. Elephants of this age are as large as an ox, when in a natural ſtate. But it is incredible how they degenerate when inſlaved and under the management of men. Their diſguſt and chagrine for the loſs of liberty ſeems never to depart from their minds. In this ſtate, though they feel, at the proper ſeaſons, the

the ſtrongeſt deſires for the ſex, no art can allure them to copulate: but the natural paſſion, reſtrained by an exceſs of modeſty, burſts out into ſuch violent fits of fury and reſentment, that the ſtrongeſt chains are hardly ſufficient to command them. This is a ſtriking difference betwixt the elephant and moſt other tamed animals. It is only the individual that we can enſlave; the ſpecies, in ſpite of all our endeavours, ſtill retain their original freedom and independence.

The manner of taking and taming the elephant, therefore, merits our attention. In foreſts and ſuch places as are frequented by elephants, the Indians chuſe a ſpot and incloſe it with ſtrong pallisſades; they uſe the largeſt trees as the principal ſtakes, to which are fixed ſmaller ones in a tranſverſe direction. Theſe croſs-trees are fixed ſo as to allow a man to paſs eaſily through. There is likewiſe a large port left for the elephant, over which is ſuſpended a ſtrong barrier, which is let down as ſoon as he enters. In order to decoy him into the incloſure, the hunters take along with them a tame female in ſeaſon, and travel about till they come ſo near as that the cry of the female can reach a male, whom they previouſly obſerve in the foreſt; then the guide of the female makes her give the cry peculiar to the ſeaſon of love: the male inſtantly replies, and ſets out in queſt of her. The guide then makes the female proceed toward the artificial incloſure, repeating her cries from time to time as ſhe goes along. She enters into the incloſure, the male follows her, and the Indians immediately ſhut the port behind him. He no ſooner diſcovers the hunters, and that he is incloſed, than his paſſion for the ſex is converted into rage and fury. The hunters entangle him with ſtrong ropes; they fetter his legs and trunk; they bring two or three tame elephants in order to pacify and reconcile him to his condition. In a word, they reduce them to obedience in a few days, by a proper application of torture, and careſſes. There are many other methods of catching elephants. Inſtead of making large incloſures with pallisſades, like the kings of Siam, and other monarchs, the poor Indians content themſelves with a very ſimple apparatus: they dig deep pits in the roads frequented by elephants, covering them over with branches of trees, turf, *&c.* When an elephant falls into one of theſe pits, he is unable to get out again.

The elephant, when tamed, is the moſt friendly and obedient of all animals: he is entirely attached to the perſon who feeds and takes care of him. In a ſhort time he underſtands ſigns, and the ſound of his maſter's voice. He diſtinguiſhes the language of paſſion, of command, of ſatisfaction, and acts accordingly. He receives his orders with attention, and executes them with prudence and alacrity, but without precipitation. He eaſily learns to bow his knees and lower his body, for the convenience of thoſe who mount him. He careſſes his friends with his trunk. He lifts burdens with his trunk, and aſſiſts thoſe who are loading him in laying them on his back. He delights in ſhining harneſs and trappings. When yoked in a cart or waggon, he pulls equally and chearfully, unleſs he be abuſed by injudicious chaſtiſements. His guide is generally mounted on his neck, with a ſmall rod of iron ſharp at the point in his hand; he directs his motion by pricking him on the ears and head; but, for the moſt part, a word is ſufficient.

A tame elephant will do more labour than ſix horſes; but then he requires a proportional quantity of food. They are the principal beaſts of burden in many parts of Africa and the Eaſt Indies. They carry ſacks and bundles of all kinds on their neck, back, and tuſks. They never loſe or damage any thing committed to their care: They will ſtand on the edge of a river, take bundles off their necks and tuſks, lay them carefully in a boat wherever they are deſired, and try with their trunk whether they are properly ſituate; if they be loaded with caſks, they go in queſt of ſtones to prop them and prevent them from rolling.

From the earlieſt accounts in hiſtory, the eaſtern nations have employed elephants in war; Alexander the Great was the firſt European who ever mounted an elephant. He carried a number of them into Greece, which Pyrrhus employed ſome years after againſt the Romans at the battle of Tarentum. Both the Greeks and Romans ſoon learnt to get the better of theſe monſtrous animals, they opened their ranks and allowed them to paſs through; neither did they attempt to hurt them, but threw darts, *&c.* at their guides. Now that fire-arms are the principal inſtruments of war, elephants, who are terrified at the noiſe and flame, inſtead of being uſeful, would only tend to embarraſs and confuſe an army. However, in Cochin and other parts of Malabar, as alſo in Tonquin, Siam, and Pegu, where fire-arms are little underſtood, they are ſtill uſed in battle. The guide ſits aſtride upon the neck, and the combatants ſit or ſtand upon the other parts of the body.

When the elephant is properly managed, he lives very long even in a ſtate of ſlavery and labour. That ſome have lived in this ſtate 130 years, is pretty well authenticated. In a natural ſtate, they often exceed 200 years, and propagate their ſpecies till they be 120: It is 30 years before they come to their full growth. [Plate LXXIV. fig. 3.]

ELEVATION, the ſame with altitude or height. See ALTITUDE.

ELEVATION *of the hoſt*, in the church of Rome, that part of the maſs where the prieſt raiſes the hoſt above his head for the people to adore. See MASS and HOST.

ELEVATOR, in anatomy, the name of ſeveral muſcles, ſo called from their ſerving to raiſe the parts of the body to which they belong. See ANATOMY, Part II.

ELEVATORY, in ſurgery, an inſtrument for raiſing depreſſed or fractured parts of the ſcull, to be applied after the integuments and perioſteum are removed. See SURGERY.

ELEUSINIA, in Grecian antiquity, a feſtival kept in honour of Ceres, every fourth year by ſome ſtates, but by others every fifth. The Athenians celebrated it at Eleuſis, a town of Attica, whence the name.

It was celebrated with a world of ceremony, and perſons of both ſexes were initiated in it; it being deemed

deemed impious to neglect doing ſo. The myſteries were of two ſorts, the leſſer, and the greater; whereof the former were ſacred to Proſerpine, Ceres's daughter, and the latter to Ceres herſelf. According to Lactantius, they conſiſted in a myſtical repreſentation of what mythologiſts teach of Ceres; though ſome of the Chriſtian fathers will have the great myſtery, or ſecret, which they were forbidden by law, upon pain of death, to divulge, to have been the repreſentation or figures of both male and female privities, which were handed about and expoſed to the company.

ELEUTHERIA, another feſtival celebrated at Platæa, by delegates from almoſt all the cities of Greece, in honour of Jupiter Eleutherius, or the aſſertor of liberty.

It was inſtituted in memory of the victory obtained by the Grecians, in the territories of Platæa, over Mardonius, the Perſian general, left by Xerxes with a mighty army to ſubdue Greece.

ELF, a term now almoſt obſolete, formerly uſed to denote a fairy, or hobgoblin. an imaginary being, the creature of ignorance, ſuperſtition, and craft. See Fairy.

Elf-arrows, in natural hiſtory, a name given to the flints, anciently faſhioned into arrow-heads, and ſtill found foſſile in Scotland, America, and ſeveral other parts of the world; they are believed by the vulgar to be ſhot by fairies, and that cattle are ſometimes killed by them.

ELGIN, the capital of the county of Murray, in Scotland, ſituated on the river Loſey, about ſix miles north of the Spey: W. long. 2° 25′, N. lat. 57° 40.

ELIQUATION, in metallurgy, a ſeparation of the different parts of mixed bodies, by the different degrees of fire required to melt them. See Chemistry.

ELISION, in grammar, the cutting off, or ſuppreſſing a vowel at the end of a word, for the ſake of ſound, or meaſure, the next word beginning with a vowel.

Eliſions are pretty frequently met with in Engliſh poetry, but more frequently in the Latin, French, *&c.* They chiefly conſiſt in ſuppreſſions of the *a*, *e*, and *i*, though an eliſion ſuppreſſes any of the other vowels.

ELIXATION, in pharmacy, the extracting the virtues of ingredients by boiling or ſtewing.

ELIXIR, in medicine, a compound tincture extracted from many efficacious ingredients. Hence the difference between a tincture and an elixir ſeems to be this, that a tincture is drawn from one ingredient, ſometimes with an addition of another to open it, and to diſpoſe it to yield to the menſtruum; whereas an elixir is a tincture extracted from ſeveral ingredients at the ſame time. See Tincture.

ELK, in zoology. See Cervus.

ELKHOLM, a port-town of Gothland, in Sweden, twenty-four miles weſt of Carelſcroon.

ELL, a meaſure of length, different in different countries; but thoſe moſtly uſed, are the Engliſh and Flemiſh ells: whereof the former is three feet nine inches, or one yard and a quarter; and the latter only twenty-ſeven inches, or three quarters of a yard. In Scotland, the ell contains $37\frac{2}{10}$ Engliſh inches.

ELLERENA, a town of Eſtremadura, in Spain, fifty miles ſouth eaſt of Merida.

ELLIPSIS, in geometry. See Conic Sections.

Ellipsis, in grammar, a figure of ſyntax, wherein one or more words are not expreſſed; and from this deficiency, it has got the name ellipſis.

The ellipſis, properly ſo called, is when the deficient word or words muſt be ſupplied from elſewhere; as *Hectoris Andromache*, where *uxor* is underſtood; that is, Andromache, Hector's wife.

ELLIPTIC, or Elliptical, ſomething belonging to an ellipſis.

ELLIPOMACHROSTYLA, in natural hiſtory, a genus of imperfect cryſtals, with ſingle pyramids; one end of their column being affixed to ſome ſolid body. They are dodecahedral, with thinner hexangular columns and hexangular pyramids.

Of theſe cryſtals, authors enumerate a great many ſpecies; among which are the whitiſh pellucid ſprig cryſtal, a bright brown kind, a dull brown kind, and a bright yellow kind, all which are farther diſtinguiſhed according to the different lengths of their pyramids.

ELLIPOPACHYSTYLA, in natural hiſtory, a genus of imperfect cryſtals, compoſed of twelve planes, in an hexangular column, terminated by an hexangular pyramid at one end, and irregularly affixed to ſome other body at the other, with ſhorter columns.

There are two ſpecies of theſe cryſtals, one ſhort, bright and colourleſs, found in great plenty in New Spain and other parts of America; the other, a ſhort, dull, and duſky brown one, found in Germany, and ſometimes in England.

ELM, in botany. See Ulmus.

ELNA, a town of Catalonia in Spain, but ſubject to France, ſituated ten miles ſouth of Perpignan.

ELOCUTION, in rhetoric, the adapting words and ſentences to the things or ſentiments to be expreſſed. It conſiſts of elegance, compoſition, and dignity. The firſt comprehending the purity and perſpicuity of a language, is the foundation of elocution; the ſecond ranges the words in proper order; and the laſt adds the ornaments of tropes and figures to give ſtrength and dignity to the whole.

ELODES, in botany. See Hypericum.

ELOGY, a praiſe or panegyric beſtowed on any perſon or thing, in conſideration of its merit. The beauty of elogy conſiſts in an expreſſive brevity. Eulogiums ſhould not have ſo much as one epithet, properly ſo called, nor two words ſynonymous; they ſhould ſtrictly adhere to truth; for extravagant and improbable elogies rather leſſen the character of the perſon or thing they would extol.

ELOINED, in law, ſignifies reſtrained or hindered from doing ſomething: thus it is ſaid, that if thoſe within age be eloined, ſo that they cannot ſue perſonally, their next friend ſhall ſue for them.

ELONGATION, in aſtronomy, the digreſſion or receſs of a planet from the ſun, with reſpect to an eye placed on our earth. See Astronomy.

Elongation, in ſurgery, is an imperfect luxation, occaſioned by the ſtretching or lengthening of the ligaments of any joint.

ELOPEMENT, in law, is where a married woman departs

parts from her hufband, and cohabits with an adulterer; in which cafe the hufband is not obliged to allow her any alimony out of his eftate, nor is he chargeable for neceffaries for her of any kind.

ELOPS, in ichthyology, a genus of the order of abdominales. The head is fmooth, and the teeth are in the margin of the jaws and the palate; there are thirty rays in the branchioftege membrane. There is but one fpecies, *viz.* the favrus, with a tail armed both above and below. It is a native of Carolina.

ELOQUENCE, the art of fpeaking well, fo as to affect and perfuade.

Cicero defines it, the art of fpeaking with copioufnefs and embellifhment.

Eloquence and rhetoric differ from each other, as the theory from the practice; rhetoric being the art which defcribes the rules of eloquence, and eloquence that art which ufes them to advantage.

ELSINORE, a port-town of Denmark, about twenty-two miles north of Copenhagen, and fituated on the Sound or the entrance into the Baltic fea

ELVAS, a city and bifhop's fee of Alentejo, in Portugal, fituated near the frontiers of Spanifh Eftremadura: W. long. 7° 35′, and N. lat. 38° 45′.

It is one of the ftrongeft fortreffes in Portugal.

ELUL, in ancient chronology, the twelfth month of the Jewifh civil year, and the fixth of the ecclefiaftical: it confifted of only twenty-nine days, and anfwered pretty nearly to our Auguft.

ELUTRIATION, the feparating the lighter matters from the mixt ores of metals, by means of great quantities of fair water. See CHEMISTRY.

ELY, a city and bifhop's fee of Cambridgefhire, fituated about twelve miles north of Cambridge: E. long. 15′, and N. lat. 52° 24′.

It is a county of itfelf, including the territory around, and has a judge who determines all caufes civil and criminal within its limits.

ELYMUS, in botany, a genus of the tetrandria digynia clafs. The involucrum confifts of two leaves; and the fpiculæ are double. There are eight fpecies, only one of which, *viz.* the arenarius, or fea lyme grafs, is a native of Britain.

ELYSIUM, or ELYSIAN FIELDS, in heathen mythology, certain plains abounding with woods, fountains, verdure, and every delightful object; fuppofed to be the habitation of heroes and good men after death.

According to fome, the fable of Elyfium is of Phœnician extraction, or rather founded upon the account of paradife delivered in the Scriptures.

ELYTROIDES, or VAGINALES, in anatomy. See Vol. I. p. 270.

EMANATION, the act of flowing or proceeding from fome fource or origin; or, the thing that proceeds from that action.

EMANCIPATION, in the Roman law, the fetting free a fon from the fubjection of his father; fo that whatever moveables he acquires belong in property to him, and not to his father as before emancipation.

Emancipation puts the fon in capacity of managing his own affairs, and of marrying without his father's confent, though a minor. Emancipation differs from manumiffion, as the latter was the act of a mafter in favour of a flave, whereas the former was that of a father in favour of his fon.

There were two kinds of emancipation; the one tacit, which was by the fons being promoted to fome dignity, by his coming of age, or by his marrying, in all which cafes he became his own mafter of courfe.

The other, exprefs; where the father declared before a judge, that he emancipated his fon. In performing this, the father was firft to fell his fon imaginarily to another, whom they called *pater fiduciarius*, father in truft, of whom being bought back again by the natural father, he manumitted him before the judge by a verbal declaration.

Emancipation ftill obtains in France with regard to minors or pupils, who are hereby fet at liberty to manage their own effects, without the advice or direction of their parents or tutors.

EMARGINATED, amongft botanifts. See Vol. I. p. 640.

EMASCULATION, the act of caftrating or depriving a male of thofe parts which characterife his fex. See CASTRATION.

EMBALMING, is the opening a dead body, taking out the inteftines, and filling the place with odoriferous and deficcative drugs and fpices, to prevent its putrifying. The Egyptians excelled all other nations in the art of preferving bodies from corruption; for fome that they have embalmed upwards of two thoufand years ago, remain whole to this day, and are often brought into other countries as great curiofities. Their manner of embalming was thus: they fcooped out the brains with an iron fcoop, out at the noftrils, and threw in medicaments to fill up the vacuum: they alfo took out the entrails, and, having filled the body with myrrh, caffia, and other fpices, except frankincenfe, proper to dry up the humours, they pickled it in nitre, where it lay foaking for feventy days. The body was then wrapped up in bandages of fine linen and gums, to make it ftick like glue, and fo was delivered to the kindred of the deceafed, entire in all its features, the very hairs of the eye-lids being preferved. They ufed to keep the bodies of their anceftors, thus embalmed, in little houfes magnificently adorned, and took great pleafure in beholding them, alive as it were, without any change in their fize, features, or complexion. The Egyptians alfo embalmed birds, *&c.* The prices for embalming were different; the higheft was a talent, the next twenty minæ, and fo decreafing to a very fmall matter: but they who had not wherewithal to anfwer this expence, contented themfelves with infufing, by means of a fyringe, thro' the fundament, a certain liquor extracted from the cedar, and leaving it there wrapped up the body in falt of nitre: the oil thus preyed upon the inteftines, fo that when they took it out, the inteftines came away with it, dried, and not in the leaft putrified: the body being inclofed in nitre, grew dry, and nothing remained befides the fkin glued upon the bones.

EMBARGO, in commerce, in arreft on fhips, or merchandife,

chandiſe, by public authority; or a prohibition of ſtate, commonly on foreign ſhips, in time of war, to prevent their going out of port, ſometimes to prevent their coming in, and ſometimes both, for a limited time.

The king may lay embargoes on ſhips, or employ thoſe of his ſubjects, in time of danger, for ſervice and defence of the nation; but they muſt not be for the private advantage of a particular trader, or company; and therefore a warrant to ſtay a ſingle ſhip is no legal embargo. No inference can be made from embargoes which are only in war time; and are a prohibition by advice of council, and not at proſecution of parties. If goods be laden on board, and after an embargo or reſtraint from the prince or ſtate comes forth, and then the maſter of the ſhip breaks ground, or endeavours to ſail, if any damage accrues, he muſt be reſponſible for the ſame; the reaſon is, becauſe his freight is due, and muſt be paid, nay though the goods be ſeized as contraband.

Embargo differs from quarantine, inſomuch as this laſt is always for the term of forty days, in which perſons from foreign parts, infected with the plague, are not permitted to come on ſhore. See QUARANTINE.

EMBASSADOR, or AMBASSADOR, a public miniſter ſent from one ſovereign prince, as a repreſentative of his perſon, to another.

Embaſſadors are either ordinary or extraordinary. Embaſſador in ordinary, is he who conſtantly reſides in the court of another prince, to maintain a good underſtanding, and look to the intereſt of his maſter. Till about two hundred years ago, embaſſadors in ordinary were not heard of; all, till then, were embaſſadors extraordinary, that is, ſuch as are ſent on ſome particular occaſion, and who retire as ſoon as the affair is diſpatched.

By the law of nations, none under the quality of a ſovereign prince can ſend or receive an embaſſador. At Athens, embaſſadors mounted the pulpit of the public orators, and there opened their commiſſion, acquainting the people with their errand. At Rome, they were introduced to the ſenate, and delivered their commiſſions to them.

Embaſſadors ſhould never attend any public ſolemnities, as marriages, funerals, &c. unleſs their maſters have ſome intereſt therein: nor muſt they go into mourning on any occaſions of their own, becauſe they repreſent the perſons of their prince. By the civil law, the moveable goods of an embaſſador, which are accounted an acceſſion to his perſon, cannot be ſeized on, neither as a pledge, nor for payment of a debt, nor by order or execution of judgment, nor by the king's or ſtate's leave where he reſides, as ſome conceive; for all actions ought to be far from an embaſſador, as well that which toucheth his neceſſaries, as his perſon: if, therefore, he hath contracted any debt, he is to be called upon kindly, and if he refuſes, then letters of requeſt are to go to his maſter Nor can any of the embaſſador's domeſtic ſervants that are regiſtered in the ſecretaries of ſtate's office be arreſted in perſon or goods: if they are, the proceſs ſhall be void, and the parties ſuing out and executing it ſhall ſuffer and be liable to ſuch penalties and corporal puniſhment as the lord chancellor or either of the chief juſtices ſhall think fit to inflict. Yet embaſſadors cannot be defended when they commit any thing againſt that ſtate, or the perſon of the prince, with whom they reſide; and if they are guilty of treaſon, felony, &c. or any other crime againſt the law of nations, they loſe the privilege of an embaſſador, and may be ſubject to puniſhment as private aliens.

EMBASSY, the office or function of an embaſſador. See the preceding article.

EMBDEN, a port-town and city of Germany, capital of a county of the ſame name, now in poſſeſſion of the king of Pruſſia; it is ſituated at the mouth of the river Ems: E. long 6° 45′, and N. lat. 53° 50′.

EMBER-WEEKS, or DAYS, in the epiſcopal church, are certain ſeaſons of the year, ſet apart for the imploring God's bleſſing, by prayer and faſting, upon the ordinations performed in the church at ſuch times.

Theſe ordination-faſts are obſerved four times in the year, *viz.* the Wedneſday, Friday, and Saturday after the firſt Sunday in lent, after Whitſunday, after the fourteenth of September and the thirteenth of December; it being enjoined, by a canon of the church, that deacons and miniſters be ordained, or made, only upon the Sundays immediately following theſe ember-faſts.

EMBERIZA, in ornithology, a genus of birds, belonging to the order of paſſeres. The bill is conical, and the mandibles recede from each other towards the baſe; the inferior mandible has the ſides narrowed inwards, but the upper one is ſtill narrower. There are twenty-four ſpecies, *viz.* The nivalis, or great pyed mountain-finch of Ray, and the ſnow-bird of Edwards, has white-wings; but the outer edge of the prime-feathers are black; the tail is black, with three white feathers on each ſide, They inhabit Lapland and Hudſon's bay, and in hard winters they come into Sweden, when they are totally white. 2. The hyemalis, or ſnow-ſparrow of Cateſby, is black above, and the belly is white. It is a native of North America. 3. The miliaris, or grey emberiza, is of a greyiſh colour, ſpotted with black in the belly, and the orbits are rediſh. It is the bunting of Engliſh authors, and a bird of Europe. 4. The hortulana, or ortolan, has black wings; the firſt three feathers on the tail are white on the edges, only the two lateral are black outwardly. The orbits of the eyes are naked and yellow; the head is greeniſh, and yellow towards the inferior mandible. It feeds principally upon the panick-graſs; grows very fat, and is reckoned a delicate morſel by certain epicures. It is a bird of Europe. 5. The citrinella, or yellow hammer, has a blackiſh tail, only the two outward ſide-feathers are marked on the inner edge with a ſharp white ſpot. It is a bird of Europe, and comes about houſes in winter: it builds its neſt on the ground in meadows. 6. The olivacea, or olive emberiza, is of an olive colour above, whiter below; the nape of the neck is orange-coloured, and it has a black belt acroſs the breaſt. It is a native of Dominica. 7. The orix, or grenadier of

of Edwards, is greyiſh, with the front and belly black, a tawny neck and rump, and a black-bill. It is a native of Africa. 8. The quelca, has a grey back, a black front, and a red bill. It is a native of Africa. 9. The capenſis, or ortolon of the cape of Good Hope, is greyiſh, with a white nape of the neck, and a black belt round the orbits and mandibles. It inhabits the Cape of Good Hope. 10. The ludovicia is greyiſh above, and pale below; the breaſt is reddiſh, and there is a black circle on the head. 11. The cia, is reddiſh, with white eye-brows, and black lines on the head. It is a bird of Europe. 12. The cirlus, is a bird of Europe; it has a greyiſh back, a ſpotted breaſt, and yellowiſh eye-brows. 13. The familiaris is greyiſh and ſpotted; the tips of the tail-feathers are white, and hind part of the back yellow. It is a native of Aſia. 14. The flaveola, is greyiſh, with a yellow face; it is about the ſize of a ſiſkin, and is a native of warm countries. 15. The amazona is of a tanny colour, with the crown of the head yellow, and the baſe of the wings white underneath. It is a native of Surinam. 16. The orizivora, or ortolan of Carolina, is browniſh, with a tawny head, and a black belly. It is properly a native of Cuba, but migrates to Carolina about the autumn after the rice is reaped. 17. The ſchoeniclas, or reed-ſparrow, has a black head, a blackiſh-grey body, and a white ſpot on the quill-feathers. It is a bird of Europe. 18. The pſittacus, is of a tawny aſh-colour, with yellow wings, and two of the tail-feathers remarkably long. 19. The paradiſæa is browniſh, with a red breaſt, and two long ſharp-pointed feathers in the tail, and a black bill. It is a native of Africa, and ſheds the long feathers of the tail every year, like the peacock. 20. The ſerena, has a red bill, a black fillet, a red vertex, and a wedge-ſhaped tail. 21. The vidua, or Indian ſparrow of Aldrovandus, is blackiſh above, and white below, with four very long feathers in the tail, and a red bill. It is a native of India. 22. The principalis, is ſpotted, with the breaſt, bill, and legs red. It is a bird of Argola. 23. The regia, has a red bill, four long equal feathers in the tail, and red legs. It is a native of Africa. 24. The ciris, has a blueiſh head, a yellow belly, and a green back. It is a native of North America.

EMBLEM, a kind of painted enigma, or certain figures painted or cut, metaphorically expreſſing ſome action, with reflections underneath, which in ſome meaſure explain the ſenſe of the device, and at the ſame time inſtruct us in ſome moral truth, or other matter of knowledge.

EMBLEMENTS, among lawyers, denote the profits of ſown lands; but are ſometimes uſed, more largely, for any products that naturally ariſe from the ground.

EMBOLISMIC, or INTERCALARY. See INTERCALARY.

EMBOLUS, the moveable part of a pump, or ſyringe, called alſo the piſton, or ſucker.

EMBOSSING, or IMBOSSING, in architecture and ſculpture, the forming or faſhioning works in relievo, whether cut with a chiſſel or otherwiſe.

EMBRASURE, in architecture, the enlargement made of the aperture of a door or window, on the inſide of the wall; its uſe being to give the greater play for the opening of the door or caſement, or to admit the more light.

EMBROCATION, in ſurgery and pharmacy, an external kind of remedy, which conſiſts in an irrigation of the part affected, with ſome proper liquor, as oils, ſpirits, &c. by means of a woollen or linen cloth, or a ſpunge, dipped in the ſame.

EMBROIDERY, a work in gold, or ſilver, or ſilk thread, wrought by the needle upon cloth, ſtuffs, or muſlin, into various figures. In embroidering ſtuffs, the work is performed in a kind of loom, becauſe the more the piece is ſtretched, the eaſier it is worked. As to muſlin, they ſpread it upon a pattern ready deſigned; and ſometimes, before it is ſtretched upon the pattern, it is ſtarched, to make it more eaſy to handle. Embroidery on the loom is leſs tedious than the other, in which, while they work flowers, all the threads of the muſlin, both lengthwiſe and breadthwiſe, muſt be continually counted; but, on the other hand, this laſt is much richer in points, and ſuſceptible of greater variety. Cloths too much milled are ſcarce ſuſceptible of this ornament, and in effect we ſeldom ſee them embroidered. The thinneſt muſlins are left for this purpoſe; and they are embroidered to the greateſt perfection in Saxony: in other parts of Europe, however, they embroider very prettily, and eſpecially in France.

There are ſeveral kinds of embroidery; as, 1. Embroidery on the ſtamp, where the figures are raiſed and rounded, having cotton or parchment put under them to ſupport them. 2. Low embroidery, where the gold and ſilver lie low upon the ſketch, and are ſtitched with ſilk of the ſame colour. 3. Guimped embroidery: this is performed either in gold or ſilver; they firſt make a ſketch upon the cloth, then put on cut vellum, and afterwards ſow on the gold and ſilver with ſilk thread: in this kind of embroidery they often put gold and ſilver cord, tinſel, and ſpangles. 4. Embroidery on both ſides, that which appears on both ſides of the ſtuff. 5. Plain embroidery, where the figures are flat and even, without cords, ſpangles, or other ornaments.

EMBRUN, or AMBRUN, a city of Dauphiny, in France, near the confines of Piedmont: E. long. 6° 6′, and N. lat. 44° 35.

EMBRIO, in phyſiology, the firſt rudiments of an animal in the womb, before the ſeveral members are diſtinctly formed; after which period it is denominated a fœtus.

EMBRYOTHLASTES, in midwifery, an inſtrument contrived for breaking the bones, for the more eaſy extraction of the fœtus in difficult labours.

EMBRYOTOMY, the cutting a fœtus to pieces whilſt in the womb, practiſed in caſes of neceſſity, when there is no other way of ſaving the mother.

EMBRYULCUS, a hook for extracting the child in difficult labours. See MIDWIFERY.

EMERALD, in natural hiſtory, a genus of precious ſtones, of a green colour, and next in hardneſs to the ruby.

Our jewelers diſtinguiſh emeralds into two kinds, the oriental

oriental and occidental: the emeralds of the East-Indies are evidently finer than those of any other part of the world; but our jewellers, seldom meeting with these, call the American emeralds the oriental, and usually sell crystal accidentally tinged with green, under the name of the occidental emerald: these being also the most common, there has grown an opinion among the lapidaries, that the emerald is no harder than the crystal; because what they take to be emeralds, are in general only crystals.

The genuine emerald, in its most perfect state, is perhaps the most beautiful of all the gems; it is found of various sizes, but usually small; a great number of them are met with of about the sixteenth part of an inch in diameter, and they are found from this to the size of a walnut.

The emerald is of different figures like the diamond and many of the other gems, being sometimes found in a roundish or pebble-like form, but much more frequently in a columnar one, resembling common crystal: the pebble-emeralds are always the hardest and brightest, but are seldom found exceeding the size of a pea: the crystalliform ones grow several together, and are often larger: the pebble kind are found loose in the earths of mountains, and sands of rivers; the columnar are found usually bedded in, or adhering to, a white, opake, and coarse crystalline mass, and sometimes to the jasper, or the prasius.

The oriental emerald is of the hardness of the sapphire and ruby, and is second only to the diamond in lustre and brightness: the American is of the hardness of the garnet, and the European somewhat softer than that yet considerably harder than crystal: It loses it colour in the fire, and becomes undistinguishable from the white sapphire.

The oriental emeralds are very scarce, and at present found only in the kingdom of Cambay; very few of them have of late been imported into Europe, insomuch that it has been supposed there were no oriental emeralds; but within these ten years, some few have been brought from Cambay into Italy, that greatly excel the American ones. The American, being what our jewelers call oriental emeralds, are found principally about Peru; and the European are principally from Silesia.

To counterfeit EMERALDS: Take of natural crystal, four ounces; of red-lead, four ounces; verdegrease, forty-eight grains; crocus martis, prepared with vinegar, eight grains; let the whole be finely pulverized and sifted; put this into a crucible, leaving one inch empty: lute it well, and put it into a potter's furnace, and let it stand there as long as they do their pots. When cold, break the crucible, and you will find a matter of a fine emerald colour, which, after it is cut and set in gold, will surpass in beauty an oriental emerald.

EMERY, in natural history, a rich iron ore found in large masses of no determinate shape or size, extremely hard, and very heavy. It is usually of a dusky brownish red on the surface; but when broken, is of a fine bright iron-grey, but not without some tinge of redness; and is spangled all over with shining specks, which are small flakes of a foliaceous talc, highly impregnated with iron. It is also sometimes very red, and then usually contains veins of gold. It makes no effervescence with any of the acid menstruums, and is found in the island of Guernsey, in Tuscany, and many parts of Germany.

EMETIC, a medicine which induces vomiting.

EMINENCE, a title of honour peculiar to cardinals. See CARDINAL.

EMIR, a title of dignity among the Turks, signifying a prince.

This title was first given to the caliphs; but when they assumed the title of sultans, that of emir remained to their children; as that of Cæsar among the Romans. At length the title became attributed to all who were judged to descend from Mahomet by his daughter Fatimah, and who wear the green turban instead of the white. The Turks make an observation, that the emirs, before their fortieth year, are men of the greatest gravity, learning and wisdom; but after this, if they are not great fools, they discover some signs of levity and stupidity. This is interpreted by the Turks as a sort of divine impulse in token of their birth and sanctity. The Turks also call the vizirs, bashaws, or governors of provinces, by this name.

EMISSARY, in a political sense, a person employed by another to sound the opinions of people, spread certain reports, or act as a spy over other peoples actions.

EMMENAGOGUES, in pharmacy, medicines which promote the menses, either by giving a greater force to the blood in its circulation, whereby its momentum against the vessels is increased; or by making it thinner, whereby it will more easily pass through any outlet.

EMMERIC, a city of Westphalia, in Germany, subject to Prussia: E. long. 5° 45′, N. lat. 51° 48′.

EMOLLIENTS, in medicine and pharmacy, are such remedies as sheath and soften the asperity of the humours, and relax and supple the solids at the same time.

EMPALEMENT, an ancient kind of punishment, which consisted in thrusting a stake up the fundament.

EMPALEMENT *of a flower*, the same with calix. See CALIX.

EMPEROR, a title of honour among the ancient Romans, conferred on a general who had been victorious, and now made to signify a sovereign prince, or supreme ruler of an empire.

The title of emperor adds nothing to the rights of sovereignty; it only gives preheminence above other sovereigns. The emperors, however, pretend, that the imperial dignity is more eminent than the regal. It is disputed whether emperors have the power of disposing of the regal title; however this may be, they have sometimes taken upon them to erect kingdoms: thus it is that Bohemia, Prussia, and Poland, are said to have been raised to that dignity. In the east, the title of emperor is more frequent than with us; thus the sovereign princes of China, Mogul, &c. are called emperors.

perors. In the weſt, the title has been a long time reſtrained to the emperors of Germany. The firſt who bore it was Charlemagne, who was crowned by Pope Leo III. in 800. And it is to be obſerved, that there was not a foot of land or territory annexed to the emperor's title.

In the year 1723, the Czar of Muſcovy aſſumed the title of emperor of all the Ruſſias. The kings of France were alſo called emperors, when they reigned with their ſons, whom they aſſociated in the crown: thus Hugh Caput was called emperor, and his ſon Robert king. The kings of England were anciently ſtyled emperors, as appears from a charter of king Edgar.

The emperor of Germany is a limited monarch in regard to the empire, though he is an abſolute ſovereign in moſt of his hereditary dominions; the late emperors of the Auſtrian family, having hereditary dominions, enumerated all of them in their title. Charles VI. was ſtyled emperor of the Romans, always auguſt, king Bohemiah and Hungary, archduke of Auſtria, *&c.*; but the preſent empreſs inheriting thoſe countries, her conſort enjoys only the title of emperor of the Romans, duke of Lorrain and Tuſcany. The emperor creates dukes, marquiſſes, and other noblemen; and he appoints moſt of the officers, civil and military, in the empire: he is elected by the nine electors; and he ſummons the general diet of the empire.

EMPETRUM, BERRY BEARING HEATH, in botany, a genus of the diœcia triandria claſs. The calix of both male and female conſiſts of three ſegments, and the corolla of three petals. The female has nine ſtyli; and the berry contains nine ſeeds. There are two ſpecies, one of which, *viz.* the nigrum, black-berried heath, crow or crake berries, is a native of Britain.

EMPHASIS, in rhetoric, a particular ſtreſs of the voice and action, laid on ſuch parts or words of the oration as the orator wants to enforce upon his audience.

EMPHYSEMA, in ſurgery, a tumour generally occaſioned in a fracture of the ribs. See SURGERY, and MEDICINE.

EMPIRE, a large extent of land, under the juriſdiction or government of an emperor. See EMPEROR.

EMPIRIC, an appellation given to thoſe phyſicians who conduct themſelves wholly by their own experience, without ſtudying phyſic in a regular way. Some even uſe the term, in a ſtill worſe ſenſe, for a quack who preſcribes at random, without being at all acquainted with the principles of the art.

EMPIS, in zoology, a genus of inſects belonging to the order of diptera. The beak is horny, inflected, conſiſts of two valves, and is longer than the thorax. There are five ſpecies, principally diſtinguiſhed by their colour.

EMPRESS, the ſpouſe of an emperor, or a woman who governs an empire. See EMPEROR.

EMPROSTHOTONOS, a ſpecies of convulſion, wherein the head bends forward. See MEDICINE.

EMPYREMA, in medicine, a diſorder wherein purulent matter is contained in the thorax or breaſt, after an inflammation and ſuppuration of the lungs and pleura. See MEDICINE, and SURGERY.

EMPYREUM, a term uſed by divines for the higheſt heaven, where the bleſſed enjoy the beatific viſion.

EMPYREUMA, among chemiſts and phyſicians, the fiery taſte or offenſive ſmell which brandies, and other bodies prepared by fire, are impregnated with. See CHEMISTRY.

EMRODS. See HÆMORRHOIDS.

EMULGENT, or RENAL ARTERIES. See ANATOMY, Part III.

EMULSION, a ſoft liquid remedy, of a colour and conſiſtence reſembling milk. See CHEMISTRY.

EMUNCTORY, in anatomy, a general term for all thoſe parts which ſerve to carry off the excrementitious parts of the blood and other humours of the body. Such more eſpecially are the kidneys, bladder, and moſt of the glands. See ANATOMY.

ENÆMON, in medicine, an epithet often applied by Hippocrates and Galen, to ſuch topical medicines as are appropriated to a wound newly inflicted, before the blood be ſtopped.

ENÆOREMA, in medicine, that pendulous ſubſtance which floats in the urine. It is alſo called ſublimamentum and nubeculæ, from its reſemblance to little clouds.

ENALLAGE, in grammar, is when one word is ſubſtituted for another of the ſame part of ſpeech: a ſubſtantive for an adjective, as *exercitus victor*, for *victorioſus*; *ſcelus*, for *ſceleſtus*.

ENAMEL, a kind of coloured glaſs, uſed in enamelling and painting in enamel.

Enamels have for their baſis a pure cryſtal glaſs or frit, ground up with a fine calx of lead and tin prepared for the purpoſe, with the addition uſually of white ſalt of tartar. Theſe ingredients baked together, are the matter of all enamels, which are made by adding colours of this or that kind in powder to this matter, and melting or incorporating them together in a furnace.

For white enamel, Neri (De Arte Vitriar.) directs only manganeſe to be added to the matter which conſtitutes the baſis. For azure, zaffer mixed with calx of braſs. For green, calx of braſs with ſcales of iron, or with crocus martis. For black, zaffer with manganeſe, or with crocus martis; or manganeſe with tartar. For red, manganeſe, or calx of copper and red tartar. For purple, manganeſe with calx of braſs. For yellow, tartar and manganeſe. And for violet-coloured enamel, manganeſe with thrice-calcined braſs.

In making theſe enamels, the following general cautions are neceſſary to be obſerved. 1. That the pots muſt be glazed with white glaſs, and muſt be ſuch as will bear the fire. 2. That the matter of enamels muſt be very nicely mixed with the colours. 3. When the enamel is good, and the colour well incorporated, it muſt be taken from the fire with a pair of tongs. 4. The general way of making the coloured enamel is this: powder, ſift, and grind all the colours very nicely, and firſt mix them with one another, and then with the common matter of enamels: then ſet them in pots in a furnace, and when they are well mixed and incorporated,

incorporated, caſt them into water; and when dry, ſet them in a furnace again to melt; and when melted, take a proof of it. If too deep-coloured, add more of the common matter of enamels; and if too pale, add more of the colours.

Enamels are uſed either in counterfeiting or imitating precious ſtones, in painting in enamel; or by enamellers, jewellers, and goldſmiths, in gold, ſilver, and other metals. The two firſt kinds are uſually prepared by the workmen themſelves, who are employed in theſe arts. That uſed by jewellers, *&c.* is brought to us chiefly from Venice or Holland, in little cakes of different ſizes, commonly about four inches diameter, having the mark of the maker ſtruck upon it with a puncheon. It pays the pound 1 s. 7 $\frac{41}{100}$ d. on importation, and draws back 1 s. 5 $\frac{70}{100}$ d. at the rate of 4 s. per pound.

ENAMELLING, the art of laying enamel upon metals, as gold, ſilver, copper, *&c.* and of melting it at the the fire, or of making divers curious works in it at a lamp. It ſignifies alſo to paint in enamel.

The method of painting in ENAMEL. This is performed on plates of gold or ſilver, and moſt commonly of copper, enamelled with the white enamel; whereon they paint with colours which are melted in the fire, where they take a brightneſs and luſtre like that of glaſs. This painting is the moſt prized of all for its peculiar brightneſs and vivacity, which is very permanent, the force of its colours not being effaced or ſullied with time, as in other painting, and continuing always as freſh as when it came out of the workman's hands. It is uſual in miniature, it being the more difficult the larger it is, by reaſon of certain accidents it is liable to in the operation. Enamelling ſhould only be practiſed on plates of gold, the other metals being leſs pure: copper, for inſtance, ſcales with the application, and yields fumes; and ſilver turns the yellows white. Nor muſt the plate be made flat; for in ſuch caſe, the enamel cracks; to avoid which, they uſually forge them a little round or oval, and not too thick. The plate being well and evenly forged, they uſually begin the operation by laying on a couch of white enamel (as we obſerved above) on both ſides, which prevents the metal from ſwelling and bliſtering; and this firſt lay ſerves for the ground of all the other colours. The plate being thus prepared, they begin at firſt by drawing out exactly the ſubject to be painted with red vitriol, mixed with oil of ſpike, marking all parts of the deſign very lightly with a ſmall pencil. After this, the colours (which are to be before ground with water in a mortar of agate extremely fine, and mixed with oil of ſpike ſomewhat thick) are to be laid on, obſerving the mixtures and colours that agree to the different parts of the ſubject; for which it is neceſſary to underſtand painting in miniature. But here the workman muſt be very cautious of the good or bad qualities of the oil of ſpike he employs to mix his colours with, for it is very ſubject to adulterations. See OIL.

Great care muſt likewiſe be taken, that the leaſt duſt imaginable come not to your colours while you are either painting or grinding them; for the leaſt ſpeck, when it is worked up with it, and when the work comes to be put into the reverberatory to be red-hot, will leave a hole, and ſo deface the work.

When the colours are all laid, the painting muſt be gently dried over a ſlow fire to evaporate the oil, and the colours afterwards melted to incorporate them with the enamel, making the plate red-hot in a fire like what the enamellers uſe. Afterwards that part of the painting muſt be paſſed over again which the fire hath any thing effaced, ſtrengthening the ſhades and colours, and committing it again to the fire, obſerving the ſame method as before, which is to be repeated till the work be finiſhed.

Method of ENAMELLING *by the lamp.* Moſt enamelled works are wrought at the fire of a lamp, in which, inſtead of oil, they put melted horſe-greaſe, which they call caballine oil. The lamp, which is of copper or white iron, conſiſts of two pieces, in one of which is a kind of oval plate, ſix inches long, and two high, in which they put the oil and the cotton. The other part, called the box, in which the lamp is incloſed, ſerves only to receive the oil which boils over by the force of the fire. This lamp, or, where ſeveral artiſts work together, two or three more lamps are placed on a table of proper height. Under the table, about the middle of its height, is a double pair of organ-bellows, which one of the workmen moves up and down with his foot, to quicken the ſlame of the lamps, which are by this means excited to an incredible degree of vehemence. Grooves made with a gauge in the upper part of the table, and covered with parchment, convey the wind of the bellows to a pipe of glaſs before each lamp; and that the enamellers may not be incommoded with the heat of the lamp, every pipe is covered at ſix inches diſtance with a little tin plate, fixed into the table by a wooden handle. When the works do not require a long blaſt, they only uſe a glaſs pipe, into which they blow with their mouth.

It is incredible to what a degree of fineneſs and delicacy the threads of enamel may be drawn at the lamp. Thoſe which are uſed in making falſe tufts of feathers are ſo fine, that they may be wound on the reel like ſilk or thread. The fictitious jets of all colours, uſed in embroideries, are alſo made of enamel; and that with ſo much art, that every ſmall piece hath its hole to paſs the thread through wherewith it is ſewed. Theſe holes are made by blowing them into long pieces, which they afterwards cut with a proper tool.

It is ſeldom that the Venetian or Dutch enamels are uſed alone; they commonly melt them in an iron-ladle, with an equal part glaſs or cryſtal; and when the two matters are in perfect fuſion, they draw it out into threads of different ſizes, according to the nature of the work. They take it out of the ladle while liquid, with two pieces of broken tobacco pipes, which they extend from each other at arm's length. If the thread is required ſtill longer, then another workman holds one end, and continues to draw it out, while the firſt holds the enamel to the flame. Thoſe threads, when cold,

cold, are cut into what lengths the workman thinks fit, but commonly from ten to twelve inches; and as they are all round, if they are required to be flat, they muſt be drawn through a pair of pincers while yet hot. They have alſo another iron inſtrument in form of pincers, to draw out the enamel by the lamp when it is to be worked and diſpoſed in figures. Laſtly, they have glaſs-tubes of various ſizes, ſerving to blow the enamel into various figures, and preſerve the neceſſary vacancies therein; as alſo to ſpare the ſtuff, and form the contours. When the enameller is at work, he ſits before his lamp with his foot on the ſtep that moves on the bellows; and holding in his left hand the work to be enamelled, or the braſs or iron-wires the figures are to be formed on, he directs with his right the enamel thread, which he holds to the flame with a management and patience equally ſurpriſing. There are few things they cannot make or repreſent with enamel; and ſome figures are as well finiſhed, as if done by the moſt ſkilful carvers.

ENARTHROSIS, in anatomy, a ſpecies of diarthroſis. See ANATOMY, Part I.

ENCÆNIA, the name of three ſeveral feaſts celebrated by the Jews in memory of the dedication, or rather purification, of the temple, by Judas Maccabæus, Solomon, and Zorobabel.

This term is likewiſe uſed in church-hiſtory for the dedication of Chriſtian churches.

ENCAMPMENT, the pitching of a camp. See CAMP.

ENCANTHIS, in ſurgery, a tubercle ariſing either from the caruncula lacrymalis, or from the adjacent red ſkin; ſometimes ſo large, as to obſtruct not only the puncta lacrymalia, but alſo part of the ſight, or pupil itſelf. See SURGERY.

ENCAUSTIC and ENCAUSTUM, the ſame with enamelling and enamel. See ENAMELLING, and ENAMEL.

ENCEINTE, in fortification, is the wall or rampart which ſurrounds a place, ſometimes compoſed of baſtions or curtains, either faced or lined with brick or ſtone, or only made of earth. The enceinte is ſometimes only flanked by round or ſquare towers, which is called a Roman wall.

ENCEPHALI, in medicine, worms generated in the head, where they cauſe ſo great a pain, as ſometimes to occaſion diſtraction.

ENCEPPE', in heraldry, denotes fettered, chained, or girt about the middle, as is uſual with monkeys.

ENCHANTER, a perſon ſuppoſed to practiſe enchantment or faſcination. See FASCINATION, WITCHCRAFT, *&c.*

ENCHANTER'S NIGHTSHADE, in botany. See CIRCÆA.

ENCHASING, INCHASING, or CHASING, the art of enriching and beautifying gold, ſilver, and other metalwork, by ſome deſign or figures repreſented thereon in low relievo.

Enchaſing is practiſed only on hollow thin works, as watch-caſes, cane-heads, tweezer-caſes, or the like. It is performed by punching or driving out the metal, to form a figure, from with-inſide, ſo as to ſtand out prominent from the plane or ſurface of the metal. In order to this, they provide a number of fine ſteel blocks, or puncheons, of divers ſizes; and the deſign being drawn on the ſurface of the metal, they apply the inſide upon the heads or tops of theſe blocks, directly under the lines or parts of the figures; then, with a fine hammer, ſtriking on the metal, ſuſtained by the block, the metal yields, and the block makes an indenture or cavity on the inſide, correſponding to which there is a prominence on the outſide, which is to ſtand for that part of the figure.

Thus the workmen proceeds to chaſe and finiſh all the parts by ſucceſſive application of the block and hammer to the ſeveral parts of the deſign. And it is wonderful to conſider with what beauty and juſtneſs, by this ſimple piece of mechaniſm, the artiſts in this kind will repreſent foliages, groteſques, animals, hiſtories, *&c.*

ENCHYSMA, in medicine, the ſame with enema. See ENEMA.

ENCLITICA, in grammar, particles which are ſo cloſely united with other words, as to ſeem part of them, as in *virumque*, *&c.*

There are three enclitic particles in Latin, viz. *que*, *ne*, *ve*.

ENCRATITES, in church-hiſtory, heretics who appeared towards the end of the ſecond century: they were called Encratites, or Continentes, becauſe they gloried in abſtaining from marriage and the uſe of wine and animal-food.

ENCYCLOPÆDIA. See CYCLOPÆDIA, and DICTIONARY.

ENDECERIS, in antiquity, denotes a veſſel or galley with eleven tires of oars.

ENDEMIC, or ENDEMICAL DISEASES, thoſe to which the inhabitants of particular countries are ſubject more than others, on account of the air, water, ſituation, and manner of living.

ENDIVE, in botany. See CICHORIUM.

ENDLESS, ſomething without an end: thus authors mention endleſs rolls, the endleſs ſcrew, *&c.*

ENDORSE, in heraldry, an ordinary, containing the eighth part of a pale, which Leigh ſays is only uſed when a pale is between two of them.

ENDORSED, in heraldry, is ſaid of things borne back to back, more uſually called adoſsé. See ADOSSE'.

ENDOWMENT, in law, denotes the ſettling a dower on a woman; though ſometimes it is uſed figuratively, for ſettling a proviſion upon a parſon, on the building of a church; or the ſevering a ſufficient portion of tithes for a vicar, when the benefice is appropriated.

ENEMA, in medicine. See CLYSTER.

ENEMY, in law, an alien or foreigner, who publicly invades the kingdom.

ENERGUMENS, in church-hiſtory, perſons ſuppoſed to be poſſeſſed by the devil, concerning whom there were many regulations among the primitive Chriſtians. They were denied baptiſm, and the euchariſt; at leaſt, this was the practice of ſome churches: and though they were under the care of exorciſts, yet it was thought

thought a becoming act of charity to let them have the public prayers of the church, at which they were permitted to be present. See Exorcism.

ENERGY, a term of Greek origin, signifying the power, virtue, or efficacy of a thing. It is also used, figuratively, to denote emphasis of speech.

ENFILADE, in the art of war, is used in speaking of trenches, or other places, which may be scoured by the enemy's shot along their whole length. In conducting the approaches at a siege, care must be taken that the trenches be not enfiladed from any work of the place. See Trenches.

ENFRANCHISEMENT, in law, the incorporating a person into any society or body politic.

ENGASTRIMYTHI, in Pagan theology, the Pythians, or priestesses of Apollo, who delivered oracles from within, without any action of the mouth or lips.

The ancient philosophers, *&c.* are divided upon the subject of the engastrimythi. Hippocrates mentions it as a disease. Others will have it a kind of divination. Others attribute it to the operation or possession of an evil spirit. And others to art and mechanism. M. Scottus maintains that the engastrimythi of the ancients were poets, who, when the priests could not speak, supplied the defect by explaining in verse what Apollo dictated in the cavity of the bason on the sacred tripod.

ENGENDERING, a term sometimes used for the act of producing or forming any thing: thus meteors are said to be engendered in the middle region of the atmosphere, and worms in the belly. See Generation.

ENGERS, the capital of a county of the same name, in Germany, situated on the river Rhine, about seven miles north of Coblentz

ENGHIEN, a city of Hainalt, about fourteen miles south-west of Brussels.

ENGINA, an island on the north-east of the Morea, about fifty miles east of Corinth.

ENGINE, in mechanics, is a compound machine, made of one or more mechanical powers, as levers, pullies, screws, *&c.* in order to raise, cast, or sustain any weight, or produce any effect which could not be easily effected otherwise. See Mechanics.

Engine *for extinguishing fires*. See Hydrostatics, and Hydraulics.

Pile-Engine, one contrived for driving piles. See Mechanics.

Steam-Engine, a machine to raise water by fire, or rather by the force of water turned into steam. See Hydrostatics, and Hydraulics.

ENGINEER, in the military art, an able expert man, who, by a perfect knowledge in mathematics, delineates upon paper, or marks upon the ground, all sorts of forts, and other works proper for offence and defence. He should understand the art of fortification, so as to be able, not only to discover the defects of a place, but to find a remedy proper for them; as also how to make an attack upon, as well as to defend, the place. Engineers are extremely necessary for these purposes: wherefore it is requisite that, besides being ingenious, they should be brave in proportion. When at a siege the engineers have narrowly surveyed the place, they are to make their report to the general, by acquainting him which part they judge the weakest, and where approaches may be made with most success. Their business is also to delineate the lines of circumvallation and contravallation, taking all the advantages of the ground; to mark out the trenches, places of arms, batteries, and lodgments, taking care that none of their works be flanked or discovered from the place. After making a faithful report to the general of what is a-doing, the engineers are to demand a sufficient number of workmen and utensils, and whatever else is necessary.

ENGLAND, the southern division of Great Britain, situated in the Atlantic ocean, between 2° E. and 6° W. longitude, and between 49° 55′ and 55° 55′ N. latitude.

There are in England, including Wales, fifty-two counties, two archbishoprics, twenty-four bishoprics, two universities, twenty-nine cities, upwards of eight hundred towns, and near ten thousand parishes; supposed to contain about 7,000,000 of people.

New England, comprehending the colonies of Massachusets, New Hampshire, Connecticut, Rhode-island, and Providence-Plantation, is situated between 67° and 73° W. longitude, and between 41° and 45° N. latitude

ENGLISH, or the English tongue, the language spoken by the people of England, and, with some variation, by those of Scotland, as well as part of Ireland, and the rest of the British dominions.

The ancient language of Britain is generally allowed to have been the same with the Gaulic, or French; this island, in all probability, having been first peopled from Gallia, as both Cæsar and Tacitus affirm, and prove by many strong and conclusive arguments, as by their religion, manners, customs, and the nearness of their situation. But now we have very small remains of the ancient British tongue, except in Wales, Cornwall, the islands and highlands of Scotland, part of Ireland, and some provinces of France; which will not appear strange, when what follows is considered.

Julius Cæsar, some time before the birth of our Saviour, made a descent upon Britain, though he may be said rather to have discovered than conquered it; but, about the year of Christ 45, in the time of Claudius, Aulus Plautius was sent over with some Roman forces, by whom two kings of the Britons, Codigunus and Caractacus, were both overcome in battle: whereupon a Roman colony was planted at Malden in Essex, and the southern parts of the island were reduced to the form of a Roman province: after that, the island was conquered as far north as the friths of Dumbarton and Edinburgh, by Agricola, in the time of Domitian; whereupon, a great number of the Britons, in the conquered part of the island, retired to the west part called Wales, carrying their language with them.

The greatest part of Britain being thus become a Roman province, the Roman legions, who resided in Britain for above two hundred years, undoubtedly disseminated

ſeminated the Latin tongue; and the people being afterwards governed by laws written in Latin, muſt neceſſarily make a mixture of languages. This ſeems to have been the firſt mutation the language of Britain ſuffered.

Thus the Britiſh tongue continued, for ſome time, mixed with the provincial Latin, till, the Roman legions being called home, the Scots and Picts took the opportunity to attack and harraſs England: upon which, K. Vortigen, about the year 440, called the Saxons to his aſſiſtance, who came over with ſeveral of their neighbours, and having repulſed the Scots and Picts, were rewarded for their ſervices with the iſle of Thanet, and the whole county of Kent; but growing too powerful, and not being contented with their allotment, diſpoſſeſſed the inhabitants of all the country on this ſide of the Severn: thus the Britiſh tongue was in a great meaſure deſtroyed, and the Saxon introduced in its ſtead.

What the Saxon tongue was long before the conqueſt, about the year 700, we may obſerve in the moſt ancient manuſcripts of that language, which is a gloſs on the Evangeliſts, by biſhop Edfrid, in which the three firſt articles of the Lord's prayer runs thus.

" Uren fader thic arth in heofnas, ſic gehalgud thin " noma, ſo cymeth thin ric. Sic thin willa ſue is " heofnas, and in eortho, *&c.*"

In the beginning of the ninth century the Danes invaded England; and getting a footing in the northern and eaſtern part of the country, their power gradually increaſed, and they became ſole maſters of it in about two hundred years. By this means the ancient Britiſh obtained a tincture of the Daniſh language: but their government being of no long continuance, did not make ſo great an alteration in the Anglo-Saxon, as the next revolution, when the whole land, *A. D.* 1067, was ſubdued by William the Conqueror, duke of Normandy in France: for the Normans, as a monument of their conqueſt, endeavoured to make their language as generally received as their commands, and thereby rendered the Britiſh language an entire medley.

About the year 900, the Lord's prayer, in the ancient Anglo-Saxon, ran thus:

" Thue ur fader the eart on heofenum, ſi thin na-" ma gehalgod; cume thin rice ſi thin willa on eorthan " ſwa, ſwa on heofenum, *&c.*"

About the year 1160, under Henry II. it was rendered thus by pope Adrian, an Engliſhman, in rhyme:

" Ure fader in heaven riche,
" Thy name be halyed ever lich,
" Thou bring us thy michell bliſſe:
" Als hit in heaven y-doe,
" Evar in yearth beene it alſo, *&c.*"

Dr Hicks gives us an extraordinary ſpecimen of the Engliſh, as ſpoken in the year 1385, upon the very ſubject of the Engliſh tongue.

" As it is knowe how meny maner peple beeth in " this lond; ther beeth alſo ſo many dyvers longages " and tonges. Nothelefs Walſchemen and Scots that " beeth nought medled with other nation, holdeth wel " nyh hir firſte longage and ſpeche; but yif the Scottes, " that were ſometime confederate and woned with the " Pictes, drawe ſomewhat after hir ſpeche; but the " Flemynges, that woneth on the weſte ſide of Wales, " haveth loſt her ſtrange ſpech, and ſpeketh Sexon-" liche now. Alſo Engliſhemen, they had from the " bygynnynge thre maner ſpeche: northerne, ſou-" therne, and middel ſpeche in the middel of the " lond, as they come of thre maner of peple of Ger-" mania: nothelefs by commyxtion and mellynge firſt " with Danes, and afterwards with Normans, in meny " the contrary longage is apayred (*corrupted.*)

" This apayrynge of the burth of the tunge is bycauſe " of tweie thinges; oon is for children in ſcole agenſt " the uſuage and maner of all other nations, beeth " compelled for to leve hire own longage, and for to " conſtrue hir leſſons and here thynges in French, and " ſo they haveth ſethe Normans come firſt into Enge-" lond. Alſo gentlemen children beeth taught to " ſpeke Frenſche from the tyme that they beeth rok-" ked in here cradel, and kunneth ſpeke and play " with a childes broche; and uplondiſſche men will " lykne hymſelf to gentilmen, and fondeth with great " beſyneſſe for to ſpeak Frenſche to be told of.—Hit " ſeemeth a greet wonder how Engliſchemen and her " own longage and tonge is ſo dyverſe of ſown in this " oon ilond: and the longage of Normandie is com-" lynge of another lond, and hath oon maner ſoun " amonge alle men that ſpeketh hit arigt in Engelond. " Alſo of the foreſaid Saxon tonge that is deled (*di-" vided*) a three, and is abide ſcarceliche with fewe " uplondiſſche men is greet wonder. For men of the " eſt, with men of the weſt, is, as it were, undir " the ſame partie of hevene acordeth more in ſown-" ynge of ſpeche, than men of the north, with men " of the ſouth. Therefore it is that Mercii, that " beeth men of myddel Engelond, as it were, par-" teners of the endes, underſtondeth bettre the ſide " longages northerne and ſoutherne, than northerne or " ſoutherne underſtondeth either other.—All the lon-" gage of the Northumbers and ſpechialliche at York, " is ſo ſcharp, ſlitting and frotynge, and unſchape, that " we ſoutherne men may that longage unnethe un-" derſtonde, *&c.*" *Hicks's Theſaur. liter. ſept.*

In the year 1537, the Lord's prayer was printed as follows: " O oure Father which arte in heven, ha-" lowed be thy name: let thy kingdome come, thy " will be fulfiled as well in erth as it is in heven; " geve us this daye in dayly bred, *&c.*" Where it may be obſerved that the diction is brought almoſt to the preſent ſtandard, the chief variations being only in the orthography. By theſe inſtances, and many others that might be given, it appears, that the Engliſh Saxon language, of which the Normans deſpoiled us in a great meaſure, had its beauties, was ſignificant and emphatical, and preferable to what they impoſed on us. " Great, verily," ſays Camden, " was the glory of our " tongue before the Norman conqueſt, in this, that the " old Engliſh could expreſs, moſt aptly, all the concep-" tions of the mind in their own tongue, without bor-" rowing from any." Of this he gives ſeveral examples.

Having

Having thus ſhewn how the ancient Britiſh language was in a manner extirpated by the Romans, Danes, and Saxons, and ſucceeded by the Saxon, and after that the Saxon blended with the Norman French, we ſhall now mention two other cauſes of change in the language: the firſt of theſe is owing to the Britons having been a long time a trading nation, whereby offices, dignities, names of wares, and terms of traffic are introduced, which we take with the wares from the perſons of whom we have them, and form them anew, according to the genius of our own tongue; and beſides this change in the language, ariſing from commerce, Britain's having been a conſiderable time ſubject to the ſee of Rome, in eccleſiaſtical affairs, muſt unavoidably introduce ſome Italian words among us. Secondly, as to the particular properties of a language, our tongue has undergone no ſmall mutation, or rather has received no ſmall improvement upon that account: for, as to the Greek and Latin, the learned have, together with the arts and ſciences now rendered familiar among us, introduced abundance; nay, almoſt all the terms of art in the mathematics, philoſophy, phyſic, and anatomy; and we have entertained many more from the Latin, French, *&c.* for the ſake of neatneſs and elegancy: ſo that, at this day, our language, which about 1800 years ago, was the ancient Britiſh, or Welch, *&c.* is now a mixture of Saxon, Teutonic, Dutch, Daniſh, Norman, and modern French, embelliſhed with the Greek and Latin. Yet this, in our opinion, is ſo far from being a diſadvantage to the Engliſh tongue, as now ſpoke (for all languages have undergone changes, and do continually participate with each other) that it has ſo enriched it, as now to become the moſt copious, ſignificant, fluent, courteous, and maſculine language in Europe, if not in the world.

ENGRAFTING, or GRAFTING, in gardening. See GARDENING.

ENGRAILED, or INGRAILED, in heraldry, a term derived from the French *greſly*, hail; and ſignifying a thing the hail has fallen upon and broke off the edges, leaving them ragged, or with half-rounds, or ſemicircles, ſtruck out of their edges.

ENGRAVING, the art of cutting metals and precious ſtones, and repreſenting thereon figures, letters, or whatever device, or deſign, the artiſt fancies.

Engraving, properly a branch of ſculpture, is divided into ſeveral other branches, according to the matter whereon it is employed, and the manner of performing it.

The original way of engraving on wood is denominated at preſent, with us, by cutting in wood; that on metals with aquafortis, is named etching; that by the knife, burniſher, punch, and ſcraper, is called mezzotinto; that on ſtones for tombs, *&c.* ſtone-cutting; and that performed with the graver on metals or precious ſtones, keeps alone the primitive name of engraving, being that which we ſhall at preſent attend to.

ENGRAVING *on copper*, is employed in repreſenting portraits, hiſtories, landſkips, foliages, figures, buildings, *&c.* either after paintings, or deſigns for that purpoſe.

It is performed with the graver on a plate of copper, which, being well poliſhed, is covered over thinly with virgin-wax, and then ſmoothed, while warm, with a feather, ſo that the wax be of an equal thickneſs on the plate; and on this the draught or deſign, done in black lead, red chalk, or ungummed ink, is laid with the face of the drawing on the wax: then they rub the backſide, which will cauſe the whole deſign of the drawing to appear on the wax. The deſign, thus transferred, is traced through on the copper, with a point, or needle; then heating the plate, and taking off the wax, the ſtrokes remain to be followed, heightened, *&c.* according to the tenor of the deſign, with the graver, which muſt be very ſharp and well pointed.

In the conduct of the graver conſiſts almoſt all the art, which depends not ſo much upon rules as upon practice, the habitude, diſpoſition, and genius of the artiſt, the principles of engraving being the ſame with thoſe of painting; for if an engraver be not a perfect maſter of deſign, he can never hope to arrive at a degree of perfection in this art. In conducting the ſtrokes, or cuts, of the graver, he muſt obſerve the action of the fingers, and of all their parts, with their outlines; and remark how they advance towards, or fall back from his ſight, and then conduct his graver according to the riſings or cavities of the muſcles, or folds, widening the ſtrokes in the light, and contracting them in the ſhades; as alſo at the extremity of the outlines, to which he ought to conduct the cuts of the graver, that the figures or objects repreſented may not appear as if they gnawn; and lightening his hand, that the outlines may be perfectly ſound, without appearing cut or ſlit; and, although his ſtrokes neceſſarily break off where a muſcle begins, yet they ought always to have a certain connection with each other, ſo that the firſt ſtroke ſhould often ſerve to make the ſecond, becauſe this will ſhew the freedom of the graver.

If hair be the ſubject, let the engraver begin his work by making the outlines of the principal locks, and ſketch them out in a careleſs manner, which may be finiſhed, at leiſure, with finer and thinner ſtrokes to the very extremities.

The engraver muſt avoid making very acute angles, eſpecially in repreſenting fleſh, when he croſſes the firſt ſtrokes with the ſecond, becauſe it will form a very diſagreeable piece of tabby-like lattice-work except in the repreſentation of ſome clouds, in tempeſts, the waves of the ſea, and in repreſentations of ſkins of hairy animals, and leaves of trees. So that the medium between ſquare and acute ſeems to be the beſt and moſt agreeable to the eye. He that would repreſent ſculpture, muſt remember, that as ſtatues, *&c.* are moſt commonly made of white marble, or ſtone, whoſe colour does not produce ſuch dark ſhades as other matters do, they have no black to their eyes, nor hair of the head and beard flying in the air. If the engraver would

would preferve one quality and harmony in his works, he fhould always fketch out the principal objects of his piece before any part of them are finifhed.

The inftruments neceffary for this fort of engraving are, befides a graver, a cufhion, or fand-bag, made of leather, to lay the plate on, in order to give it the neceffary turns and motions; a burnifher made of iron, or fteel, round at one end, and ufually flattifh at the other, to rub out flips and failures, foften the ftrokes, *&c.*; a fcraper, to pare off the furface, on occafion; and a rubber, of a black hat, or cloth rolled up, to fill up the ftrokes that they may appear the more vifible.

In ENGRAVING *precious ftones*, they ufe either the diamond, or the emery. The diamond, which is the hardeft of all ftones, is only cut by itfelf, or with its own matter. The firft thing to be done in this branch of engraving, is to cement two rough diamonds to the ends of two fticks big enough to hold them fteady in the hand, and to rub or grind them againft each other till they be brought to the form defired. The duft or powder that is rubbed off ferves afterwards to polifh them, which is performed with a kind of mill that turns a wheel of foft iron. The diamond is fixed in a brafs difh, and, thus applied to the wheel, is covered with diamond-duft, mixt up with oil of olives; and when the diamond is to be cut facet-wife, they apply firft one face, then another, to the wheel. Rubies, fapphires, and topazes, are cut and formed the fame way on a copper wheel, and polifhed with tripoli diluted in water. As to agates, amethyfts, emeralds, hyacinths, granates, rubies, and others of the fofter ftones, they are cut on a leaden wheel, moiftened with emery and water, and polifhed with tripoli, on a pewter wheel Lapis-lazuli, opal, *&c.* are polifhed on a wooden wheel. To fafhion and engrave vafes of agate, cryftal, lapis-lazuli, or the like, they make ufe of a kind of lathe, like that ufed by pewterers to hold the veffels, which are to be wrought with proper tools; that of the engraver generally holds the tools, which are turned by a wheel; and the veffel is held to them to be cut and engraved, either in relievo or otherwife; the tools being moiftened, from time to time, with diamond-duft and oil, or at leaft emery and water. To engrave figures or devices on any of thefe ftones, when polifhed, fuch as medals, feals, *&c.* they ufe a little iron wheel, the ends of whofe axis are received within two pieces of iron, placed upright, as in the turner's lathe; and to be brought clofer, or fet further apart, at pleafure: at one end of the axis are fitted the proper tools, being kept tight by a fcrew. Laftly, The wheel is turned by the foot, and the ftone applied by the hand to the tool, and is fhifted and conducted as occafion requires.

The tools are generally of iron, and fometimes of brafs; their form is various, but it generally bears fome refemblance to chiffels, gouges, *&c.* Some have fmall round heads, like buttons, others like ferrels, to take the pieces out, and others flat, *&c.* when the ftone has been engraven, it is polifhed on wheels of hair-brufhes and tripoli.

ENGRAVING *on fteel* is chiefly employed in cutting feals, punches, matrices, and dyes proper for ftriking coins, medals, and counters. The method of engraving with the inftruments, *&c.* is the fame for coins as for medals and counters: All the difference confifts in their greater or lefs relievo, the relievo of coins being much lefs confiderable than that of medals, and that of counters ftill lefs than that of coins.

Engravers in fteel commonly begin with punches, which are in relievo, and ferve for making the creux, or cavities, of the matrices and dyes: though fometimes they begin with the creux, or hollownefs, but then it is only when the intended work is to be cut very fhallow. The firft thing done, is that of defigning the figures; the next is the moulding them in wax, of the fize and depth they are to lie, and from this wax the punch is engraven When the punch is finifhed, they give it a very high temper, that it may the better bear the blows of the hammer with which it is ftruck to give the impreffion to the matrix.

The fteel is made hot to foften it, that it may the more readily take the impreffion of the punch; and after ftriking the punch on it, in this ftate, they proceed to touch up or finifh the ftrokes and lines, where by reafon of their finenefs or the too great relievo they are any thing defective, with fteel gravers of different kinds, chiffels, flatters, *&c.* being the principal inftruments ufed in graving on fteel.

The figure being thus finifhed, they proceed to engrave the reft of the medal, as the mouldings of the border, the engrailed ring, letters, *&c.* with little fteel punches, well tempered, and very fharp.

ENGUICHE', in heraldry, is faid of the great mouth of a hunting horn, when its rim is of a different colour from that of the horn itfelf.

ENGYSCOPE, the fame with microfcope. See MICROSCOPE.

ENHARMONIC, in the ancient mufic, one of their genera or kinds of mufic, fo called from its fuperior excellence; though wherein it confifted, fays Mr Malcom, is hard to fay: it was allowed by all to be fo very difficult, that few could ever practife it.

ENHYDRUS, in natural hiftory, a genus of fiderochita or cruftated ferrugineous bodies, formed in large and in great part empty cafes, inclofing a fmall quantity of an aqueous fluid.

Of this genus there are only two fpecies: 1. The thick-fhelled enhydrus, with black, reddifh-brown, and yellow crufts, 2. The thinner fhelled kind, with yellowifh-brown and purple crufts; neither of which ferments with aqua fortis, or gives fire with fteel.

ENIXUM, among chemifts, a kind of neutral falt, generated of an acid and an alkali.

The fal enixum of Paracelfus, is the caput mortuum of fpirits of nitre with oil of vitriol, or what remains in the retort after the diftillation of this fpirit; being of a white colour, and pleafing acid tafte.

ENMANCHE', in heraldry, is when lines are drawn from the centre of the upper edge of the chief to the fides, to about half the breadth of the chief; fignifying

fying sleeved, or resembling a sleeve, from the French *manche*.

ENNEAGON, in geometry, a polygon with nine sides. See POLYGON.

ENNEAHEDRIA, in natural history, a genus of columnar, crystalliform, and double-pointed spars, composed of a trigonal column, terminated at each end by a trigonal pyramid.

Of this genus there are several species, distinguished by the length or shortness of the column and pyramids, none of which will give fire with steel, but all of them ferment with aqua fortis. See SPAR.

ENNEANDRIA, in botany. See BOTANY, p. 635. and Plate LIII. fig. 9.

ENS, among metaphysicians, denotes entity, being, or existence: this the schools call *ens reale*, and *ens positivum*, to distinguish it from their *ens rationis*, which is only an imaginary thing, or exists only in the imagination.

ENS, among chemists, imports the power, virtue, and efficacy which certain substances exert upon our bodies.

ENS, in geography, a city of Germany, situated at the confluence of the Danube and the river Ens, about eighty miles south of Vienna: E. long. 14° 20′, N. lat. 48° 16′.

ENSEELED, in falconry, is said of a hawk that has a thread drawn through her upper eye-lid, and made fast under her beak, to take away the sight.

ENSIGN, in the military art, a banner under which the soldiers are ranged according to the different companies or parties they belong to.

ENSIGN is also the officer that carries the colours, being the lowest commissioned officer in a company of foot, subordinate to the captain and lieutenant.

ENSISHEIM, a town of Germany, in the landgraviate of Alsace, about fifty miles south of Strasburg: E. long. 7° 30′, N. lat. 47° 50′.

ENSKIRKEN, a town of Germany, fifteen miles south-west of Cologn.

ENTABLATURE, or ENTABLEMENT, in architecture, is that part of an order of a column which is over the capital, and comprehends the architrave, frieze, and corniche. See ARCHITECTURE.

ENTABLER, in the menage, the fault of a horse whose croupe goes before his shoulders in working upon volts; which may be prevented by taking hold of the right rein, keeping your right leg near, and removing your left leg as far from the horse's shoulder as possible.

This is always accompanied with another fault called aculer. See ACULER.

ENTAIL. See TAILZIE.

ENTE′, in heraldry, a method of marshalling. more frequent abroad than with us, and signifying grafted or ingrafted.

We have, indeed, one instance of enté in the fourth grand quarter of his majesty's royal ensign, whose blazon is Brunswick and Lunenburg impaled with ancient Saxony, *enté en pointé*, grafted in point.

ENTELECHIA, a word used by Aristotle to express the soul, and which, not occurring in any other author, has given the commentators upon that philosopher great trouble to discover its true meaning.

ENTEROCELE, in surgery, a tumor formed by a prolapsion of the intestines through the rings of the abdomen, and processes of the peritonæum, into the scrotum. See SURGERY.

ENTEROLOGY, a term used by physicians, for a discourse or treatise on the contents of the head, breast, and abdomen.

ENTEROMPHALUS, the same with a hernia umbilicalis, or rupture at the navel.

ENTERSOLE, in architecture, a kind of little story, sometimes called a mezanzine, contrived occasionally at the top of the first story, for the conveniency of a wardrobe, *&c.*

ENTHUSIASM, a transport of the mind, whereby it is led to think and imagine things in a sublime, surprising, yet probable manner. This is the enthusiasm felt in poetry, oratory, music, painting, sculpture, *&c.*

ENTHUSIASM, in a religious sense, implies a transport of the mind, whereby it fancies itself inspired with some revelation, impulse, *&c.* from heaven.

ENTHUSIAST, a person possessed with enthusiasm. See the preceding article.

ENTHYMEME, among logicians, denotes a syllogism, perfect in the mind, but imperfect in the expression, by reason one of the propositions is suppressed, as being easily supplied by the understanding of those with whom we discourse.

ENTOMON, in zoology. See ONISCUS.

ENTREPAS, in the manege, a broken pace or going, that is neither walk nor trot, but has somewhat of an amble.

This is a pace or gait of such horses as have no reins or back, and go upon their shoulders; or, of such as are spoiled in their limbs.

ENTRING-LADDERS, in a ship, are of two sorts; one used by the vessel's sides, in a harbour, or in fair weather, for persons to go in and out of the ship: the other is made of ropes, with small staves for steps; and is hung out of the gallery to enter into the boat, or to come aboard the ship, when the sea runs so high that they dare not bring the boat to the ship's side for fear of staving it.

ENTROCHUS, in natural history. See ISIS.

ENTRY *of an heir*, in Scots law, that form of law by which an heir vests in himself a proper title to his predecessor's estate. See *Precept of* CLARE CONSTAT.

Bill of ENTRY, in commerce. See BILL.

In making entries inwards, it is usual for merchants to include all the goods they have on board the same ship in one bill, though sometimes they may happen to be upwards of twenty several kinds; and in case the goods are short entered, additional or post entries are now allowed; though formerly the goods, so entered, were forfeited. As to bills of entry outwards, or including goods to be exported, upon delivering them, and paying the customs, you will receive a small piece of

of parchment called a cocket, which teſtifies your payment thereof, and all duties for ſuch goods.

If ſeveral ſorts of goods are exported at once, of which ſome are free, and others pay cuſtoms; the exporter muſt have two cockets, and therefore muſt make two entries; one for the goods that pay, and the other for the goods that do not pay cuſtom.

Entries of goods, on which a drawback is allowed, muſt likewiſe contain the name of the ſhip in which the goods were imported, the importer's name, and time of entry inwards. The entry being thus made, and an oath taken that the cuſtoms for thoſe goods were paid as the law directs, you muſt carry it to the collector and comptroller, or their deputies; who, after examining their books, will grant warrant, which muſt be given to the ſurveyor, ſearcher, or land-waiter, for them to certify the quantity of goods; after which the certificate muſt be brought back to the collector and comptroller, or their deputies, and oath made that the ſaid goods are really ſhipped, and not landed again in any part of Great Britain.

ENVELOPE, in fortification, a work of earth, ſometimes in form of a ſimple parapet, and at others like a ſmall rampart with a parapet: it is raiſed ſometimes on the ditch, and ſometimes beyond it.

ENVIRONNE', in heraldry, ſignifies ſurrounded with other things: thus, they ſay, a lion environné with ſo many bezants. See BEZANT.

ENUMERATION, an account of ſeveral things, in which mention is made of every particular article.

ENVOY, a perſon deputed to negociate ſome affair with any foreign prince or ſtate. Thoſe ſent from the courts of France, Britain, Spain, *&c.* to any petty prince or ſtate, ſuch as the princes of Germany, the republics of Venice, Genoa, *&c.* go in quality of envoys, not embaſſadors; and ſuch a character only do thoſe perſons bear, who go from any of the principal courts of Europe to another, when the affair they go upon is not very ſolemn or important. There are envoys ordinary and extraordinary, as well as embaſſadors; they are equally the ſame under the protection of the law of nations, and enjoy all the privileges of embaſſadors, only differing from them in this, that the ſame ceremonies are not performed to them.

ENVY, in ethics, an uneaſineſs of the mind, cauſed by the conſideration of a good we deſire, obtained by one we think leſs worthy of it than ourſelves. See PASSION, and MORALS.

EPACT. See ASTRONOMY, *Of the Diviſion of Time.*

EPANORTHOSIS, in rhetoric, a figure by which a perſon corrects, or ingeniouſly revokes, what he juſt before alledged, as being too weakly expreſſed, in order to add ſomething ſtronger, and more conformable to the paſſion with which he is agitated.

The epanorthoſis is diſtinguiſhed into two kinds. The one is when we correct or revoke the word, as in the following example of the apoſtle, *But I laboured more abundantly than they all: yet not I, but the grace of God, which was with me,* 1 Cor. xv. 10. where, what he firſt attributed to his own merit, he chuſes afterwards to call the work of grace, as being the principal cauſe. The ſecond kind of epanorthoſis, is when we correct or revoke the ſentiment, as in the following of Cicero: *Italiam ornare, quam domum ſuam, maluit: quamquam, Italia ornata, domus ipſa mihi videtur ornatior.*

EPARER, in the menage, ſignifies the flinging of a horſe, or his yerking and ſtriking with his hind-legs.

EPAULEMENT, in fortification, a work raiſed to cover ſidewiſe, is either of earth, gabions, or faſcines loaded with earth. The epaulements of the places of arms for the cavalry, at the entrance of the trenches, are generally of faſcines mixed with earth.

EPENTHESIS, in grammar, the interpoſition or inſertion of a letter or ſyllable in the middle of a word; as *alituum,* for *alitum*; *relligio,* for *religio*; *indupe-rator,* for *imperator,* &c.

EPERLANUS, in ichthyology. See SALMO.

EPHA, or EPHAH, in Jewiſh antiquity, a meaſure for things dry, containg 1.0961 of a buſhel.

EPHÆTUM, in botany See RANUNCULUS.

EPHEDRA, the SEA-GRAPE, or SHRUB HORSE-TAIL, in botany, a genus of the dioecia monadelphia claſs. The calix of the amentum of the male and female is divided into ſegments; the corolla is wanting in both; the ſtamina are ſeven; there are two piſtils, and two ſeeds covered with a kind of cup-berry. There are two ſpecies, none of them natives of Britain.

EPHEMERY, in medicine, the name of a ſpecies of fever continuing the ſpace of one day, or ſometimes more; for the medical writers expreſs themſelves by *ephemera ſimplex, vel plurium dierum.* See MEDICINE.

EPHEMERA, the DAY-FLY, in zoology, a genus belonging to the order of neuroptera. It has no teeth or palpæ; there are two large protuberances above the eyes; the wings are erect, the two hind ones being largeſt; and the tail is briſtly. There are eleven ſpecies, diſtinguiſhed by their colour and the number of briſtles in their tail. This fly derives its name from the circumſtance of its living but one day.

EPHEMERIDES, in literary hiſtory, an appellation given to thoſe books or journals, which ſhew the motions and places of the planets for every day of the year.

It is from the tables contained in theſe ephemerides that eclipſes, and all the variety of aſpects of the planets, are found.

EPHEMERUM, in botany. See TRADESCANTIA.

EPHIALTES, in medicine, the ſame with the incubus, or night-mare. See INCUBUS.

EPHIPPUIM, in anatomy. See ANATOMY, Part I.

EPHOD, in Jewiſh antiquity, one part of the prieſtly habit; being a kind of girdle, which, brought from behind the neck over the two ſhoulders, and hanging down before, was put croſs the ſtomach, then carried round the waiſt, and made uſe of as a girdle to the tunic.

There were two ſorts of ephods, one of plain linen for the prieſts, and the other embroidered for the high prieſt.

EPHORI, in Grecian antiquity, magiſtrates eſtabliſhed in

in ancient Sparta to balance the regal power. The authority of the ephori was very great. They ſometimes expelled and even put to death the kings, and aboliſhed or ſuſpended the power of the other magiſtrates, calling them to account at pleaſure. There were five of them, others ſay nine. They preſided in the public ſhews and feſtivals. They were entruſted with the public treaſure, made war and peace, and were ſo abſolute, that Ariſtotle makes their government equal to the prerogative of a monarchy. They were eſtabliſhed by Lycurgus.

EPHYDRUM, in botany. See EQUISETUM.

EPIC, or HEROIC POEM. See COMPOSITION.

EPICEDIUM, in ancient poetry, a poem rehearſed during the funeral ſolemnity of perſons of diſtinction.

EPICOENE, in grammar, a term applied to nouns, which, under the ſame gender and termination, mark indifferently the male and female ſpecies.

EPICUREAN PHILOSOPHY, the doctrine or ſyſtem of philoſophy maintained by Epicurus and his followers.

His philoſophy conſiſted of three parts, canonical, phyſical, and etherial. The firſt was about the canons, or rules of judging. The cenſure which Tully paſſes upon him for his deſpiſing logic, will hold true only with regard to the logic of the ſtoics, which he could not approve of, as being too full of nicety and quirk. Epicurus was not acquainted with the analytical method of diviſion and argumentation, nor was he ſo curious in modes and formation as the ſtoics. Soundneſs and ſimplicity of ſenſe, aſſiſted with ſome natural reflections, was all his art. His ſearch after truth proceeded only by the ſenſes, to the evidence of which he gave ſo great a certainty, that he conſidered them as an infallible rule of truth, and termed them the firſt natural light of mankind.

In the ſecond part of this philoſophy he laid down atoms, ſpace, and gravity, as the firſt principles of all things: he did not deny the exiſtence of God, but thought it beneath his majeſty to concern himſelf with human affairs: he held him a bleſſed immortal being, having no affairs of his own to take care of, and above meddling with thoſe of others.

As to his ethics, he made the ſupreme good of man to conſiſt in pleaſure, and conſequently ſupreme evil in pain. Nature itſelf, ſays he, teaches us this truth, and prompts us from our birth to procure whatever gives us pleaſure, and avoid what gives us pain. To this end he propoſes a remedy againſt the ſharpneſs of pain: this was to divert the mind from it, by turning our whole attention upon the pleaſures we have formerly enjoyed: he held that the wiſe man muſt be happy, as long as he is wiſe; that pain, not depriving him of his wiſdom, cannot deprive him of his happineſs.

There is nothing that has a fairer ſhew of honeſty than the moral doctrine of Epicurus. Gaſſendus pretends, that the pleaſure in which this philoſopher has fixed the ſovereign good, was nothing elſe but the higheſt tranquillity of mind in conjunction with the moſt perfect health of body: but Tully, Horace, and Plutarch, as well as almoſt all the fathers of the church, give us a very different repreſentation: indeed the nature of this pleaſure, in which the chief happineſs is ſuppoſed to be ſeated, is a grand problem in the morals of Epicurus. Hence there were two kinds of Epicureans, the rigid and the remiſs: the firſt were thoſe who underſtood Epicurus's notion of pleaſure in the beſt ſenſe, and placed all their happineſs in the pure pleaſures of the mind, reſulting from the practice of virtue: the looſe or remiſs Epicureans, taking the words of that philoſopher in a groſs ſenſe, placed all their happineſs in bodily pleaſures or debauchery.

EPICYCLE, in the ancient aſtronomy, a little circle whoſe centre is in the circumference of a greater circle; or it is a ſmall orb, or ſphere, which being fixed in the deferent of a planet, is carried along with it; and yet, by its own peculiar motion, carries the planet faſtened to it round its proper centre.

It was by means of epicycles, that Ptolemy and his followers ſolved the various phænomena of the planets, but more eſpecially their ſtations and retrogradations.

EPICYCLOID, in geometry, a curve generated by the revolution of the periphery of a circle, along the convex or concave ſide of the periphery of another circle.

EPICYEMA, among phyſicians, denotes a ſuperfœtation; being a falſe conception or mole happening after the birth of a regular fœtus.

EPIDEMIA, in Grecian antiquity, feſtivals kept in honour of Apollo and Diana, at the ſtated ſeaſons when theſe deities, who could not be preſent every where, were ſuppoſed to viſit different places, in order to receive the vows of their adorers.

EPIDEMIC, among phyſicians, an epithet of diſeaſes which at certain times are popular; attacking great numbers at or near the ſame time. See MEDICINE.

EPIDENDRUM, in botany, a genus of the gynandria diandria claſs. The nectarium is oblique, reflected, and ſhaped like a turban. There are thirty ſpecies, none of them natives of Britain.

EPIDERMIS, in anatomy. See ANATOMY, p. 255.

EPIDIDYMIS, in anatomy. See ANATOMY, p. 171.

EPIGASTRIC REGION, a part or ſubdiviſion of the abdomen. See ANATOMY, p. 256.

EPIGLOTTIS, in anatomy, one of the cartilages of the larynx, or wind-pipe. See ANATOMY, p. 281.

EPIGRAM, in poetry, a ſhort poem in verſe, treating only of one thing, and ending with ſome lively, ingenious, and natural thought or point.

EPIGRAPHE, among antiquarians, denotes the inſcription of a building, pointing out the time when, the perſons by whom, the uſes, and the like, for which it was erected.

EPILEPSY, in medicine, the ſame with what is otherwiſe called the falling-ſickneſs, from the patient's falling ſuddenly to the ground. See MEDICINE.

EPILOBIUM, in botany, the WILLOW-HERB, a genus of the octandria monogynia claſs. The calix is divided into four ſegments, and the corolla conſiſts of four petals; the capſule is oblong and below the flower; and the ſeeds are pappous. There are ſeven ſpecies, all of them natives of Britain, *viz.* the anguſtifolium, or

roſebay

rosebay willow-herb; the hirsutum, or small-flowered hairy willow herb; the ramosum, great flowered willow herb, or codlings and cream; the montanum, or smooth-leaved willow herb; the tetragonum, or narrow-leaved willow-herb; the palustre, or marsh willow herb; and the alpinum, or mountain willow-herb.

EPILOGUE, in oratory, the end or conclusion of a discourse, ordinarily containing a recapitulation of the principal matters delivered.

EPILOGUE, in dramatic poetry, a speech addressed to the audience after the play is over, by one of the principal actors therein, usually containing some reflections on certain incidents in the play, especially those in the part of the person that speaks it.

EPIMEDIUM, BARREN-WORT, in botany, a genus of the tetrandia monogynia class. It has four cap-shaped nectaria lying upon the petals; the corolla consists of four petals; and the calix is caducous. There is but one species, a native of Germany.

EPIPHANY, a Christian festival, otherwise called the Manifestation of Christ to the Gentiles, observed on the sixth of January, in honour of the appearance of our Saviour to the three magi, or wise-men, who came to adore him and bring him presents. The feast of epiphany was not originally a distinct festival, but made a part of that of the nativity of Christ, which being celebrated twelve days, the first and last of which were high or chief days of solemnity, either of these might properly be called epiphany, as that word signifies the appearance of Christ in the world.

EPIPHONEMA, in rhetoric, a sententious exclamation containing a lively remark placed at the end of a discourse or narration.

EPIPHORA, in medicine, a preternatural defluxion of the eyes, when they continually discharge a sharp serous humour, which excoriates the cheeks. See MEDICINE.

EPIPHYSIS, in anatomy. See ANATOMY, Part I.

EPIPLOCELE, in medicine, is a kind of hernia, or rupture, in which the omentum subsides into the scrotum.

EPIPLOOMPHALON, in medicine, an hernia umbilicalis, proceeding from the omentum falling into the region of the umbilicus or navel.

EPIPLOON. See OMENTUM.

EPISCOPACY, the quality of episcopal government, or that form of church-discipline, wherein diocesian bishops are established distinct from and superior to priests or presbyters. See BISHOP.

EPISCOPAL, something belonging to bishops.

EPISCOPALIANS, in church-history, an appellation given to those who prefer the episcopal government and discipline to all others.

By the test act, none but episcopalians, or members of the church of England, are qualified to enjoy any office civil or military.

EPISCOPUS. See BISHOP.

EPISODE, in poetry, a separate incident, story, or action, which a poet invents, and connects with his principal action, that his work may abound with a greater diversity of events; though, in a more limited sense, all the particular incidents whereof the action or narration is compounded, are called episodes. See COMPOSITION.

EPISPASTIC, in medicine, a topical remedy, which being applied to the external parts of the body, attracts the humours to that part.

EPISTATES, in the Athenian government, was the president of the proedri. See PROEDRI.

EPISTEMONARCH, in the ancient Greek church, an officer of great dignity, who had the care of every thing relating to faith, in the quality of censor. His office answered pretty nearly to that of master of the sacred palace at Rome.

EPISTLE, denotes the same with a missive letter; but is now chiefly used in speaking of ancient writings, as the epistles of St Paul, epistles of Cicero, epistles of Pliny, *&c.*

EPISTOLARY, something belonging to an epistle. See EPISTLE.

EPISTROPHE, in rhetoric, a figure, wherein that which is supposed of one thing, is strongly affirmed of another: thus, *Are they Hebrews? so am I. Are they Israelites? so am I. Are they of the seed of Abraham? so am I*, &c.

EPISTYLE, in the ancient architecture, a term used by the Greeks for what we call architrave, *viz.* a massive piece of stone or wood, laid immediately over the capital of a column.

EPITAPH, a monumental inscription in honour or memory of a person defunct, or an inscription engraven or cut on a tomb, to mark the time of a person's decease, his name, family; and, usually, some eulogium of his virtues, or good qualities.

EPITASIS, in ancient poetry, the second part or division of a dramatic poem, wherein the plot, entered upon in the first part, or protasis, was carried on, heightened, and worked up, till it arrived at its state, or height, called catastasis.

EPITASIS, in medicine, the increase of a disease, or beginning of a paroxysm, particularly in a fever.

EPITHALAMIUM, in poetry, a nuptial song, or composition, in praise of the bride and bridegroom, praying for their prosperity, for a happy offspring, *&c.*

Among the Greeks, the married couple were no sooner bedded, than the young men and maids gathered round the door, dancing and singing the epithalamium, shouting and stamping with their feet, with intention to drown the maid's cries.

EPITHEM, in pharmacy, a kind of fomentation, or remedy of a spirituous or aromatic kind, applied externally to the regions of the heart, liver, *&c.* to strengthen and comfort the same, or to correct some intemperature thereof. See FOMENTATION.

EPITHET, in poetry and rhetoric, an adjective expressing some quality of a substantive to which it is joined; or such an adjective as is annexed to substantives by way of ornament and illustration, not to make up an essential part of the description. Nothing, says Aristotle, tires the reader more than too great a redundancy of epithets, or epithets placed improperly; and yet

nothing

nothing is so essential in poetry as a proper use of them. The writings of the best poets are full of them, especially Virgil.

EPITOME, in literary history. See ABRIDGEMENT.

EPITRITUS, in prosody, a foot consisting of three long syllables and one short.

EPIZEUXIS, in rhetoric, a figure which repeats the same word, without any other intervening; such is that of Virgil, *Nunc, nunc, insurgite remis*.

EPOCHA, in chronology, a term or fixed point of time, whence the succeeding years are numbered or accounted. See ASTRONOMY, p. 487.

EPODE, in lyric poetry, the third or last part of the ode; the ancient ode being divided into strophe, antistrophe, and epode. See ODE.

EPOPOEIA, in poetry, the story, fable, or subject treated of in an epic poem.

EPOTIDES, in the naval architecture of the ancients, two thick blocks of wood, one on each side the prow of a galley, for warding off the blows of the rostra of the enemy's vessels.

EPPINGEN, a town of Germany, situated about ten miles north of Halibron.

EPSOM, a town of Surry, about fifteen miles south-west of London; much resorted to on account of its medicinal waters; from which the bitter purging salt being first extracted, got the name of Epsom-salt. At present, however, the bitter purging salt is procured from the bittern, remaining after the crystallization of common salt; and this is found to answer all the purposes of that first obtained from Epsom-waters, and goes by its name. See CHEMISTRY.

EPULONES, in Roman antiquity, ministers who assisted at the sacrifices, and had the care of the sacred banquet committed to them.

EQUABLE, an appellation given to such motions as always continue the same in degree of velocity, without being either accelerated or retarded. See MECHANICS.

EQUAL, a term of relation between two or more things of the same magnitude, quantity, or quality.

Mathematicians speak of equal lines, angles, figures, circles, ratios, solids.

EQUALITY, that agreement between two or more things, whereby they are denominated equal.

EQUANIMITY, in ethics, denotes that even and calm frame of mind and temper, under good or bad fortune, whereby a man appears to be neither puffed up nor overjoyed with prosperity, nor dispirited, soured, or rendered uneasy by adversity.

EQUATION, in algebra. See ALGEBRA, p. 100.

EQUATION *of time*, in astronomy and chronology, the reduction of the apparent time or motion of the sun, to equable, mean, or true time. See ASTRONOMY, p. 459.

EQUATOR, in geography, a great circle of the terrestrial globe, equidistant from its poles, and dividing it into two equal hemispheres; one north, and the other south. See GEOGRAPHY.

EQUERRY, in the British customs, an officer of state, under the master of the horse.

There are five equerries, who ride abroad with his majesty: for which purpose they give their attendance monthly, one at a time, and are allowed a table.

As to the equerries of the crown stable, they have this distinct appellation, as being employed in mounting, managing, and breaking the saddle horses for his majesty's use, and holding his stirrup.

EQUES AURATUS, is used for a knight batchelor, called *auratus*, q. d. *gilt*, because anciently none but knights were allowed to beautify their armour, or other habiliments for war, with gold.

EQUESTRIAN STATUE, signifies the statue of a person mounted on horseback.

EQUESTRIAN ORDER, among the Romans, signified their knights, or equites; as also their troopers, or horsemen in the field; the first of which orders stood in contradistinction to the senators, as the last did to the foot, military, or infantry: each of these distinctions was introduced into the state by Romulus.

EQUIANGULAR, in geometry, an epithet given to figures, whose angles are all equal: such are a square, an equilateral triangle, *&c.*

EQUICRURAL, in geometry. See ISOSCELES.

EQUIDISTANT, an appellation given to things placed at equal distance from some fixed point, or place, to which they are referred.

EQUILATERAL, in general, something that hath equal sides, as an equilateral angle.

EQUILIBRIUM, in mechanics, is when the two ends of a lever or balance hang so exactly even and level, that neither doth ascend or descend, but keep in a position parallel to the horizon; which is occasioned by their being both charged with an equal weight.

EQUIMULTIPLES, in arithmetic and geometry, are numbers or quantities multiplied by one and the same number or quantity. Hence, equimultiples are always in the same ratio to each other, as the simple quantities before multiplication: thus, if 6 and 8 are multiplied by 4, the equimultiples 24 and 32 will be to each other as 6 to 8.

EQUINOCTIAL, in astronomy, a great circle of the celestial globe, whose poles are the poles of the world. See ASTRONOMY, and GEOGRAPHY.

EQUINOX, the time when the sun enters either of the equinoctial points, where the ecliptic intersects the equinoctial. See ASTRONOMY.

Precession of the EQUINOXES. See ASTRONOMY.

EQUISETUM, or HORSE-TAIL, in botany, a genus of the cryptogamia filices class. The fructification is disposed on an oblong spike, and of an orbicular figure. There are seven species, six of which are natives of Britain, *viz.* the sylvaticum, or wood horse-tail; the arvense, or corn horse-tail; the palustre, or marsh horse-tail; the fluviatile, or river horse-tail; the limosum, or smooth horse-tail; and the hyemale, or rough horse-tail.

EQUITY, in a general sense, the virtue of treating all other men according to common reason and justice, or as we would be gladly treated ourselves, when we understand aright what is our due. See JUSTICE.

EQUIVALENT, an appellation given to things which agree

agree in nature, or other circumſtances, as force, virtue, &c.

EQUIVOCAL TERMS or WORDS, among logicians, are thoſe which have a doubtful or double meaning.

According to Mr Locke, the doubtfulneſs and uncertainty of words has its cauſe more in the ideas themſelves, than in any incapacity of the words to ſignify them; and might be avoided, would people always uſe the ſame term to denote the ſame idea, or collection of ideas: but, adds he, it is hard to find a diſcourſe on any ſubject where this is the caſe; a practice which can only be imputed to folly, or great diſhoneſty; ſince a man, in making up his accounts, might with as much fairneſs uſe the numeral characters ſometimes for one, ſometimes for another collection of unities.

EQUIVOCAL GENERATION, the production of animals, without the intercourſe between the ſexes, by the influence of the ſun or ſtars, &c.

This kind of generation is now quite exploded by the learned.

EQUULEUS, or ECUULEUS, in antiquity, a kind of rack uſed for extorting a confeſſion, at firſt chiefly practiſed on ſlaves, but afterwards made uſe of againſt the Chriſtians.

The equuleus was made of wood, having holes at certain diſtances, with a ſcrew, by which the criminal was ſtretched to the third, ſometimes to the fourth, or fifth holes, his arms and legs being faſtened on the equuleus with cords; and thus was hoiſted aloft, and extended in ſuch a manner, that all his bones were diſlocated. In this ſtate red-hot plates were applied to his body, and he was goaded in the ſides with an inſtrument called ungula.

EQUULUS, in aſtronomy. See ASTRONOMY, p. 487.

EQUUS, the HORSE, in zoology, a genus of quadrupeds belonging to the order of belluæ. This genus comprehends the horſe, the aſs, and the zebra; they have ſix erect and parallel fore-teeth in the upper jaw, and ſix ſomewhat prominent ones in the under jaw; the dog-teeth are ſolitary, and at a conſiderable diſtance from the reſt; and the feet conſiſt of an undivided hoof. The horſe is a domeſtic animal, and the figure and dimenſions of his body are ſo well known, that a general deſcription is altogether unneceſſary. We ſhall therefore confine ourſelves to the natural hiſtory of this noble animal.

The horſe, in a domeſtic ſtate, is a bold and fiery animal; equally intrepid as his maſter, he faces danger and death with ardour and magnanimity. He delights in the noiſe and tumult of arms, and ſeems to feel the glory of victory: he exults in the chaſe; his eyes ſparkle with emulation in the courſe. But though bold and intrepid, he is docile and tractable: he knows how to govern and check the natural vivacity and fire of his temper. He not only yields to the hand, but ſeems to conſult the inclination of his rider. Conſtantly obedient to the impreſſions he receives, his motions are entirely regulated by the will of his maſter. He in ſome meaſure reſigns his very exiſtence to the pleaſure of man. He delivers up his whole powers; he reſerves nothing; he will rather die than diſobey. Who could endure to ſee a character ſo noble abuſed! Who could be guilty of ſuch groſs barbarity!

This character, though natural to the animal, is in ſome meaſure the effect of education. His education commences with the loſs of liberty, and it is finiſhed by conſtraint. The ſlavery of the horſe is ſo ancient and ſo univerſal, that he is but rarely ſeen in a natural ſtate. Several ancient writers talk of wild horſes, and even mention the places where they were to be found. Herodotus takes notice of white ſavage horſes in Scythia; Ariſtotle ſays, they are to be found in Syria; Pliny, in the northern regions; and Strabo, in Spain and the Alps. Among the moderns, Leardon ſays, that wild horſes are to be found in the Highlands of Scotland, and the Orkney Iſles; Olaus, in Muſcovy; Dapper, in the iſland of Cyprus; Leo and Marmol, in Arabia and Africa, &c. But, as Europe is almoſt equally inhabited, wild horſes are not to be met with in any part of it; and thoſe of America were originally tranſported from Europe by the Spaniards; for this ſpecies of animals did not exiſt in the new world. The Spaniards carried over a great number of horſes, left them in different iſlands, &c. with a view to propagate that uſeful animal in their colonies. Theſe have multiplied incredibly in the vaſt deſarts of thoſe thinly peopled countries, where they roam at large, without any reſtraint. M. de Salle relates, that he ſaw, in the year 1685, horſes feeding in the meadows of North America, near the bay of St Louis, which were ſo ferocious that nobody durſt come near them. Oexmelin ſays, that he has ſeen large troops of them in St Domingo running in the valleys; that when any perſon approached, they all ſtopt; and one of them would advance till within a certain diſtance, then ſnort with his noſe, take to his heels, and the whole troop after him. Every author who takes notice of theſe horſes of America, agree that they are ſmaller and leſs handſome than thoſe of Europe. Theſe relations ſufficiently prove, that the horſe, when at full liberty, though not a fierce or dangerous animal, has no inclination to aſſociate with mankind; that all the ſoftneſs and ductility of his temper proceeds entirely from the culture and poliſh he receives in his domeſtic education, which in ſome meaſure commences as ſoon as he is brought forth.

The motions of the horſe are chiefly regulated by the bit and the ſpur; the bit informs him how to direct his courſe, and the ſpur quickens his pace. The mouth of the horſe is endowed with an amazing ſenſibility: the ſlighteſt motion or preſſure of the bit gives him warning, and inſtantly determines his courſe.

The horſe has not only a grandeur in his general appearance, but there is the greateſt ſymmetry and proportion in the different parts of his body. The regularity and proportion of the different parts of the head gives him an air of lightneſs, which is well ſupported by the ſtrength and beauty of his cheſt. He erects his head, as if willing to exalt himſelf above the condition of other quadrupeds: his eyes are open and lively; his

Plate LXXV.

Fig. 1. EQUUS CABALLUS or HORSE.

Fig. 2. EQUUS ASINUS or ASS.

Fig. 3. EQUUS ZEBRA.

his ears are handfome, and of a proper height; his main adorns his neck, and gives him the appearance of ftrength and boldnefs

At the age of two years, or two years and a half, the horfe is in a condition to propagate; and the mare, like moft other females, is ready to receive him ftill fooner. But the foals produced by fuch early embraces are generally ill made and weakly. The horfe fhould never be admitted to the mare till he is four or four and a half; this is only meant with regard to draught-horfes. Fine horfes fhould not be admitted to the mare before they be fix years old; and Spanifh ftalions not till feven. The mares are generally in feafon from the beginning of April to the end of March; but their chief ardour for the horfe lafts but about 15 or 20 days, and this critical feafon fhould always be embraced. The ftalion ought to be found, well made, vigorous, and of a good breed. For fine faddle horfes, foreign ftalions, as Arabians, Turks, Barbs, and Andaloufians, are preferable to all others. Next to thefe, Britifh ftalions are the beft; becaufe they originally fprang from thofe above mentioned, and are very little degenerated. The ftalions of Italy, and efpecially the Neapolitans, are very good. The beft ftalions for draught or carriage horfes, are thofe of Naples, Denmark, Holftein, and Freezeland. The ftalions for faddle-horfes fhould be from 14 to 15 hands high, and for draught-horfes at leaft 15 hands. Neither ought the colour of ftalions to be overlooked; as a fine black, grey, bay, forrel, *&c.* Befides thefe external qualities, a ftalion ought to have courage, tractability, fpirit, agility, a fenfible mouth, fure limbs, *&c.* Thefe precautions in the choice of a ftalion are the more neceffary, becaufe he has been found by experience to communicate to his offspring almoft all his good or bad qualities, whether natural or acquired.

The mare contributes lefs to the beauty of her offfpring than the ftalion; but fhe contributes perhaps more to their conftitution and ftature: for thefe reafons, it is neceffary that the mares for breed be perfectly found, and make good nurfes. For elegant horfes, the Spanifh and Italian mares are beft; but, for draught-horfes, thofe of Britain and Normandy are preferable. However, when the ftalions are good, the mares of any country will produce fine horfes, provided they be well made and of a good breed.

Mares go with young eleven months and fome days. They bring forth ftanding; contrary to the courfe of moft other quadrupeds, who lie during this operation. They continue to bring forth till the age of 16 or 18 years; and both horfes and mares live between 25 and 30 years. Horfes caft their hair once a year, generally in the fpring, but fometimes in the autumn. At this time they are weak, and require to be better fed and taken care of than at any other feafon.

In Perfia, Arabia, and moft eaftern countries, they never geld their horfes, as is done in Europe and China. This operation greatly diminifhes their ftrength, courage, and fpirit; but it makes them good humoured, gentle, and tractable. With regard to the time of performing this operation, the practice of different countries is different: fome geld their horfes when a year old, and others at 18 months. But the beft and moft general practice is to delay the operation till they be two years old at leaft; becaufe, when the gelding is delayed for two years or more, the animals retain more of the ftrength and other qualities which naturally belong to the male.

As the utility of horfes furpaffes that of all other domeftic animals, it may be of ufe to fubjoin fome marks by which the age and other properties of horfes may be diftinguifhed.

The firft teeth that appear are four, two above and two below, which are called foal-teeth, and may be eafily diftinguifhed from the others by their whitenefs. The reft come out aftewards till they are twelve in number, fix above and fix below. When a colt is between two years and a half and three years old he cafts four of thefe teeth, two above and two below. Thefe we call nippers or gatherers, and are much longer and larger than the fore teeth; with thefe he nips off the grafs, and pulls the hay from the rack. When thefe are complete, the horfe will be three years old, or fomewhat more.

When he is about four, he cafts again two above and two below, one on each fide the nippers; fo that now there are no fore-teeth remaining but the corner-teeth; and hence it may be concluded that he is about four years old. The tufks appear next after thefe, and are a little crooked. Thofe below come out before thofe on the upper jaw, and at four years old they are very fmall. When all the colt-teeth are caft, and the corner-teeth begin to fhew themfelves, then the horfe comes five.

From five to five and a half the corner teeth remain hollow within, and are not quite filled up till the horfe is fix. At five and a half they are about a quarter of an inch high, and when he is full fix near half an inch. Every thing that is to be examined at fix years old, are the corner-teeth and the tufks. That part of the corner-teeth that had flefh in it firft turns to a brownifh fpot, like the eye of a garden-bean. At feven the mark or fpot becomes faint, and the tooth more even. At eight it quite difappears, though it poffibly may remain in a very fmall degree for two or three years more, which has deceived many. The longer the corner teeth are, the older is the horfe; and they are apt to grow foul and turn yellow. When the mark is gone, if you touch the tufks on the upper jaw with your finger, and find it worn away and equal with the palate, you may certainly judge that the horfe is ten years old at leaft. Laftly, when the flanks of a horfe are much funk, the feet broken and fpoiled, the pace bad, and the eye-pits very yellow, you may certainly conclude the horfe is confiderably advanced in years.

When the horfe is without blemifh, the legs and thighs are clean, the knees ftrait, the fkin and fhank thin, and the back finew ftrong and well braced. The finews and the bones fhould be fo diftinct, as to make the legs appear thin and lathy, not full and round. The paftern joints fhould never be large and round;

nor

nor muſt there be any ſwelling near the coronet. The hocks ſhould be lean and dry, not puffed up with wind. With regard to the hoof, the coronet ſhould be equally thick, and the horn ſhining and greyiſh. A white horn is a ſign of a bad foot, for it will wear out in a ſhort time; and likewiſe when the horn is thin, it is liable to be ſpoiled in ſhoeing, and by travelling hard on ſtony grounds. This is beſt known when the ſhoe is taken off; for then the verge all round the ſole will appear thin, and the horſe will wince at the leaſt touch of the pincers.

A ſtrong foot has the fibres of the hoof very diſtinct running in a direct line from the coronet to the toe, like the grain of wood. In this caſe care muſt be taken to keep the foot moiſt and pliable. The greateſt inconvenience attending a hard ſtrong foot, is its being ſubject to rifts and fiſſures, which cleave the hoof quite through ſometimes from the coronet down to the bottom.

A narrow heel is likewiſe a defect; and when it is not above two fingers in breadth the foot is bad. A high heel cauſes a horſe to trip and ſtumble often; and the low one, with long yielding paſterns, is very apt to be worn quite away on a journey. Too large a foot in proportion to the reſt of the body, renders a horſe weak and heavy.

The head of a horſe ſhould be ſmall, and rather lean than fleſhy. The ears ſhould be ſmall, erect, thin, ſprightly, and pointed. The forehead, or brow, ſhould be neither too broad nor too flat, and ſhould have a ſtar or ſnip thereon. The noſe ſhould riſe a little, and the noſtrils ſhould be wide that he may breath more freely. The muzzle ſhould be ſmall, and the mouth neither too deep nor too ſhallow. The jaws ſhould be thin, and not approach too near together at the throat, nor too high upwards towards the onſet, that the horſe may have ſufficient room to carry his head in an eaſy graceful poſture. The eyes ſhould be of a middle ſize, bright, lively, and full of fire. The tongue ſhould be ſmall, that it may not be too much preſſed by the bit; and it is a good ſign when his mouth is full of white froth, for it ſhews that he will not ſoon be overheated.

The neck ſhould be arched towards the middle, growing ſmaller by degrees from the breaſt and ſhoulders to the head. The hair of the main ſhould be long, ſmall, and fine; and if it be a little frizzled, ſo much the better. The ſhoulders ſhould be pretty long, the withers thin, and enlarge gradually from thence downwards; but ſo as to render his breaſt neither too narrow nor too groſs. A thick-ſhouldered horſe ſoon tires, and trips and ſtumbles every minute; eſpecially if he has a thick large neck at the ſame time. When the breaſt is ſo narrow that the fore-thighs almoſt touch, they are never good for much. A horſe of a middle ſize ſhould have the diſtance of five or ſix inches between his fore-thighs, and there ſhould be leſs diſtance between his feet than his thighs near the ſhoulders when he ſtands upright.

The body or carcaſe of a horſe ſhould be of a middling ſize in proportion to his bulk, and the back ſhould ſink a little below the withers; but the other parts ſhould be ſtrait, and no higher behind than before. He ſhould alſo be home-ribbed; but the ſhort ribs ſhould not approach too near the haunches, and then he will have room to fetch his breath. When a horſe's back is ſhort in proportion to his bulk, and yet otherwiſe well limbed, he will hold out a journey tho' he will travel ſlow. When he is tall, at the ſame time with very long legs, he is but of little value.

The wind ſhould never be overlooked in the choice of a horſe; and it may eaſily be known by his flanks, if he is broken-winded, when he ſtands quiet in the ſtable; becauſe he always pinches them in with a very ſlow motion, and drops them ſuddenly. A thick-winded horſe fetches his breath often, and ſometimes rattles and wheezes. This may be always diſcovered when he is put to briſk exerciſes.

The temper of a horſe ſhould always be obſerved; a vicious horſe generally lays his ears cloſe to his pole, ſhews the whites of his eyes, and looks ſullen and dogged. An angry horſe may be known by his frowning looks; and he generally ſeems to ſtand in a poſture of defence. When he is very vicious, he pays no regard to the groom that feeds him: However, ſome horſes that are tickliſh will lay back their year ears, and yet be of a good diſpoſition. A fearful horſe is apt to ſtart, and never leaves it off till he is old and uſeleſs. A fretful horſe is very unfit for a journey; and you may diſcover his temper as ſoon as he gets out of the ſtable. A dull, heavy, ſluggiſh horſe may be eaſily known, whatever tricks are uſed to rouſe his ſpirits.

With regard to the colour of a horſe, the bright bay, and indeed all kinds of bays in general, are accounted a good colour. The cheſnut horſe is generally preferable to the ſorrel, unleſs the former happens to be bald, or party-coloured with white legs. Brown horſes have generally black manes and tails, and their joints are of a ruſty black. Thoſe of this colour that are dappled are much handſomer than the reſt. Horſes of a ſhining black, and well-marked, without too much white, are in high eſteem for their beauty. A ſtar, or blaze, or white muzzle, or one or more feet tipped with white, are thought to be rather better than thoſe that are quite black.

Of greys, the dappled are accounted beſt; though the ſilver grey makes a more beautiful appearance, and often prove good. The iron grey with white manes and tails are thought not to be ſo hardy. Greys of every kind will turn white ſooner or later; but the nutmeg grey, when the dappled parts incline to bay or cheſnut, are ſaid to be good hardy horſes. Roan horſes have a diverſity of colours mixed together; but the white is more predominant than the reſt. They are all generally hardy, and fit for the road; and ſome are exceeding good. Thoſe of a ſtrawberry colour moſt reſemble the ſorrel, and they are often marked with white on the face and legs. When the bay is blended with it, he ſeems to be tinctured with claret; and ſome of theſe prove to be very good. Dun, ſallow, and cream-coloured horſes have a liſt down their backs; and their manes and tales are black.

Dun

Dun horſes are ſeldom choſen by gentlemen, and yet they may be very uſeful to the country farmer. The fallow and cream-coloured are better eſteemed, both for beauty and uſe. Thoſe horſes that are finely ſpotted with gay colours like leopards are a great rarity, and for that reaſon are only in the hands of great men.

There is ſome difference in horſes according to the different countries where they are bred. For inſtance, in France, thoſe of Bretagne are pretty ſtrong made, and have generally black hair, or brown bay; and they have good legs and feet, with a hardy mouth, and a head ſhort and fleſhy; but in general they are pretty clumſy. The horſes of Franche Compté are ſaid to have the legs of tigers, and the belly of a hind; but they are ſhort and thick, and of a middle ſize; being much more proper for drawing than riding. The horſes of Gaſcony are not unlike thoſe of Spain; but they are not ſo handſome, nor ſo active, and therefore they are more proper to draw carriages. The Limoſin horſes are very vicious, and are good for little till they are ſix years old. Their colour is generally bay, or a bay brown. The horſes of Normandy are much like thoſe of Bretagne; and thoſe of Poitou have good bodies, legs, feet, and eyes; but they are far from being handſome.

The horſes of Germany are much better and more handſome than thoſe of the Low countries. They are of great uſe for carriages; but much more for the army, and for drawing the artillery. They have a great deal of hair, eſpecially about the legs. They are not large, but they are well ſet; and yet they have tender feet. The Hungarian horſes are excellent for the coach, as well as for riding; but they are large, though well proportioned, and they are of all colours, and in general very ſwift.

The Britiſh horſes are of all kinds, they having been brought at firſt from different countries; but for racers no country can equal them, they having been bred from what are called barbs. The Daniſh horſes are low, ſhort, and ſquare; but they have a fine head, and ſhort hair. The horſes of the Low countries are very fit for the coach, and they are beſt known by the name of Flanders mares. The Poliſh horſes are like the Daniſh; only they have not ſo fine a fore-hand: their colour is generally a bright bay, and that of the outward peel of an onion; and they are fiery and vicious. The horſes of Switzerland are pretty much like thoſe of Germany; which is no wonder, ſince the Germans purchaſe a great number of them. The horſes of Piedmont are of a middle ſize, and of all ſorts of colours; their legs are good and handſome, their eyes fine, their ears ſmall, and their mouths good; but they do not carry their heads well.

The horſes of Naples and Italy are generally ill made, and lean; and yet they are good and uſeful; for they are light and proper for racing, though not for a long courſe; they never do well in a colder climate. The Spaniſh horſes are very well made, and handſome, as well as very active and nimble; they have good eyes, handſome legs and heads, and are eaſily managed; they are alſo good for racing if they are well kept: however, they are not ſo good in northern climates as in their own country. The Turkiſh horſes are of different ſhapes; but they are generally ſwift, though their mouths are bad. Moſt of them are white; tho' there are other colours; and they are large, hardy, ſtrong, and fit for the road.

The horſes of Barbary, commonly called barbs, have ſtrong hoofs, and are more proper for racing than any others whatever: ſome have ſaid they never grow old, becauſe they preſerve their vigour to the laſt. They are excellent ſtallions; and ſome of them are uſed as ſuch in Britain: however, the Arabian horſes are not quite ſo good as the Barbary, though ſome think they are both of the ſame kind; only thoſe that are uſed to the deſerts of Arabia are always in action. The horſes of the gold-coaſt of Guinea are very few in number, and in other parts of that coaſt there are none at all; for many of the negroes, when they have been firſt brought over to our American plantations, have expreſſed great admiration at the ſight of a horſe, and even been afraid to come near one.

The horſes of the Cape of Good Hope were originally brought from Perſia; and they are generally ſmall and of a cheſnut colour; for thoſe that are natives of that country are all wild, and could never yet be tamed. The horſes of China are good, and more particularly thoſe in the province Yun Nan, for they are very vigorous, though a little low. The horſes of the Eluth Tartars are good and full of fire; and their ſize is much the ſame as the Poliſh horſes: they are afraid of nothing, not even of lions and tigers; but perhaps this may be owing to uſe. In the country of the Mogul they are very numerous, and of all colours: they are generally of the middle ſize, tho' there are ſome as large and as handſome as thoſe in Europe. The wild horſes of Tartary differ little from the tame; but they are ſo ſwift, that they avoid the arrows of the moſt ſkilful hunters. [Plate LXXV. fig. 1.]

For the method of training and managing horſes, ſee HORSEMANSHIP; and for their diſeaſes and cure, ſee FARRIERY.

2. The aſs is likewiſe a domeſtic animal, and eaſily diſtinguiſhed from the horſe at firſt ſight; we never confound theſe two animals, even though they ſhould happen to be of the ſame colour and ſtature; however, when we view the different parts of the aſs, whether the external or internal, and compare them with the correſponding parts of the horſe, the reſemblance of theſe parts is ſo perfect, that we are ſurpriſed to find the individuals ſo different and ſo eaſily diſtinguiſhable by the eye. From this circumſtance, ſome naturaliſts have conſidered the aſs and the horſe to be the ſame ſpecies of animals; and t[illegible] the ſmall differences between them are accidental, or owing to the influence of climate, culture, &c. Linnæus's ſpecific mark of the horſe is, that the whole tail is covered with long hair; and his ſpecific mark of the aſs is, that the tail has long hair only towards the point, and a black croſs over the ſhoulders. On the other hand, when we conſider the differences in the temper, the manners and diſpoſitions of theſe two animals, and, above all, the impoſſi-

impoſſibility of mixing them ſo as to produce a common or intermediate ſpecies capable of propagating and tranſmitting in the ſame manner as other diſtinct ſpecies, the notion that the horſe and the aſs are the ſame ſpecies will appear to be without any ſolid foundation. Beſides, the aſs differs materially from the horſe in the thickneſs of the head, the length of the ears, the hardneſs of the ſkin, and in the voice, the diſpoſitions, the manner of drinking, *&c.* With regard to animals, there is perhaps but one permanent and uniform ſpecific diſtinction in nature: a male and female of different ſpecies may copulate, may produce a third animal reſembling both, but very different from either: but here nature has put a final ſtop to all further procreation: the third animal, although it be ſeemingly furniſhed with every thing neceſſary for propagating, remains for ever barren. Now, the horſe may be made to copulate with the aſs; a mule, or mixture of the two, is the fruit of the unnatural embrace: but the impregnation of a mule is found by experience to be altogether impoſſible.

The aſs, therefore, is a diſtinct ſpecies, and his race as ancient as that of the horſe. Why then ſhould this uſeful, patient, ſober animal be ſo much deſpiſed? We are apt to compare him, on every occaſion, with the horſe, and from this compariſon are led to very falſe and unfavourable concluſions. The horſe is educated with great care and expence; while the poor aſs, abandoned to the abuſe of the meaneſt ſervants or the cruelty of children, inſtead of deriving benefit from inſtruction, loſes in effect his natural good qualities by the bad treatment he ſuffers. He is the ſport and buffet-block of every ruſtic, who beat and overload him without mercy or diſcretion. They never conſider, that the aſs would be the moſt uſeful, the beſt made, and moſt diſtinguiſhed of all animals, if there were no horſes in the world.

The aſs is as humble, patient, and tranquil, as the horſe is bold, ardent, and impetuous. He ſubmits with firmneſs, perhaps with magnanimity, to ſtrokes and chaſtiſement; he is temperate both as to the quantity and quality of his food; he contents himſelf with the rigid and diſagreeable herbage which the horſe and other animals leave to him, and diſdain to eat: he is more delicate with regard to his drink, never uſing water, unleſs it be perfectly pure. As his maſter does not take the trouble of combing him, he often rolls himſelf on the turf among thiſtles, ferns, *&c.* Without regarding what he is carrying, he lies down to roll as often as he can, ſeeming to reproach his maſter for neglect and want of attention.

When very young, the aſs is a gay, ſprightly, nimble, and gentle animal. But he ſoon loſes theſe qualities, probably by the bad uſage he meets with; and becomes lazy, untractable, and ſtubborn. When under the influence of love, he becomes perfectly furious. The affection of the female for her young is ſtrong: Pliny aſſures us, that when an experiment was made to diſcover the ſtrength of maternal affection in a ſhe-aſs, ſhe run through the flames in order to come at her colt.

Although the aſs be generally ill uſed, he diſcovers a great attachment to his maſter; he ſmells him at a diſtance, ſearches the places and roads he uſed to frequent, and eaſily diſtinguiſhes him from the reſt of mankind. The aſs has a very fine eye, an excellent ſcent, and a good ear. When overloaded, he hangs his head, and ſinks his ears: when too much teaſed or tormented, he opens his mouth and retracts his lips in a diſagreeable manner, which gives him an air of ridicule and deriſion. If you cover his eyes, he will not move another ſtep; if you lay him on his ſide, and place his head ſo that one eye reſts on the ground, and cover the other with a cloth, he will remain in this ſituation without making any attempt to get up. He walks, trots, and gallops in the ſame manner as the horſe; but all his motions are ſlower. Whatever be the pace he is going at, if you puſh him, he inſtantly ſtops.

The cry of the horſe is known by the name of *neighing;* that of the aſs, by *braying*, which is a long, diſagreeable noiſe, conſiſting of alternate diſcords from ſharp to grave and from grave to ſharp: he ſeldom cries but when preſſed with hunger or love: the voice of the female is clearer and more piercing than that of the male.

The aſs is leſs ſubject to vermin than other animals covered with hair; he is never troubled with lice, probably owing to the hardneſs and drineſs of his ſkin; and it is probably for the ſame reaſon, that he is leſs ſenſible to the whip and ſpur than the horſe.

The teeth of the aſs fall out and grow at the ſame age and in the ſame manner as thoſe of the horſe; and he has nearly the ſame marks in his mouth.

Aſſes are capable of propagating when two years old. The females are in ſeaſon during the months of May and June. The milk appears in the dugs ten months after impregnation; ſhe brings forth in the twelfth month, and always one at a time. Seven days after the birth, the ſeaſon of the female returns, and ſhe is again in a condition to receive the male. The colt ſhould be taken from her at the end of five or ſix months, that the growth and nouriſhment of the fœtus may not be obſtructed. The ſtallion or jack-aſs ſhould be the largeſt and ſtrongeſt that can be found; he ſhould be at leaſt three years old, and never ought to exceed ten.

The aſs, like the horſe, takes three or four years in growing, and lives till he be 25 or 30: he ſleeps leſs than the horſe, and never lies down to ſleep but when exceſſively fatigued. He is more robuſt, and leſs ſubject to diſeaſes than the horſe.

Travellers inform us that there are two ſorts of aſſes in Perſia; one of which is uſed for burdens, they being ſlow and heavy; and the other is kept like horſes for the ſaddle, for they have ſmooth hair, carry their head well, and are much quicker in their motion; but when they ride them, they ſit nearer their buttocks than when on a horſe: they are dreſſed like horſes, and are taught to amble like them; but they generally cleave their noſtrils to give them more room for breathing. Dr Ruſſell likewiſe tells us they have two ſorts in Syria, one of which is like ours, and the other very large, with remarkable long ears; but they are both put to the ſame uſe, which is, to carry burdens.

The

The onager, or wild aſs, has, by ſome authors, been confounded with the zebra; but very improperly, for this laſt is a diſtinct ſpecies; for the onager is not ſtreaked like this, nor is his ſhape ſo beautiful. Wild-aſſes are ſaid to be very ſwift of courſe; and when they ſee a man, they make a bound, and immediately fly away; inſomuch, that there is no taking of them, but by traps and gins. They have much the ſame ſhape as common aſſes; but they are of a brighter colour, and there runs a white liſt from the head to the tail. Of the hide of theſe aſſes, and particularly of that part next the rump, they make that excellent leather which we call ſhagreen, and which is put to ſo many curious uſes.

In America they have no aſſes at all, nor yet horſes; but they have been carried thither long ago, at firſt by the Spaniards, and afterwards by other nations, where they have multiplied greatly; inſomuch, that, in ſome places, there are whole droves of them that run wild, and are very hard to be caught. Aſſes in general carry the heavieſt burdens in proportion to their bulk; and, as their keeping coſts little or nothing, it is a great wonder they are not put to more uſes than they generally are among us.

The fleſh of the common aſs is never eaten in theſe parts of the world; though ſome pretend their colts are tender, and not diſagreeable. [Plate LXXV. fig. 2.]

3. The zebra.—This animal has the figure and gracefulneſs of the horſe, joined to the ſwiftneſs of the ſtag. He is about 7 feet long, from the point of the muzzle to the origin of the tail, and about 4 feet high. The colour of his ſkin is beautiful and uniform, conſiſting of alternate parallel rings of black and white diſpoſed in the moſt regular manner, as repreſented in the plate, [LXXV. fig. 3.] He is generally leſs than the horſe, and larger than the aſs.

The Zebra is found no where but in the eaſtern and ſouthern provinces of Africa, from Æthiopia to the Cape of Good Hope, and from the Cape of Good Hope to Congo. The Dutch have been at great pains to tame and uſe them for domeſtic purpoſes, but with little ſucceſs. He is hard-mouthed, and kicks when any perſon attempts to touch or come near him. He is reſtleſs and obſtinate as a mule: but perhaps the wild horſe is naturally as untractable as the Zebra; for, it is probable, if he were early accuſtomed to obedience and a domeſtic life, he would become as docile as the horſe.

ERANARCHA, a public officer among the ancient Greeks, whoſe buſineſs was to preſide over and direct the alms and proviſions made for the poor. Cornelius Nepos, in his life of Epaminondas, deſcribes his office thus: when any perſon was reduced to poverty, taken captive, or had a daughter to marry, which he could not effect for want of money, *&c.* the eranarcha called an aſſembly of friends and neighbours, and taxed each according to his means and eſtate, to contribute towards his relief.

ERANTHEMUM, in botany, a genus of the diandria monogynia claſs. The calix is divided into five ſegments; the tube is filiform; and the ſtigma is ſimple. There is but one ſpecies, a native of Æthiopia.

ERASED, in heraldry. See ARRACHE.

ERECTION, in a general ſenſe, the art of raiſing or elevating any thing, as the erection of a perpendicular, *&c.* It is alſo uſed in a figurative ſenſe, as the erection of a biſhopric, marquiſate, *&c.*

ERECTOR CLITORIS. See CLITORIS.

ERECTOR PENIS. See PENIS.

EREMIT. See HERMIT.

EREMITA, in zoology. See SCARABÆUS.

ERFURT, a large and beautiful city of Upper Saxony in Germany, capital of Thuringia, and ſubject to the elector of Mentz: E. long. 11° 6′, N. lat. 51°.

ERGOT, in farriery, is a ſtub, like a piece of ſoft horn, about the bigneſs of a cheſnut, placed behind and below the paſtern joint, and commonly hid under the tuft of the fetlock.

ERICA, or HEATH, in botany, a genus of the octandria monogynia claſs. The calix conſiſts of four leaves, and the corolla of four ſegments; the filaments are inſerted into the receptacle; the antheræ are bifid; and the capſule has four cells. There are thirty-eight ſpecies, five of which are natives of Britain, *viz.* the vulgaris, or common heath; the cinerea, or fine-leaved heath; the tetralix, or croſs-leaved heath; the ciliaris, or rough-leaved heath; and the multiflora, or fir-leaved heath.

ERIDANUS, in aſtronomy. See Vol I. p. 487.

ERIE, a vaſt lake to the weſtward of Penſilvania, in North America, ſituated between 80° and 87° W. long. and between 41° and 42° N lat.

ERIGERON, or SWEET FLEA BANE, in botany, a genus of the ſyngeneſia polygamia ſuperflua claſs. The receptacle is naked; the pappus is hairy; and the radii of the corolla are linear and very narrow. There are ſixteen ſpecies, two of which are natives of Britain, *viz.* the acre, or blue-flowered flea-bane; and the canadenſe, or Canada flea-bane.

ERINACEUS, or HEDGE-HOG, in zoology, a genus of quadrupeds belonging to the order of feræ, the characters of which are theſe: they have two foreteeth in the upper-jaw, at a conſiderable diſtance from one another, and two in the under jaw, leſs diſtant; and they have two recumbent dog-teeth, one on each ſide. There are three ſpecies, *viz.* 1. The europæus, or common hedge-hog, with round ears, and creſted noſtrils. It is about nine inches long; the upper part of the body is totally covered with ſharp prickles, and the under part is covered with hair. The hedge-hog, even when ſtanding on his legs, has a very ugly aſpect. His body is an oblong maſs, convex above, terminated on the fore-part by a very ſharp muzzle, and mounted on four ſhort legs, of which nothing appears but the feet, and the tail is not diſcernible. His ears are broad, round, and ſhort; and his eyes are ſmall and protuberant. The length of his body, from the point of the muzzle to the anus, is about nine inches.

The hedge-hog has a very uncommon method of defending himſelf from the attacks of other animals: being poſſeſſed of little ſtrength or agility, he does not attempt to fly from or aſſail his enemies; but erects his briſtles, and rolls himſelf up like a ball, expoſing no

part

part of his body that is not furnished with sharp weapons of defence; he will not unfold himself, unless thrown into water: the more he is frightened or harassed, the closer he shuts himself up, and frequently discharges his urine, which has a very fœtid an loathsome smell. While in this state, most dogs, instead of biting him, stand off and bark, not daring to seize him; or, if they attempt it once, their mouths are so pricked with his bristles, that they cannot be prevailed on to attempt it a second time. Both the male and female are covered with bristles from the head to the tail. These bristles are of great use in defending them from other animals; but must be very inconvenient when they incline to copulate. This operation they cannot perform in the manner of other quadrupeds; but do it face to face, either standing on end, or the female lying on her back. The females come in season in the spring, and bring forth their young in the beginning of summer. They commonly bring forth three or four, and sometimes five, at a time. The young ones are of a whitish colour, and only the points of the bristles appear above the skin. It is impossible to tame them: the mother and her young have frequently been confined together, and furnished with plenty of provisions: but, instead of nourishing them, she uniformly devoured them one after another. Males and females have likewise been kept in one apartment, where they lived, but never copulated. Hedge-hogs feed upon fallen fruits, some roots, and insects: they are very fond of flesh-meat, whether raw or roasted. They frequent woods, and live under the trunks of old trees, in the chinks of rocks, or under large stones. Naturalists alledge that they go into gardens, mount the trees, and come down with pears, apples, or plumbs, stuck upon their bristles. But this is a mistake: although kept in a garden, they never attempt to climb trees, or stick even fallen fruit upon their bristles, but lay hold of their food with their mouth. They never come out of their holes in the day, but go about in quest of food during the night. They eat but little, and can live very long without taking any nourishment. They do not lay up any store of provisions in harvest; such an instinct would be useless, as they sleep all the winter. See Plate LXXIV. fig. 6.

2. The inauris, or white hedge-hog, has no external ears. It is a native of America.

3. The malacensis, has hanging ears, and is a native of Asia

ERINGO, in botany. See ERYNGIUM.

ERIOCAULON, in botany, a genus of the triandria trigynia class. The common calix has an imbricated capitulum; it has three equal petals: and the stamina are above the germen. There are five species, none of them natives of Britain.

ERIOCEPHALUS, in botany, a genus of the syngenesia polygamia necessaria class. The receptacle is somewhat hairy; it has no pappus; the calix consists of six equal petals: and there are five floscules in the radius. There are two species, none of them natives of Britain.

ERIOPHORUM, in botany, a genus of the triandria monogynia class. The gluma is paleaceous, and imbricated on each side; the corolla is wanting; and there is but one seed, surrounded by long down.

ERITHACUS, in ornithology See MOTACILLA.

ERIVAN, a city of Persia, on the frontiers of Turky, situated on the south end of a lake of the same name: E. long. 45°, N. lat. 40° 16′.

ERKELENS, a city of Westphalia, in Germany, ten miles north of Juliers: E. long. 6°, N. lat. 51°.

ERMIN, in zoology. See MUSTELA.

ERMIN, in heraldry, is always argent and sable, that is, a white field, or fur, with black spots. These spots are not of any determinate number, but may be more or less, at the pleasure of the painter, as the skins are thought not to be naturally so spotted; but serving for lining the garments of great persons, the furriers were wont, in order to add to their beauty, to sew bits of the black tails of the creatures that produced them, upon the white of their skin, to render them the more conspicuous, which alteration was introduced into armory. See Plate LXXIV. fig. 7.

ERMIN, or EARS OF CORN, an order of knights in France, instituted by Francis the last of that name, duke of Britany.

This order was so called on account that the collar of it was made up of ears of corn, lying athwart one another in saltier, bound together, both above and below, each ear being crossed twice, the whole of gold. To this collar there hung a little white beast, called an ermin, running over a bank of grass diversified with flowers.

ERMINE′, or CROSS ERMINE′, is one composed of four ermin spots, placed as represented in Plate LXXIV. fig. 8.

It is to be observed, that the colours in these arms are not to be expressed, because neither this cross nor these arms can be of any other colour but white and black.

ERMINITES should signify little ermines, but it is otherwise; for it expresses a white field powdered with black, only that every such spot hath a little red hair on each.

Erminites also signify a yellow field powdered with black, which the French express much better by *or semée d'ermine de sable*.

EROSION, among physicians, denotes much the same with corrosion, only in a stronger degree. See CORROSION, and CORROSIVES.

EROTIC, in general, any thing relating to the passion love.

ERRATIC, in general, something that wanders, or is not regular: hence it is the planets are called erratic stars.

ERRHINES, in pharmacy, medicines which, when snuffed up the nose, promote a discharge of mucus from that part.

ERROUR, ERROR, a mistake of our judgment, giving assent to that which is not true.

Mr Locke reduces the causes of error to these four; first

first, want of proofs; secondly, want of ability to use them: thirdly, want of will to use them; and fourthly, wrong measures of probability.

ERUCA, in general, denotes caterpillars of all kinds. See Natural History, *Of insects*.

Eruca, the White rocket, in botany. See Brassica.

Eruca marina. See Aphrodita.

ERUCAGO, in botany. See Bunias.

ERUDITION denotes an extensive acquaintance with books, especially such as treat of the belles lettres.

ERVI species, in botany. See Sophora.

ERUPTION, in medicine, a sudden and copious excretion of humours, as pus or blood: it signifies also the same with exanthema, any breaking out, as the pustules of the plague, small-pox, measles, *&c.* See Medicine.

ERVUM, in botany, a genus of the diadelphia decandria class. The calix consists of five segments of an equal length with the corolla. There are six species, three of which are natives of Britain, *viz.* the soloniense, or spring tare; the tetraspermum, or smooth tare; and the hirsutum, or hairy tare.

ERINGIUM, Eringo, in botany, a genus of the pentandria digynia class. The flowers are capitated, and the receptacle is paleaceous. There are ten species, two of which are natives of Britain, *viz.* the maritimum, or sea-holly eringo; and the campestre, or common eringo. The root of the sea-holly is said to be aperient, diuretic, and aphrodisiac.

ERYSIMUM, in botany, a genus of the tetradynamia siliquosa class. The pod is four-sided, divided into two cells. There are six species, four of which are natives of Britain, *viz.* the officinale, or hedge-mustard; the cheirianthoides, or treacle worm-seed; the barbarea, rocket, or winter-cresses; and the alliaria, Jack-by-the-hedge, or sawce-alone. The leaves of the hedge-mustard are said to promote expectoration, and to excite urine and other excretions.

ERYSIPELAS, in medicine, an eruption of a fiery or acrid humour, from which no part of the body is exempted, though it chiefly attacks the face. See Medicine.

ERYTHRINA, in botany, a genus of the diadelphia decandria class. The calix is bilabiated; and the corolla consists of a long lanceolated vexillum. There are three species. none of them natives of Britain.

ERYTHRINUS, in ichthyology, a species of sparus. See Sparus.

ERYTHROIDES, in anatomy, the first of the proper tunics or coats which cover the testicles. See Anatomy, p. 170.

ERYTHRONIUM, Dog's-tooth violet, in botany, a genus of the hexandria monogynia class. The corolla is bell-shaped, and consists of six petals; there are two nectariferous tubercles at the base of every second petal. There is but one species, a native of Germany.

ERYTHROPHTHALMUS, in ichthyology, a species of cyprinus. See Cyprinus.

ERZERUM, the capital of the province of Turcomania, or Armenia: E. long. 41°, N. lat. 40°. It is a great thoroughfare from Persia and India to Constantinople, by the way of Trebisond and the Black-sea.

ESCHAR, in surgery, the crust or scab occasioned by burns or caustic medicines.

ESCHAROTICS, in pharmacy, medicines which produces eschars. See Eschar.

ESCHEAT, in Scots law, is that forfeiture which is incurred upon a person's being denounced rebel. It is either single or liferent: single escheat is the forfeiture of the rebel's moveable estate; liferent escheat is the forfeiture of the rents of his heritable estate, during his life. See Scots Law, title 12.

ESCHRAKITES, in matters of religion, a sect of Mahometans, who believe that man's sovereign good consists in the contemplation of God. They avoid all manner of vice, and appear always in good humour, despising the sensual paradise of Mahomet. The most able preachers, in the royal mosques, are of this sect.

ESCLATTE', in heraldry, signifies a thing forcibly broken, or rather a shield that has been broken and shattered with the stroke of a battle-ax.

ESCUAGE, in our old customs, a kind of knight-service, called service of the shield, by which the tenant was bound to follow his lord to the wars at his own charge.

ESCULENT, an appellation given to such plants as may be eaten. See Botany, p. 628.

ESCULUS, in botany. See Quercus.

ESCURIAL, a palace of the king of Spain, twenty-one miles north-west of Madrid; being one of the largest and most beautiful in the world. It has eleven thousand windows, fourteen thousand doors, one thousand eight hundred pillars, seventeen cloysters or piazzas, and twenty-two courts; with every convenience and ornament that can render a place agreeable in so hot a climate, as an extensive park, groves, fountains, cascades, grottos, *&c.*

ESCUTCHEON, or Scutcheon, in heraldry, is derived from the French *escusson*, and that from the Latin *scutum*, and signifies the shield whereon coats of arms are represented.

Most nations, of the remotest antiquity, were wont to have their shields distinguished by certain marks painted on them; and to have such on their shields was a token of honour, none being permitted to have them till they had performed some honourable action.

The escutcheon, as used at present is square, only rounded off at the bottom.

ESDRAS, the name of two apocryphal books, usually bound up with the scriptures. They were always excluded the Jewish canon, and are not admitted as canonical by the papists themselves.

ESENS, a town of Westphalia, twenty-five miles north of Embden.

ESK, a river which forms part of the boundary between England and Scotland; and, running from north east to south-west, falls into the Solway frith: it gives name to the country of Eskdale.

ESKIMAUX, ſometimes called New Britain, and Terra de Labrador, is an extenſive country of North America, ſituated between 59° and 80° W. long. and between 50° and 64° N. lat.

It is bounded by Hudſon's ſtraits, which ſeparate it from Greenland, on the north; by the Atlantic ocean, on the eaſt; by the river and bay of St Laurence, on the ſouth-eaſt; and by Hudſon's bay, on the weſt.

ESLINGEN, an imperial city of Swabia in Germany, ſeven miles ſouth-eaſt of Stutgard.

ESOX, in ichthyology, a genus belonging to the order of abdominales. The body is elongated; the head is plainiſh above; the upper jaw is plain, and ſhorter than the under one, which is dotted; and the branchioſtege membrane has from ſeven to twelve rays. There are nine ſpecies.

ESPALIERS, in gardening, are rows of trees planted about a whole garden or plantation, or in hedges, ſo as to incloſe quarters or ſeparate parts of a garden; and are trained up regularly to a lattice of wood-work in a cloſe hedge, for the defence of tender plants againſt the injuries of wind and weather.

The trees chiefly planted for eſpaliers, are apples, pears, and ſome plumbs. See GARDENING.

ESPERIE, a city of Hungary, forty miles north of Tockay: it is remarkable for its ſalt mines.

ESPINAL, a town of Lorrain on the Moſelle, thirty-five miles ſouth-eaſt of Nancy.

ESPLANADE, in fortification, the ſloping of the parapet of the covered way towards the campaign.

ESPLEES, in law, the general products which lands yield, or the profit or commodity that is to be taken or made of a thing.

ESPOUSALS, in law, ſignify a contract or promiſe made between a man and a woman, to marry each other; and in caſes where marriage may be conſummated, eſpouſals go before. Marriage is termed an eſpouſal *de præſenti.*

ESQUIRE was anciently the perſon that attended a knight in time of war, and carried his ſhield.

This title has not for a long time, had any relation to the office of the perſon, as to carry arms, *&c.* Thoſe to whom the title of eſquire is now of right due, are all noblemens younger ſons, and the eldeſt ſons of ſuch younger ſons; the eldeſt ſons of knights, and their eldeſt ſons; the officers of the king's courts, and of his houſehold; counſellors at law, juſtices of the peace, *&c.* though thoſe latter are only eſquires in reputation: beſides, a juſtice of the peace holds this title no longer than he is in commiſſion, in caſe he is not otherwiſe qualified to bear it: but a ſheriff of a county, who is a ſuperior officer, retains the title of eſquire during life, in conſequence of the truſt once repoſed in him: the heads of ſome ancient families are ſaid to be eſquires by preſcription.

ESQUIRES *of the king*, are ſuch as have that title by creation, wherein there is ſome formality uſed, as the putting about their necks a collar of SS, and beſtowing on them a pair of ſilver-ſpurs, *&c.*

ESSAY, a trial or experiment for proving the quality of any thing; or an attempt to learn, whether or no any invention will ſucceed.

ESSAY, in literature, a peculiar kind of compoſition, the character whereof is to be free, eaſy, and natural; not tied to ſtrict order or method, nor worked up and finiſhed like a formal ſyſtem.

ESSAY-HATCH is the miner's term for a little trench or hole, which they dig to ſearch for ſhoad or ore.

ESSECK, a town of Hungary, near the confluence of the rivers Drave and Danube, with a bridge five miles over: it lies about eighty miles north-weſt of Belgrade.

ESSEN, a town of Weſtphalia, about ten miles north-eaſt of Duſſeldorp.

ESSENCE, in metaphyſics, that which conſtitutes the particular nature of each genus or kind, and diſtinguiſhes it from all others; being nothing but that abſtract idea to which this name is affixed; ſo that every thing contained in it, is eſſential to that particular kind.

ESSENES, or ESSENIANS, in Jewiſh antiquity, one of the three ancient ſects among that people. They allowed a future ſtate, but denied a reſurrection from the dead. Their way of life was very ſingular: they did not marry, but adopted the children of others, whom they bred up in the inſtitutions of their ſect: they deſpiſed riches, and had all things in common, and never changed their cloaths till they were entirely worn out. When initiated, they were ſtrictly bound not to communicate the myſteries of their ſect to others; and if any of their members were found guilty of enormous crimes, they were expelled.

Pliny tells us, that they dwelt on the weſt ſide of the lake of Aſphaltites; and that they were a ſolitary kind of men, living without women or money, and feeding upon the fruit of the palm-tree: he adds, that they were conſtantly recruited by new-comers, whom the ſurges of ill fortune had made weary of the world; in which manner the ſect was kept up for ſeveral thouſands of years, without any being born among them. The reaſon why we find no mention made of them in the New Teſtament, may be their recluſe and retired way of life, no leſs than their great ſimplicity and honeſty, whereby they lay open to no cenſure or reproof.

ESSENTIAL, ſomething neceſſarily belonging to a thing, from which it cannot be conceived diſtinct: thus the primary qualities of bodies, as extenſion, figure, number, *&c* are eſſential or inſeparable from them in all their changes and alterations.

ESSENTIAL OIL. See CHEMISTRY, p. 93.

ESSEX, a county of England, bounded by Suffolk, on the north; by the German ſea, on the eaſt; by the river Thames, which divides it from Kent, on the ſouth; and by Middleſex and Hertfordſhire, on the weſt.

ESSOIN, in law, an excuſe for a perſon ſummoned to appear and anſwer to an action, on account of the ſickneſs or other juſt cauſe of his abſence.

ESSORANT, in heraldry, denotes a bird ſtanding on the

the ground with its wings expanded, as if it had been wet, and were drying itſelf.

ESTATE, in law, ſignifies the title or intereſt that a perſon has in lands, tenements, or other effects.

Estates, in a political ſenſe, is uſed either to denote the dominions of ſome prince, or the general claſſes into which the people are divided.

In Britain, the eſtates are the king, lords, and commons; or rather the lords and commons, who meet the king in parliament, for reforming abuſes, and enacting good and wholeſome laws.

ELSETE', in heraldry, denotes the heads of beaſts torn off by main force. See Arache' and Erased.

ESTHER, a canonical book of the Old Teſtament, containing the hiſtory of a Jewiſh virgin, dwelling with her uncle Mordecai at Shuſhan, in the reign of Ahaſuerus, one of the kings of Perſia.

ESTOILE'E, or Cross estoille'e, in heraldry, a ſtar with only four long rays in form of a croſs; and, accordingly, broad in the centre, and terminating in ſharp points.

ESTONIA, a province ſubject to Ruſſia, on the north of Livonia.

ESTRAY, in law, any beaſt not wild that is found within a lordſhip, and owned by nobody.

ESTREMADURA, a province of Spain, bounded by Leon, on the north; by the two Caſtiles, on the eaſt; by Andaluſia, on the ſouth; and by the province of Alentejo, in Portugal, on the weſt.

Estremadura is alſo a province of Portugal, lying north of Alentejo, and weſtward of Spaniſh Eſtremadura. Liſbon is its capital, as alſo of the kingdom.

ESTREMOS, a town of Alentejo, in Portugal, eighty-five miles ſouth-eaſt of Liſbon.

ETCHING, a method of engraving on copper, in which the lines or ſtrokes, inſtead of being cut with a tool or graver, are eaten in with aquafortis.

Etching is done with more eaſe and expedition than engraving: it requires fewer inſtruments, and repreſents moſt kind of ſubjects better and more agreeable to nature, as landſcapes, ruins, grounds, and all ſmall, faint, looſe, remote objects, buildings, *&c.* See Engraving.

The method of etching is as follows: Chuſe the copperplate as directed for engraving, and furniſh yourſelf with a piece of ground, tied up in a bit of thin ſilk, kept very clean, to be laid upon the plate, when both have been warmed; proper needles, to hatch with on the ground; a pencil or bruſh, to wipe away the bits of ground which riſe after its hatching; a poliſher; two or three gravers; a pair of compaſſes, to meaſure diſtances and draw circles; a ruler, to hatch ſtraight lines; green wax, to make the wall round the edges of the plate, to contain the aquafortis; an oil-ſtone; a bottle of aquafortis; ſome red lead, to colour the back ſide of the copy; a ſtift, and a hand-vice, to hold the plate over the candle. See Needle, Graver, Polisher, Compass, *&c.*

To make the ground, take three ounces of aſphaltum, two ounces of clean roſin, half an ounce of Burgundy-pitch, three ounces of black wax, and three ounces of virgin-wax: let all theſe be melted in a clean earthern pipkin over a ſlow fire, ſtirring it all the time with a ſmall ſtick; if it burn to the bottom, it is ſpoiled. After the ingredients are well melted, and it boils up, put it into a pan of fair water; and before it be quite cold, take it out, and roll it into ſmall lumps to be kept from duſt: this ground is what others call the varniſh. The next thing is to clean the plate to receive the ground: take a piece of liſting, roll it up as big as an egg, tie it very tight, ſo as to make it a rubber; and having dropped a ſmall quantity of ſweet oil, and added a little powder of rotten ſtone on the plate, rub it with this ball, till it will almoſt ſhew your face, Then wipe it all off with a clean rag; and after that, make it quite dry with another clean rag and a little fine whitening.

The next thing is to lay on the varniſh; to do which aright you muſt take a hand-vice, and fix it at the middle of one part of the plate, with a piece of paper between the teeth of the hand-vice and the plate, to prevent the marks of the teeth: then laying the plate on a chaffing-diſh, with a ſmall charcoal fire in it, till the plate be ſo hot that, by ſpitting on the back-ſide, the wet will fly off: rub the plate with the ground tied up in ſilk, till it be covered all over; and after that daub the plate with a piece of cotton wrapped up in ſilk, till the ground be quite ſmooth, keeping the plate a little warm all the time. The varniſh being thus ſmoothed upon the plate, it muſt be blacked in the following manner: take a thick tallow candle that burns clear, with a ſhort ſnuff; and having driven two nails into the wall, to let it reſt upon, place the plate againſt the wall with the varniſh ſide downward, and take care not to touch the ground with your fingers: then taking the candle, apply the flame to the varniſh as cloſe as poſſible, without touching the varniſh with the ſnuff of the candle, and guide the flame all over it, till it become perfectly black. After this is done, and the plate dry, the deſign is traced with a needle through the varniſh, and a rim or border of wax is raiſed round the circumference of the plate; and then the artiſt has a compoſition of common varniſh and lamp-black made very thin, wherewith he covers the parts that are not to be bitten, by means of a hair-pencil. And he is every now and then covering or uncovering this or that part of the deſign, as occaſion may require; the conduct of the aquafortis being the principal concern, on which the effect of the print very much depends The operator muſt be attentive to the ground, that it does not fail in any part, and where it does to ſtop up the place with the above compoſition. The plate is defended from the aquafortis every where, but in the lines or hatches cut through it with the needle, through which the water eats into the copper to the depth required; remembering to keep it ſtirring with a feather all the while; which done, it is to be poured off again.

Single aquafortis is moſt commonly uſed; and if it be too ſtrong, mix it with vinegar, otherwiſe it will make the work very hard, and ſometimes break up the ground: the aquafortis having done its part, the ground

ground is taken off, and the plate washed and dried: after which nothing remains for the artist, but to examine the work with his graver, to touch it up, and heighten it where the aquafortis has missed.

And, lastly, it is to be remembered, that a fresh dip of aquafortis is never given, without first washing out the plate in fair water, and drying it at the fire.

ETERNITY, an attribute of God, expressing his infinite or endless duration.

According to Mr Locke, we come by the idea of eternity, by being able to repeat any part of time, as a year, as often as we will, without ever coming to an end.

ETHER. See ÆTHER.

ETHICS. See MORALS.

ETHIOPIA, or ÆTHIOPIA, a very extensive country of Africa, comprehending Abyssinia, Nubia, and Abex: it is bounded by Egypt, and the desart of Barca, on the north; by the Red sea and Indian ocean, on the east; by Anian, and the unknown parts of Africa, on the south; and by other unknown countries on the west.

ETHMOIDAL, in anatomy. See ANATOMY, p. 152.

ETHMOIDES os, in anatomy. See ANAT. p. 157.

ETNA, or mount GIBELLO, a vulcano, or burning mountain of Sicily, situated fifty miles south-west of Messina, and twenty west of Catania. See VULCANO.

ETYMOLOGY, that part of grammar which considers and explains the origin and derivation of words, in order to arrive at their first and primary signification. See GRAMMAR.

EVACUANTS, in pharmacy, are properly such medicines as diminish the animal fluids, by throwing out some morbid or redundant humour, or such as thin, attenuate, and promote the motion and circulation thereof.

EVACUATION, in medicine, the art of diminishing, emptying, or attenuating the humours of the body. See MEDICINE

EVANGELIST, a general name given to those who write or preach the gospel of Jesus Christ.

The word is of Greek origin, signifying one who publishes glad tiding, or is the messenger of good news.

According to Hooker, evangelists were presbyters of principal sufficiency, whom the apostles sent abroad, and used as agents in ecclesiastical affairs, wheresoever they saw need.

The term evangelist however is at present confined to the writers of the four gospels.

EVANID, a name given by some authors to such colours as are of no long duration, as those in the rainbow, in clouds before and after sun set, *&c.*

Evanid colours are also called fantastical and emphatical colours.

EVANTES, in antiquity, the priestesses of Bacchus, thus called, by reason, that in celebrating the orgia, they ran about as if distracted, crying, *Evan, evan, ohé evan.* See BACCHANALIA

EVAPORATION, in chemistry, the setting a liquor in a gentle heat to discharge its superfluous humidity, reduce it to a proper consistence, or obtain its dry remainder. See CHEMISTRY.

EVATES, a branch or division of the druids, or ancient Celtic philosophers. Strabo divides the British and Gaulish philosophers into three sects; bards, evates, and druids. He adds, that the bards were the poets and musicians; the evates, the priests and naturalists; and the druids were moralists as well as naturalists: But Marcellus and Hornius reduce them all to two sects, *viz.* the bards and druids.

EUBAGES, an order of priests, or philosophers, among the ancient Celtæ, or Gauls: some will have the eubages to be the same with the druids and saronidæ of Diodorus; and others, that they were the same with what Strabo calls evates.

EUCHARIST, the sacrament of the Lord's supper, properly signifies giving thanks.

This sacrament was instituted by Christ himself, and the participation of it called communion.

As to the manner of celebrating the eucharist among the ancient Christians, after the customary oblations were made, the deacon brought water to the bishops and presbyters, standing round the table, to wash their hands, according to that of the psalmist, "I will wash my hands in innocency, and so will I "compass thy altar, O Lord." Then the deacon cried out aloud, "Mutually embrace and kiss each "other;" which being done, the whole congregation prayed for the universal peace and welfare of the church, for the tranquillity and repose of the world, for the prosperity of the age, for wholesome weather, and for all ranks and degrees of men. After this followed mutual salutations of the minister and people; and then the bishop or presbyter having sanctified the elements by a solemn benediction, he brake the bread, and delivered it to the deacon, who distributed it to the communicants; and after that the cup. Their sacramental wine was usually diluted or mixed with water. During the time of administration, they sang hymns and psalms; and, having concluded with prayer and thanksgiving, the people saluted each other with a kiss of peace, and so the assembly broke up.

EVER-GREEN, in gardening, a species of perennials, which continue their verdure, leaves, *&c.* all the year: such are hollies, phillyria's, laurustinus's, bays, pines, firs, cedars of Lebanon, *&c.*

EVERLASTING PEA, a genus of plants, otherwise called lathyrus. See LATHYRUS.

EVESDROPPERS, in law, persons who stand under the eves, walls, or windows of a house, by day or by night, to listen after news, and carry it to others, thereby raising strife and contention in the neighbourhood.

EVESHAM, a borough town thirteen miles south-east of Worcester, which sends two members to parliament.

EUGENIA, the SILVER TREE, in botany, a genus of the icosandria monogynia class. The calix is above the fruit, and consists of four segments; the petals are four; and the drupa is quadrangular, and contains

one

one feed. There are five fpecies, none of them natives of Britain.

EVIAN, a town of Savoy, fituated twenty-five miles north-eaft of Geneva, on the fouth fide of the lake of Geneva.

EVICTION, in law, fignifies a recovery of lands, or tenements by law.

EVIDENCE, that perception of truth which arifes either from the teftimony of the fenfes, or from an induction of reafon. See METAPHYSICS, and MORALS.

EVIDENCE, in law, any proof, whether it be by teftimony of men on oath, or by writings and records fo called, becaufe hereby the point in iffue is made evident by a jury.

EVIL. See MORALS.

King's-EVIL, in medicine. See MEDICINE.

EULOGY, in church-hiftory, a name by which the Greeks call the *panis benedictus*, or bread over which a bleffing is pronounced, and which is diftributed to thofe who are unqualified to communicate.

EUMENIDES, in antiquity. See FURIES.

EUNOMIANS, in church-hiftory, Chriftian heretics, in the fourth century. They were a branch of Arians, and took their name from Eunomius, bifhop of Cyzicus, who was inftructed by Ætius, in the points which were then controverted in the church, after having at firft followed the profeffion of arms. Eunomius fo well anfwered the defigns of his mafter, and declaimed fo vehemently againft the divinity of the WORD, that the people had recourfe to the authority of the prince, and had him banifhed; but the Arians obtained his recall, and elected him bifhop of Cyzicus. The manners and doctrines of the Eunomians were the fame with thofe of the Arians.

EUNUCH, a caftrated perfon. See CASTRATION.

EUNUCHS, in church-hiftory, a fect of heretics in the third century, who were mad enough to caftrate, not only thofe of their own perfuafion, but even all others that they could lay hold of: they took their rife from the example of Origen, who, mifunderftanding the following words of our Saviour,—" And eunuchs who " made themfelves eunuchs for the kingdom of hea-" ven,"—caftrated himfelf.

EVOLUTION, in algebra. See ALGEBRA, p. 86.

EVOLUTION, in the art of war, the motion made by a body of troops, when they are obliged to change their form and difpofition, in order to preferve a poft, or occupy another, to attack an enemy with more advantage, or to be in a condition of defending themfelves the better.

EUONYMOIDES, in botany. See CELASTRUS.

EUONYMUS, the SPINDLE-TREE, in botany, a genus of the pentandria monogynia clafs. The corolla confifts of five petals; the capfule is five-fided, and has five coloured cells; and the feeds have calyptra. There are two fpecies, one of which, *viz.* the europæus, fpindle-tree, or prickwood, is a native of Britain.

EVORA, or EBORA, a city of Portugal, feventy miles fouth-eaft of Lifbon.

EUPATORIOPHALACRON, in botany. See VERBESINA.

EUPATORIUM, HEMP-AGRIMONY, in botany, a genus of the fyngenefia polygamia æqualis clafs. The receptacle is naked; the pappus is plumofe; the calix is oblong and imbricated; and the ftylus is long and femi-bifid. There are twenty-one fpecies, only one of which is a native of Britain, *viz.* the cannabinum, hemp-agrimony, or Dutch agrimony. The leaves are faid to ftrengthen the ftomach.

EUPHYMISM, in rhetoric, a figure which expreffes things in themfelves difagreeable and fhocking, in terms implying the contrary quality.

EUPHORBIA, in botany, a genus of the dodecandria trigynia clafs. The corolla confifts of four or five petals; and the calix has but one leaf. There are fixty-two fpecies, twelve of which are natives of Britain, *viz.* the peplus, or fmall purple fea-fpurge; the peplus, or petty fpurge; the exigua, or dwarf-fpurge; the fegetalis, or corn-fpurge; the helioscopia, funfpurge, or wart-wort; the portlandica, or Portland fpurge; the paralias, or fea-fpurge; the verrufca, or rough fruited fpurge; the platyphyllus, or broad-leaved fpurge; the amygdaloides, or wood-fpurge; the characias, or red fpurge; and the hyberna, or knotty-rooted fpurge. The fpurges are exceedingly acrid, and are now rejected both by the Edinburgh and London difpenfatories.

EUPHORBIUM, in pharmacy, a gum refin brought us always in loofe, fmooth, and gloffy gold-coloured drops or granules. It is the produce of the euphorbium antiquorum verum, which grows to ten or twelve feet high. Its principal ufe is externally in finapifms, and plafters applied to the feet, which are intended to ftimulate, but not abfolutely to raife blifters: for it is obferved by Avifenna, that when taken internally in large dofes, it has been found to exulcerate the inteftines, and bring on death itfelf, after the moft terrible fymptoms.

EUPHRASIA, in botany, a genus of the didynamia angiofpermia clafs. The calix is cylindrical, and confifts of four fegments; and the capfule is oblong and bilocular. There are fix fpecies, two of which are natives of Britain, *viz.* the officinalis, or eye-bright; and the odentites, or red eye bright. The eye-bright was formerly celebrated as an ophthalmic, but is now totally difregarded.

EUPHRATES, the fineft river in Turky in Afia, has two fources, northward of the city of Erzerum, in 40° N. lat. After paffing through Armenia, it divides Syria from Diarbec or Affyria, runs through Eyraca or Chaldea; and uniting with the Tygris, it paffes by the city of Baffora, fifty miles below which it falls into the gulf of Perfia.

EUREUX, a city of Normandy in France, twenty-five miles fouth of Rouen.

EURIPUS, a ftrait between the ifland of Negropont, and the continent of Greece, remarkable for its irregular tides.

The term euripus is fometimes ufed, in a more general

general ſenſe, for any ſtraits where the water is much agitated.

EUROPE, the leaſt of the four grand diviſions of the earth, is ſituated between 36° and 72° N. lat.; and between 10° degrees W. long. and 65° E. long. being about 3000 miles long from north to ſouth, and 2500 miles broad from eaſt to weſt. It is bounded by the frozen ocean on the north, by Aſia on the eaſt, by the Mediterranean, which ſeparates it from Africa, on the ſouth, and by the Atlantic ocean on the weſt.

Europe is commonly ſubdivided into three grand diviſions, north, middle, and ſouth. The north or upper diviſion comprehends Ruſſia, or Muſcovy, Sweden, Denmark, and Norway, and the iſlands of Britain, Iceland, Greenland, and thoſe of the Baltic. The middle diviſion contains Poland, Germany, and the hereditary dominions of the houſe of Auſtria, the Low Countries, or Netherlands, and France. The ſouthern diviſion comprehends Turky in Europe, the ancient Greece chiefly, Switzerland, Italy, Spain and Portugal, and the iſlands of Sicily, Sardinia, Corſica, Majorca, Minorca, Ivica, and thoſe of the Archipelago.

EURYTHMY, in architecture, painting, and ſculpture, is a certain majeſty, elegance, and eaſineſs, appearing in the compoſition of divers members, or parts of a body, painting, or ſculpture, and reſulting from the fine proportion of it.

EUSTACE, or EUSTATIA, one of the Caribbee iſlands, four miles weſt of St Chriſtopher's, and ſubject to the Dutch

EUSTYLE, in architecture, a ſort of building in which the pillars are placed at the moſt convenient diſtance one from another, the intercolumniations being juſt two diameters and a quarter of the column, except thoſe in the middle of the face, before and behind, which are three diameters diſtant.

EUTYCHIANS, in church-hiſtory, heretics in the Vth century, who embraced the errors of the monk Eutyches, maintaining that there was only one nature in Jeſus Chriſt.

EUXINE, the ſame with the Black Sea. See BLACK SEA.

EWAGE, a toll paid for the paſſage of water, and otherwiſe called aquage.

EWE, the Engliſh name of a female ſheep. See OVIS.

EWRY, in the Britiſh cuſtoms, an office in the king's houſhold, which has the care of the table-linen, of laying the cloth, and ſerving up water in ſilver ewers after dinner.

EXACERBATION. See PAROXYSM.

EXACUM, in botany, a genus of the tetrandria monogynia claſs. The calix conſiſts of four leaves, and the corolla of four ſegments, with a roundiſh tube; the capſule is biſulcated, and has two cells containing many ſeeds. There are two ſpecies, none of them nativ s of Britain.

EXÆRESIS, in ſurgery, the operation of extracting or taking away ſomething that is hurtful to the human body.

EXAGGERATION, in rhetoric, a kind of hyperbole, whereby things are augmented or amplified, by ſaying more than the truth, either as to good or bad.

EXAGGERATION, in painting, a method by which the artiſt, in repreſenting things, changes them too much, or makes them too ſtrong, either in reſpect of the deſign or the colouring.

EXALTATION, in chemiſtry, ſignifies an operation by which a ſubſtance has its properties changed, and raiſed to a higher degree of dignity and virtue.

EXAMINERS, in chancery, two officers of that court, who examine, upon oath, witneſſes produced in cauſes depending there, by either the complainant or defendant, where the witneſſes live in London, or near it. Sometimes parties themſelves, by particular order, are examined. In the country, above twenty miles from London, on the parties joining in commiſſion, witneſſes are examined by commiſſioners, being uſually counſellors or attornies not concerned in the cauſe.

EXANTHEMA among phyſicians, denotes any kind of efflorescence or eruption, as the meaſles, purple ſpots in the plague, or malignant fevers, &c.

EXARCH, in antiquity, an officer ſent by the emperors of the eaſt into Italy, in quality of vicar, or rather præfect, to defend that part of Italy which was yet under their obedience, and particularly the city of Ravenna, againſt the Lombards. The exarch reſided at Ravenna, which place, with Rome, was all that was left to the emperors of their Italian dominions. The firſt exarch was under Juſtin the younger, in the year 567, after Beliſarius and Narſes had driven the barbarians out of Italy. The laſt was Eutychius, defeated by Adolphus king of the Lombards in 752.

EXCELLENCY, a title anciently given to kings and emperors, but now to embaſſadors, and other perſons who are not qualified for that of *highneſs*, and yet are to be elevated above the other inferior dignities.

EXCENTRIC, in geometry, a term applied to circles and ſpheres which have not the ſame centre, and conſequently are not parallel; in oppoſition to concentric, where they are parallel, having one common centre.

EXCENTRICITY, in aſtronomy, is the diſtance of the centre of the orbit of a planet from the centre of the ſun; that is, the diſtance between the centre of the ellipſis and the focus thereof. See ASTRONOMY.

EXCEPTION, in law, denotes a ſtop or ſtay to an action.

EXCERPTA, in matters of literature. See EXTRACT.

EXCESS, in arithmetic and geometry, is the difference between any two unequal numbers or quantities, or that which is left after the leſſer is taken from or out of the greater. See ARITHMETIC.

EXCHANGE, in a general ſenſe, a contract or agreement, whereby one thing is given or exchanged for another.

EXCHANGE, in commerce, is the receiving or paying of money in one country for the like ſome in another, by means of bills of exchange.

The ſecurity which merchants commonly take from one another when they circulate their buſineſs, is a bill

bill of exchange, or a note of hand: these are looked upon as payment.

The punctuality of acquitting those obligations is essential to commerce; and no sooner is a merchant's accepted bill protested, than he is considered as a bankrupt. For this reason, the laws of most nations have given very extraordinary privileges to bills of exchange. The security of trade is essential to every society; and were the claims of merchants to linger under the formalities of courts of law when liquidated by bills of exchange, faith, confidence, and punctuality would quickly disappear, and the great engine of commerce would be totally destroyed.

A regular bill of exchange is a mercantile contract, in which four persons are concerned, *viz.* 1. The drawer, who receives the value: 2. His debtor in a distant place, upon whom the bill is drawn, and who must accept and pay it: 3. The person who gives value for the bill, to whose order it is to be paid: and, 4. The person to whom it is ordered to be paid, creditor to the third.

By this operation, reciprocal debts, due in two distant parts, are paid by a sort of transfer, or permutation of debtors and creditors.

(A) in London is creditor to (B) in Paris, value 100*l.* (C) again in London is debtor to (D) in Paris for a like sum. By the operation of the bill of exchange, the London creditor is paid by the London debtor, and the Paris creditor is paid by the Paris debtor; consequently, the two debts are paid, and no money is sent from London to Paris, nor from Paris to London.

In this example, (A) is the drawer, (B) is the acceptor, (C) is the purchaser of the bill, and (D) receives the money. Two persons here receive the money, (A) and (D), and two pay the money, (B) and (C); which is just what must be done when two debtors and two creditors clear accounts.

This is the plain principle of a bill of exchange. From which it appears, that reciprocal and equal debts only can be acquitted by them.

When it therefore happens that the reciprocal debts of London and Paris (to use the same example) are not equal. there arises a balance on one side. Suppose London to owe Paris a balance, value 100*l.* How can this be paid? Answer, It may either be done with or without the intervention of a bill.

With a bill, if an exchanger, finding a demand for a bill upon Paris for the value of 100*l.* when Paris owes no more to London, sends 100*l.* to his correspondent at Paris in coin, at the expence (suppose) of 1*l.* and then, having become creditor on Paris, he can give a bill for the value of 100*l* upon his being repaid his expence, and paid for his risk and trouble.

Or it may be paid without a bill, if the London debtor sends the coin himself to his Paris creditor, without employing an exchanger.

This last example shews of what little use bills are in the payment of balances. As far as the debts are equal, nothing can be more useful than bills of exchange; but the more they are useful in this easy way of business, the less profit there is to any person to make a trade of exchange, when he is not himself concerned either as debtor or creditor.

When merchants have occasion to draw and remit bills for the liquidation of their own debts, active and passive, in distant parts, they meet upon change; where, to pursue the former example, the creditors upon Paris, when they want money for bills, look out for those who are debtors to it. The debtors to Paris again, when they want bills for money, seek for those who are creditors upon it.

This market is constantly attended by brokers, who relieve the merchant of the trouble of searching for those he wants. To the broker every one communicates his wants, so far as he finds it prudent; and by going about among all the merchants, the broker discovers the side upon which the greater demand lies, for money, or for bills.

He who is the demander in any bargain, has constantly the disadvantage in dealing with him of whom he demands. This is no where so much the case as in exchange, and renders secrecy very essential to individuals among the merchants. If the London merchants want to pay their debts to Paris, when there is a balance against London, it is their interest to conceal their debts, and especially the necessity they may be under to pay them; from the fear that those who are creditors upon Paris would demand too high a price for the exchange over and above par.

On the other hand those who are creditors upon Paris, when Paris owes a balance to London, are as careful in concealing what is owing to them by Paris, from the fear that those who are debtors to Paris would avail themselves of the competition among the Paris creditors, in order to obtain bills for their money, below the value of them, when at par. A creditor upon Paris, who is greatly pressed for money at London, will willingly abate something of his debt, in order to get one who will give him money for it.

From the operation carried on among merchants upon change, we may discover the consequence of their separate and jarring interests They are constantly interested in the state of the balance. Those who are creditors on Paris, fear the balance due to London; those who are debtors to Paris, dread a balance due to Paris. The interest of the first is to dissemble what they fear; that of the last, to exaggerate what they wish The brokers are those who determine the course of the day: and the most intelligent merchants are those who dispatch their business before the fact is known.

Now, how is trade in general interested in the question, Who shall outwit, and who shall be outwitted, in this complicated operation of exchange among merchants?

The interest of trade and of the nation is principally concerned in the proper method of paying and receiving the balances. It is also concerned in preserving a just equality of profit and loss among all the merchants, relative to the real state of the balance. Unequal competition among men engaged in the same pursuit, constantly draws along with it bad consequences to the general undertaking; and secrecy in trade will be found, upon examination, to be much more useful to merchants in their

private

private capacity, than to the trade they are carrying on.

Merchants endeavour to ſimplify their buſineſs as much as poſſible ; and commit to brokers many operations which require no peculiar talents to execute. This of exchange is of ſuch a nature, that it is hardly poſſible for a merchant to carry on the buſineſs of his bills, without their aſſiſtance, upon many occaſions. When merchants come upon change, they are ſo full of fears and jealouſies, that they will not open themſelves to one another, leſt they ſhould diſcover what they want to conceal. The broker is a confidential man, in ſome degree, between parties, and brings them together.

Beſides the merchants who circulate among themſelves their reciprocal debts and credits ariſing from their importation and exportation of goods, there is another ſet of merchants who deal in exchange ; which is the importation and exportation of money and bills.

Were there never any balance on the trade of nations, exchangers and brokers would find little employment: reciprocal and equal debts would eaſily be tranſacted openly between the parties themſelves. No man feigns and diſſembles, except when he thinks he has an intereſt in ſo doing.

But when balances come to be paid, exchange becomes intricate; and merchants are ſo much employed in particular branches of buſineſs, that they are obliged to leave the liquidation of their debts to a particular ſet of men, who make it turn out to the beſt advantage to themſelves.

Whenever a balance is to be paid, that payment coſts, as we have ſeen, an additional expence to thoſe of the place who owe it, over and above the value of the debt.

If, therefore, this expence be a loſs to the trading man, he muſt either be repaid this loſs by thoſe whom he ſerves, that is, by the nation; or the trade he carries on will become leſs profitable.

Every one will agree, that the expence of high exchange upon paying a balance, is a loſs to a people, no way to be compenſated by the advantages they reap from enriching the few individuals among them who gain by contriving methods to pay it off: and if an argument is neceſſary to prove this propoſition, it may be drawn from this principle, to wit, whatever renders the profit upon trade precarious or uncertain, is a loſs to trade in general: this loſs is the conſequence of high exchange ; and although a profit does reſult from it upon one branch of trade, the exchange-buſineſs, yet that cannot compenſate the loſs upon every other.

We may, therefore, here repeat what we have ſaid above, that the more difficulty is found in paying a balance, the greater is the loſs to the nation.

The courſe of EXCHANGE.

The courſe of exchange is the current price betwixt two places, which is always fluctuating and unſettled, being ſometimes above and ſometimes below par, according to the circumſtances of trade.

When the courſe of exchange riſes above par, the country where it riſes may conclude for certain, that the balance of trade runs againſt them. The truth of this will appear, if we ſuppoſe Britain to import from any foreign place goods to the value of 100,000 l. at par, and export only to the value of 80,000. ; in this caſe, bills on the ſaid foreign place will be ſcarce in Britain, and conſequently will riſe in value ; and after the 80,0000 l. is paid, bills muſt be procured from other places at a high rate to pay the remainder, ſo that perhaps 120,000 l. may be paid for bills to diſcharge a debt of 100,000 l.

Though the courſe of exchange be in a perpetual flux, and riſes or falls according to the circumſtances of trade, yet the exchanges of London, Holland, Hamburgh, and Venice, in a great meaſure regulate thoſe of all other places in Europe.

I. *Exchange with Holland.*

MONEY-TABLE.

		Par in Sterling.		*s.*	*d.*
8 Pennings, or 2 duytes,	make	1 groat or penny	=	0	0.54
2 Groats, or 16 pennings,		1 ſtiver	=	0	1.09
6 Stivers, or 12 pence,		1 ſchilling	=	0	6.56
20 Schillings,		1 pound Flemiſh	=	10	11.18
20 Stivers, or 40 pence,		1 guilder or florin	=	1	9.86
6 Guilders, or florins,		1 pound Flemiſh	=	10	11.18
$2\frac{1}{2}$ Guilders, or florins,		1 rixdollar	=	4	6.66

In Holland there are two ſorts of money, bank and current. The bank is reckoned good ſecurity ; demands on the bank are readily anſwered ; and hence bank-money is generally rated from 3 to 6 *per cent.* better than the current. The difference between the bank and current money is called the *agio*.

Bills on Holland are always drawn in bank-money; and if accounts be ſent over from Holland to Britain in current money, the Britiſh merchant pays theſe accounts by bills, and in this caſe has the benefit of the agio.

PROB. I. *To reduce bank money to current money.*

RULE. As 100 to 100+agio, ſo the given guilders to the anſwer.

EXAMPLE. What will 2210 guilders in bank money amount to in Holland currency, the agio being $3\frac{1}{8}$ *per cent.*?

Guild.

```
              Guild.
As 100 : 103⅛ :: 2210

In Amſterdam, Rotterdam, Middleburgh, *&c.* books and accounts are kept by ſome in guilders, ſtivers, and pennings, and by others in pounds, ſhillings, and pence, Flemiſh.

Britain gives 1 l. Sterling for an uncertain number of ſhillings and pence Flemiſh. The par is 1l. Sterling for 36.59 s. Flemiſh; that is, 1 l. 16 s. 7.08 d. Flemiſh.

When the Flemiſh rate riſes above par, Britain gains and Holland loſes by the exchange, and *viee verſa.*

Sterling money is changed into Flemiſh, by ſaying,

As 1 l. Sterling to the given rate,
So is the given Sterling to the Flemiſh ſought.
Or, the Flemiſh money may be caſt up by practice.

Dutch money, whether pounds, ſhillings, pence Flemiſh, or guilders, ſtivers, pennings, may be changed into Sterling, by ſaying,

As the given rate to 1 l. Sterling,
So the given Dutch to the Sterling ſought.

Example. 1. A merchant in Britain draws on Amſterdam for 782 l. Sterling: How many pounds Flemiſh, and how many guilders will that amount to, exchange at 34 s. 8 d. *per* pound Sterling?

```
 L.  s. d.    L.         |        Decimally.

Holland exchanges with other nations as follows, *viz.* with

		Flem d.
Hamburgh, on the dollar,	=	$66\frac{2}{3}$
France, on the crown,	=	54
Spain, on the ducat,	=	$109\frac{4}{5}$
Portugal on the cruſade,	=	50
Venice, on the ducat,	=	93
Genoa, on the pezzo,	=	100
Leghorn, on the piaſtre,	=	100
Florence, on the crown,	=	120
Naples, on the ducat,	=	$74\frac{2}{3}$
Rome, on the crown,	=	136
Milan, on the ducat,	=	102
Bologna, on the dollar,	=	$94\frac{4}{9}$

Exchange between Britain and Antwerp, as alſo the Auſtrian Netherlands, is negociated the ſame way as with Holland, only the par is ſomewhat different, as will be deſcribed in article 2d, following.

II. *Exchange with Hamburgh.*

MONEY-TABLE.

		Par in Sterling.		*s.*	*d.*
12 Phennings	make	1 ſchilling-lub	=	0	$1\frac{1}{8}$
16 Schilling-lubs		1 mark	=	1	6
2 Marks		1 dollar	=	3	0
3 Marks		1 rixdollar	=	4	6
$6\frac{1}{4}$ Marks		1 ducat	=	9	$4\frac{1}{2}$

Books and accounts are kept at the bank, and by moſt people in the city, in marks, ſchilling-lubs, and phennings; but ſome keep them in pounds, ſchillings, and groots Flemiſh.

The agio at Hamburgh runs between 20 and 40 *per cent.* All bills are paid in bank-money.

Hamburgh exchanges with Britain by giving an uncertain number of ſchillings and groots Flemiſh for the pound Sterling. The groot or penny Flemiſh here, as alſo at Antwerp, is worth $\frac{54}{96}$ of a penny Sterling; and ſo ſomething better than in Holland, where it is only $\frac{54}{100}$ d. Sterling.

		Flemiſh.
6 Phennings	make	1 groot or penny
6 Schilling lubs		1 ſchilling
1 Schilling-lub		2 pence or groots
1 Mark		32 pence or groots
$7\frac{1}{2}$ Marks		1 pound.

The par with Hamburgh, and alſo with Antwerp, is 35 s. $6\frac{2}{3}$ d. Flemiſh for 1 l. Sterling.

Examples. 1. How many marks muſt be received at Hamburgh for 300 l. Sterling, exchange at 35 s. 3 d. Flemiſh *per* l. Sterling?

VI. *Exchange with Venice.*

MONEY-TABLE.

$5\frac{1}{6}$ Soldi	make	1 gros	
24 Gros	make	1 ducat	= $50\frac{1}{4}$ d. Sterling.

The

The money of Venice is of three ſorts, *viz.* two of bank money, and the picoli money. One of the banks deals in banco money, and the other in banco current. The bank money is 20 *per cent.* better than the banco current, and the banco current 20 *per cent.* better than the picoli money. Exchanges are always negotiated by the ducat banco, the par being 4 s. $2\frac{1}{4}$ d. Sterling, as in the table.

Though the ducat be commonly divided into 24 gros, yet bankers and negotiators, for facility of computation, uſually divide it as follows, and keep their books and accounts accordingly.

12 Deniers d'or	make	1 ſol d'or
20 Sols d'or		1 ducat = $50\frac{1}{4}$ d. Sterling.

The courſe of exchange is from 45 d. to 55 d. Sterling *per* ducat.

Examp. 1. How much Sterling money is equal to 1459 ducats 18 ſols 1 denier, bank money of Venice, exchange at $52\frac{3}{4}$ d. Sterling *per* ducat?

Bank money is reduced to current money, by allowing for the agio, as was done in exchange with Holland; *viz.* ſay, As 100 to 120, or as 10 to 12, or as 5 to 6, ſo the given bank money to the current ſought. And current money is reduced to bank money by reverſing the operation. And in like manner may picoli money be reduced to current or to bank money, and the contrary.

100 ducats banco of Venice.

In Leghorn = 93 pezzos	In Lucca = 77 crowns
In Rome = $68\frac{1}{2}$ crowns	In Francfort = $139\frac{1}{2}$ florins

VII. *Exchange with Genoa.*

MONEY-TABLE.

			s.	*d.*
12 Denari	make	1 ſoldi		
20 Soldi		1 pezzo =	4	6 Sterling.

Books and accounts are generally kept in pezzos, ſoldi, and denari; but ſome keep them in lires, ſoldi, and denari; and 12 ſuch denari make 1 ſoldi, and 20 ſoldi make 1 lire.

The pezzo of exchange is equal to $5\frac{3}{4}$ lires; and, conſequently, exchange money is $5\frac{3}{4}$ times better than the lire money. The courſe of exchange runs from 47 d. to 58 d. Sterling *per* pezzo.

Examp. How much Sterling money is equivalent to 3390 pezzos 16 ſoldi, of Genoa, exchange at $51\frac{7}{8}$ d. Sterling *per* pezzo?

```
  Soldi.  d.      Pez. ſoldi.
  If 20 : 51⅞ :: 3390  16
      8   ————        20
    ————   415     ————————
     160             67816
                       415
                    ———————
                    339080
                    67816
                   271264
                   ———————      d.             L.  s.  d.
  160)28143640(175897¾ = 732  18  1¾
```

If Sterling money be given, it may be reduced or changed into pezzos of Genoa, by reverſing the former operation.

Exchange money is reduced to lire money, by being multiplied by $5\frac{3}{4}$, as follows:

```
          Pez. ſoldi.              Decimally.
           3390  16                  3390.8
                 5¾                    5.75
          ———————————              ——————————
          16954   0                  169550
    ½ =    1695   8                 237356
    ¼ =     847  14                 169540
          ———————————              ——————————
  Lires   19497   2          Lires 19497.100
```

And lire money is reduced to exchange money by dividing it by $5\frac{3}{4}$.

		Soldi of Genoa.
In Milan, 1 crown	=	80
In Naples, 1 ducat	=	86
In Leghorn, 1 piaſtre	=	20
In Sicily, 1 crown	=	$127\frac{2}{9}$

VIII. *Exchange with Leghorn.*

MONEY-TABLE.

			s. d.
12 Denari	make	1 foldi	
20 Soldi		1 piaftre =	4 6 *Ster.*

Books and accounts are kept in piaftres, foldi, and denari. The piaftre here confifts of 6 lires, and the lire contains 20 foldi, and the foldi 12 denari, and confequently exchange money is 6 times better than lire money. The courfe of exchange is from 47 d. to 58 d. Sterling *per* piaftre.

Example. What is the Sterling value of 731 piaftres, at $55\frac{1}{2}$d. each.

s. d.	731 piaftres, at $55\frac{1}{2}$d.
4 or 48 = $\frac{1}{6}$	146 4
7 = $\frac{1}{8}$	18 5 6
$1\frac{1}{2}$ = $\frac{1}{4}$	4 11 $4\frac{1}{2}$
	L. 169 0 $10\frac{1}{2}$ *Anf.*

Sterling money is reduced to money of Leghorn, by reverfing the former operation; and exchange money is reduced to lire money by multiplying by 6, and lire money to exchange money by dividing by 6.

100 piaftres of Leghorn are

In Naples = 134 ducats. | In Geneva = $185\frac{1}{3}$ crowns.

Soldi of Leghorn.

In Sicily, 1 crown = $133\frac{1}{3}$

In Sardinia, 1 dollar = $95\frac{5}{9}$

The above are the chief places in Europe with which Britain exchanges directly; the exchanges with other places are generally made by bills on Hamburg, Holland, or Venice. We fhall here however fubjoin the par of exchange betwixt Britain and moft of the other places in Europe, with which we have any commercial intercourfe.

		Par in Sterling.		L.	s.	d.
Rome	1	crown	=		6	$1\frac{1}{3}$
Naples,	1	ducat	=		3	$4\frac{1}{2}$
Florence,	1	crown	=		5	$4\frac{5}{8}$
Milan,	1	ducat	=		4	7
Bologna,	1	dollar	=		4	3
Sicily,	1	crown	=		5	0
Vienna,	1	rixdollar	=		4	8
Aufburgh,	1	florin	=		3	$1\frac{1}{3}$
Francfort,	1	florin	=		3	0
Bremen,	1	rixdollar	=		3	6
Breflau,	1	rixdollar	=		3	3
Berlin,	1	rixdollar	=		4	0
Stetin,	1	mark	=		1	6
Embden,	1	rixdollar	=		3	6
Bolfenna,	1	rixdollar	=		3	8
Dantzic,	$13\frac{1}{2}$	florins	=	1	0	0
Stockholm,	$34\frac{4}{7}$	dollars	=	1	0	0
Ruffia,	1	rubble	=		4	5
Turkey,	1	afper	=		4	6

The following places, *viz.* Switzerland, Noremburgh, Leipfic, Drefden, Ofnaburgh, Brunfwic, Cologn, Liege, Strafburgh, Cracow, Denmark, Norway, Riga, Revil, Narva, exchange with Britain, when direct exchange is made, upon the rixdollar, the par being 4s. 6d. Sterling.

IX. *Exchange with America and the Weft Indies.*

In North America and the Weft Indies, accounts, as in Britain, are kept in pounds, fhillings, and pence. In North America they have few coins circulating among them, and on that account have been obliged to fubftitute a paper-currency for a medium of their commerce; which having no intrinfic value, is fubjected to many difadvantages, and generally fuffers a great difcount. In the Weft Indies coins are more frequent, owing to their commercial intercourfe with the Spanifh fettlements.

Exchange betwixt Britain and America, or the Weft Indies, may be computed as in the following examples:

1. The neat proceeds of a cargo from Britain to Bofton amount to 845 l. 17 s. 6d. currency: How much is that in fterling money, exchange at 80 *per cent.?*

```
If 180 : 100
    18 :  10     L.  s. d.
     9 :   5 :: 845 17 6

$\frac{1}{8}$ = $\frac{1}{4}$	.733125
$9\frac{5}{8}$	56.450625 add
	642.950625

2. How much Sterling will 625 l. Irish amount to, exchange at $10\frac{3}{8}$ *per cent.*?

If $110\frac{3}{8}$: 100 :: 625
8 800
L. s. d.
883 800 883)500000(566 5 $0\frac{1}{4}$ Ster. *Ans.*

XI. *Exchange betwixt London and other places in Britain.*

The several towns in Britain exchange with London for a small premium in favour of London; such as, 1, $1\frac{1}{4}$, *&c. per cent.* The premium is more or less according to the demand for bills.

EXAMP. Edinburgh draws on London for 860 l. exchange at $1\frac{3}{8}$ *per cent.*: How much money must be paid at Edinburgh for the bill?

per cent.	*L.* 860
1 = $\frac{1}{100}$	8 12
$\frac{2}{8}$ = $\frac{1}{4}$	2 3
$\frac{1}{8}$ = $\frac{1}{2}$	1 1 6
	11 16 6 premium.
	871 16 6 paid for the bill.

To avoid paying the premium, it is an usual practice to take the bill payable at London a certain number of days after date; and in this way of doing, 73 days is equivalent to 1 *per cent.*

XII. *Arbitration of Exchanges.*

The course of exchange betwixt nation and nation naturally rises or falls according as the circumstances and balance of trade happen to vary. Now to draw upon and remit to foreign places, in this fluctuating state of exchange, in the way that will turn out most profitable, is the design of arbitration. Which is either simple or compound.

I. *Simple Arbitration.*

In simple arbitration the rates or prices of exchange from one place to other two are given; whereby is found the correspondent price between the said two places, called the *arbitrated price*, or *par of arbitration*: and hence is derived a method of drawing and remitting to the best advantage.

EHAMP. 1. If exchange from London to Amsterdam be 33 s. 9 d. *per* l. Sterling; and if exchange from London to Paris be 32 d. *per* crown; what must be the rate of exchange from Amsterdam to Paris, in order to be on a par with the other two?

Ster. Flem. Ster.
s. s. d. d.
If 20 : 33 9 :: 32
12 12

240 405
32

810
1215

240)12560(54 d. Flem. *per* crown. *Ans.*

2. If exchange from Paris to London be 32 d. Sterling *per* crown; and if exchange from Paris to Amsterdam be 54 d. Flemish *per* crown; what must be the rate of exchange between London and Amsterdam, in order to be on a par with the other two?

Ster. Flem. Ster.
d. d. d.
If 32. : 54 :: 240
240

216
108
12) *s. d.*
32)12960(405 (33 9 Flem. *per* l. Ster. *Ans.*

From these operations it appears, that if any sum of money be remitted, at the rates of exchange mentioned, from any one of the three places to the second, and from the second to the third, and again from the third to the first, the sum so remitted will come home entire, without increase or diminution.

From

From the par of arbitration thus found, and the course of exchange given, is deduced a method of drawing and remitting to advantage, as in the following example.

3. If exchange from London to Paris be 32 d. Sterling *per* crown, and to Amsterdam 405 d. Flemish *per* l. Sterling; and if, by advice from Holland or France, the course of exchange between Paris and Amsterdam is fallen to 52 d Flemish *per* crown; what may be gained *per cent.* by drawing on Paris, and remitting to Amsterdam?

The par of arbitration between Paris and Amsterdam in this case, by Ex. 1. is 54 d. Flemish *per* crown. Work as under.

d. St. Cr. L. St. Cr.
If 32 : 1 :: 100 : 750 debit at Paris

Cr. d. Fl. Cr. d. Fl.
If 1 : 52 :: 750 : 39000 credit at Amsterdam.

d. Fl. L. St. d. Fl. L. s. d. Ster.
If 405 : 1 :: 39000 : 96 5 11$\frac{1}{9}$ to be remitted.
100
———————
3 14 0$\frac{8}{9}$

But if the course of exchange between Paris and Amsterdam, instead of falling below, rise above the par of arbitration, suppose to 56 d. Flemish *per* crown; in this case, if you propose to gain by the negotiation, you must draw on Amsterdam, and remit to Paris. The computation follows.

L. St. d. Fl. L. St. d. Fl.
If 1 : 405 :: 100 : 40500 debit at Amsterdam.
d. Fl. Cr. d. F. Cr.
If 56 : 1 :: 40500 : 723$\frac{3}{14}$ credit at Paris.
Cr. d. St. Cr. L. s. d. Ster.
If 1 : 32 :: 723$\frac{3}{14}$: 96 8 6$\frac{6}{7}$ to be remitted.
100
———————
3 11 5$\frac{1}{7}$ gained *per cent.*

In negotiations of this sort, a fund for remittance is afforded out of the sum you receive for the draught; and your credit at the one foreign place pays your debit at the other.

II. *Compound Arbitration.*

In compound arbitration the rate or price of exchange between three, four, or more places, is given, in order to find how much a remittance passing through them all will amount to at the last place; or to find the arbitrated price, or par of arbitration, between the first place and the last. And this may be done by the following

RULES. I. Distinguish the given rates or prices into antecedents and consequents; place the antecedents in one column, and the consequents in another on the right, fronting one another by way of equation.

II. The first antecedent, and the last consequent to which an antecedent is required, must always be of the same kind.

III. The second antecedent must be of the same kind with the first consequent, and the third antecedent of the same kind with the second consequent, &c.

IV. If to any of the numbers a fraction be annexed, both the antecedent and its consequent must be multiplied into the denominator.

V. To facilitate the operation, terms that happen to be equal or the same in both columns, may be dropped or rejected, and other terms may be abridged.

VI. Multiply the antecedents continually for a divisor, and the consequents continually for a dividend, and the quot will be the answer or antecedent required.

EXAMP. 1. If London remit 1000 l. Sterling to Spain, by way of Holland, at 35 s. Flemish *per* l. Sterling; thence to France, at 58 d. Flemish *per* crown; thence to Venice, at 100 crowns *per* 60 ducats; and thence to Spain, at 360 mervadies *per* ducat; how many piastres, of 272 mervadies, will the 1000 l. Sterling amount to in Spain?

Antecedents.		*Consequents.*	*Abridged.*
1 l. Sterling	=	35 s. or 420 d. Fl.	1=210
58 d. Flemish	=	1 crown France	29= 1
100 crowns France	=	60 ducats Venice	1= 30
1 ducat Venice	=	360 mervadies Spain	1= 45
272 mervadies	=	1 piastre	17= 1
How many piastres	=	1000 l. Sterling	= 10

In order to abridge the terms, divide 58 and 420 by 2, and you have the new antecedent 29, and the new consequent 210; reject two ciphers in 100 and 1000; divide 272 and 360 by 8, and you have 34 and 45; divide 34 and 60 by 2, and you have 17 and 30; and the whole will stand abridged as above.

Then, 29 × 17=493 divisor; and, 210 × 30 × 45 × 10=2835000 dividend; and, 493)2835000(5750$\frac{1}{2}$ piastres. *Ans.*

Or, the consequents may be connected with the sign of multiplication, and placed over a line by way of numerator; and the antecedents, connected in the same manner, may be placed under the line, by way of denominator; and then abridged, as follows:

$$\frac{420\times60\times360\times100}{58\times100\times272}=\frac{210\times60=360\times10}{29\times1\times272}$$
$$=\frac{210\times60\times45\times100}{29\times34}=\frac{210\times30\times45\times10}{29\times17}$$
$$=\frac{2835000}{493},$$

And, 493)2835000(5750$\frac{1}{2}$ piastres. *Ans.*

The placing the terms by way of antecedent and consequent, and working as the rules direct, save so many statings of the rule of three, and greatly shortens the operation. The proportions at large for the above question would stand as under.

L. St. d. Fl. L. St. d. Fl.
If 1 : 420 :: 1000 : 420000

d. Fl. Cr. d. Fl. Cr.
If 58 : 1 :: 420000 : 7241$\frac{11}{29}$

Cr.

	Cr.		*Duc.*		*Cr.*		*Duc.*
If	100	:	60	::	$7241\frac{11}{29}$	:	$4344\frac{24}{29}$

	Duc.		*Mer.*		*Duc.*		*Mer.*
If	1	:	360	::	$4344\frac{24}{29}$	:	$1564137\frac{27}{29}$

	Mer.		*Piaſt.*		*Mer.*		*Piaſt.*
If	272	:	1	::	$1564137\frac{27}{29}$	:	$5750\frac{250}{493}$

If we ſuppoſe the courſe of direct exchange to Spain to be $42\frac{1}{2}$ d. Sterling *per* piaſtre, the 1000l. remitted would only amount to $5647\frac{1}{2}$ piaſtres; and, conſequently, 103 piaſtres are gained by the negociation; that is, about 2 *per cent.*

2. A banker in Amſterdam remits to London 400 l. Flemiſh; firſt to France at 56 d. Flemiſh *per* crown; from France to Venice at 100 crowns *per* 60 ducats; from Venice to Hamburgh at 100 d. Flemiſh *per* ducat; from Hamburgh to Liſbon at 50 d. Flemiſh *per* cruſade of 400 rees; and, laſtly, from Liſbon to London at 64 d. Sterling *per* milree: How much Sterling money will the remittance amount to? and how much will be gained or ſaved, ſuppoſing the direct exchange from Holland to London at 36 s. 10 d. Flemiſh *per* l. Sterling?

Antecedents.		*Conſequents.*
56 d. Flem.	=	1 crown
100 crowns	=	60 ducats.
1 ducat	=	100 d. Flem.
50 d. Flem.	=	400 rees.
1000 rees	=	64 d. Sterling.
How many d. Ster	=	400 l. or 96000 d. Flemiſh?

This, in the fractional form, will ſtand as follows.

$$\frac{60 \times 100 \times 400 \times 64 \times 96000}{56 \times 100 \times 50 \times 1000} = \frac{368640}{7}, \text{ and}$$

7)368640($52662\frac{6}{7}$ d. Ster. = 219 l. 8. s. $6\frac{6}{7}$ d. St. *Anſ.*

To find how much the exchange from Amſterdam directly to London, at 36 s. 10 d. Flemiſh *per* l. Sterling, will amount to, ſay,

s.	*d.*		*d. Fl.*		*L. St.*		*d. Fl.*		*L.*	*s.*	*d. St.*
36	10	If	442	:	1	::	96000	:	217	3	$10\frac{1}{2}$
12									219	8	$6\frac{3}{4}$
442		Gained or ſaved,							2	4	$8\frac{1}{4}$

In the above example, the par of arbitration, or the arbitrated price, between London and Amſterdam, *viz.* the number of Flemiſh pence given for 1 l. Sterling, may be found thus:

Make 64 d. Sterling, the price of the milree, the firſt antecedent; then all the former conſequents will become antecedents, and all the antecedents will become conſequents. Place 240, the pence in 1 l. Sterling, as the laſt conſequent, and then proceed as taught above, *viz.*

Antecedents.		*Conſequents.*
64 d. Ster.	=	1000 rees.
400 rees	=	50 d. Flem.
100 d. Flem.	=	1 ducat.
60 ducats	=	100 crowns.
1 crown	=	56 d. Flem.
How many d. Flem.	=	240 d. Ster.?

$$\frac{1000 \times 50 \times 100 \times 56 \times 240}{64 \times 400 \times 100 \times 60} = \frac{875}{2}, \text{ and}$$

2)875($437\frac{1}{2}$ d. = 36 s. $5\frac{1}{2}$ d. Flem. *per* l. Ster. *Anſ.*

Or the arbitrated price may be found from the anſwer to the queſtion, by ſaying,

	d. Ster.		*d. Flem.*		*d. St.*
If	$\frac{368640}{7}$	:	96000	::	240
			7		
			672000		
			240		
			2688		
			1344		

368640)161280000($437\frac{1}{2}$ *d.* = 36 *s.* $5\frac{1}{2}$ *d. Flem.* as before.

The work may be proved by the arbitrated price thus: As 1 l. Sterling to 36 s. $5\frac{1}{2}$ d. Flemiſh, ſo 219 l. 8 s. $6\frac{6}{7}$ d. Sterling to 400 l. Flemiſh.

The arbitrated price compared with the direct courſe ſhows whether the direct or circular remittance will be moſt advantageous, and how much. Thus the banker at Amſterdam will think it better exchange to receive 1 l. Sterling for 36 s. $5\frac{1}{2}$ d. Flemiſh, than for 36 s. 10 d. Flemiſh.

EXCHANGE ſignifies alſo a place in moſt conſiderable trading cities, wherein the merchants, negociants, agents, bankers, brokers, interpreters, and other perſons concerned in commerce, meet on certain days, and at certain times thereof, to confer and treat together of matters relating to exchanges, remittances, payments, adventures, aſſurances, freightments, and other mercantile negociations, both by ſea and land.

EXCHEQUER, in the Britiſh juriſprudence, an ancient court of record, in which all cauſes concerning the revenues and rights of the crown are heard and determined, and where the crown-revenues are received.

It took this name from the cloth that covered the table of the court, which was party-coloured, or chequered.

This court is ſaid to have been erected by William the conqueror, its model being taken from a like court eſtabliſhed in Normandy long before that time. Anciently its authority was ſo great, that it was held in the king's palace, and the acts thereof were not to be examined or controlled in any other of the king's courts; but, at preſent, it is the laſt of the four courts at Weſtminſter.

In the exchequer, some reckon seven courts, *viz.* those of pleas, accounts, recepts, exchequer-chamber, (which is an assembly of all the judges on difficult matters in law) errors in the exchequer, errors in the king's bench, and, lastly, the court of equity in the exchequer.

But the exchequer, for dispatch of business, is generally divided into two parts; one of which is chiefly conversant in the judicial hearing and deciding of all causes relating to the king's coffers, formerly termed the exchequer of accounts: the other is called the receipt of the exchequer, as being principally employed in receiving and payment of money.

Officers of the receipt may take one penny in the pound, as their fee for sums issued out; and they are obliged, without delay, to receive the money brought thither; and the money received is to be put in chests under three different locks and keys, kept by three several officers. All sheriffs, bailiffs, *&c.* are to account in the exchequer; and in the lower part, termed the receipt, the debtors of the king, and persons in debt to them, the king's tenants, and the officers and ministers of the court, are privileged to sue one another, or any stranger, and to be sued in the like actions as are brought in the courts of king's bench and common-pleas.

The judicial part of the exchequer, is a court both of law and equity. The court of law is held in the office of pleas, according to the course of common law, before the barons: in this court, the plaintiff ought to be a debtor or accountant to the king; and the leading process is either a writ of subpœna, or quo minus, which last goes into Wales, where no process out of our courts of law ought to run, except a capias utlagatum.

The court of equity is held in the exchequer-chamber before the treasurer, chancellor, and barons; but, generally, before the barons only; the lord chief baron being the chief judge to hear and determine all causes. The proceedings in this part of the exchequer, are by English bill and answer, according to the practice of the court of chancery; with this difference, that the plaintiff here must likewise set forth that he is a debtor to the king, whether he be so or not. It is in this court of equity that the clergy exhibit bills for the recovery of their tythes, *&c.* Here too the attorney-general exhibits bills for any matters concerning the crown; and a bill may be exhibited against the king's attorney by any person aggrieved in any cause prosecuted against him on behalf of the king, to be relieved therein: in which case, the plaintiff is to attend on the attorney-general with a copy of the bill, and procure him to give in an answer thereto; in the making of which he may call in any person interested in the cause, or any officer, or others, to instruct him, that the king be not prejudiced thereby, and his answer is to be put in without oath.

But besides the business relating to debtors, farmers, receivers, accountants, *&c.* all penal punishments, intrusion, and forfeitures upon popular actions, are matters likewise cognizable by this court; where there also sits a puisne-baron, who administers the oaths to high-sheriffs, bailiffs, auditors, receivers, collectors, comptrollers, surveyors and searchers of all the customs, *&c.*

The exchequer in Scotland, has the same privileges and jurisdiction as that of England; and all matters competent to the one, are likewise competent to the other.

Black book of the EXCHEQUER, a book containing a description of the court of England in 1175, and its officers, with their ranks, wages, privileges, perquisites, *&c.* also the revenues of the crown, both in money and cattle.

EXCIPIENT, in pharmacy, denotes the ingredient, which, in compound medicines, receives all the rest; as the conserve in electuaries, the syrup in boluses, *&c.*

EXCISE, a certain duty or impost charged upon liquors, as beer, ale, cyder, *&c.* malt, and several other commodities, within the kingdom of Great Britain, and town of Berwick upon Tweed.

The excise is one of the most considerable branches of the king's revenue. It was formerly farmed out, but is now managed for the king by commissioners in both kingdoms, who receive the whole product of the excise, and pay it into the exchequer. These commissioners are nine in number in England, and four in Scotland. The former have a salary of 1000 l. a year, the later 500 l. They are obliged by oath to take no fee or reward but from the king himself; and from them there lies an appeal to five other commissioners called commissioners of appeals.

The duty of excise was first granted to king Charles II. by act of parliament in the year 1660, during the life of that monarch. 1. It was 15 d. *per* barrel upon every barrel of beer or ale above 6 s. the barrel, and 3 d. *per* barrel for every barrel of 6 s. or under, brewed for retail; 15 d. for every hogshead of cyder or perry sold by retail; 1 d. for every gallon of strong water, aqua vitæ, *&c.* 2. A new excise was granted for ever by the fifth money-act of William and Mary, being for every barrel of beer or ale above 6 s. the barrel, 9 d; and for every barrel of 6 s. or under, 3 d.; for every hogshead of cyder or perry, 1 s. *per* hogshead. In this excise, the price of the liquor is to be reckoned exclusive of the duty. 3. An excise was granted of 6 d. a bushel on malt in the reign of king William, which by subsequent statutes has been continued yearly ever since. But such malt as shall be made for exportation, and be so entered and kept separate from other malt, is exempted from the payment of this duty. 4. Another new excise upon home-made liquors was granted in queen Anne's reign; being an additional excise upon every barrel of beer or ale brewed for sale above 6s. the barrel, 3 d. exclusive of the duties; and for every barrel at 6s. or under, 1 d.; for every hogshead of cyder or perry, 5 d.; for every gallon of strong waters or aqua vitæ, 1 d. This excise was not laid upon any such liquors imported. 5. An excise on candles was first granted in the reign of queen Anne, and continued for ever, being a duty of 4 d. a pound on wax, and a halfpenny the pound on tallow candles, made in Great Britain for sale or not for sale; but makers for their own use may compound for 1 s. a head for every person in their family. An additional excise on candles was afterwards granted,

granted, being the same with the former in every respect. 6. An excise upon hides and skins tanned in Britain, first granted in queen Anne's reign, was an excise of seventeen different kinds, upon so many different kinds of hides and skins particularly named, and upon all others not named, 13 l. *per cent. ad valorem.* An additional excise was afterwards granted, being an additional duty of different kinds, upon so many different sorts of hides and skins particularly named, and on all others not named, 15 l. *per cent.* on the value. 7. An excise on home-made vellum and parchment, first granted by the same act, being 1 s. *per* dozen on vellum, and 6 d. the dozen on parchment. And afterwards an additional excise on vellum, *&c.* was granted, being an additional duty of 2 s. the dozen on vellum, and 1 s. the dozen on parchment. 8. An excise on hops of home growth was first granted in queen Anne's reign, being 1 d. *per* pound. 9. An excise on paper, pasteboards, milled-boards, and scale-boards, was first granted in the reign of queen Anne, being a duty of eleven different kinds on so many different sorts of paper particularly named, made in Great Britain; on pasteboards, *&c.* 3 s. the hundred weight, and on all sorts of paper not named, 12 l. *per cent.* on the value. An additional duty on paper, *&c.* was granted of eleven different kinds, *&c.* on pasteboard, 1 s. 6 d. the hundred weight, and on all sorts of paper not named, 6 l. *per cent.* on the value; and on painted paper for hangings, a halfpenny the yard square. 10. An excise of 1 d. *per* pound on soap made in Great Britain, was granted by the same act; to which an additional excise has been added of a halfpenny *per* pound. 11. An excise upon printed silks, callicoes, linens and stuffs made in Great Britain, and printed, painted, stained or dyed here, was first granted in queen Anne's reign, being a duty of 3 d. on silks and callicoes, and $1\frac{1}{2}$ d. on linen and stuffs the yard square, excepting silk-handkerchiefs, linens and fustains dyed of one colour, and stuffs made of woollen, or the greatest part in value of woollen. And an additional excise was granted of 6 d. the yard of half-yard broad silks; 1 d. the yard square of silk handkerchiefs; 3 d. the yard square of callicoes, and $1\frac{1}{2}$ d. the yard square of linens and stuffs, excepting, as before, callicoes, *&c.* dyed of one colour, and woollen stuffs. 12. An excise on starch was first granted for 1 d. the pound; and afterwards an additional excise of 1 d. the pound. 13. The excise on gilt and silver wire made in Great Britain, is 8 d. the ounce on gilt wire, and 6 d. the ounce on silver wire.

If any brewers do not make true entries of their liquors brewed, once a-week at the excise-office, they forfeit 10 l. but this is subject to mitigation, so as not to be less than double the duty; and the retailers of beer and ale and strong waters, neglecting to make their entries once a-month of what liquors they retail, are liable to 40 s. penalty. In case any brewer erects or alters any back, copper, cooler, *&c.* or keeps a private store-house, or if any maltster keeps any private vessel for steeping barley, without giving proper notice to the officers of excise, such brewer or maltster forfeit 50 l. and where they bribe a gauger, it is 10 l. The officers of excise may go on board ships, and search for any exciseable liquors, as officers of the customs do, and seize commodities forfeited, *&c.* and complaints made at the chief office of excise are to be heard by three or more commissioners; but two justices of the peace have the power to determine in seizures out of the limits of the excise-office in London.

EXCLAMATION, in rhetoric, a figure that expresses the violent and sudden breaking out, and vehemence of any passion.

EXCOMMUNICATION, an ecclesiastical penalty or censure, whereby such persons as are guilty of any notorious crime or offence, are separated from the communion of the church, and deprived of all spiritual advantages.

Excommunication among the Jews, according to Elias, a German rabbin, was distinguished into three kinds: 1. Niddui, which was a separation of but a few days; 2. Cherem, a separation attended with execration and malediction; and, 3. Shammatha, which was the last and greater excommunication. But Selden says, that niddui and shammatha are the same thing; and therefore that there were but two kinds of excommunication among the Jews, *viz.* the greater and the lesser. They made also another distinction in excommunication, into total or universal, by which a man was excommunicated with regard to all men; and partial, by which a man was excommunicated in one city, and with regard to certain persons, and not others.

It is observable, that not only the judges had the power of excommunicating, but that each particular person in conversation might excommunicate another, and himself likewise; and this excommunication, if well grounded, was of force: nay, if a man dreamed that he was excommunicated by himself or by another, he was considered as an excommunicated person, because this dream was supposed to be sent from God.

As to the effects of the Jewish excommunication, the lesser excluded the excommunicated person from the society of men; that is, he was not to come nearer them than four cubits, neither he, his wife, children, or domestics, according to Buxtorf. The greater absolutely sequestered the person from the conversation of others; and sometimes he was shut up in a small chamber or prison, where he lived alone. Baronius and Beza pretend, that the greater excommunication excluded men from the use of sacred things. Selden, on the contrary, affirms, that they were allowed to be present in the temple, and partake of the public worship. Buxtorf, who is of the same opinion, adds, that whereas others came into the temple at the right hand, and went out at the left, the excommunicated were obliged both to go in and out at the left.

Excommunication, among the modern Jews, is attended with the most terrible consequences. The excommunicated person is refused all human assistance: if there be a corpse in his house, or a child to be circumcised, none must help him. He is cursed by the book of the law, by the curse of Joshua against Jericho, by that of Elisha against the children, by heaven and earth,

earth, and God is besought that a whirlwind may dash him to pieces. He is pelted with stones if he appear in the streets; and if he obtains absolution, it is upon the most mortifying conditions; for he is publicly tied to a post and whipped, after which he lays himself down at the door of the synagogue, and all those who go out pass over him. This was the very case of the famous Jew Acosta.

In the ancient Christian church, the power of excommunication, as well as other acts of ecclesiastical discipline, was lodged in the hands of the clergy, who distinguished it into the greater and lesser. The lesser excommunication, simply called *aphorismos*, separation or suspension, consisted in excluding men from the participation of the eucharist, and the prayers of the faithful. But they were not expelled the church; for they had the privilege of being present at the reading of the scriptures, the sermons, and the prayers of the catechumens and penitents. This excommunication was inflicted for lesser crimes, such as neglecting to attend the service of the church, misbehaviour in it, and the like.

The greater excommunication, called *panteles aphorismos*, total separation and anathema, consisted in an absolute and intire exclusion from the church and the participation of all its rites. When any person was thus excommunicated, notice was given of it by circular letters to the most eminent churches all over the world, that they might all confirm this act of discipline, by refusing to admit the delinquent to their communion. The consequences of this latter excommunication was very terrible. The excommunicated person was avoided in civil commerce and outward conversation. No one was to receive him into his house, nor eat at the same table with him; and when dead, he was denied the solemn rites of burial. It has been a question, whether the ancient church used to add execration to her censures. Grotius thinks this was done, though very seldom, as in the case of Julian the apostate, for whose destruction the ancient Christians absolutely prayed to God. St Chrysostom was utterly against this practice, affirming that we ought not to pray against the sinner, but against his opinions or actions.

The Romish pontifical takes notice of three kinds of excommunication. 1. The minor, incurred by those who have any correspondence with an excommunicated person. 2. The major, which falls upon those who disobey the commands of the holy see, or refuse to submit to certain points of discipline; in consequence of which they are excluded from the church militant and triumphant, and delivered over to the devil and his angels. 3. Anathema, which is properly that pronounced by the pope against heretical princes and countries. In former ages, these papal fulminations were most terrible things; but at present, they are formidable to none but a few petty states of Italy.

Excommunication in the Greek church, cuts the offender off from all communion with the 318 fathers of the first council of Nice, and with the saints; consigns him over to the devil, and the traitor Judas; and condemns his body to remain after death as hard as a flint or piece of steel, unless he humbles himself and makes atonement for his sins by a sincere repentance. The form abounds with dreadful imprecations; and the Greeks assert, that if a person dies excommunicated, the devil enters into the lifeless corpse; and therefore, in order to prevent it, the relations of the deceased cut his body in pieces, and boil them in wine. It is a custom for the patriarch of Jerusalem annually to excommunicate the pope and the church of Rome; on which occasion, together with a great deal of idle ceremony, he drives a nail into the ground with a hammer, as a mark of malediction.

The form of excommunication in the church of England anciently ran thus: "By the authority of God the Father Almighty, the Son and Holy Ghost, and of Mary the blessed mother of God, we excommunicate, anathematize, and sequester from the pale of holy mother church," *&c.* The causes of excommunication in England are, contempt of the bishop's court, heresy, neglect of public worship and the sacraments, incontinency, adultery, simony, *&c.* It is published in the church; and if the offender does not submit in forty days, the civil magistrate interposes, and the excommunicated person is imprisoned till he submits and obtains absolution. Excommunication disables a person from doing any judicial act, as suing in an action at law, being a witness, *&c.*

Excommunication, among the Pagans, excluded the person from the sacrifices and the temples, and delivered him over to the furies, which was called *exsecrare*, and *diris devovere.* When Marcus Crassus set out on his expedition against the Parthians, Atteius, tribune of the people, not being able to prevent him, ran to the gate of the city through which the general was to pass, and setting a chaffing-dish in the middle of the way with fire in it, when Crassus drew near, he threw some perfumes into the chaffing-dish, and pronounced curses against Crassus with great exclamation, and thus excommunicated him.

EXCORIATION, in medicine and surgery, the galling or rubbing off of the cuticle, especially of the parts between the thighs, and about the anus.

EXCREMENT, whatever is discharged out of the body of animals after digestion, or the fibrous parts of the aliment, mixed with the bile, saliva, and other fluids. Urine and the fæces are the gross excrements that are discharged out of the bladder or belly. Other excrements are the various humours that are secreted from the blood through the various strainers in the body, and which serve for several uses, such as the saliva, sweat, bile, the pancreatic juice, lymph, the semen, nails, the hair, the horns and hoofs of animals.

EXCRESCENCE, in surgery, denotes every preternatural tumour which arises upon the skin, either in the form of a wart or tubercle. If they are born with a person, as they frequently are, they are called *nævi materni*, or marks from the mother; but if the tumour is large, so as to depend from the skin like a fleshy mass, it is then called a sarcoma.

EXCRETION, or SECRETION, in medicine, a separation of some fluid, mixed with the blood, by means of the

the glands. Excretions, by which we mean thofe that evacuate fuperfluous and heterogeneous humours, purify the mafs of blood: the humours which are generated in the blood are excreted by the glands, and are replaced by a fufficient quantity of aliment.

EXCRETORY, in anatomy, a term applied to certain little ducts or veffels, deftined for the reception of a fluid, fecreted in certain glandules, and other vifcera, for the excretion of it in the appropriated places.

Letters of EXCULPATION, in Scots law, a writ or fummons iffued by authority of the court of jufticiary, at the inftance of a panel, for citing witneffes to prove his defences, or his objections to any of the jury or witneffes cited againft him. See tit. 33.

EXCURSION, in aftronomy, is ufed in a fynonymous fenfe with elongation. See ELONGATION.

EXECRATION, in antiquity, a kind of punifhment, confifting of direful curfes and marks of infamy: fuch was that ufed againft Philip king of Macedon, by the Athenians. A general affembly of the people being called, they made a decree, that all the ftatues and images of that king, and of all his anceftors, fhould be demolifhed, and their very names razed; that all the feftivals, facred rites, priefts, and whatever elfe had been inftituted in honour of him, fhould be prophaned; that the very places where there had been any monument or infcription to his honour, fhould be deteftable; that nothing fhould be fet up, or dedicated in them, which could be done in clean places: and, laftly, that the priefts, as often as they prayed for the Athenian people, allies, armies, and fleets, fhould as many times deteft and execrate Philip, his children, kingdom, land and fea forces, and the whole race and name of the Macedonians.

EXECUTION, in a general fenfe, the act of accomplifhing, finifhing, or atchieving any thing.

EXECUTION of fummonfes or letters, in Scots law, fee LAW, tit. 12. Execution of teftaments; fee tit. 28. Execution of civil fentences and decrees; fee tit. 32. Execution of criminal fentences; fee tit. 33.

EXECUTOR, in Scots law, fignifies either the perfon intitled to fucceed to the moveable eftate of one deceafed, or who by law or fpecial appointment is intrufted with the adminiftration of it. See tit. 28.

EXECUTRY, in Scots law, is the moveable eftate falling to the executor. Under executry, or moveables, is comprehended every thing that moves itfelf, or can be moved; fuch as corns, cattle, furniture, ready money, *&c.* See tit. 9. and 28.

EXEDRÆ, in antiquity, a general name for fuch buildings as were diftinct from the main body of the churches, and yet within the limits of the church taken in its largeft fenfe. Among the exedræ the chief was the baptiftory. See BAPTISTORY.

EXEGESIS, a difcourfe by way of explanation or comment upon any fubject. In the Scotch univerfities, there is an exercife among the ftudents in divinity, called an exegefis, in which a queftion is ftated by the refpondent, who is then oppofed by two or three other ftudents in their turns; during which time the profeffor moderates, and folves the difficulties which the refpondent cannot overcome.

EXEMPLAR, denotes much the fame with model. See MODEL.

EXEMPLIFICATION *of letters patent*, a tranfcript or duplicate of them, made from the inrollment thereof, and fealed with the great feal.

EXEMPTION, in law, a privilege to be free from fome fervice or appearance: thus, barons and peers of the realm are, on account of their dignity, exempted from being fworn upon inquefts; and knights, clergymen, and others, from appearing at the fheriff's turn. Perfons of feventy years of age, apothecaries, *&c.* are alfo by law exempted from ferving on juries; and juftices of the peace, attorneys, *&c.* from parifh-offices.

EXERCISE, among phyficians, fuch an agitation of the body, as produces falutary effects in the animal œconomy. See MEDICINE.

EXERCISE, in military affairs, is the ranging a body of foldiers in form of battle, and making them perform the feveral motions and military evolutions with different management of their arms, in order to make them expert therein.

EXERCITOR, in Scots law, he who employs a fhip in trade, whether he be owner, or only freights her from the owner.

EXERGUM, among antiquarians, a little fpace around or without the figures of a medal, left for the infcription, cypher, device, date, *&c.*

EXETER, the capital city of Devonfhire, fituated on the river Ex, ten miles north of the Britifh channel: W. long. 3° 40′, N. lat. 50° 44′.

EXFOLIATION, a term ufed by furgeons for the fcaling of a bone, or its rifing and feparating into thin laminæ or fcales.

EXHALATION, a general term for all effluvia or fteams raifed from the furface of the earth in form of vapour.

EXHIBIT, in law, is where a deed, or other writing, being produced in a chancery fuit, to be proved by witneffes, the examiner, or commiffioner appointed for the examination of any fuch, certifies on the back of the deed or writing, that the fame was fhewn to the witnefs at the time of his examination, and by him fworn to.

EXHORTATION, in rhetoric, differs only from fuafion, as being more directly addreffed to the paffions.

EXIGENT, in law, a writ which lies where the defendant in a perfonal action cannot be found, nor any effects of his within the county, by which he may be attached or diftrained.

EXIGENTERS, four officers in the court of common-pleas, who make all exigents and proclamations, in all actions where procefs of outlawry lies. Writs of fuperfedeas, as well as the prothonotaries upon exigents, were likewife drawn up in their office.

EXILE. See BANISHMENT.

EXISTENCE, that whereby any thing has an actual effence, or is faid to be. See METAPHYSICS.

EXIT, in a theatrical fenfe, the action of a player in going off the ftage, after he has played his part.

EXLEGALITUS, among lawyers, the fame with an outlawed perfon.

EXOCOETUS, the FLYING-FISH, in ichthyology, a genus belonging to the order of abdominales. The head is fcaly, and it has no teeth; it has ten radii in the branchioftege membrane; the body is whitifh, and the

the belly is angular: the pectoral fins are very large. When purfued by any other fifh, it raifes itfelf from the water by means of thefe long fins, and flies in the air to a confiderable diftance, till the fins dry, and then it falls down into the water. There are two fpecies, *viz.* 1. The volitans, with the belly carinated on each fide. It is a native of the European and American feas. 2. The evolans, with a cylindrical belly. It is a native of the German ocean.

EXODIARY, in the ancient Roman tragedy, was the perfon who, after the drama or play was ended, fung the exodium. See Exodium.

EXODIUM, in the ancient Greek drama, one of the four parts or divifions of tragedy, being fo much of the piece as included the cataftrophe and unravelling of the plot, and anfwering nearly to our fourth and fifth acts.

Exodium, among the Romans, confifted of certain humourous verfes rehearfed by the exodiary at the end of the Fabulæ Atellanæ.

Exodium, in the Septuagint, fignifies the end or conclufion of a feaft. Particularly it is ufed for the eighth day of the feaft of tabernacles, which, it is faid, had a fpecial view to the commemoration of the exodus, or departure out of Egypt.

EXODUS, a canonical book of the Old Teftament; being the fecond of the pentateuch, or five books of Mofes.

It is fo called, from the Greek, [*exodos*], the going out, or departure of the children of Ifrael from the land of Egypt; the hiftory of which is delivered in this book, together with the many miracles wrought on that occafion.

EX OFFICIO, among lawyers, fignifies the power a perfon has, by virtue of his office, to do certain acts without being applied to.

EXOMPHALUS, in furgery, called alfo omphalocele, and hernia umbilicalis, is a preternatural tumour of the abdomen, at the navel, from a rupture, or diftenfion of the parts which inveft that cavity. See Surgery.

EXORCISM, among ecclefiaftical writers, the expelling devils from perfons poffeffed, by means of conjurations and prayers.

Exorcifm makes a confiderable part of the fuperftition of the church of Rome, the rituals of which forbid the exorcifing any perfon without the bifhop's leave.

The ceremony is performed at the lower end of the church, towards the door. The exorcift firft figns the poffeffed perfon with the fign of the crofs, makes him kneel, and fprinkles him with holy water. Then follow the litanies, pfalms, and prayer; after which the exorcift afks the devil his name, and adjures him by the myfteries of the Chriftian religion not to afflict the perfon any more: then, laying his right hand on the dæmoniac's head, he repeats the form of exorcifm, which is this: "I exorcife thee, unclean fpirit, in "the name of Jefus Chrift: tremble, O Satan! "thou enemy of the faith, thou foe of mankind, who "haft brought death into the world, who haft deprived men of life, and haft rebelled againft juftice; "thou feducer of mankind, thou root of evil, thou "fource of avarice, difcord, and envy.

The Romanifts likewife exorcife houfes and other places, fuppofed to be haunted by unclean fpirits; and the ceremony is much the fame with that for perfons poffeffed.

EXORCISTS, in church-hiftory, an order of men, in the ancient church, whofe employment it was to exorcife or caft out devils. See the preceding article.

EXORDIUM, in rhetoric, is the preamble or beginning, ferving to prepare the audience for the reft of the difcourfe.

Exordiums are of two kinds, either juft and formal, or vehement and abrupt. The laft are moft fuitable on occafions of extraordinary joy, indignation, or the like.

EXOTIC, an apellation denoting a thing to be the produce of foreign countries.

EXPANSION, among metaphyficians, denotes the idea we have of lafting diftance, all whofe parts exift together.

Expansion, in phyfiology, the fwelling or increafe of the bulk of bodies when heated.

EXPECTORANTS, in pharmacy, medicines which promote expectoration. See the next article.

EXPECTORATION, the act of evacuating or bringing up phlegm or other matters out of the trachea, lungs, *&c.* by coughing, hauking, fpitting, *&c.*

EXPERIENCE, a kind of knowledge acquired by long ufe, without any teacher. Mr Locke fays, that men receive all the materials of knowledge from experience and obfervation.

EXPERIMENT, in philofophy, is the trial of the refult or effect of the applications and motions of certain natural bodies, in order to difcover fomething of their motions and relations, whereby to afcertain fome of their phænomena, or caufes.

EXPERIMENTAL philosophy, that philofophy which proceeds on experiments, which deduces the laws of nature, and the properties and powers of bodies, and their actions upon each other, from fenfible experiments and obfervations. The bufinefs of experimental philofophy is to inquire into, and to inveftigate the reafons and caufes of, the various appearances and phænomena of nature; and to make the truth or probability thereof obvious and evident to the fenfes, by plain, undeniable, and adequate experiments, reprefenting the feveral parts of the grand machinery and agency of nature. See Mechanics, Hydrostatics, Optics, and the other branches of Natural Philosophy.

EXPIATION, a religious act, by which fatisfaction, atonement, or amends, is made for the commiffion of fome crime, the guilt done away, and the obligation to punifhment cancelled.

The method of expiation among the Jews was chiefly by facrifice, whether for fins of ignorance, or to purify themfelves from certain pollutions.

Great day of Expiation, an annual folemnity of the Jews, upon the tenth day of the month Tifri, which anfwers to our September. On this occafion the high-prieft laid afide his breaft-plate and embroidered ephod, as being a day of humiliation. He firft offered a bullock and a ram for his own fins, and thofe of the priefts;

priests; then he received from the heads of the people two goats for a sin-offering, and a ram for a burnt-offering, to be offered in the name of the whole multitude. It was determined by lot which of the goats should be sacrificed, and which set at liberty. After this he perfumed the sanctuary with incense, and sprinkled it with blood: then, coming out, he sacrificed the goat upon which the lot had fallen. This done, the goat which was to be set at liberty being brought to him, he laid his hands upon its head, confessed his sins, and the sins of the people, and then sent him away into some desart place: it was called azazel, or the scape-goat.

As to the expiations among the heathens, they were of several kinds, as sacrifices, and religious washings.

Expiation, in a figurative sense, is applied by divines to the pardon procured to mens sins, by the merits of Christ's death.

EXPIRATION, in physic, that part of respiration whereby the air is expelled, or driven out of the lungs.

EXPLICITE, in the schools, something clear, distinct, formal, and unfolded.

EXPLOSION, in physics, is properly applied to the going off of gun-powder and the report made thereby. Hence, it is used to express such sudden actions of bodies as generate air instantaneously.

EXPONENT, in algebra. See Algebra.

Exponent is also used in arithmetic, in the same sense as index or logarithm.

EXPORTATION, the shipping and carrying out of the the kingdom wares and commodities for other countries. See Commerce.

EXPOSITION, in general, denotes the setting a thing open to public view: thus it is the Romanists say, the host is exposed, when shewn to the people.

Exposition, in a literary sense, the explaining an author, passage, writing, or the like, and setting their meaning in an obvious and clear light.

EXPOSITOR, or Expository, a title given to small dictionaries, serving to explain the hard words of a language.

EXPOSTULATION, in rhetoric, a warm address to a person, who has done another some injury, representing the wrong in the strongest terms, and demanding redress.

EXPOSURE, in gardening, the situation of a garden, wall, or the like, with respect to the points of the compass, as south or east.

EXPRESS, something that is determinate or precise, or in such formal terms as leaves no room for doubt.

Express also denotes a courier. See Courier.

EXPRESSED oils, in chemistry. See Chemistry, p. 93.

Expression, in rhetoric, the elocution, diction, or choice of words in a discourse. See Composition.

Expression, in painting, a natural and lively representation of the subject, or of the several objects intended to be shewn.

The expression consists chiefly in representing the human body and all its parts, in the action suitable to it: in exhibiting in the face the several passions proper to the figures, and observing the motions they impress on the external parts.

EXPULSION, in a general sense, the act of violently driving a person out of any city, society, &c.

Expulsion, in medicine, the act whereby any thing is forcibly driven out of the place in which it is: thus we say, the expulsion of the foetus in delivery.

EXTASY, a transport which suspends the function of the senses, by the intense contemplation of some extraordinary or supernatural object.

Extasy, in medicine, a species of catalepsy, when a person perfectly remembers, after the paroxysm is over, the ideas he conceived during the time it lasted.

EXTENSION, in philosophy, one of the common and essential properties of body, or that by which it possesses or takes up some part of universal space, which is called the place of that body. See Metaphysics.

EXTENSOR, an appellation given to several muscles, from their extending or stretching the parts to which they belong. See Anatomy, Part II.

Old and new EXTENT, in Scots law. The *old extent* was a valuation or estimate of the annual value of all the lands in Scotland, taken (it is thought before the reign of Alexander III.) for the purpose of proportionating the public subsidies, and ascertaining the rates of certain feudal casualties. By improvement, and the alteration in the nominal value of money, this valuation, or old extent, became, in length of time, too low a standard for computing their feudal casualties; wherefore, about the reign of Robert I. all inquests for serving heirs were ordained to take proof also of the *present value* of the lands contained in the brief. This last was called the *new extent*. See Scots Law, title 12.——None of these extents is the rule by which the land-tax is now proportioned in Scotland. See Valuation, or Valued Rent.

EXTERIOR, or External. See External.

EXTERMINATION, in general, the extirpating or destroying something.

Extermination, in Algebra. See Algebra, p. 104.

EXTERNAL, a term of relation applied to the surface or outside of a body; or that part which appears or presents itself to the eye, touch, &c. in contradistinction to internal.

External is also used to signify any thing that is without-side a man, or that is not within himself, particularly in his mind, in which sense we may say external objects, &c.

EXTINCTION, in general, denotes the putting out or destroying something, as a fire or flame.

EXTINGUISHMENT, in law, is a consolidation or union, as where one has due to him a yearly rent out of lands, and afterwards purchases the lands out of which the rent arises: in this case, both the property and the rent being united in one possessor, the rent is said to be extinguished.

EXTIRPATION, the same with extermination. See Extermination.

EXTISPEX, in antiquity, the person who drew presages from viewing the intrails of animals offered in sacrifice.

crifice. See SACRIFICE, HARUSPEX, and DIVINATION.

EXTORTION, in law, is an illegal manner of wresting any thing from a man either by force, menace, or authority.

EXTRACT, in pharmacy, is a solution of the purer parts of a mixed body inspissated, by distillation or evaporation, nearly to the consistence of honey. See CHEMISTRY.

EXTRACT, in matters of literature, is something copied or collected from a book or paper.

EXTRACTION, in chemistry and pharmacy, the operation by which essences, tinctures, *&c.* are drawn from natural bodies. See CHEMISTRY.

EXTRACTION, in surgery, is the drawing any foreign matter out of the body by the hand, or by the help of instruments. See SURGERY.

EXTRACTION, in genealogy, implies the stock or family from which a person is descended.

EXTRACTION *of roots*, in algebra and arithmetic. See ALGEBRA, p. 86. and ARITHMETICK, p. 420.

EXTRACTOR, in midwifery, an instrument, or forceps, for extracting children by the head. See MIDWIFERY.

EXTRAVAGANTES, those decretal epistles, which were published after the clementines. See CLEMENTINES.

They were so called because, at first, they were not digested, or ranged, with the other papal constitutions, but seemed to be, as it were, detached from the canon law. They continued to be called by the same name when they were afterwards inserted in the body of the canon law. The first extravagantes are those of John XXII. successor of Clement V. the last collection was brought down to the year 1483, and was called the common extravagantes, notwithstandinng that they were likewise incorporated with the rest of the canon law.

EXTRAVASATION, in contusions, fissures, depressions, fractures, and other accidents of the cranium, is when one or more of the blood-vessels, that are distributed on the dura mater, is broke or divided, whereby there is such a discharge of blood as greatly oppresses the brain, and disturbs its office; frequently bringing on violent pains, and other mischiefs; and at length death itself, unless the patient is timely relieved. See SURGERY, and MEDICINE.

EXTREMES, in logic, the terms expressing the two ideas whose relation we inquire after in a syllogism.

EXTREME UNCTION. See UNCTION.

EXTRINSIC, among metaphysicians, is taken in various senses: sometimes it signifies a thing's not belonging to the essence of another; in which sense, the efficient cause and end of a thing are said to be extrinsic. Sometimes it signifies a thing's not being contained within the capacity of another; in which sense, these causes arc called extrinsic which introduce something into a subject from without, as when a fire introduces heat. Sometimes it signifies a thing added or applied to another; in which sense accidents and adherents are said to be extrinsic to the subjects to which they adhere. Sometimes the vision is said to be extrinsic from some form which does not exist in that thing, but is adjacent to it, or by some means or other without it.

EXULCERATION, in surgery. See ULCER.

EXUVIÆ, among naturalists, denote the cast-off parts or coverings of animals, as the skins of serpents, caterpillars, and other insects.

EYE, in anatomy. See ANATOMY, p. 289.

Bull's EYE, in astronomy. See ALDEBARAN.

EYE-GLASS, in the microscope. See MICROSCOPE and OPTICS.

EYEMOUTH, or AYMOUTH, a port-town of Scotland, about six miles north of Berwick.

EYRAC, or IZACA ARABIC, a province of Asiatic Turky, situated on the river Euphrates, being the ancient Chaldea or Babylonia.

EYRAC, or IRAC AGEM, the ancient Parthia, now the principal province of Persia, is situated almost in the centre of that kingdom, its capital city being Ispahan, the metropolis of the whole kingdom.

EYRE, or EIRE, in law, the court of itinerant justices. See JUSTICES.

EYSENACH, a city of Germany, in the circle of Upper Saxony: E. long. 10° 12′, and N. lat. 51°.

EZEKIEL, a canonical book of the Old Testament, referring chiefly to the degenerate manners and corruptions of the Jews of those times.

It abounds with fine sentences and rich comparisons, and discovers a good deal of learning in profane matters.

Ezekiel was carried captive to Babylon with Jechoniah, and began his prophecies in the fifth year of the captivity. He was cotemporary with Jeremiah, who prophesied at the same time in Judea He foretold many events, particularly the destruction of the temple, the fatal catastrophe of those who revolted from Babylon to Egypt, and the happy return of the Jews to their own land.

EZRA, a canonical book of the Old Testament, comprehending the history of the Jews from the time of Cyrus's edict for their return, to the twentieth year of Artaxerxes Longimanus. It specifies the number of Jews who returned, and Cyrus's proclamation for the rebuilding the temple, together with the laying its foundation, the obstructions it met with, and the finishing thereof in the reign of Darius.

The illustrious author of this book, was also the restorer and publisher of the canon of the Old Testament.

F.

F

FABA, in botany. See Vicia.

FABAGO, in botany. See Zygophillum.

FABER, in ichthyology. See Zeus.

FABLE, a tale, or feigned narration, defigned either to inftruct or divert, difguifed under the allegory of an action, *&c.*

Fables were the firft pieces of wit that made their appearance in the world, and have been ftill highly valued, not only in times of the greateft fimplicity, but among the moft polite ages of the world. Jotham's fable of the trees is the oldeft that is extant, and as beautiful as any that have been made fince. Nathan's fable of the poor man is next in antiquity. We find Æfop, in the moft diftant ages of Greece; and in the early days of the Roman commonwealth, we read of a mutiny appeafed by the fable of the belly and the members. As fables had their rife in the very infancy of learning, they never flourifhed more than when learning was at its greateft height; witnefs Horace, Boileau, and Fontaine.

Fable, is alfo ufed for the plot of an epic or dramatic poem; and is, according to Ariftotle, the principal part, and, as it were, the foul of a poem. See Composition.

FACE, in anatomy, comprehends all that part of the head which is not covered with the common long hair. See Anatomy, Part I. II. and VI.

Face, in the military art, a word of command, intimating to turn about; thus, *face to the right*, is to turn upon the left heel a quarter-round to the right; and, *face to the left*, is to turn upon the right heel a quarter-round to the left.

FACET, or Facette, among jewellers, is the name of the little faces or planes to be found in brilliant and rofe diamonds.

FACTION, a cabal or party formed in a ftate, city, or company.

Faction, in antiquity, a name given to the different companies of combatants in the circus. They were four, *viz.* the white, the red, the green, and the blue; to which Domitian added another of purple colour. They were fo denominated from the colour of the liveries they wore, and were dedicated, according to M. Aur. Caffiodorus, to the four feafons of the year, the green being confecrated to fpring, the blue to winter, the red to fummer, and the white to autumn. It appears from ancient infcriptions, that each faction had its procurators and phyfician; and from hiftory, that party rage ran fo high among them, that in a diffenfion between two factions, in the time of Juftinian, almoft forty thoufand men loft their lives in the quarrel.

FACTITIOUS, any thing made by art, in oppofition to what is the produce of nature. Thus, factitious cinnabar is oppofed to native cinnabar.

FACTOR, in commerce, is an agent or correfpondent refiding beyond the feas, or in fome remote part, commiffioned by merchants to buy or fell goods on their account, or affift them in carrying on their trade.

A factor receives from the merchants, his conftituents, in lieu of wages, a commiffion or factorage, according to the ufage of the place where he refides, or the bufinefs he tranfacts, this being various in different countries, on the purchafes and fales of different commodities. He ought to keep ftrictly to the tenor of his orders; as a deviation from them, even in the moft minute particular, expofes him to make ample fatisfaction for any lofs that may accrue from his non-obfervance of them. When unlimited orders are given to factors, and they are left to fell or buy on the beft conditions they can, whatever detriment occurs to their conftituents, they are excufed, as it is to be prefumed they acted for the beft, and were governed by the dictates of prudence. But a bare commiffion to fell is not fufficient authority for the factor to truft any perfon, wherefore he ought to receive the money on the delivery of the goods; and, by the general power, he may not truft beyond one, two, or three months, *&c.* the ufual time allowed for fales, otherwife he fhall be anfwerable out of his own eftate. If a factor fells on the ufual truft to a perfon of good credit, who afterwards becomes infolvent, he is difcharged; but not if the man's credit was bad at the time of fale. If a factor gives a man time for payment of money contracted on fale of his principal's goods, and, after that time is elapfed, fell him goods of his own for ready money, and the man becomes infolvent, the factor in equity ought to indemnify his principal; but he is not compellable by the common law. A factor fhould always be punctual in the advices of his tranfactions, in fales, purchafes, freights, and more efpecially in draughts by exchange. If he purchafes goods for another at a price limited, and afterwards they rife, and he fraudulently takes them for his own account, and fends them to another part, in order to fecure an advantage that feemingly offers, he will, on proof, be obliged, by the cuftom of merchants, to fatisfy his principal for damages. If a factor, in conformity with a merchant's orders, buys with his money, or on his credit, a commodity he fhall be directed to purchafe; and, without giving advice of the tranfaction, fells it again to profit, and appropriates to himfelf the advantage, the merchant fhall recover it from him, and befides have him amerced for his fraud. When factors have obtained a profit for their principal, they muft be cautious how they difpofe of it; for, if they act without commiffion, they are refponfible: and if a merchant remits goods to his factor, and about a month after draws a bill on him, the factor, having effects in his hands, accepts the bill, then the principal breaks, and the goods are feized in the factor's hands for

for the behalf of the creditors, it has been conceived the factor muſt anſwer the bill notwithſtanding, and come in a creditor for ſo much as he was obliged, by reaſon of his acceptance, to pay. A factor who enters into a charter-party with a maſter for freight, is obliged by the contract; but if he loads aboard generally, the principal and the lading are liable for the freightment, and not the factor. If a factor, having money in his hands belonging to his principal, neglect to inſure a ſhip and goods, according to order; if the ſhip miſcarry, the factor, by the cuſtom of merchants, ſhall make good the damage; and if he make any compoſition with the inſurers after inſurance, without orders ſo to do, he is anſwerable for the whole inſurance.

As fidelity and diligence are expected from the factor, ſo the law requires the like from the principal: if, therefore, a merchant remits counterfeit jewels to his factor, who ſells them as if true; if he receive loſs or prejudice by impriſonment or other puniſhment, the principal ſhall not only make full ſatisfaction to the factor, but to the party who bought the jewels.

What is here ſaid of factors, is meant of ſuch as reſide abroad to act for merchants, and may be applied to ſupercargoes, who go a voyage to diſpoſe of a cargo, and afterwards return with another to their principals: but it is alſo the cuſtom of the merchants of the higheſt credit throughout the world, to act mutually in the capacity of factors for each other. The buſineſs ſo executed is called commiſſion buſineſs, and is generally deſirable by all merchants, provided they have always effects in their hands, as a ſecurity for all the affairs which they tranſact for the account of others. And this claſs of traders of eſtabliſhed reputation, have current as well as commiſſion account, conſtantly between them, and draw on, remit to, and ſend commiſſions to each other only by the intercourſe of letters, which, among men of honour, are as obligatory and authoritative as all the bonds and ties of law.

FACTOR, in arithmetick. See ARITHMETICK, p. 371.

FACTORAGE, called alſo commiſſion, is the allowance given to factors by the merchant who employs them. The gain of factorage is certain, however the voyage or ſale prove to the merchant: but the commiſſions vary; at Jamaica, Barbadoes, Virginia, and moſt of the weſtern parts of the world, the commiſſion runs at 8 *per cent.* generally through Italy, 2½; in France, Spain, and Portugal, &c. 2; and in Holland and other places near home, 1½ *per cent.*

FACTORY is a place where a conſiderable number of factors reſide, to negociate for their maſters or employers. See FACTOR.

The moſt conſiderable factories belonging to the Britiſh are thoſe eſtabliſhed in the Eaſt-Indies, Portugal, Turky, &c.

FACTUM, in arithmetic, the product of two quantities multiplied by each other.

FACULÆ, in aſtronomy, certain bright and ſhining parts, which the modern aſtronomers have, by means of teleſcopes, obſerved upon or about the ſurface of the ſun: they are but very ſeldom ſeen.

FACULTY, in law, a privilege granted to a perſon, by favour and indulgence, of doing what, by law, he ought not to do.

For granting theſe privileges, there is a court under the archbiſhop of Canterbury, called the court of the faculties, the chief officer whereof is ſtyled maſter of the faculties; who has a power of granting diſpenſations in divers caſes, as to marry without the bans being firſt publiſhed; to eat fleſh on days prohibited; to ordain a deacon under age; for a ſon to ſucceed his father in his benefice; a clerk to hold two or more livings, &c.

FACULTY, in the ſchools, a term applied to the different members of an univerſity, divided according to the arts and ſciences taught there: thus in moſt univerſities there are four faculties, *viz.* 1. Of arts, which include humanity and philoſophy. 2. Of theology. 3. Of phyſic. And 4. Of civil law.

FACULTY *of Advocates.* See ADVOCATES.

FACULTY is alſo uſed to denote the powers of the human mind, *viz.* underſtanding, will, memory, and imagination. See METAPHYSICS.

FÆCES, in chemiſtry, the groſs matter, or ſediment, that ſettles at the bottom after diſtillation, fermentation, and the like.

FÆCES, in medicine, the excrements voided by ſtool.

FÆCULENT, in general, is applied to things abounding with fæces, or dregs: thus the blood and other humours of the human body, are ſaid to be fæculent, when without that purity which is neceſſary to health.

FAENSA, a city and biſhop's ſee of Italy, ſituated in the pope's territories, about thirty miles eaſt of Bologna: E. long. 12° 38′, and N. lat. 44° 30′.

FAGARA, in botany, a genus of the tetrandria monogynia claſs. The calix conſiſts of four ſegments, and the corolla of four petals; and the capſule has four cells, two valves, and contains one ſeed. There are three ſpecies, none of them natives of Britain.

FAGGOT, in times of popery here, was a badge worn on the ſleeve of the upper garment of ſuch perſons as had recanted, or abjured what was then termed hereſy; being put on after the perſon had carried a faggot, by way of penance, to ſome appointed place of ſolemnity. The leaving off the wear of this badge was ſometimes interpreted a ſign of apoſtacy.

FAGGOTS, among military men, perſons hired by officers, whoſe companies are not full, to muſter and hide the deficiencies of the company; by which means they cheat the king of ſo much money.

FAGONIA, in botany, a genus of the decandria monogynia claſs. The calix conſiſts of five leaves, and the corolla of five cordated petals; the capſule has five cells with one ſeed in each, and ten valves. There are three ſpecies, none of them natives of Britain.

FAGOPYRUM. See POLYGONUM.

FAGUS, the BEECH, in botany, a genus of the monœcia polyandria claſs. The calix of the male is bell-ſhaped, and conſiſts of five ſegments; it has no corolla, but twelve ſtamina: the calix of the female conſiſts of four teeth; it has no corolla; the ſtyli are three; and the capſule is muricated, has four cells and two ſeeds. There are three ſpecies, two of them natives of Britain, *viz.* the caſtanea, or cheſnut-tree; and the ſylvatica, or beech-tree.

FAINTING. See LIPOTHYMIA.

FAIR, a greater kind of market, granted to a town, by privilege, for the more ſpeedy and commodious providing of ſuch things as the place ſtands in need of. See MARKET.

It is incident to a fair, that perſons ſhall be free from being arreſted in it for any other debt contracted than what was contracted in the ſame; or, at leaſt, promiſed to be paid there. Theſe fairs are generally kept once or twice a year, and, by ſtatute, they ſhall not be held longer than they ought, by the lords thereof, on pain of their being ſeized into the king's hands, *&c.* Alſo proclamation is to be made how long they are to continue; and no perſon ſhall ſell any goods after the time of the fair is ended, on forfeiture of double the value, one fourth to the proſecutor, and the reſt to the king. There is a toll uſually paid in fairs, on the ſale of things, and for ſtallage, picage, *&c.* See TOLL.

FAIRFIELD, a town of New England, in the province of Connecticut, about an hundred miles ſouth-weſt of Boſton: W. long. 72°, and N. lat. 41°.

FAIRFORD, a market-town about nineteen miles ſouth-eaſt of Gloceſter.

FAIRY, in ancient traditions and romances, ſignifies a ſort of deity, or imaginary genius, converſant on earth, and diſtinguiſhed by a variety of fantaſtical actions, either good or bad.

The fairies are a peculiar ſpecies of divinities, that have but little relation to any of thoſe of the ancient Greeks or Romans, unleſs perhaps to the larvæ; tho' others, with great reaſon, will not have them ranked among gods, but ſuppoſe them an intermediate kind of beings, neither gods, angels, men, or devils. They are of oriental extraction, and ſeem to have been invented by the Perſians and Arabs, whoſe religion and hiſtory abound with relations concerning them: theſe have a particular country which they ſuppoſe the fairies to inhabit, called Fairy-land.

Spencer's Fairy Queen is an epic poem, under the perſons and characters of fairies. In this ſort of writing the poet loſes ſight of nature, and entertains the reader's imagination with the characters of fairies, witches, magicians, dæmons, and departed ſpirits. It requires an odd turn of thought, and a peculiar caſt of fancy, with an imagination naturally fruitful and ſuperſtitious.

This ſort of poetry raiſes a pleaſing kind of horror in the mind of the reader, and amuſes his imagination with the ſtrangeneſs and novelty of the perſons who are repreſented in it; but the judicious object to it, as not having probability enough to affect the imagination.

FAIRY CIRCLE or RING, a phænomenon pretty frequent in the fields, *&c.* ſuppoſed by the vulgar to be traced by the fairies in their dances: there are two kinds of it, one of about ſeven yards in diameter, containing a round bare path, a foot broad, with green graſs in the middle of it. The other is of different bigneſs, encompaſſed with a circumference of graſs. Meſſ. Jeſſop and Walker, in the Philoſophical Tranſact. aſcribe them to lightning, which is confirmed by their being moſt frequently produced after ſtorms of that kind, as well as by the colour and brittleneſs of the graſs-roots, when firſt obſerved.

Lightning, like all other fires, moves round, and burns more in the extremity than in the middle: the ſecond circle ariſes from the firſt, the graſs burnt up growing very plentifully afterwards. Others maintain that theſe circles are made by ants, which are frequently found in great numbers therein.

FAITH, in divinity and philoſophy, the firm belief of certain truths upon the teſtimony of the perſon who reveals them.

The grounds of a rational faith are, 1. That the things revealed be not contrary to, though they may be above natural reaſon. 2. That the revealer be well acquainted with the things he reveals. 3. That he be above all ſuſpicion of deceiving us.

Where theſe criterions are found, no reaſonable perſon will deny his aſſent: thus, we may as well doubt of our own exiſtence, as of the truth of a revelation coming from God, who can neither be deceived himſelf, nor deceive others by propoſing things to be believed that are contradictory to the faculties he has given us. Whatever propoſitions, therefore, are beyond reaſon, but not contrary to it, are, when revealed, the proper matter of faith.

Confeſſion of FAITH. See CONFESSION.

FAITHFUL, an appellation aſſumed by the Mahometans. See MAHOMETANS.

FAKENHAM, a market-town of Norfolk, about ſixteen miles north-weſt of Norwich.

FAKIR, in Pagan theology, a kind of Indian monks, who even outdo the mortifications and ſeverities of the ancient Chriſtian anachorets. See ANACHORET.

Some of them mangle their bodies with ſcourges and knives others never lie down; and others remain all their lives in one poſture.

There are alſo another kind of fakirs, who do not practice ſuch ſeverities: theſe flock together in companies, and go from village to village, propheſying and telling fortunes. It is ſaid that even perſons of fortune, in India, become fakirs, and that there are more than two millions of them.

FALCADE, in the menage, the motion of a horſe when he throws himſelf upon his haunches two or three times, as in very quick corvets: which is done in forming a ſtop and half ſtop. See STOP.

FALCATED, ſomething in the form of a ſickle: thus, the moon is ſaid to be falcated when ſhe appears horned. See MOON and PHASES.

FALCO, in ornithology, a genus belonging to the order of accipitres, the characters of which are theſe: the beak is crooked, and furniſhed with wax at the baſe; the head is thick-ſet with feathers, and the tongue is cloven, There are thirty-two ſpecies, *viz.* 1. The coronatus, or crowned eagle of Edwards, with aſh-coloured wax; the legs are covered with white downy feathers, interſperſed with black ſpots; the breaſt is reddiſh; and there are black belts on the ſides. It is a native of Guinea. 2. The melanæetus, or

black eagle of Ray, has yellowifh-wax on the beak; the legs are half covered with feathers; and the body is afh-coloured and ftreaked with yellow. It is a native of Europe. 3. The leucocephalus, or white-headed eagle of Catefby, is afh-coloured, with the head and tail white; the iris of the eye is white, over which is a prominence covered with a yellow fkin; the bill and the fear or wax are yellow, as are likewife the legs and feet; and the talons are black. Though it is an eagle of fmall fize, it weighs nine pounds, is ftrong and full of fpirit, preying on lambs, pigs, and fawns. They always make their nefts near the fea, or great rivers, and ufually upon old, dead pine or cyprefs trees, continuing to build annually on the fame tree till it falls. Tho' he is fo formidable to all birds; yet he fuffers them to build near his royal neft without moleftation; particularly the fifhing hawk, herons, *&c.* which all build on high-trees, and in fome places are fo near one another that they appear like a rookery. It is a native both of Europe and America. *Pl.* 76. *fig.* 1. 4. The offifragus, with yellow wax, and half-feathered legs; it is about the fize of a peacock; the feathers are white at the bafe, iron-coloured in the middle, and black at the points; and the legs are yellow: it is a native of Europe. 5. The chryfaëtos, or golden eagle, has yellow wax on the beak, and feathered legs; the body is variegated with a brown and iron colour; and the bafe of the tail is undulated with an afh-colour: it is a bird of Europe. 6. The fulvus, with yellow wax, feathered legs, a brown back, and a white ftreak on the tail; the face is bare betwixt the eyes and noftrils: it is a native of Europe and Canada. 7. The rufticolus, with a yellow wax, yellow ring round the eyes, and yellow legs; the body is afh-coloured undulated with white, and a white ring round the neck: it is a native of Sweden. 8. The barbarus, with yellow wax, and yellow legs; the body is blueifh, and fpotted with brown: it is a native of Barbary. 9. The cærulefcens, with yellow wax, a yellow ring round the eyes, and the feet yellow underneath; the back is of a blackifh blue colour; and the temples are furrounded with a white line. This is the fmalleft bird of the genus, and is a native of Afia. 10. The cyaneus, with white wax, yellow legs, a whitifh blue body, and a white ring round the eyes and throat. It is the blue hawk of Edwards, and is a native of Europe and Africa. 11. The pygargus, with yellow wax and legs; the body is afh-coloured, with pale red fpots along the belly, and white orbits. It is a bird of Europe. 12. The milvus, or kite, with yellow wax on the back, a forked tail, and iron-coloured bill, and the head of a lighter colour. It is a bird of Europe, Afia, and Africa. Bellonius relates, that, about the end of April, in lefs than fourteen days, incredible numbers of them are feen flying over the Black Sea into Afia. They feed upon offals, young-birds, *&c.* Like all the fpecies of this genus, they fly remarkably high, and are endowed with uncommon acutenefs of vifion. 13. The gentilis, with yellow wax and legs; the body is afh-coloured, with brown fpots; and the tail has four blackifh ftreaks. It is a native of the Alps, and is peculiarly fond of larks. 14. The fubbuteo, with yellow wax and legs; the back is brown, the nape of the neck white, and the belly is pale, with oblong brown fpots. It is called the hobby by Englifh authors, and is a native of Europe. 15. The buteo, with yellowifh wax and legs, a brown body, and a pale belly, with brown fpots. He feeds upon rabbits, toads, *&c.* and is a bird of Europe. 16. The tinnunculus, with yellow wax and legs; the back is reddifh, and fpotted with black; it has brownifh ftreaks on the breaft, and a roundifh tail. It inhabits old buildings, and lives upon fmall birds and mice. 17. The fufflator, with yellowifh wax and legs; the body is of a brownifh white colour; and the covers of the eyes are bony. He has a flefhy lobe between the noftrils, which, when angry or terrified, he inflates till his head becomes as large as his whole body. He is a native of Surinam. 18. The cachinnans, or laughing hawk, has yellowifh legs and wax, and white eye-brows; the body is variegated with brown and white; and it has a black ring round the top of the head. It makes a laughing kind of noife when it obferves any perfon, and is a native of America. 19. The hudfonius, has yellow wax, and yellow legs, a brown back, and white eye-brows. It is found at Hudfon's bay. 20. The fparverius, has yellow wax, a brown head, a red belly, and blueifh wings. It is a native of America. 21. The columbarius, or pigeon-hawk of Catefby, weighs about fix ounces. The bill is black at the point, and whitifh at the bafe; the iris of the eye is yellow; the bafe of the upper mandible is covered with a yellow fear or wax; all the upper part of the body, wings, and tail, are brown. The interior vanes of the quill-feathers have large red fpots. The tail is marked with four regular tranfverfe white lines; the throat, breaft, and belly are white, mixed with brown; the fmall feathers that cover the thighs reach within half an inch of the feet, and are white, with a tincture of red, befet with long fpots of brown; the legs and feet are yellow. It is a very fwift and bold hawk, preying on pigeons, young turkeys, *&c.* and is a native of Carolina. *Pl.* 76. *fig.* 3. 22. The fuperciliofus has yellow legs and wax, and yellow eye-brows; and the body is brown, waved with white. It is a native of Surinam. 23. The vefpertinus, is about the fize of a pigeon; the body is of a blueifh brown colour; and the bill is yellow, and brown at the point. It is a native of Ingria, and flies both in the day and in the night. 24. The lanarius, has yellowifh wax, and the bill and legs, which are fhort, are blueifh. It is a native of Europe. 25. The furcatus, or fwallow-tailed hawk, weighs about 14 ounces; the bill is black; the eyes are large and black, with a red iris; the head, neck, breaft, and belly are white; the upper part of the back and wings a dark purple; but more dufky towards the lower parts, with a tincture of green. The wings are long in proportion to the body, and, when extended, are four feet. The tail is dark purple mixed with green, and remarkably forked. Like fwallows, they continue long on the wing, catching, as they fly, beetles, flies, and other infects. They are faid to prey upon lizards and ferpents, and are found in America. *Pl.* 76. *fig.* 2. 26. haliætus, or fifhing hawk of Catefby, weighs three pounds and a quarter; it meafures, from one end of the wing to the other, five feet and a half. The bill is black, with a blue fear or wax; the iris of the eye is yellow, and the crown of the head brown, with a mixture of white feathers; from each eye, backwards, runs a brown ftripe:

Fig. 1.
FALCO LEUCOCEPHALUS
or
WHITE HEADED EAGLE

Fig. 2.
FALCO FURCATUS
or
SWALLOW TAILD HAWK

Fig. 3.
FALCO COLUMBARIUS
or
PIGEON HAWK

A. Bell Sculp.t

Fig. 1. FALCO HALIÆTUS
or
FISHING HAWK

Fig. 2. FELIS DOMESTICUS
CAT of ANGORA

A. Bell Sculp.

the back, wings, and tail, are of a dark brown; the throat, neck, and belly white; the legs and feet are rough and ſcaly, and of a pale blue colour; the talons are black, and nearly of an equal ſize; the feathers of the thighs are ſhort, and adhere cloſe to them, contrary to others of the hawk-kind, which nature ſeems to have deſigned for their more eaſy penetrating the water. Their manner of fiſhing is, after hovering a while over the water, to precipitate into it with prodigious ſwiftneſs, where they remain for ſome minutes, and ſeldom riſe without a fiſh. The white-headed eagle, who is generally on the watch, no ſooner ſpies him with his fiſh, than he flies furiouſly upon him: the hawk immediately mounts, and ſcreams out; but the eagle always ſoars above him, and compells him to let the fiſh fall; the eagle inſtantly darts down upon the fiſh, and ſeldom fails to catch it before it reaches the water. It is remarkable, that, whenever the hawk catches a fiſh, he calls out, as if it were to give warning to his enemy the eagle, who always obeys the call when within hearing. The lower parts of the rivers and creeks near the ſea in America, abound with thoſe eagles and hawks, where theſe diverting conteſts are frequently ſeen. *Pl.* 77 *fig.* 1. 27. The gyrfalco, with blue wax on the beak, yellow legs, a brown body, marked with aſh-coloured ſtreaks underneath, and the ſides of the tail white. It is the gyrfalco of Ray, lives upon cranes, pigeons, *&c.* and is a native of Europe. 28. The aviporus, with black wax, yellow legs, half naked, the head of an aſh-colour, and having an aſh-coloured ſtripe on the tail, which is white at the end It is the honey-buzzard of Ray, and is a native of Europe; it feeds upon mice, lizards, frogs, bees, and other inſects. 29. The æruginoſus, with greeniſh wax, a greyiſh body; and the top of the head, nape of the neck, and legs, are yellowiſh. It is a native of Europe, and builds its neſt in marſhes. 30. The palumbarius, with black wax edged with yellow, yellow legs, a brown body, and the prime feathers of the tail are marked with pale ſtreaks, and the eye-brows are white. It is the gooſe-hawk of Ray, is an inhabitant of Europe, and an enemy to domeſtic fowls. 31. The niſus, with green wax, yellow legs, and a white belly undulated with grey; the tail is marked with blackiſh belts. It is the ſparrow-hawk of Ray, and a native of Europe. It is peculiarly fond of pigeons, ſparrows, and larks. 32. The minutus, with brown wax, yellow legs, and the body is white underneath. It is the leaſt hawk of Briſſonius, being about the ſize of a thruſh, and is found at Melita.

FALCONER, one who tames, manages, and looks after falcons, or other hawks. See the next article.

FALCONRY, the art of training all manner of hawks, but more eſpecially the larger ſort, to the exerciſe of hawking. See HAWKING.

When a falcon is taken, ſhe muſt be ſeeled in ſuch a manner, that as the ſeeling ſlackens, ſhe may ſee what proviſion lies before her; but care ought to be taken, not to ſeel her too hard. A falcon or hawk newly taken, ſhould have all new furniture, as new jeſſes of good leather, mailled leaſhes with buttons at the end, and new bewets. There ſhould alſo be provided a ſmall round ſtick, to ſtroke the hawk; becauſe the oftener this is done, the ſooner and better will ſhe be manned. She muſt alſo have two good bells, that ſhe may be found when ſhe ſcattereth. Her hood ſhould be well faſhioned, raiſed and emboſſed againſt her eyes, deep, and yet ſtrait enough beneath, that it may faſten about her head without hurting her; and her beak and talons muſt be a little copied, but not ſo near as to make them bleed.

FALKIRK, a town of Scotland: W. long. 3° 48′, N. lat. 56° 20′.

FALL, the deſcent of a heavy body towards the center of the earth; it is alſo the name of a meaſure of length uſed in Scotland, containing ſix ells.

FALLACY, a deception, fraud, or falſe appearance.

The Epicureans deny that there is any ſuch thing as a fallacy of the ſenſes: for, according to them, all our ſenſations and perceptions, both of ſenſe and phantaſy, are true: whence they make ſenſe the primary criterion of truth.

FALLING SICKNESS. See MEDICINE.

FALLOPIAN TUBES. See ANATOMY, p. 275.

FALLOW, a pale red colour, like that of brick half burnt: ſuch is that of a fallow-deer.

FALLOW-FIELD, or FALLOW GROUND, land laid up, or that has lain untilled for a conſiderable time.

FALLOWING *of land*, a particular method of improving land. See AGRICULTURE.

FALMOUTH, a port-town of Cornwall, in England, ſituated in W. long. 5° 30′, N. lat. 50° 15′, on a fine bay of the Engliſh channel, the entrance whereof is guarded by two forts.

FALSE, in general, ſomething contrary to truth, or not what it ought to be; thus we ſay, a falſe witneſs, falſe action, falſe weights, falſe claim, *&c.*

FALSHOOD, in philoſophy, is the repreſenting a thing otherwiſe than it is.

Crimen falſi, in the civil law, is fraudulent ſubornation or concealment with deſign to darken or hide the truth, and make things appear otherwiſe than they are. The crimen falſi is committed, 1. By words, as when a witneſs ſwears falſely. 2. By writing, as when a man antedates a contract, or the like. 3. By deed, as when he ſells by falſe weights and meaſures.

FALX, in anatomy. See ANATOMY, p. 284.

FAN, a machine uſed to raiſe wind and cool the air by agitating it. The cuſtom which now prevails of wearing fans, was borrowed from the Eaſt, where they are almoſt indiſpenſably neceſſary for keeping off the ſun and the flies. Fans are made of a thin ſkin or piece of paper, taffaty, or other light ſtuff, cut ſemicircularly, and mounted on ſeveral little ſticks of wood, ivory, tortoſe-ſhell, or the like. The paper, *&c.* is uſually painted, and in mounting is plaited in ſuch a manner, as that the plaits may be alternately inward and outward.

FAN is alſo an inſtrument uſed in winnowing corn.

Fans for corn pay on importation, 1 s. $3\frac{40}{100}$d. and draws back on exportation, 1 s. $1\frac{50}{100}$d. India fans pay for every 100 l. groſs value at the ſale 26 l. 14 s $2\frac{52\frac{5}{8}}{100}$d.

The draw-back on exportation is 25 l. 2 s. $11\frac{51\frac{3}{8}}{100}$d.

FANATICS, wild, enthusiastic, visionary persons, who pretend to revelation and inspiration.

FANCY, or IMAGINATION. See IMAGINATION.

FANIONS, in the military art, small flags carried along with the baggage.

FANO, a bishop's see and port-town of Italy, situated on the gulph of Venice, in 14° E. long. and 44° N. lat.

FAR, in horsemanship, an appellation given to any part of a horse's right side: thus the far foot, far shoulder, *&c.* is the same with the right foot, right shoulder, *&c.*

FARCE, was originally a droll or petty shew exhibited by mountebanks and their buffoons in the open streets, to gather the people together. At present it is of more dignity: it is removed from the street to the theatre, and instead of being performed by merry-andrews to amuse the rabble, is acted by comedians, and become the entertainment of a polite audience. Poets have reformed the wildness of the primitive farces, and brought them to the taste and manner of comedy. The difference between the two on our stage is, that comedy keeps to nature and probability, and therefore is confined to certain laws prescribed by ancient critics; whereas farce disallows of all laws, or rather sets them aside on occasion. Its end is purely to make merry; and it sticks at nothing which may contribute thereto, however wild and extravagant. Hence the dialogue is usually low, the persons of inferior rank, the fable or action trivial or ridiculous, and nature and truth every where heightened and exaggerated to afford the more palpable ridicule.

FARCIN, FARCY, or FASHIONS, in farriery, a creeping ulcer, and the most loathsome, stinking, and filthy disease that a horse can be affected with.

For the cure, first bleed the horse well; then take oil of bay and euphorbium mixed together, and anoint the knots with it; or bathe the place with the stale of an ox or cow, and the herb called lion's foot, all boiled together. Some apply tallow and horse-dung, burn the knots with a hot iron, or wash the sore with salt, vinegar, alum, verdigrease, green copperas, and gun-powder, boiled in chamber-lee. Others again anoint the sores with a salve made of a penny-worth of tar, two penny worth of white mercury, and two handfuls of pigeon's dung.

FARDING-DEAL, the fourth part of an acre of land. See ACRE.

FARE, most commonly signifies the money paid for a voyage, or passage by water; but, in London, it is what persons pay for being conveyed from one part of the town to another in a coach or chair.

FAREHAM, a market town of Hampshire, ten miles east of Southampton.

FAREWELL CAPE, the most southerly promontory of Greenland, in 50° W. long. and 60° N. lat.

FARINA FOECUNDANS, among botanists, the supposed impregnating meal or dust on the apices or antheræ of flowers. See BOTANY, Sect. III.

FARINGTON, a market town of Berkshire, twenty-five miles north-west of Reading.

FARM, or FERM, signifies the chief messuage in a village; or any large messuage, whereto belongs land, meadow, pasture, wood, common, *&c.* and which has been used to let for term of life or years, under a certain yearly rent payable by the tenant for the same.

FARNHAM, a market-town in the county of Surry, ten miles west of Guilford, remarkable for its large plantations of hops.

FARO, a sea-port town of Portugal, in the province of Algarva: W. long. 9°, N. lat. 36° 50′.

FARREATION, in antiquity. See CONFARREATION.

FARRIER, one whose emoloyment is to shoe horses, and cure them when diseased or lame.

F A R R I E R Y.

FARRIERY, the art of curing the diseases of horses. The practice of this useful art has been hitherto almost entirely confined to a set of men who are totally ignorant of anatomy, and the general principles of medicine. It is not therefore surprising, that their prescriptions should be equally absurd as the reasons they give for administering them. It cannot indeed be expected that farriers, who are almost universally illiterate men, should make any real progress in their profession. They prescribe draughts, they rowel, cauterise, *&c.* without being able to give any other reason for their practice, but because their fathers did so before them. How can such men deduce the cause of a disease from its symptoms, or form a rational method of cure, when they are equally ignorant of the causes of diseases and the operation of medicines?

The miserable state of this useful art, especially in this country, has determined us to select, from the best authors, such a system of practice as seemed to be formed on rational principles; this, we hope, will be a sufficient apology for being so full upon this article.

General Directions with regard to the Management of Horses.

IT ought to be laid down as a general rule, to give horses as few medicines as possible; and by no means to comply with the ridiculous custom of some, who are frequently bleeding, purging, and giving balls, though their horses be in perfect health, and have no indication that requires such treatment.

Proper management in their feeding, exercise, and dressing, will alone cure many disorders, and prevent most;

moſt; for the ſimplicity of a horſe's diet, which chiefly conſiſts of grain and herbage, when good in kind, and diſpenſed with judgment, ſecures him from thoſe complicated diſorders, which are the general effects of intemperance in the human body.

In France, Germany, and Denmark, horſes are ſeldom purged; there they depend much on alteratives; the uſe of the liver of antimony, we have from the French, which is in general a good medicine for that purpoſe, and may, in many caſes, be ſubſtituted in the room of purging.

As hay is ſo material an article in a horſe's diet, great care ſhould be taken to procure the beſt: when it is not extraordinary, the duſt ſhould be well ſhook out before it is put in the rack; for ſuch hay is very apt to breed vermin.

Beans afford the ſtrongeſt nouriſhment of all grain, but are fitteſt for laborious horſes; except on particular occaſions. In ſome ſeaſons they breed a kind of vermin called the red bugs, which is thought to be dangerous; the beſt method in ſuch a caſe, is to procure them well dried and ſplit.

Bran ſcalded is a kind of panada to a ſick horſe; but nothing is worſe than a too frequent uſe of it, either dry or ſcalded; for it relaxes and weakens the bowels too much. The bots in young horſes may be owing to too much muſty bran and chaff, given with other foul feed to make them up for ſale: particular care therefore ſhould be taken that the bran be always ſweet and new.

Oats, well ripened, make a more hearty and durable diet than barley, and are much better ſuited to the conſtitutions of Britiſh horſes. A proper quantity of cut ſtraw and hay mixed with them, is ſometimes very uſeful to horſes troubled with bots, indigeſtion, *&c.*

Horſes who eat their litter, ſhould particularly have cut ſtraw and powdered chalk given them with their feed; as it is a ſign of a depraved ſtomach, which wants correcting.

The ſalt-marſhes are good paſture for horſes who have been ſurfeited, and indeed for many other diſorders; they purge more by dung and urine than any other paſture, and make afterwards a firmer fleſh: their water is for the moſt part brackiſh, and of courſe, as well as the the graſs, ſaturated with ſalts from the ſea-water.

A ſummer's graſs is often neceſſary; more particularly to horſes glutted with food, and which uſe little execiſe; but a month or two's running is proper for moſt: thoſe eſpecially who have been worked hard, and have ſtiff limbs, ſwelled legs, or wind-galls. Horſes whoſe feet have been impaired by quitters, bad ſhoeing, or any other accidents, are alſo beſt repaired at graſs. Thoſe lameneſſes particularly require turning out to graſs, where the muſcles or tendons are contracted or ſhrunk; for by the continual gentle excercife in the field, with the aſſiſtance of a pattin-ſhoe on the oppoſite foot, the ſhortened limb is kept on the ſtretch, the waſted parts are reſtored to their uſual dimenſions, and the limb again recovers its uſual tone and ſtrength.

The fields which lie near great towns, and are much dunged, are not proper paſture for horſes; but on obſervation appear very injurious to them, if they feed thereon all the ſummer.

Horſes may be kept abroad all the year, where they have a proper ſtable or ſhed, to ſhelter them from the weather, and hay at all times to come to. So treated, they are ſeldom ſick, their limbs are always clean and dry; and, with the allowance of corn, will hunt, and do more buſineſs than horſes kept conſtantly within doors.

If horſes, when taken from graſs, ſhould grow hot and coſtive, mix bran and chopt hay with their corn; and give them ſometimes a feed of ſcalded bran for a fortnight, or longer: let their exerciſe and diet be moderate for ſome time, and increaſe both by degrees.

When horſes are ſoiled in the ſtable, care ſhould be taken that the herbage is young, tender, and full of ſap; whether it be green barley, tares, clover, or any thing elſe the ſeaſon produces, and that it be cut freſh once every day at leaſt, if not oftener.

When horſes loſe their fleſh much in ſoiling, they ſhould in time be taken to a more ſolid diet; for it is not in ſoiling as in grazing; where, though a horſe loſes his fleſh at firſt, yet, after the graſs has purged him, he ſoon grows fat.

Young horſes who have not done growing, muſt be indulged more in their feeding, than thoſe come to their maturity; but if their exerciſe is ſo little, as to make it neceſſary to abridge their allowance of hay, a little freſh ſtraw ſhould conſtantly be put in their racks, to prevent their nibbling the manger, and turning cribbiters; they ſhould alſo ſometimes be ſtrapped back in order to cure them of this habit.

It is obvious to every one, what care ſhould be taken of a horſe after violent exerciſe, that he cools not too faſt, and drinks no cold water, *&c.* for which reaſon we ſhall wave particular directions.

Moſt horſes fed for ſale, have the interſtices of their muſcles ſo filled with fat, that their true ſhapes are hardly known. For which reaſon, a horſe juſt come out of the dealer's hands, ſhould at firſt be gently uſed. He ought to loſe blood, and have his diet lowered, though not too much: walking exerciſe is moſt proper at firſt, two hours in a day; in a week or fortnight two hours at a time, twice a-day; after this uſage for a month, bleed him again, and give him two or three times a-week ſcalded bran, which will prepare him for purging phyſic, that may now be given ſafely, and repeated at the uſual intervals.

When a horſe comes out of a dealer's hands, his cloathing muſt be abated by degrees, and care taken to put him in a moderately warm ſtable; otherwiſe the ſudden tranſition would be attended with the worſt conſequences.

Some General Directions in regard to Bleeding, Purging, *&c.*

Horſes who ſtand much in ſtable, and are full fed, require bleeding now and then, eſpecially when their eyes look heavy, dull, red, and inflamed; as alſo, when they feel hotter than uſual, and mangle their hay.

Young horſes ſhould be bled when they are ſhedding their teeth, as it takes off thoſe feveriſh heats they are then ſubject to. But the caſes that chiefly require bleeding, are colds, fevers of moſt kinds, falls, bruiſes, hurts of the eyes, ſtrains, and all inflammatory diſorders, *&c.*

It is right to bleed a horſe, when he begins to grow fleſhy

fleshy at grass, or at any other time when he looks heavy: and it is generally proper to bleed before purging.

Let your horse always be bled by measure, that you may know what quantity you take away: two or three quarts is always enough at one time; when you repeat it, allow for the disorder, and the horse's constitution.

Let the blood, when cold, be carefully examined, both as to colour and consistence, whether black, florid, sizey, &c.

Purging is often necessary in gross full horses, in some disorders of the stomach, liver, &c. but should be directed with caution. Before a purge is given to any horse, it is necessary some preparation should be made for it, in order to render the operation more safe and efficacious; thus a horse that is full of flesh should first be bled, and at the same time have his diet lowered for a week, especially those that have been pampered for sale; several mashes of scalded bran should also previously be given, in order to open the bowels, and unload them of any indurated excrement; which sometimes proves an obstacle to the working of the physic, by creating great sickness and griping.

Let it be remembered, that a horse is purged with difficulty; that the physic generally lies twenty-four hours in the guts before it works; and, that the tract of bowels it has to pass through, is above thirty yards; and lying horizontally, consequently resinous and other improper drugs may, and often do, by their violent irritations, occasion excessive gripings and cold sweats, shave off the very mucus or lining of the guts, and bring on inflammations, which often terminate in mortifications, and death.

It is remarkable too, that the stomach and guts of a horse are but thin, compared to some other animals of the same bulk, and therefore must be more liable to inflammation and irritation.

Horses kept much in the stable, who have not the proper benefit of air, and exercise, in proportion to their food, should in spring have a mild purge or two, after a previous preparation by bleeding, lowering their diet, and scalded mashes.

Horses that fall off in their stomach, whether it proceeds from too full feeding, or ingendering crudities and indigested matter, should have a mild purge or two.

Horses of a hot temperament, will not bear the common aloetic purges; their physic therefore should be mild and cooling.

Purging is always found very beneficial in stubborn dry coughs: but mild mercurials joined with them, make them yet more efficacious.

Horses of a watery constitution, who are subject to swelled legs, that run a sharp briny ichor, cannot have the causes removed any way so effectually as by purging.

The first purge you give to a horse should be mild, in order to know his constitution.

It is a mistaken notion, that if a proper prepared purge does not work to expectation, the horse will be injured by it; for though it does not pass by stool, its operation may be more efficacious, as an alterative to purify the blood, and it may pass by urine, or other secretions.

Purging medicines are very successfully given in small quantities, mixed with others; and act then as alteratives.

If mercurial physic is given, care should be taken that it be well prepared; and warmer cloathing, and greater circumspection is then required.

Purges should be given early in the morning upon an empty stomach: about three or four hours after the horse has taken it, he should have a feed of scalded bran; and a lock or two of hay may then be put into his rack. The same day give him two more mashes; but should he refuse warm meat, he may be allowed raw bran.

All his water should be milk warm, and have a handful of bran squeezed in it; but if he refuses to drink white water, give it him without bran.

Early the next morning, give him another mash; but if he refuses to eat it, give him as much warm water as he will drink: let him be properly cloathed, and rode gently about. This should be done two or three times a-day, unless he purges violently, once or twice will then be sufficient: at night give him a feed of oats mixed with bran.

During the working, a horse should drink plentifully; but, if he will not drink warm water, he must be indulged with cold, rather than not drink at all.

We shall here insert some general forms of purges,

Take succotrine aloes ten drams, jallap and salt of tartar each two drams, grated ginger one dram, oil of cloves thirty drops; make them into a ball with syrup of buckthorn.

Or,

Take aloes and cream of tartar each one ounce, jallap two drams, cloves powdered one dram, syrup of buckthorn a sufficient quantity.

Or,

The following, which has an established character among sportsmen.

Take aloes, from ten drams to an ounce and an half, myrrh and ginger powdered each half an ounce, saffron and oil of annifeed each half a dram.

Mr Gibson recommends the following,

Take succotrine aloes ten drams, myrrh finely powdered half an ounce, saffron and fresh jallap in powder of each a dram, make them into a stiff ball with syrup of roses, then add a small spoonful of rectified oil of amber.

The succotrine aloes should always be preferred to the Barbadoes or plantation aloes; though the latter may be given to robust strong horses, but even then should always be prepared with the salt, or cream of tartar; which by opening its parts, prevents its adhesion to the coats of the stomach, and bowels; from whence horrid gripings, and even death itself has often ensued. This caution is well worth remarking, as many a horse hath fallen a sacrifice to the neglect of it.

Half an ounce of Castile soap, to a horse of a gross constitution, may be added to any of the above; and the proportions may be increased for strong horses.

When mercurial physic is intended, give two drams of calomel over night, mixed up with half an ounce of a diapente and a little honey, and the purging ball the next morning. The

The following, when it can be afforded, is a very gentle and effectual purge, particularly for fine delicate horses; and if prepared with the Indian rhubarb, will not be expensive.

TAKE of the finest succotrine aloes one ounce, rhubarb powdered half an ounce or six drams, ginger grated one dram; make into a ball with syrup of roses.

The following purging drink may be given with the utmost safety; it may be quickened, or made stronger, by adding an ounce more senna, or two drams of jalap.

TAKE senna two ounces, infuse it in a pint of boiling water two hours, with three drams of salt of tartar; pour off, and dissolve in it four ounces of Glauber's salts, and two or three of cream of tartar.

This last physic is cooling, easy, and quick in its operation; and greatly preferable in all inflammatory cases to any other purge, as it passes into the blood, and operates also by urine.

When horses lose their apetites after purging, it is necessary to give them a warm stomach-drink, made of an infusion of chamomile flowers, anniseeds and saffron: or the cordial ball may be given for that purpose.

Should the purging continue too long, give an ounce of dioscordium in an English pint of Port wine, and repeat it once in twelve hours, if the purging continues. Plenty of gum arabic water should also be given; and in case of violent gripes, fat broth glysters, or tripe liquor, should be often thrown up, with an hundred drops of laudanum in each.

The arabic solution may be thus prepared.

TAKE of gum arabic and tragacanth of each four ounces, juniper-berries and carraway-seeds of each an ounce, cloves bruised half an ounce; simmer gently in a gallon of water, till the gums are dissolved: give a quart at a time in half a pail of water; but if he will not take it freely this way, give it him often in a horn.

When a purge does not work, but makes the horse swell, and refuse his food and water, which is sometimes the effect of bad drugs, or catching cold, warm diuretics are the only remedy; of which the following are recommended.

TAKE a pint of white wine, nitre one ounce; mix with it a dram of camphire, dissolved in a little rectified spirit of wine; then add two drams of oil of juniper, and the same quantity of unrectified oil of amber, and four ounces of honey, or syrup of marshmallows.

When a horse swells much with physic, do not suffer him to be rode about till he has some vent; but rather lead him gently in hand, till some evacuation is obtained.

As it is observed, that horses more willingly take sweet and palatable things, than those that are bitter and of an ill taste; care should be taken, that the latter are given in balls; and that their drinks are always contrived to be as little nauseous as possible, and sweetened either with honey or liquorice. Those that are prepared with gross powders, are by no means so agreeable to a horse, as those made by infusion; as the former often clam the mouth, irritate the membranes about the palate and throat, and frequently occasion the cough they are intended to prevent.

Balls should be of an oval shape, and not exceed the size of a pullet's egg; when the dose is larger, it should be divided into two; and they should be dipt in oil, to make them slip down the easier.

As we have given some general forms of purges, we shall observe the same rule in regard to glysters, with some few cautions and remarks.

Let it be observed then, that, before the administring emollient clysters in costive disorders, a small hand, well oiled, should be passed up the horse's fundament, in order to bring away any hardened dung, which otherwise would be an obstacle to the glyster's passage.

A bag and pipe of a proper form, is to be preferred to a syringe, which throws up the glyster with so much force, that it often surprises a horse, and makes him reject it as fast as it goes in; whereas the liquor, when pressed gently from the bag, gives him no surprize or uneasiness, but passes easily up into the bowels, where it will sometimes remain a long time, and be extremely useful, by cooling and relaxing them; and will sometimes incorporate so with the dung, as not easily to be distinguished from the other contents of the guts. These emollient glysters are extremely serviceable in most fevers, and greatly preferable to purging ones; which in general are too pungent, and stimulate too much, especially if aloes are a part of the composition.

Nutritive glysters are very necessary, and often save a horse from starving, when his jaws are so locked up by convulsions that nothing can be conveyed by the mouth.

They should not exceed a quart or three pints at a time, but be often repeated: nor should they be too fat; but made of sheeps heads, trotters, or any other meat-broths, milk pottage, rice-milk strained, and many other such nourishing things. For an emollient glyster, take the following.

TAKE marshmallows and chamomile flowers each a large handful, bay-berries and sweet fennel-seeds bruised each an ounce; boil in a gallon of water to three quarts, pour off into a pan, and dissolve in it half a pound of treacle, and a pint of lint-seed oil, or any common oil.

To make it more laxative, add four ounces of lenitive electuary, or the same quantity of cream of tartar, or common purging salts.

Purging Glyster.

TAKE two or three handful of marshmallows, senna one ounce, bitter apple half an ounce, bay berries and anniseed bruised each an ounce, salt of tartar half an ounce; boil a quarter of an hour in three quarts of water; pour off, and add four ounces of syrup of buckthorn, and half a pint of oil.

This glyster will purge a horse pretty briskly; and may be given succesfully, when an immediate discharge is wanting; especially in some fevers with inflamed lungs, or other disorders, which require speedy relief

But it is necessary to caution against a solution of course aloes for this purpose, as it has been found to gripe horses violently, and excite feverish, and sometimes convulsive

convulſive ſymtoms; and indeed all pungent and ſtimulating medicines, as the ſtronger purgatives generally are, ſhould be given in this form with great caution.

But the generality of emollient glyſters, may be prepared with much leſs trouble: as two quarts of water-gruel, with a half a pound of treacle, a pint of oil, and a handful of common ſalt, will as effectually anſwer every purpoſe. The following is a reſtringent glyſter.

Take pomegranate-bark or oak-bark two ounces, red roſe-leaves freſh or dry a handful, balauſtines an ounce; boil in two quarts of water, till one is near conſumed; pour off and diſſolve in it four ounces of diaſcordium; to which may be added a pint of Port wine.

This will anſwer in all common caſes, where reſtringents are neceſſary, but ſhould never be given in larger quantities; for the longer glyſters of this kind lie in the bowels, the more efficacious they are.

Of Colds.

By taking cold, we mean that the pores and outlets of the ſkin (which in a natural healthy ſtate of body are continually breathing out a fine fluid, like the ſtream ariſing from hot water, or ſmoke from fire) are ſo far ſhut up, that theſe ſtreams, or perſpirable matter, not having a free paſſage through them, are hindered from going off in the uſual manner; the conſequence of which is, their recoiling on the blood, vitiating its quality, overfilling the veſſels, and affecting the head, glands or kernels of the neck and throat, the lungs, and other principal parts.

To enumerate the various cauſes of colds would be endleſs; the moſt uſual are, riding horſes till they are hot, and ſuffering them to ſtand in that condition where the air is cold and piercing; removing a horſe from a hot ſtable to a cold one, and too ſuddenly changing his cloathing; hence it is, that horſes often catch ſuch ſevere colds, after they come out of dealers hands; and by not being carefully rubbed down, when they come in hot, off journeys.

The ſigns of a horſe's catching cold, are a cough, heavineſs and dullneſs, which affect him more or leſs in proportion to the ſeverity of it: the eyes are ſometimes moiſt and watery, the kernels about the ears and under the jaws ſwell, the noſe gleets, and he rattles in his breathing; and when the cold is violent, the horſe will be feveriſh, his flanks work, and he will both loath his hot meat and refuſe his water. When theſe laſt ſymptoms are attended with a ſlimy mouth, ears, and feet cold, and a great inward ſoreneſs, there is danger of a bad fever.

But when the horſe coughs ſtrong, ſnorts after it, is but little off his ſtomach, pricks up his ears, and moves briſkly in his ſtall, dungs and ſtales freely, his ſkin feels kindly, and his coat does not ſtare, he is in no danger, and there will be no occaſion for medicines of any kind; but you ſhould bleed him about two quarts, keep him warm, and give him feeds of ſcalded ban, with as much warm water as he will drink, in order to dilute his blood.

If the diſorder ſhould increaſe, the horſe feel hot, and refuſe his meat, bleed him, if ſtrong, two quarts more; and if you are not ſatisfied, without giving medicines, avoid, as you would poiſon, a farrier's drench; (which is generally compoſed of ſome hot, mauſeous powders, given in a quantity of ale; which too often encreaſes the fever, by overheating the blood, and palls the horſe's ſtomach by its loathſomneſs:) and inſtead of it, infuſe two ounces of anniſeeds, with a dram of ſaffron, in a pint and a half of boiling water; pour off the clear, and diſſolve in it four ounces of honey; to which may be added four ſpoonfuls of ſallad oil: this drink may be given every night; or one of the following balls, provided there is no fever; in which caſe, it always will be more eligible to give two or three ounces of nitre or ſalt prunella every day in his feeds, or water, till it is removed; but ſhould the horſe be inclined to coſtiveneſs, remember that his body ſhould be kept open by emollient glyſters, or cream of tartar diſſolved in his water, to the quantity of three or four ounces a-day.

Pectoral Horſe-ball.

Take of the freſh powders of anniſeed, elicampane, carraway, liquorice, turmerick, and flour of brimſtone, each three ounces; juice of liquorice four ounces, diſſolved in a ſufficient quantity of mountain; ſaffron powdered half an ounce, ſallad oil and honey half a pound, oil of anniſeed one ounce: mix together with wheat-flour enough to make them into a paſte.

Or, the following from Dr Bracken.

Take anniſeed, carraway ſeed, and greater cardamoms, finely powdered, of each one ounce, flour of brimſtone two ounces, turmerick in fine powder one ounce and a half, ſaffron two grams, Spaniſh juice diſſolved in water two ounces, oil of anniſeed half an ounce, liquorice powder one ounce and a half, wheat-flower a ſufficient quantity to make into a ſtiff paſte, by beating all the ingredients well in a mortar.

Theſe balls conſiſt of warm opening ingredients; and, given in ſmall quantities, about the ſize of a pullet's egg, will encourage a free perſpiration; but in caſe of a fever, ſhould be cautiouſly continued. They are much more efficacious, and in all caſes ſuperior to the farrier's drenches, if diſſolved in a pint of warm ale.

This ſimple method, with good nurſing and hot maſhes, warm water and cloathing, eſpecially about the head and throat, which promotes the running at the noſtrils, will anſwer the moſt ſudden colds; and when the horſe feeds heartily, and ſnorts after coughing, moderate exerciſe every day will haſten his recovery.

To a horſe loaded with fleſh, a rowel may ſometimes be neceſſary, as may alſo a gentle purge or two, to ſome, when the diſtemper is gone off.

Of Fevers *in general.*

The ſymptoms of a fever are great reſtleſſneſs, the horſe ranging from one end of his rack to the other; his flanks beat; his eyes are red and inflamed; his tongue parched and dry; his breath is hot, and ſmells ſtrong; he

he loſes his appetite, and nibbles his hay, but does not chew it, and is frequently ſmelling to the ground; the whole body is hotter than ordinary, (though not parched, as in ſome inflammatory diſorders;) he dungs often, little at a time, uſually hard, and in ſmall bits, he ſometimes ſtales with difficulty, and his urine is high-coloured; his flanks beat; and he ſeems to thirſt, but drinks little at a time, and often; his pulſe beats full and hard, to fifty ſtrokes and upwards in a minute.

The firſt intention of cure is bleeding, to the quantity of two or three quarts, if the horſe is ſtrong and in good condition; then give him a pint of the following drink, four times a-day; or an ounce of nitre, mixed up into a ball with honey, may be given thrice a-day, inſtead of the drink, and waſhed down with three or four horns of any ſmall liquor.

Take of baum, ſage and chamomile flowers, each a handful, liquorice root ſliced half an ounce, ſalt prunel or nitre three ounces; infuſe in two quarts of boiling water; when cold, ſtrain off, and ſqueeze into it the juice of two or three lemons, and ſweeten with honey.

As the chief ingredient to be depended on in this drink is the nitre; it may perhaps be as well given in water alone; but as a horſe's ſtomach is ſoon palled, and he requires palatable medicines, the other ingredients may in that reſpect have their uſe. Soleyſel for this purpoſe adviſes two ounces of ſalt of tartar, and one of ſal armoniac to be diſſolved in two quarts of water, and mixed with a pail of common water, adding a handful of bran or barley-flour to qualify the unpleaſant taſte: this may be given every day, and is a uſeful medicine.

His diet ſhould be ſcalded bran, given in ſmall quantities; which, if he refuſes, let him have dry bran ſprinkled with water: put a handful of picked hay into the rack, which a horſe will often eat, when he will touch nothing elſe; his water need not be much warmed, but ſhould be given often, and in ſmall quantities: his cloathing ſhould be moderate; too much heat and weight on a horſe being improper in a fever; which ſcarce ever goes off in critical ſweats (as thoſe in the human body terminate) but by ſtrong perſpiration.

If in a day or two he begins to eat his bran, and pick a little hay; this method with good nurſing will anſwer: but if he refuſes to feed, more blood ſhould be taken away, and the drinks continued; to which may be added two or three drams of ſaffron, avoiding at this time all hotter medicines: the following glyſter ſhould be given, which may be repeated every day, eſpecially if his dung is knotty or dry.

Take two handfuls of marſhmallows, and one of chamomile flowers; fennel ſeed an hounce; boil in three quarts of water to two; ſtrain off, and add four ounces of treacle, and a pint of linſeed oil, or any common oil.

Two quarts of water-gruel, fat broth, or pot-liquor, with the treacle and oil, will anſwer this purpoſe; to which may be added a handful of ſalt. Theſe ſort of glyſters are properer than thoſe with purging ingredients.

The following opening drink is very effectual in theſe fevers, and may be given every other day, when the glyſters ſhould be omitted; but the nitre-balls or drink may be continued, except on thoſe days theſe are taken.

Take of cream of tartar and Glauber's ſalts, each four ounces; diſſolve in barley water, or any other liquor: an ounce or two of lenitive electuary may be added, or a dram or two of powder of jallap, to quicken the operation in ſome horſes.

Four ounces of Glauber's ſalts, or cream of tartar, with the ſame quantity of lenitive electuary, may be given for the ſame purpoſe, if the former ſhould not open the body ſufficiently.

In four or five days the horſe generally begins to pick his hay, and has a ſeeming reliſh to food; though his flanks will heave pretty much for a fortnight: yet the temper of his body and return of appetite ſhew, that nothing more is requiſite to complete his recovery, than walking him abroad in the air, and allowing plenty of clean litter to reſt him in the ſtable.

This method of treating a fever is ſimple, according to the laws of nature; and is confirmed by long experience, to be infinitely preferable to the hot method.

The intention here is to leſſen the quantity of blood; promote the ſecretion of urine and perpiration, and cool and dilute the fluids in general.

There is another ſort of fever that horſes are ſubject to, of a more complicate and irregular nature than the former; which if not properly treated, often proves fatal.

The ſigns are a ſlow fever with languiſhing, and great depreſſions; the horſe is ſometimes inwardly hot, and outwardly cold; at other times hot all over, but not to any extreme; his eyes look moiſt and languid; he has a continual moiſture in his mouth, which is the reaſon he ſeldom cares to drink, and when he does it is but little at a time. He feeds but little, and leaves off as ſoon as he has eat a mouthful or two; he moves his jaws in a feeble, looſe manner, with an unpleaſant grating of his teeth; his body is commonly open; his dung ſoft and moiſt, but ſeldom greaſy; his ſtaling is often irregular, ſometimes little, at other times profuſe, ſeldom high-coloured, but rather pale, with little or no ſediment

When a horſe's appetite declines daily, till he refuſes all meat, it is a bad ſign. When the fever doth not diminiſh, or keep at a ſtand, but increaſes, the caſe is then dangerous. But when it ſenſibly abates, and his mouth grows drier, the grating of his teeth ceaſes, his appetite mends, and he takes to lay down (which perhaps he has not done for a fortnight) theſe are promiſing ſigns. A horſe in theſe fevers always runs at the noſe, but not the kindly white diſcharge, as in the breaking of a cold, but of a reddiſh or greeniſh duſky colour, and of a conſiſtence like glue, and ſticks like turpentine to the hair on the inſide of the noſtrils: If this turns to a gleet of clear thin water, the horſe's hide keeps open, and he mends in his appetite; theſe are certain ſigns of recovery.

The various and irregular ſymptoms that attend this ſlow fever, require great ſkill to direct the cure, and more knowledge of the ſymptoms of horſes diſeaſes, than the generality of gentlemen are acquainted with. The experienced

perienced farrier ſhould therefore be conſulted and attended to, in regard to the ſymptoms; but very ſeldom as to the application of the remedy, which is generally above their comprehenſion; though it may be readily ſelected, by duly attending to the obſervations here inculcated.

Firſt then, a moderate quantity of blood, not exceeding three pints, may be taken away, and repeated in proportion to his ſtrength, fullneſs, inward ſoreneſs, cough, or any tendency to inflammation. After this, the fever-drink, (p. 457. col. 1. parag. 3.) may be given, with the addition of an ounce of ſnake-root, and three drams of ſaffron and camphor diſſolved firſt in a little ſpirit of wine; the quantity of the nitre may be leſſened, and theſe increaſed, as the ſymptoms indicate.

The diet ſhould be regular; no oats given, but ſcalded, or raw bran ſprinkled; the beſt flavoured hay ſhould be given by handfuls, and often by hand, as the horſe ſometimes cannot lift up his head to the rack.

As drinking is ſo abſolutely neceſſary to dilute the blood, if the horſe refuſes to drink freely of warm water or gruel, he muſt be indulged with having the chill only taken off, by ſtanding in the ſtable; nor will any inconvenience enſue, but oftener an advantage; for the nauſeous warmth of water, forced on horſes for a time, palls their ſtomachs, and takes away their appetites, which the cold water generally reſtores.

Should the fever after this treatment increaſe, the horſe feed little, ſtale often, his urine being thin and pale, and his dung ſometimes looſe, and at other times hard: ſhould the moiſture in his mouth continue, his ſkin being ſometimes dry, and at others moiſt, with his coat looking ſtarting, and ſurfeited: upon theſe irregular ſymptoms, which denote great danger, give the following balls, or drink; for in theſe caſes there is no time to be loſt.

Take of contrayerva-root, myrrh, and ſnake-root powdered, each two drams, ſaffron one dram, mithridate or Venice treacle half an ounce; make into a ball with honey, which ſhould be given twice or thrice a-day, with two or three horns of an infuſion of ſnake-root, ſweetened with honey; to a pint and a half of which may be added half a pint of treacle water or vinegar, which latter is a medicine of excellent uſe in all kinds of inflammatory and putrid diſorders, either external or internal.

Should theſe balls not prove ſucceſsful, add to each a dram of camphor, and where it can be afforded, to a horſe of value, the ſame quantity of caſtor. Or the following drink may be ſubſtituted in their ſtead for ſome days.

Take of contrayerva and ſnake-root of each two ounces, liquorice-root ſliced one ounce, ſaffron two drams; infuſe in two quarts of boiling water cloſe covered for two hours; ſtrain off, and add half a pint of diſtilled vinegar, four ounces of ſpirit of wine, wherein half an ounce of camphor is diſſolved, and two ounces of mithridate or Venice treacle; give a pint of this drink every four, ſix, or eight hours.

Should the horſe be coſtive, recourſe muſt be had to clyſters, or the opening drink: ſhould he purge, take care not to ſuppreſs it, if moderate; but if, by continuance, the horſe grows feeble, add diaſcordium to his drinks, inſtead of the mithridate; if it increaſes, give more potent remedies.

Let it be remembered, that camphor is a very powerful and effectual medicine in theſe kinds of putrid fevers; being both active and attenuating, and particularly calculated to promote the ſecretions of urine and perſpiration.

Regard ſhould alſo be had to his ſtaling; which, if in too great quantities, ſo as manifeſtly to depreſs his ſpirits, ſhould be controuled by proper reſtringents, or by preparing his drinks with lime-water. If, on the contrary, it happens that he is too remiſs this way, and ſtales ſo little as to occaſion a fullneſs, and ſwelling of the body and legs, recourſe may be had to the following drink:

Take of ſalt prunella, or nitre, one ounce; juniper-berries, and Venice turpentine, of each half an ounce; make into a ball with oil of amber.

Give him two or three of theſe balls, at proper intervals, with a decoction of marſh-mallows, ſweetened with honey.

But if, notwithſtanding the method we have laid down, a greeniſh or reddiſh gleet is diſcharged from his noſtrils, with a frequent ſneezing; if he continues to loſe his fleſh, and becomes hide bound; if he altogether forſakes his meat, and daily grows weaker; if he ſwells about the joints, and his eyes look fixed and dead; if the kernels under his jaws ſwell, and feel looſe; if his tail is raiſed and quivers; if his breath ſmells ſtrong, and a purging enſues with a diſcharge of fætid dark-coloured matter, his caſe may then be looked on as deſperate, and all future attempts to ſave him will be fruitleſs.

The ſigns of a horſe's recovery are known by his hide keeping open, and his ſkin feeling kindly; his ears and feet will be of a moderate warmth, and his eyes briſk and lively; his noſe grows clean and dry; his apetite mends, he lays down well, and both ſtales and dungs regularly.

Be careful not to overfeed him on his recovery; let his diet be light, feeds ſmall, and increaſed by degrees as he gets ſtrength; for by overfeeding, horſes have frequent relapſes, or great ſurfeits, which are always difficult of cure.

If this fever ſhould be brought to intermit, or prove of the intermitting kind, immediately after the fit is over, give an ounce of Jeſuit's bark, and repeat it every ſix hours, till the horſe has taken four or ſix ounces; ſhould eruptions or ſwellings appear, they ought to be encouraged, for they are good ſymptoms at the decline of a fever, denote a termination of the diſtemper, and that no further medicines are wanted.

The true reaſons perhaps why ſo many horſes miſcarry in fevers, are, that their maſters, or doctors, will not wait with patience, and let nature have fair play: that they generally neglect bleeding ſufficiently at firſt; and are conſtantly forcing down ſugar ſops, or other food in a horn, as if a horſe muſt be ſtarved in a few days, if he did not eat: then they ply him twice or thrice a-day with hot medicines and ſpirituous drinks, which (excepting a very few caſes) muſt be extremely pernicious to a horſe, whoſe diet is naturally ſimple, and whoſe ſtomach and blood, unaccuſtomed to ſuch heating medicines, muſt be greatly injured, and without doubt are often inflamed by ſuch treatment.

Dilute

Dilute the blood with plenty of water, or white drink; let his diet be warm bran mafhes, and his hay fprinkled. Should the fever rife, which will be known by the fymptoms above defcribed, give him an ounce of nitre thrice a-day in his water, or made up in a ball with honey. Let his body be kept cool and open, with the opening drink, given twice or thrice a-week; or an ounce of falt of tartar may be given every day, diffolved in his water, for that purpofe, omitting then the nitre. After a week's treatment in this manner, the cordial ball may be given once or twice a-day, with an infufion of liquorice-root fweetened with honey; to which may be added, when the phlegm is tough, or cough dry and hufky, a quarter of a pint of linfeed or fallad oil, and the fame quantity of oxymel fquills.

The following cooling purge is very proper to give at the decline of the diftemper, and may be repeated three or four times.

Take two ounces of fenna; annifeed and fennel bruifed, each half an ounce; falt of tartar three drams; let them infufe two hours in a pint of boiling water; ftrain off, and diffolve in it three ounces of Glauber's falt, and two of cream of tartar; give for a dofe in the morning.

This purge generally works before night very gently; and in fevers, and all inflammatory diforders, is infinitely preferable to any other phyfic.

Before we clofe this chapter on fevers, it may be no improper hint to the curious, to take notice that a horfe's pulfe fhould more particularly be attended to than is cuftomary, as a proper eftimate may thereby be made both of the degree and violence of the fever prefent, by obferving the rapidity of the blood's motion, and the force that the heart and arteries labour with to propel it round. The higheft calculation that has been made of the quicknefs of the pulfe in a healthy horfe, is, that it beats about forty ftrokes in a minute; fo that in proportion to the increafe above this number, the fever is rifing, and if farther increafed to above fifty, the fever is very high.

How often the pulfe beats in a minute may eafily be difcovered by meafuring the time with a ftop-watch, or minute fand-glafs, while your hand is laid on the horfe's near fide, or your fingers on any artery; thofe which run up on each fide the neck, are generally to be feen beating as well as felt a little above the cheft; and one withinfide each leg may be traced with the finger.

A due attention to the pulfe is fo important an article, in order to form a proper judgment in fevers, that it would appear amazing it has fo much been neglected, if one did not recollect, that the generality of farriers are fo egregioufly ignorant, that they have no manner of conception of the blood's circulation, nor in general have they ability enough to diftinguifh the difference between an artery and a vein.—With fuch pretty guardians do we intruft the healths and lives of the moft valuable of animals!

Of a Pleurisy, *and* Inflammation *of the* Lungs, *&c.*

These diforders have fcarce been mentioned by any writer in farriery before Mr Gibfon; who, by frequently examining the carcafes of dead horfes, has found them fubject to the different kinds of inflammations here defcribed.

In order to diftinguifh thefe diforders from others, we fhall defcribe the fymptoms in Mr Gibfon's own words.

"A pleurify then, which is an inflamation of the pleura; and a peripneumony, which is an inflammation of the lungs; have fymptoms very much alike; with this difference only, that in a pleurify a horfe fhews great uneafinefs, and fhifts about from place to place; the fever, which at firft is moderate, rifes fuddenly very high; in the beginning he often ftrives to lie down, but ftarts up again immediately, and frequently turns his head towards the affected fide, which has caufed many to miftake a pleuritic diforder for the gripes, this fign being common to both, though with this difference: in the gripes a horfe frequently lies down and rolls, and when they are violent he will alfo have convulfive twitches, his eyes being turned up, and his limbs ftretched out as if he were dying; his ears and feet are fometimes occafionally hot, and fometimes as cold as ice; he falls into profufe fweats, and then into cold damps; ftrives often to ftale and dung, but with great pain and difficulty; which fymptoms generally continue, till he has fome relief: but in a pleurify, a horfe's ears and feet are always burning hot, his mouth parched and dry, his pulfe hard and quick: even fometimes when he is nigh dying, his fever is continued and increafing; and though in the beginning he makes many motions to lie down, yet afterwards he reins back as far as his collar will permit, and makes not the leaft offer to change his pofture, but ftands panting with fhort ftops, and a difpofition to cough, till he has relief, or drops down.

In an inflammation of the lungs, feveral of the fymptoms are the fame; only in the beginning he is lefs active, and never offers to lie down during the whole time of his ficknefs; his fever is ftrong, breathing difficult, and attended with a fhort cough: and whereas in a pluerify a horfe's mouth is generally parched and dry; in an inflammation of the lungs, when a horfe's mouth is open, a ropy flime will run out in abundance; he gleets alfo at the nofe a reddifh or yellowifh water, which fticks like glue to the infide of his noftrils.

In a pleurify, a horfe heaves and works violently at his flanks, with great reftleffnefs, and for the moft part his belly is tucked up; but in an inflammation of the lungs, he always fhews fullnefs, and the working of his flanks is regular, except after drinking and fhifting his pofture; and his ears and feet are for the moft part cold, and often in damp fweets.

The cure of both thefe diforders is the fame. In the beginning a ftrong horfe may lofe three quarts of blood, the next day two quarts more; and if fymptoms do not abate, the bleedings muft be repeated, a quart at a time; for it is fpeedy, large, and quick-repeated bleedings that are in thefe cafes chiefly to be depended on. But if a horfe has had any previous weaknefs, or is old, you muft bleed him in lefs quantities, and oftener. Mr Gibfon recommends rowels on each fide the breaft, and one on the belly; and a bliftering ointment to be rubbed all over his brifket upon the foremoft ribs.

The

The diet and medicines ſhould be both cooling, attenuating, relaxing, and diluting; and the horſe ſhould have warm maſhes, and plenty of water or gruel. The following balls may be given thrice a-day.

Take of ſpermaceti and nitre, of each one ounce; oil of anniſeed, thirty drops; honey enough to make a ball.

A pint of barley-water, in which figs and liquorice-root have been boiled, ſhould be given after each ball; to which the juice of lemons may be added; and if the lungs are greatly oppreſſed with a dry ſhort cough, two or three horns full of the decoction may be given three or four times a-day, with four ſpoonfuls of honey and linſeed oil. A ſtrong decoction of the rattle-ſnake-root is alſo much recommended in pleuritic diſorders, and may be given to the quantity of two quarts a-day, ſweetened with honey. It remarkably attenuates the blood, and diſperſes the inflammation, and in ſome parts is deemed a ſpecific for this complaint.

An emollient glyſter ſhould be injected once a-day, to which may be added two ounces of nitre or cream of tartar.

In two or three days he will probably run at the noſe, and begin to feed; but ſhould he not, and continue hot and ſhort-breathed, you muſt bleed him again, and give the following glyſter.

Take ſenna and marſhmallows, of each two ounces; fennel and bay-berries, each one ounce; boil in five pints of clear water, to two quarts; pour off the clear, and add four ounces of purging ſalts, two or three of ſyrup of buckthorn, and half a pint of linſeed, or any common oil.

If by theſe means he grows cooler, and his pain moderates, repeat the glyſter the next day, unleſs it worked too much; then intermit a day; and when he comes to eat ſcalded bran and picked hay, leave off the balls, and continue only the decoction, with now and then a glyſter.

But let it be obſerved, that a horſe ſeldom gets the better of theſe diſorders, unleſs he has relief in a few days; for if the inflammation is not checked in that time, it uſually terminates in a gangrene, or collection of matter, which, for want of expectoration, ſoon ſuffocates him.

But as pleuritic diſorders are apt to leave a taint on the lungs, great care ſhould be taken of the horſe's exerciſe and feeding, which ſhould be light and open for two or three weeks.

There is alſo an external pleuriſy, or inflammation of the muſcles between the ribs, which, when not properly treated, proves the foundation of that diſorder called the *cheſt-founder*; for if the inflammation is not diſperſed in time, and the viſcid blood and juices ſo attenuated by internal medicines, that a free circulation is obtained; ſuch a ſtiffneſs and inactivity will remain on theſe parts, as will not eaſily be removed, and which is generally known by the name of cheſt-founder.

The ſigns of this inflammation, or external pleuriſy, are a ſtiffneſs of the body, ſhoulders, and fore-legs; attended ſometimes with a ſhort dry cough, and a ſhrinking when handled in thoſe parts.

Bleeding, ſoft pectorals, attenuants, and gentle purges are the internal remedies; and externally, the parts affected may be bathed with equal parts of ſpirit of ſal armoniac, and ointment of marſhmallows, or oil of chamomile.

Theſe outward inflammations frequently fall into the inſide of the fore-leg, and ſometimes near the ſhoulder; forming abſceſſes, which terminate the diſorder.

The membrane which ſeparates the lungs, and more particularly the diaphragm or midriff, is often alſo inflamed; which is ſcarce to be diſtinguiſhed from the pleuriſy, only in this, that when the midriff is greatly inflamed, the horſe will ſometimes be jaw-ſet, and his mouth ſo much cloſed that nothing can be got in; but the method of cure is the ſame.

Of a Cough, *and* Asthma.

The conſequence often of the preceding diſorders injudiciouſly treated, are ſettled habitual coughs; which frequently degenerate into aſthmas, and broken-wind.

Nothing has more perplexed practitioners than the cure of ſettled coughs; the cauſe of which, perhaps, has been their want of attention to the different ſymptoms which diſtinguiſh one cough from another; for without ſtrict obſervance thereof, it is impoſſible to find out the true method of cure.

Thus, if a horſe's cough is of long ſtanding, attended with loſs of appetite, waſting of fleſh, and weakneſs, it denotes a conſumption; and that the lungs are full of knotty, hard ſubſtances, called tubercles, which have often been diſcovered on diſſection.

The following ſigns denote when the cough proceeds from phlegm, and ſlimy matter, that ſtop up the veſſels of the lungs.

The horſe's flanks have a ſudden quick motion; he breathes thick, but not with his noſtrils open, like a horſe in a fever, or that is broken-winded; his cough is ſometimes dry and huſky, ſometimes moiſt, before which he wheezes, rattles in the throat, and ſometimes throws out of his noſe and mouth great gobs of white phlegm, eſpecially after drinking, or when he begins or ends his exerciſe, which diſcharge commonly gives great relief. Some ſuch horſes wheeze and rattle to ſuch a degree, and are ſo thick-winded, that they can ſcarce move on, till they have been out ſome time in the air; though then they will perform beyond expectation.

The above aſthmatic caſe proves often very obſtinate; but, if it happens to a young horſe, and the cough is not of long ſtanding, it is greatly relieved, if not totally cured, by the following method.

If the horſe is full of fleſh, bleed him plentifully; if low in fleſh, more ſparingly; which may occaſionally be repeated, on very great oppreſſions and difficulty of breathing, in proportionate quantities.

As mercurial medicines are found remarkably uſeful in theſe caſes, give a mercurial ball (with two drams of calomel) over night, and a common purge next morning: or the following, which is recommended by Mr Gibſon.

Take gum-galbanum, ammoniacum, and aſſa fœtida, of

of each two drams, fine aloes one ounce, ſaffron one dram, oil of anniſeeds two drams, oil of amber one dram; with honey enough to form into a ball.

They may be repeated at proper intervals, with the uſual cautions. In the intermediate days, and for ſome time after, one of the following balls may be given every morning.

Take cinnabar of antimony, finely levigated, ſix ounces; gum ammoniacum, galbanum, and aſſa fætida, of each two ounces; garlick four ounces; ſaffron half an ounce: make into a paſte for balls, with a proper quantity of honey.

Take of the pectoral or cordial ball one pound, balſam of Peru half an ounce, balſam of ſulphur anniſated one ounce, flowers of Benjamin half an ounce, honey as much as is ſufficient to form them into a paſte; give the ſize of a pigeon's egg every morning.

Exerciſe in a free open air is very ſerviceable, and the diet ſhould be moderate.

The following are the ſymptoms of a dry cough, or aſthma.

The horſe afflicted with this cough eats heartily, hunts and goes through his buſineſs with alacrity, appears well coated, and has all the ſigns of perfect health; yet he coughs at particular times almoſt inceſſantly, without throwing up any thing, except that the violence of the cough will cauſe a little clear water to diſtill from his noſe. Though this cough is not periodical, yet ſome of theſe horſes cough moſt in a morning, after drinking.

This may properly be ſtyled a nervous aſthma in a horſe; as probably it chiefly affects the nerves in the membranous parts of the lungs and midriff; and is a caſe very doubtful at leaſt, if not incurable; but when the horſe is young, the following method may be ſucceſsful.

Take away firſt a moderate quantity of blood; then give him two drams of calomel, mixed up with an ounce of diapente, for two nights; and the next morning a purging ball. Keep him well cloathed and littered, and feed him with ſcalded bran and warm water.

Once in eight or ten days this purge may be repeated, with one mercurial ball only, given over night.

The following balls may then be taken, one every day, about the ſize of a pullet's egg, the horſe faſting two hours afterwards; and ſhould be continued two months, or longer, to be of real ſervice.

Take native cinnabar, or cinnabar of antimony, half a pound; gum guaiacum four ounces; myrrh, and gum armoniac, of each two ounces; Venice ſoap half a pound: the cinnabar muſt be finely levigated, as before obſerved, and the whole mixed up with honey, or oxymel ſquills.

The following alſo will be found a uſeful remedy in obſtinate dry coughs.

Take gum ammoniacum, ſquills, and Venice ſoap, of each four ounces, balſam of ſulphur with anniſeeds one ounce; beat up into a maſs, and give as the former.

Before we cloſe this ſection, it may be neceſſary to obſerve here, that ſome young horſes are ſubject to coughs on cutting their teeth; their eyes alſo are affected from the ſame cauſe. In theſe caſes, always bleed; and if the cough is obſtinate, repeat it, and give warm maſhes; which, in general, are alone ſufficient to remove this complaint.

Of a Broken-wind.

This diſorder hitherto ſeems to have been little underſtood; but Mr Gibſon is inclined to think, that the ſource of it is frequently owing to injudicious or haſty feeding young horſes for ſale; by which means the growth of the lungs, and all the contents within the cheſt, are ſo increaſed, and in a few years ſo preternaturally enlarged, that the cavity of the cheſt is not capacious enough for them to expand themſelves in, and perform their functions.

A narrow contracted cheſt with large lungs may ſometimes naturally be the cauſe of this diſorder: and it has been obſerved, that horſes riſing eight years old are as liable to this diſtemper, as, at a certain period of life, men fall into aſthmas, conſumptions, and other chronic diſeaſes.

The reaſon why this diſorder becomes more apparent at this age, may be, that a horſe comes to his full ſtrength and maturity at this time: at ſix he commonly finiſhes his growth in height; after that time he lets down his belly, and ſpreads, and all his parts are grown to their full extent; ſo that the preſſure on the lungs and midriff is now more increaſed.

But how little weight ſoever theſe reaſons may have, repeated diſſections have given ocular proofs of a preternatural largeneſs, not only of the lungs of broken-winded horſes, but of their heart and its bag, and of the membrane which divides the cheſt; as well as of a remarkable thinneſs in the diaphragm, or midriff.

This diſproportion has been obſerved to be ſo great, that the heart and lungs have been almoſt of twice their natural ſize, perfectly ſound, and without any ulceration whatever; or any defect in the wind-pipe, or its glands.

Hence it appears, that this enormous ſize of the lungs, and the ſpace they occupy, by hindering the free action of the midriff, is the chief cauſe of this diſorder; and as the ſubſtance of the lungs was found more fleſhy than uſual, they of courſe muſt loſe a great deal of their ſpring and tone.

Whoever conſiders a broken-wind in this light, muſt own that it may be reckoned among the incurable diſtempers of horſes; and that all the boaſted pretenſions to cure are vain and frivolous, ſince the utmoſt ſkill can amount to no more than now and then palliating the ſymptoms, and mitigating their violence.

We ſhall therefore only lay down ſuch methods as may probably prevent this diſorder, when purſued in time. But if they ſhould not ſucceed, we ſhall offer ſome remedies and rules to mitigate its force, and to make a horſe as uſeful as poſſible under this malady.

It is uſual, before a broken wind appears, for a horſe to have a dry obſtinate cough, without any viſible ſickneſs or loſs of appetite; but, on the contrary, a diſpoſition to foul feeding, eating the litter, and drinking much water.

In,

In order then to prevent, as much as poffible, this diforder, bleed him, and give him the mercurial phyfic above prefcribed, which fhould be repeated two or three times.

The following balls are then to be taken for fome time, which have been found extremely efficacious in removing obftinate coughs.

TAKE aurum mofaicum, finely powdered, eight ounces; myrrh and elicampane, powdered, each four ounces; annifeeds and bay-berries, each an ounce; faffron, half an ounce; make into balls with oxymel fquills.

The aurum mofaicum is made of equal parts of quickfilver, tin, fal armoniac, and fulphur. We give this medicine as ftrongly recommended by Mr Gibfon; but how far the aurum mofaicum may contribute to its efficacy, may perhaps juftly be difputed: as a fubftitute in its room, therefore, for this purpofe, we recommend the fame quantity of powdered fquills, or gum ammoniacum, or equal parts of each.

Broken-winded horfes fhould eat fparingly of hay, which as well as their corn may be wetted with chamber lye, or fair water; as this will make them lefs craving after water.

The volatile falts in the urine may make it preferable to water, and may be the reafon why garlick is found fo efficacious in thefe cafes; two or three cloves given at a time in a feed, or three ounces of garlick bruifed, and boiled in a quart of milk and water, and given every other morning for a fortnight, having been found very ferviceable; for by warming and ftimulating the folids, and diffolving the tenacious juices, which choak up the veffels of the lungs, thefe complaints are greatly relieved.

Careful feeding, and moderate exercife has greatly relieved broken-winded horfes.

Horfes fent to grafs in order to be cured of an obftinate cough, have often returned completely broken-winded, where the pafture has been rich and fucculent, fo that they have had their bellies conftantly full. As the ill confequence therefore is obvious, where you have not the conveniency of turning out your horfe for a conftancy, you may foil him for a month or two with young green barley, tares, or any other young herbage.

To purfive thick-winded horfes, Barbadoes and common tar have often been given with fuccefs, to the quantity of two fpoonfuls mixed with the yelk of an egg, diffolved in warm ale, and given fafting two or three times a week, efpecially thofe days you hunt or travel.

But in order to make all thefe forts of horfes of any real fervice to you, the grand point is to have a particular regard to their diet, obferving a juft œconomy both in that and their exercife; giving but a moderate quantity of hay, corn, or water, at a time, and moiftening the former, to prevent their requiring too much of the latter, and never exercifing them but with moderation, as has before been obferved. The following alterative ball may be given once a-fortnight or three weeks; and as it operates very gently, and requires no confinement but thofe days it is given (when warm meat and water are neceffary), it may be continued for two or three months.

TAKE fuccotrine aloes fix drams; myrrh, galbanum, and ammoniacum, of each two drams; bay-berries half an ounce: make into a ball with a fpoonful of oil of amber, and a fufficient quantity of fyrup of buckthorn.

Of a CONSUMPTION.

WHEN a confumption proceeds from a defect in a horfe's lungs, or any principal bowel; the eyes look dull; the ears and feet are moftly hot; he coughs fharply by fits; fneezes much, and frequently groans with it; his flanks have a quick motion; he gleets often at the nofe, and fometimes throws out a yellowifh curdled matter; and he has little appetite to hay, but will eat corn, after which he generally grows hot.

As to the cure, one of the principal things is bleeding in fmall quantities (a pint, or pint and half, from fome horfes is fufficient) which fhould be repeated as often as the breath is more than ordinarily oppreffed. Pectorals may be given to palliate prefent fymptoms; but as diffections have difcovered both the glands of the lungs and mefentery to be fwelled, and often indurated, the whole ftrefs lies on mercurial purges, and the following ponderous alteratives, given intermediately.

TAKE native cinnabar, or cinnabar of antimony, one pound, powdered very fine, and add the fame quantity of gum guaiacum and nitre; give the horfe an ounce of this powder twice a-day, wetting his feeds.

The fpring grafs is often extremely ferviceable, but the falt marfhes are to be preferred, and to be more depended on than medicines; for great alterations are thereby made in the blood and juices, and no fmall benefit arifes from open air and proper exercife.

Of an APOPLEXY *or* STAGGERS, CONVULSIVE DISORDERS, LETHARGY, EPILEPSY, *and* PALSY.

FARRIERS generally include all diftempers of the head under two denominations, *viz. ftaggers* and *convulfions*; wherein they always fuppofe the head primarily affected. But in treating thefe diforders, we will diftinguifh between thofe that are peculiar to the head, as having their fource originally thence; and thofe that are only concomitants of fome other difeafe.

In an apoplexy a horfe drops down fuddenly, without other fenfe or motion than a working at his flanks.

The previous fymptoms are, drowfinefs; watery eyes, fomewhat full and inflamed; a difpofition to reel, feeblenefs, a bad appetite; the head almoft conftantly hanging, or refting on the manger; fometimes with little or no fever, and fcarce any alteration in the dung or urine: the horfe is fometimes difpofed to rear up, and apt to fall back when handled about the head; which is often the cafe with young horfes, to which it does not prove fuddenly mortal; but with proper help they may fometimes recover. If the apoplexy proceeds from wounds, or blows on the head, or matter on the brain; befides the above fymptoms, the horfe will be frantick by fits, efpecially after his feeds, fo as to ftart and fly at every thing. Thefe cafes feldom admit of a perfect recovery; and when horfes fall down fuddenly, and work violently at their flanks, without any ability to rife after a plentiful bleeding, they feldom recover.

All that can be done is to empty the veſſels as ſpeedily as poſſible, by ſtriking the veins in ſeveral parts at once, bleeding to four or five quarts, and to raiſe up the horſe's head and ſhoulders, ſupporting them with plenty of ſtraw. If he ſurvives the fit, cut ſeveral rowels; give him night and morning glyſters prepared with a ſtrong decoction of ſenna and ſalt, or the purging glyſter mentioned in the directions; blow once a-day up his noſtrils a dram of powder of aſarabacca, which will promote a great diſcharge; afterwards two or three aloetic purges ſhould be given; and to ſecure him from a relaple, by attenuating and thinning his blood, give him an ounce of equal parts of antimony and crocus metallorum for a month; or, which is preferable, the ſame quantity of cinnabar of antimony and gum guaiacum.

If the fit proceeds only from fulneſs of blood, high feeding, and want of ſufficient exerciſe, or a ſizy blood (which is often the caſe with young horſes, who though they reel, ſtagger, and ſometimes ſuddenly fall down, yet are eaſily cured by the above method), an opening diet with ſcalded bran and barley will be neceſſary for ſome time; and the bleeding may be repeated in ſmall quantities.

As to the other diſorders of the head, ſuch as lethargy or ſleeping evil, epilepſy or falling-ſickneſs, vertigo, frenzy, and madneſs, convulſions, and paralytical diſorders, as they are moſt of them to be treated as the apoplexy and epilepſy, by bleeding and evacuations with the alteratives there directed, we ſhall wave treating of them ſeparately, but mention ſome particular rules to diſtinguiſh them, according to the plan we laid down, and then offer ſome general remedies for the ſeveral purpoſes.

In an epilepſy, or falling ſickneſs, the horſe reels and ſtaggers, his eyes are fixed in his head, he has no ſenſe of what he is doing, he ſtales and dungs inſenſibly, he runs round and falls ſuddenly; ſometimes he is immoveable, with his legs ſtretched out as if he was dead, except only a quick motion of his heart and lungs, which cauſes a violent working of his flanks; ſometimes he has involuntary motions, and ſhaking of his limbs, ſo ſtrong, that he has not only beat and ſpurned his litter, but the pavement with it; and with theſe alternate ſymptoms a horſe continued more than three hours, and then he has as ſurpriſingly recovered; at the going off of the fit, he generally foams at the mouth, the foam being white and dry, like what comes from a healthful horſe when he champs on the bit.

But in all kinds of gripes, whether they proceed from diſorders in the guts, or retention of urine, a horſe is often up and down, rolls and tumbles about; and when he goes to lie down, generaly makes ſeveral motions with great ſeeming carefulneſs, which ſhews he has a ſenſe of his pain; and if he lays ſtretched out for any time, it is generally but for a ſhort ſpace.

Epilepſies and convulſions may ariſe from blows on the head, too violent exerciſe, and hard ſtraining; and from a fulneſs of blood, or impoveriſhed blood, and ſurfeits; which are ſome of the cauſes that denote the original diſorder.

In lethargic diſorders, the horſe generally reſts his head with his mouth in the manger, and his pole often reclined to one ſide; he will ſhew an inclination to eat, but generally falls aſleep with his food in his mouth, and he frequently ſwallows it whole, without chewing: emollient glyſters are extremely neceſſary in this caſe, with the nervous balls recommended for the ſtaggers and convulſions; ſtrong purges are not requiſite, nor muſt you bleed in too large quantities, unleſs the horſe be young and luſty. In old horſes, rowels and large evacuations are improper; but volatiles of all kinds are of uſe, when they can be afforded: the alterative purge (p 554. col. 2. par. 2 from the bottom) may be given, and repeated on his amendment.

This diſtemper is to be cured by theſe means, if the horſe is not old and paſt his vigour. It is a good ſign if he has a tolerable appetite, and drinks freely without ſlabbering, and if he lies down, and riſes up carefully, though it be but ſeldom.

But if a lethargic horſe does not lie down; if he is altogether ſtupid and careleſs, and takes no notice of any thing that comes near him; if he dungs and ſtales ſeldom, and even while he ſleeps and dozes, it is a bad ſign: if he runs at the noſe thick white matter, it may relieve him; but if a viſcid gleet, that ſticks to his noſtrils like glue, turn to a profuſe running of ropy, reddiſh and greeniſh matter, it is an infallible ſign of a great decay of nature, and that it will prove deadly.

Young horſes from four to ſix years, are very ſubject to convulſions, from bots in the ſpring; and the large coach breed, more than the ſaddle They are ſeized without any previous notice; and if bots and worms are diſcovered in their dung, the cauſe ſeems to be out of doubt; more eſpecially if they have lately come out of a dealer's hands.

When this convulſion proceeds from a diſtemperature of the midriff, or any of the principal bowels, it is to be diſtinguiſhed from bots and vermin by previous ſymptoms; the horſe falls off his ſtomach, and grows gradually weak, feeble, and diſpirited in his work, and turns ſhort-breathed with the leaſt exerciſe.

The lively deſcription of that univerſal cramp or convulſion, called by ſome the ſtag-evil, which ſeizes all the muſcles of the body at once, and locks up the jaws, ſo that it is impoſſible almoſt to force them open, we ſhall give in Mr Gibſon's own words, who ſays: As ſoon as the horſe is ſeized, his head is raiſed with his noſe towards the rack, his ears pricked up, and his tail cocked, looking with eagerneſs as an hungry horſe when hay is put down to him, or like a high-ſpirited horſe when he is put upon his mettle; inſomuch, that thoſe who are ſtrangers to ſuch things, when they ſee a horſe ſtand in this manner, will ſcarce believe any thing of conſequence ails him; but they are ſoon convinced, when they ſee other ſymptoms come on apace, and that his neck grows ſtiff, cramped, and almoſt immoveable; and if a horſe in this condition lives a few days, ſeveral knots will ariſe on the tendinous parts thereof, and all the muſcles both before and behind will be ſo much pulled and cramped, and ſo ſtretched, that he locks as if he was nailed to the pavement, with his legs ſtiff, wide, and ſtradling; his ſkin is drawn ſo tight on all parts of the body, that it is almoſt impoſſible to move it; and if trial be made to make him walk,

walk, he is ready to fall at every ſtep, unleſs he be carefully ſupported; his eyes are ſo fixed with the inaction of the muſcles, as give him a deadneſs in his looks; he ſnorts and ſneezes often, pants continually with ſhortneſs of breath; and this ſymptom increaſes continually till he drops down dead; which generally happens in a few days, unleſs ſome ſudden and very effectual turn can be given to the diſtemper.

In all theſe caſes the horſe ſhould firſt be bled plentifully, unleſs he is low in fleſh, old, or lately come off any hard continued duty, then you muſt be more ſparing of his blood; afterwards give the following ball.

TAKE aſſa fœtida half an ounce, Ruſſia caſtor powdered two drams, valerian root powdered one ounce; make into a ball with honey and oil of amber.

This ball may be given twice a-day at firſt; and then once, waſhed down with a decoction of miſletoe or valerian ſweetened with liquorice or honey: an ounce of aſſa fœtida may be tied up in a piece of ſtrong coarſe linen rag, and put behind his grinders to champ on.

The laxative purges and emollient glyſters ſhould be given intermediately to keep the body open; but when the former balls have been taken a week or ten days, the following may be given once a-day with the valerian decoction.

TAKE cinnabar of antimony ſix drams, aſſa fœtida half an ounce, ariſtolochia myrrh and bay-berries of each two drams; make into a ball with treacle and oil of amber.

This is the moſt effectual method of treating theſe diſorders; but when they are ſuſpected to ariſe from bots, and worms, which is generally the caſe, mercurial medicines moſt lead the way, thus:

TAKE mercurius dulcis and philonium of each half an ounce; make into a ball with conſerve of roſes, and give the horſe immediately; half the quantity may be repeated in four or five days.

The following infuſion ſhould then be given, to the quantity of three or four horns, three or four times a-day, till the ſymptoms abate; when the above nervous balls may be continued till they are removed.

TAKE penny-royal and rue of each two large handfuls, chamomile flowers one handful, aſſa fœtida and caſtor of each half an ounce, ſaffron and liquorice-root ſliced of each two drams; infuſe in two quarts of boiling water; pour off from the ingredients as wanted.

If the caſtor is omitted, add an ounce of aſſa fœtida.

The following ointment may be rubbed into the cheeks, temples, neck, ſhoulders, ſpines of the back and loins, and where-ever there is the greateſt contractions and ſtiffneſs.

TAKE nerve and marſhmallow ointment of each four ounces, oil of amber two ounces, with a ſufficient quantity of camphorate ſpirit of wine; make a liniment.

When the jaws are ſo locked up that medicines cannot be given by the mouth, it is more eligible to give them by way of glyſter; for forcing open the jaws by violence often puts a horſe into ſuch agonies, that the ſymptoms are thereby increaſed.

In this caſe alſo he muſt be ſupported by nouriſhing glyſters, made of milk-pottage, broths, &c. which muſt be given to the quantity of three or four quarts a-day; glyſters of this kind will be retained, and abſorbed into the blood; and there have been inſtanced of horſes thus ſupported for three weeks together, who muſt otherwiſe have periſhed.

Mr Gibſon mentions ſome extraordinary inſtances of ſucceſs in caſes of this ſort by theſe methods, and repeated frictions, which are extremely ſerviceable in all convulſive diſorders, and often prevent their being jaw-ſet; they ſhould be applied with unwearied diligence every two or three hours, where ever any ſtiffneſs or contractions in the muſcles appear; for a horſe in this condition never lies down till they are in ſome meaſure removed.

The uſe of rowels in theſe caſes is generally unſucceſsful, the ſkin being ſo tenſe and tight, that they ſeldom digeſt kindly, and ſometimes mortify; ſo that if they are applied, they ſhould be put under the jaws, and in the breaſt.

The red-hot iron ſo frequently run through the foretop and mane, near the occipital bone, for this purpoſe, has often been found to have deſtroyed the cervical ligament.

In paralytic diſorders, where the uſe of a limb or limbs is taken away, the internals above recommended ſhould be given, in order to warm, invigorate, and attenuate the blood; and the following ſtimulating embrocation ſhould be rubbed into the parts affected.

TAKE oil of turpentine four ounces, nerve ointment and oil of bays of each two ounces, camphor rubbed fine one ounce, rectified oil of amber three ounces, tincture of cantharides one ounce.

With this liniment the parts affected ſhould be well bathed for a conſiderable time, to make it penetrate; and when the hind parts chiefly are lame, the back and loins ſhould be well rubbed with the ſame. To the nervous medicines above recommended, may be added ſnake-root, contrayerva, muſtard-ſeed, horſe-raddiſh root ſteeped in ſtrong beer, or wine where it can be afforded. Take the following for an example, which may be given to the quantity of three pints a-day alone, or two horns full may be taken after the nervous balls.

TAKE ſnake-root, contrayerva, and valerian, of each half an ounce; muſtard-ſeed and horſe-raddiſh root ſcraped, of each two ounces; long pepper two drams: infuſe in three pints of ſtrong wine.

When the horſe is recovering from any of the above diſorders, the following alterative purge may be repeated two or three times, as it operates very gently.

TAKE ſuccotrine aloes one ounce, myrrh half an ounce, aſſa fœtida and gum ammoniacum of each two drams, ſaffron one dram; make into a ball with any ſyrup.

Where a retention of dung is the cauſe of this diſorder, the great gut ſhould firſt be raked thoroughly with a ſmall hand, after which plenty of emollient oily glyſters ſhould be thrown up, and the opening drink given, till the bowels are thoroughly emptied of their impriſoned dung. Their diet ſhould for ſome days be opening, and conſiſt

consist chiefly of scalded bran, with flower of brimstone, scalded barley, *&c.*

Of the STRANGLES, *and* VIVES.

THE strangles is a distemper to which colts and young horses are very subject; and begins with a swelling between the jaw-bones, which sometimes extends to the muscles of the tongue; and is attended with so great heat, pain, and inflammation, that sometimes, till matter is formed, the horse swallows with the utmost difficulty.

The symptoms are extraordinary heat and feverishness, with a painful cough, and a great inclination to drink without being able; some horses losing their appetite entirely, others eating but little, by reason of the pain which chewing and swallowing occasions: when the swelling begins on the inside of the jaw-bones, it is much longer en coming to matter than when more to the middle; when it arises among the glands, and divides into several tumours, the cure is generally tedious, as it breaks in different places; and when it forms upwards on the wind-pipe and gullet, there is sometimes danger of suffocation, unless the swelling soon breaks. But the most dangerous kind is, when, besides the above symptoms, the horse runs at the nose; this is by some called the *bastard strangles.*

As this disorder seems to be critical, the most approved method is to assist nature in bringing the swellings to maturity, by keeping them constantly moist with ointment of marshmallows, and covering the head and neck with a warm hood. But as all swellings in glandular parts suppurate slowly, the following poultice may be applied hot twice a-day.

TAKE leaves of marshmallows ten handfuls, white-lily root half a pound, linseed and fenugreek-seed bruised of each four ounces; boil them in two quarts of water till the whole is pulpy, and add four ounces of ointment of marshmallows, and a sufficient quantity of hogs-lard, to prevent its growing stiff and dry.

In five or six days, by these means, the matter is generally formed, and makes its way through the skin; and if the discharge is made freely and with ease, the opening need not be inlarged; but should be dressed with the following ointment spread on tow, still continuing the poultice over it to promote the digestion, and prevent any remaining hardness.

TAKE rosin and Burgundy pitch of each a pound and a half, honey and common turpentine each eight ounces, yellow wax four ounces, hogs-lard one pound, verdigrease finely powdered one ounce; melt the ingredients together, but do not put in the verdigrease, till removed from the fire; and it should be stirred in by degrees, till the whole is grown stiff and cool.

If the fever and inflammation run high, and the swelling be so situated as to endanger suffocation, a moderate quantity of blood must be taken away, and the remainder diluted with plenty of water-gruel, or warm water, mashes, *&c.*

The running at the nose which often attends the strangles is dangerous, especially if it continues after they have ripened and broke, as the horse will be greatly weakened thereby. To prevent this waste and decay, give him every day for some time an ounce of Jesuit's bark; or a strong decoction of guaiacum shavings, which hath been found extremely beneficial in restraining these glandular discharges when too liberal, and in drying up ulcers of all kinds in horses.

If a hardness remains after the sores are healed up, they may be anointed with the mercurial ointment; and when the horse has recovered his strength, purging will be necessary.

The vives or ives differ from the strangles only in this; that the swellings of the kernels, under the ears of the horse, (which are the parts at first chiefly affected), seldom gather, or come to matter, but by degrees perspire off and disperse by warm cloathing, anointing with the marshmallow ointment, and a moderate bleeding or two. But should the inflammation continue notwithstanding these means, a suppuration must be promoted by the methods above recommended in the strangles.

When these swellings appear in an old or full-aged horse, they are signs of great malignity, and often of an inward decay, as well as forerunners of the glanders.

The mercurial ointment above-mentioned, may be prepared thus:

TAKE of crude mercury or quicksilver one ounce, Venice turpentine half an ounce; rub together in a mortar till the globules of the quicksilver are no longer visible; then add two ounces of hogs-lard.

Of the Diseases of the EYES.

IN order to make the disorders of the eyes well understood, we shall consider them as arising from different causes; external injuries affecting the globe of the eye; and from internal causes affecting the humours within the globe. We shall consider also the eye as naturally weak from a bad conformation, which possibly may often be hereditary.

In all recent disorders of the eye from external injuries, such as blows, bites, *&c.* attended with a swelling of the lid, and a running from the eye, you must first sponge the part often with cold spring-water and vinegar; and if much swelled, bleed immediately, and apply over it a poultice made of the pulps of roasted or boiled apples, cleared from their seeds and husks; or of conserve of roses and vinegar, with a little bole, and the white of an egg. When the swelling is abated, either of the following washes will complete the cure.

TAKE white vitriol half an ounce, sugar of lead two drams; dissolve in a pint of spring-water; to which may occasionally be added, when the rheum is very great, and inflammation removed, half an ounce of tutty, or compound powder cerufs.

Let the eye and eyelid be bathed three or four times a-day with a clean sponge dipped in this wash; or it may be applied with a feather, leaving a few drops on the eye. When the veins under the eye have been turgid, opening them with a launcet has often been found successful.

Mr Gibſon, from his own experience, recommends the following, with which alone he has ſucceeded in moſt common caſes.

TAKE two drams of roſe-buds, infuſe them in half a pint of boiling water; when cold, pour off the infuſion, and add to it twenty grains of ſugar of lead.

This is to be uſed as the former; but the quantity of ſugar of lead may occaſionally be increaſed.

Sometimes from the violence of the inflammation, ſucceeding blows, and external injuries, the coats of the eye ſhall loſe their tranſparency, thicken, and turn white, or pearl-colour; in the latter caſe, the horſe has ſome glimmering of light; in the former, he is blind while the eye continues in this ſtate.

If the horſe be fleſhy and of a groſs conſtitution, bleeding may be repeated, and a rowel will be neceſſary: let his diet be ſcalded bran or barley; avoiding for ſome days oats, beans, or any thing hard to chew.

The cooling opening drink, (p. 547. col. 1. par. 1.) ſhould be given every other day, which will anſwer better than aloetic purges.

If the eye-lids continue ſwelled and moiſt, and the under ſide of the eye inflamed, an ounce of honey may be added to four ounces of the above waters; or the part may be well bathed with an ounce of honey of roſes, and half a dram of ſugar of lead, diſſolved in three ounces of ſpring-water: to which may be added, when the eye is very watery, a ſpoonful or two of red wine, which will help to thicken the matter and dry it up.

If a film or thick ſlough ſhould remain, it may be taken off, by blowing into the eye equal parts of white vitriol and ſugar-candy finely powdered.

Glaſs finely powdered, mixed up with honey and a little freſh butter, is much recommended by Dr Bracken for this purpoſe; as alſo the following ointment.

TAKE ointment of tutty one ounce, honey of roſes two drams, white vitriol burnt one ſcruple; this, with a feather, may be ſmeared over the eye twice a-day.

Let it be remembered, that it has long been obſerved in practice, that the eye in its firſt ſtate of inflammation is ſo very tender, that the eye-waters prepared with tutty and other powders aggravate the diſorder; conſequently, during this ſtate, the tinctures of vegetables and ſolutions of ſalts are greatly preferable.

Wounds of the eye may be dreſſed with honey of roſes alone, or with a little ſugar of lead mixed with it, adding thereto, after a few days, an eighth part of tincture of myrrh; all the preceding directions in regard to inflammation being attended to, eſpecially bleeding, rowels, and gentle cooling phyſic.

When the humours of the eye are thickened, and the diſorder is within the globe, ſharp external applications are not only uſeleſs, but extremely detrimental, by the irritation they occaſion, and conſequently ſhould be avoided.

In all caſes of this ſort, whether moon-eyes, which are only cataracts forming, or in confirmed ones attended with a weeping; general evacuations, with internal alteratives, can only take place.

Theſe generally make their appearance, when a horſe is turned five, coming ſix; at which time one eye becomes clouded, the eye lids being ſwelled, and very often ſhut up; and a thin water generally runs from the diſeaſed eye down the cheek, ſo ſharp as ſometimes to excoriate the ſkin; the veins of the temple, under the eye, and along the noſe, are turgid and full: though ſometimes it happens that the eye runs but little.

This diſorder comes and goes till the cataract is ripe; then all pain and running diſappears, and the horſe becomes totally blind, which is generally in about two years. During this time ſome horſes have more frequent returns than others; which continue in ſome a week or more, in others three or four; returning once in two or three months, and they are ſeldom ſo long as five without a relapſe.

There is another kind of moon-blindneſs, which is alſo the forerunner of cataracts, where no humour or weeping attends. The eye is never ſhut up or cloſed here, but will now and then look thick and troubled, at which time the horſe ſees nothing diſtinctly: when the eyes appear ſunk and periſhing, the cataracts are longer coming to maturity; and it is not unuſual in this caſe for one eye to eſcape.

Theſe caſes generally end in blindneſs of one, if not of both eyes; the moſt promiſing ſigns of recovery are when the attacks come more ſeldom, and their continuance grows ſhorter, and that they leave the cornea clear and tranſparent, and the globe plump and full.

The attempts to cure cataracts have hitherto been only palliative and mitigating the ſymptoms; yet early care has ſometimes been ſucceſsful. To this end the horſe ſhould be rowel'd and bled at proper intervals; except where the eyes appear ſunk and periſhing, where it is often pernicious. During the violence of the ſymptoms, obſerve the cooling treatment above recommended, giving him two ounces of nitre every day mixed into a ball with honey, and bathe the parts above the eye with verjuice, or vinegar, wherein roſe-leaves are infuſed; to four ounces of which, half a dram of ſugar of lead may be added. The ſwelling on the lid may afterwards be bathed with a ſponge dipt in equal parts of lime and Hungary water, mixed together: the cooling phyſic, (p. 545 col. 1. par. 4.) ſhould be given every fourth day, till the eye becomes clear, and recovers its uſual brightneſs. The following alſo is very proper phyſic for this purpoſe.

TAKE lenitive electuary and cream of tartar of each four ounces, Glauber's ſalts three ounces, ſyrup of buckthorn two ounces.

When the weeping is by theſe means removed, the alterative powders (See the ſection, *Of* ALTERATIVE MEDICINES) ſhould be given every day, till two or three pounds are taken, and after an interval of three months, the ſame courſe ſhould be repeated. This method has often been attended with good ſucceſs, where the eyes have been full, and no way periſhed; in that caſe, bathe or foment them with the following, twice a-day.

TAKE crude ſal armoniac two drams, diſſolve in a pint of lime-water, and add to it four ounces of brandy, or Hungary water.

This will act as a ſtimulus, and may help to thin and rarify

rarify the gummy juices, and bring new fupplies of nourifhment to the perifhing eyes.

This courfe not fucceeding, in order more powerfully to open the veffels of the chryftalline humour, (which in thefe cafes is always found opake, and, when the cataract is confirmed, entirely lofes its tranfparency,) and hinder as much as poffible the forming of obftructions, mercurials are chiefly to be depended on: thus give every other day, for three or four mornings, two drams of calomel, mixed up with conferve of rofes; and then purge off with the common ball.

During this courfe, particular care fhould be taken of the horfe: after repeating this, the alterative powders before-mentioned fhould be given for fome weeks or months, if you expect any benefit from them; or they may be beat up into a ball with live millepedes, and an ounce and a half given every day: if thefe fhould not fucceed, and the horfe is a valuable one, the turbith courfe recommended in the fection on alteratives, feems to be the moft promifing method left. But to horses that are not fo, an ounce of antimony, ground into an impalpable powder, may be given every day in one of his feeds for three months or longer; or a ftrong decoction of guaiacum fhavings may be given for fome time, to which crude antimony may be given in the following manner.

Take guaiacum fhavings one pound, crude antimony tied in a rag the fame quantity; boil in two gallons of forge-water to one, and give a quart a-day, either alone, or mixed with his water.

The haws is a fwelling and fponginefs that grows in the inner corner of the eye, fo large fometimes as to cover a part of the eye. The operation here is eafily performed by cutting part of it away; but the farriers are apt to cut away too much; the wound may be dreffed with honey of rofes; and if a fungus or fpongy flefh arifes, it fhould be fprinkled with burnt alum, or touched with blue vitriol.

Of the Glanders.

The caufe and feat of the glanders has till lately been fo imperfectly handled, and fo little underftood by the writers of this diftemper, that it is no wonder it fhould be ranked among the incurables: but a new light having been thrown on this whole affair by the ftudy of M. La Foffe, the king of France's farrier, who has been at the pains to trace out, and difcover, by diffections, the fource and caufe of this diforder; we hope the method he has propofed, with fome further experiments and improvements, will foon bring to a certainty of cure (in moft cafes at leaft) a diftemper fo dangerous to our horfes, and that hitherto has eluded the force of art.

M. de la Foffe has diftinguifhed feven different kinds of glanders, four of which are incurable.

The firft proceeds from ulcerated lungs, the purulent matter of which comes up the trachea, and is difcharged through the noftrils, like a whitifh liquor, fometimes appearing in lumps and grumes: in this diforder, though the matter is difcharged from the noftrils, yet the malady is folely in the lungs.

The fecond is a wafting humour, which ufually feizes horfes at the decline of a difeafe, caufed by too hard labour; this defluxion alfo proceeds from the lungs.

The third is a malignant difcharge, which attends the ftrangles fometimes, and falls upon the lungs, which runs off by the noftrils.

The fourth is, when an acrimonious humour in the farcy feizes thefe parts, where it foon makes terrible havock.

The fifth kind we fhall defcribe by and by, as arifing from taking cold.

The fixth kind is a difcharge from the ftrangles, which fometimes vents itfelf at the noftrils.

Thefe are the various diforders which have been obferved fometimes to throw matter out from the noftrils; let us now defcribe the real glanders.

The matter, then, difcharged from the noftrils of a glandered horfe, is either white, yellow, or greenifh, fometimes ftreaked, or tinged with blood: when the difeafe is of long ftanding, and the bones are fouled, the matter turns blackifh, and becomes very fœtid; and is always attended with a fwelling of the kernels or glands under the jaws; in every other refpect the horfe is generally healthy and found, till the diftemper has been of fome continuance.

It is always a bad fign, when the matter fticks to the infide of the noftrils, like glue or ftiff pafte; when the infide of the nofe is raw, and looks of a livid or lead colour; when the matter becomes bloody, and ftinks, and when it looks of an afh-colour. But when only a limpid fluid is firft difcharged, and afterwards a whitifh matter, the gland under the jaw not increafing, and the diforder of no long continuance, we may expect a fpeedy cure; for in this cafe, which arifes from taking cold, after a horfe has been overheated, the pituitary membrane is but flightly inflamed, the lymph in the fmall veffels condenfed, and the glands overloaded, but not yet ulcerated.

From thefe fymptoms, and fome obfervations made both by Bracken and Gibfon, it is plain they were not abfolute ftrangers to the feat of this diforder, though they neglected pufhing their inquiries to the fountain-head, and confequently were at a lofs to know how to apply the remedy to the parts affected.

But our author, after examining by diffection the carcafes of glandered horfes, and making a ftrict fcrutiny into the ftate of the vifcera, affifted for that purpofe by ingenious and expert anatomifts, for ten years together, affirms this difeafe to be altogether local; and that the true feat of it is in the pituitary membrane which lines the partition along the infide of the nofe, the maxillary finufes or cavities of the cheek-bones on each fide the nofe, and the frontal finufes or cavities above the orbits of the eyes; that the vifcera, as liver, lungs, *&c.* of glandered horfes are in general exceeding found; and confequently that the feat of this diforder is not in thofe parts, as has been afferted by moft authors; nor indeed is it probable it fhould: for how could fuch horfes preferve their appetite, their good appearance, fleek and fhining coats? in a word, all the figns of health for many years together (which many glandered horfes are known to enjoy) with fuch diftempered bowels.

But on nicely examining the heads of fuch horfes, he found the cavities above-mentioned more or lefs filled with a vifcous flimy matter, the membrane which lines both them and the noftrils inflamed, thickened, and corroded with

with fordid ulcers, which in some cases had eat into the bones.

He observes, that when glandered horses discharge matter from both nostrils, both sides of the membrane and cavities were affected; but when they ran at one nostril only, that side only was found distempered.

It is a curious remark of our author, that the sublingual glands, or the kernels situated under the jaw-bone, which are always swelled in this distemper, do not discharge their lymph into the mouth, as in man, but into the nostrils; and that he constantly found their obstruction agreed with the discharge; if one gland only was affected, then the horse discharged from one nostril only; but if both were, then the discharge was from both.

The seat of this disorder thus discovered, our author with great ingenuity has paved the way for cure, by trepanning these cavities, and taking out a piece of bone, by which means the parts affected may be washed with a proper injection, and in fine the ulcers deterged, healed, and dried up.

But as from the observations since made by this gentleman, there are different species of the glanders, so the cure of the milder kinds may first be attempted by injections and fumigations: thus after taking cold, should a horse for fifteen or twenty days discharge a limpid fluid or whitish matter from one or both nostrils, the glands under the jaw rather growing harder than diminishing, we may expect it will degenerate into a true glanders. To prevent which, after first bleeding, and treating him as we have directed for a cold, let an emollient injection, prepared with a decoction of linseed, marshmallows, elder, chamomile flowers, and honey of roses, or such like, be thrown up as far as possible with a strong syringe, and repeated three times a-day: should the running not lessen or be removed in a fortnight by the use of this injection, a restringent one may now be prepared with tincture of roses, lime-water, *&c.* and the nostrils fumigated with the powders of frankincense, mastich, amber, and cinnabar, burnt on an iron heated for that purpose; the fume of which may easily be conveyed through a tube into the nostrils.

This method has been found successful when used in time; but the methods of cure depend on the stubbornness of the disorder; and when inveterate, recourse must be had to the operation above described.

Of the Cholic *or* Gripes, *and* Pains *in the* Bowels, *from sudden accidents.*

There seems to be no distemper so little understood by the common farrier, as the cholic or gripes in horses, one general remedy or method serving them in all cases; but as this disorder may be produced by very different causes, the method of cure must also vary, otherwise the intended remedy, injudiciously applied, will not only aggravate the complaint, but make it fatal. We shall divide this disorder into three different species: the flatulent or windy, the bilious or inflammatory, and the dry gripes; each of which we shall distinguish by their different symptoms, and then point out the proper remedies.

The flatulent or windy cholic is thus known. The horse is often lying down, and as suddenly rising again with a spring; he strikes his belly with his hinder feet, stamps with his fore-feet, and refuses his meat; when the gripes are violent, he will have convulsive twitches, his eyes be turned up, and his limbs stretched out as if dying, his ears and feet being alternately very hot and cold; he falls into profuse sweats, and then into cold damps; strives often to stale, and turns his head frequently to his flanks; he then falls down, rolls about, and often turns on his back; this last symptom proceeds from a stoppage of urine, that almost always attends this sort of cholic, which may be increased by a load of dung pressing on the neck of the bladder.

These are the general symptoms of cholic and gripes from wind, drinking cold water when hot, and when the perspirable matter is retained, or thrown on the bowels by catching cold; in all which cases they are violently distended. Cribbing horses are more particularly subject to this complaint, by reason they are constantly sucking in great quantities of air.

The first intention is to empty the strait gut with a small hand dipt in oil, which frequently makes way for the confined wind to discharge itself; and by easing the neck of the bladder, the suppression of urine is taken off, and the horse stales and gets ease.

The following ball and glyster seldom fail of giving relief in these cases.

Take Strasburgh or Venice turpentine, and juniper-berries pounded, of each half an ounce; sal-prunella, or salt-petre, an ounce; oil of juniper, one dram; salt of tartar, two drams; make into a ball with any syrup; it may be given whole, and washed down with a decoction of juniper-berries, or a horn or two of ale.

If the horse does not break wind, or stale plentifully, he will find no relief; therefore in an hour or two give him another ball, and add to it a dram of salt of amber; which may be repeated a third time, if found necessary. During the fit the horse may be walked and trotted gently, but should by no means be harassed beyond his ability, or dragged about till he is jaded.

The following glyster may be given, between the balls, or alone, and repeated occasionally.

Take chamomile flowers two handfuls; anise, coriander, and fennel seeds, of each an ounce; long pepper half an ounce; boil in three quarts of water to two; and add Daffy's elixir, or gin, half a pint; oil of amber half an ounce, and oil of chamomile eight ounces.

The signs of a horse's recovery, are his lying quiet, without starting, or tumbling, and his gathering up his legs, and ceasing to lash out; and if he continues an hour in this quiet posture, you may conclude all danger over.

The next species of cholic we shall describe, is the bilious or inflammatory; which besides most of the preceding symptoms, is attended with a fever, great heat, panting, and dryness of the mouth; the horse also generally throws out a little loose dung, with a hot scalding water, which when it appears blackish, or of a redish colour, and fœtid smell, denotes an approaching mortification.

In this case the horse should immediately be bled to the quantity of three quarts; and it should be repeated, if the symptoms do not abate in a few hours. The emollient

lient glyster, with two ounces of nitre dissolved in it, should be thrown up twice a-day, to cool the inflamed bowels; plenty of gum-arabic water should be taken, and a pint of the following drink given every two or three hours, till several loose stools are procured; and then it should be given only night and morning till the disorder is removed.

Take senna three ounces, salt of tartar half an ounce; infuse in a quart of boiling water an hour or two; then strain off, and add two ounces of lenitive electuary, and four of Glauber's salts.

If this disorder is not removed by these means, but the inflammation and fever increase, attended with a discharge of the flesh-coloured water above described, the event will most probably be fatal: and the chief thing to be depended on now, must be a strong decoction of Jesuits bark, given to the quantity of a pint every three hours, with a gill of red port-wine.

A quart of the same may be used for a glyster, with two ounces of Venice turpentine, dissolved with the yolks of two eggs, an ounce of diascordium, and a pint of red wine, and given twice a-day: if the horse recovers, give two or three mild rhubarb purges.

The last we shall describe is the dry gripes, or the cholic, which arises often from costiveness; it is discovered by the horse's frequent and fruitless motion to dung, the blackness and hardness of the dung, the frequent and quick motion of his tail, the high colour of his urine, and his great restlessness and uneasiness.

In this case the strait gut should be examined and emptied with a small hand oiled properly for that purpose; the emollient oily glyster, (p. 545. col. 2. par. 7.) should be thrown up twice a day; and the above purging drink given, till the bowels are unloaded, and the symptoms removed.

The diet for a horse in the gripes, should be scalded bran, warm water gruel, or white water, made by dissolving four ounces of gum-arabic in a quart of water, and mixing it with his other water.

From this history and division of gripes and cholics, with their different treatment, it appears how absolutely necessary it is they should be well understood, in order to be managed skilfully: it is plain too, that violent hot medicines should in every species of this disorder be guarded against, and given with great caution and discretion, even in the first kind of flatulent cholic, where indeed they can only be wanted; yet too often, when prepared by the farriers with oil of turpentine, geneva, pepper, and brine, *&c.* they even increase that disorder, by stimulating the neck of the bladder, too forcibly heating the blood, and inflaming the bowels, till a mortification is brought on them. These are, in general, the constant appearances of horses that die of this disorder, whose bowels being examined for that purpose, have been found inflamed, full of red and livid spots, sometimes quite black, crisped with extreme heat, and rotten.

Of the Lax *and* Scouring, *with other Disorders of the* Stomach *and* Bowels.

It is sometimes a nice matter to form a proper judgment when to controul or encourage a looseness, but these general rules may be a direction: If a healthy full horse, on taking cold, or upon hard riding, overfeeding, eating unwholesome food, or with a slight fever, should have a moderate purging, by no means think of stopping it; but rather encourage it with an open diet, and plenty of warm gruel: but if it continues long, with gripings, the mucus of the bowels coming away, and the horse losing his appetite and flesh, it is then high time to give him proper medicines; if he voids great quantities of slime and greasy matter, give him the following drench, and repeat it every other day for three times.

Take lenitive electuary and cream of tartar of each four ounces, yellow rosin finely powdered one ounce, and four ounces of sweet oil; mix with a pint of water gruel.

The following alterative ball alone has been found successful for this purpose, when given twice a-week, with scalded bran and warm gruel.

Take succotrine aloes half an ounce, diapente one ounce; make into a ball with the juice of Spanish liquorice dissolved in water, and a spoonful of oil of amber.

To this may be added two drams of myrrh, and a dram of saffron, and (where it can be afforded) half an ounce of rhubarb.

When the purging is attended with a fever, rhubarb should first be given to the quantity of half an ounce, with an ounce and half of lenitive electuary; at night after the working, give half an ounce or more of diascordium in a pint of red wine mulled with cinnamon, and repeat it every day, and the rhubarb ball once in two or three.

But if the distemper increases, the horse's flanks and belly look full and distended, and he appears griped and in pain, let this glyster be given, and the quantity of diascordium increased an ounce in his night-drink.

Take chamomile flowers one handful, red roses half a handful, pomegranate and balaustines of each an ounce; boil in two quarts of water to one; strain off, and dissolve in it two or three ounces of diascordium, and one of mithridate; to which may be added a pint of port wine: repeat it once a-day.

If the flux continues violent, give an ounce of rock-alum, with an ounce and a half of bole, twice a-day; or, dissolve double this quantity with two ounce of diascordium, and the cordial ball, in two quarts of hartshorn drink; to which may be added a pint of port; and give the horse, three or four times a-day, a pint of this drink. For this purpose also a strong decoction of oak-bark may be given, with either of the above remedies, and to the same quantity; even by itself, it will be found on trial no inconsiderable remedy.

When the discharge is attended with an acrid mucus or slime, the griping and pains are very severe, the common lining of the bowels being washed away; in this case the following glyster should frequently be injected warm.

Take of tripe liquor or thin starch two quarts, oil of olives half a pint, the yelk of six eggs well broke, and two or three ounces of course sugar.

Some horses having naturally weak stomachs and bowels,

bowels, throw out their aliment undigefted; their dung is habitually foft, and of a pale colour; they feed poorly, and get no flefh: to remedy this complaint, give the following purge two or three times; and then the infufion to the quantity of a pint every morning.

Take fuccotrine aloes fix drams, rhubarb powdered three drams, myrrh and faffron each a dram; make into a ball with fyrup of ginger.

Infufion.—Take zedoary, gentian, winters bark, and orange-peel, of each two ounces; pomegranate-bark and balauftine, of each an ounce; chamomile-flowers and centaury, each a handful; cinnamon and cloves, each an ounce: infufe in a gallon of port or ftrong beer.

The bloody flux is a diftemper horfes are not very fubject to; however, as it fometimes does occcur, whenever blood is difcharged, attended with gripings, and great pain in the bowels, if the flux is not fpeedily reftrained, the horfe probably may be foon loft: we recommend therefore the following glyfter and drink for that purpofe.

Take oak-bark four ounces, tormentil-root two ounces, burnt hartfhorn three ounces; boil in three quarts of forge-water to two; ftrain off, and add two ounces of diafcordium, four ounces of ftarch, and half a dram of opium.

A glyfter may alfo be prepared with the fame quantity of fat broth, ftarch and opium, in order to plaifter over the coats of the bowels, and abate their violent irritations. Alfo,

Take foft chalk two ounces, mithridate or diafcordium one ounce, powder of Indian-root half a dram, liquid laudanum fifty or fixty drops; diffolve in a pint of hartfhorn drink, and add to it four ounces of cinnamon-water or red wine: give it twice a-day.

Gum arabic diffolved in hartfhorn drink, or in common water, fhould be the horfe's ufual drink.

When horfes are apt to be coftive, from whatever caufe it arifes, gentle openers fhould be given; fuch as cream of tartar, Glauber's falts, and lenitive electuary; four ounces of any two of thefe diffolved in warm ale, whey, or water, given every other morning for two or three times, will anfwer this purpofe; efpecially if affifted by an oily emollient glyfter, prepared with a handful of falt. Scalded bran or barely, with an ounce of fenugreek and linfeed, occafionally given, will prevent this complaint: but where it is conftitutional, and proceeds from the power and force of digeftion in the ftomach and guts, as fometimes happens, and the horfe is otherwife in perfect health, no inconvenience will arife from it; and it is obferved that fuch horfes are able to endure great fatigue and labour.

Of Worms *and* Bots.

Authors have defcribed three different forts of worms that affect horfes, *viz. Bots*, which young horfes are often troubled with in the fpring; the *Rotundi*, or thofe refembling earth-worms; and the *Afcarides*, or thofe about the fize of the largeft fewing needle, with flat heads.

The bots which breed in the ftomachs of horfes, and are fometimes the caufe of convulfions, appear to be very large maggots, compofed of circular rings, with little fharp prickly feet along the fides of their bellies (like the feet of hog-lice), which by their fharpnefs (like the points of the fineft needles) feem to be of ufe to faften them to the part where they breed and draw their nourifhment, and to prevent their being loofened from fuch adhefion before they come to maturity. The eggs from whence thefe bots are produced, are difperfed into clufters all round the lower orifice of the ftomach, and are laid under the inner coat or thin membrane of the ftomach; fo that when the animals come to form and life, they burft through this inner coat with their breech and tail ftraight outwards, and their trunks fo fixed into the mufcular or flefhy coat of the ftomach, that it fometimes requires a good pull to difengage them; from the blood of this laft coat they draw their nourifhment, which they fuck like fo many leeches, every one ulcerating and purfing up the part where it fixes like a honey comb; and they often make fuch quick havock, as to deftroy the horfe.

The fymptoms of worms are various. The bots that many horfes are troubled with in the beginning of the fummer, are always feen fticking on the ftrait gut, and are often thruft out with the dung, with a yellowifh coloured matter like melted fulphur; they are noways dangerous there, but are apt to make a horfe reftlefs and uneafy, and rub his breech againft the pofts. The feafon of their coming is ufually in the months of May and June, after which they are feldom to be feen, and rarely continue in any one horfe above a fortnight or three weeks. Thofe that take their lodgment in the ftomach, are extremely dangerous by caufing convulfions; and are feldom difcovered by any previous figns before they come to life, when they throw a horfe into violent agonies. The other kinds are more troublefome than dangerous; but are known by the following figns: The horfe looks lean and jaded, his hair ftares as if he was furfeited, and nothing he eats makes him thrive; he often ftrikes his hind-feet againft his belly, is fometimes griped, but without the violent fymptoms that attend a cholic or ftrangury; for he never rolls and tumbles, but only fhews uneafinefs, and generally lays himfelf down quietly on his belly for a little while, and then gets up and falls a feeding; but the fureft fign is when he voids them with his dung.

For the cure of bots in the ftomach, we have already taken notice that calomel fhould firft be given in large quantities, and repeated at proper intervals, (fee p. 554. col. 1.) Æthiops mineral, or fome of the under-mentioned forms, may be given afterwards.

But bots in the ftrait gut may be cured by giving the horfe a fpoonful of favin, cut very fmall, once or twice a-day in his oats or bran, moiftened; and three or four cloves of garlick may be added to advantage. Give alfo an aloetic purge between whiles; the following ftands recommended.

Take fine fuccotrine aloes, ten drams; frefh jallap, one dram; ariftochia, or birthwort, and myrrh powdered,

powdered, of each two drams; oil of savin and amber, of each one dram; syrup of buckthorn enough to form into a ball.

But as the source of worms in general proceeds from a vitiated appetite and a weak digestion, recourse must first be had to mercurials, and afterwards to such things as are proper to strengthen the stomach, promote digestion, and, by destroying the supposed ova, prevent the regeneration of these animals. Thus, two drams of calomel may be given with half an ounce of diapente, and mixed up with conserve of wormwood, over night; and the next morning the above purge: these may be repeated six or eight days. Or the following mercurial purge may be given, which will be less troublesome, and no less efficacious.

Take crude quicksilver two drams, Venice turpentine half an ounce; rub the quicksilver till no glistening appears; then add an ounce of aloes, a dram of grated ginger, thirty drops of oil of savin, and a sufficient quantity of syrup of buckthorn to make a ball.

One of these balls may be given every six days, with the usual precautions in regard to mercurial physic; and these powders intermediately.

Take powdered tin and Æthiops mineral of each half an ounce: give every night in a mash, or among his corn.

The various preparations of antimony and mercury must be given several weeks together, in order to get entire riddance of these vermin. The Æthiops mineral may be given to the quantity of half an ounce a-day; the the mercurius alkalisatus to two drams a day, incorporated with a bit of cordial ball. The cinnabar powders, as directed in the farcy, are no less effectual: and when worms are bred from high feeding, or unwholesome food; rue, garlick, tansy, savin, box, and many other simples, may be given successfully; being for that purpose mixed with their food; as also cut tobacco, from half an ounce to an ounce a-day.

Of the Yellows, *or* Jaundice.

Horses are frequently subject to this distemper; which is known by a dusky yellowness of the eyes; the inside of the mouth and lips, the tongue and bars of the roof of the mouth, looking also yellow. The horse is dull, and refuses all manner of food; the fever is slow, yet both that and the yellowness increase together. The dung is often hard and dry, of a pale yellow, or light pale green. His urine is commonly of a dark dirty brown colour; and when it has settled some time on the pavement, it looks red like blood. He stales with some pain and difficulty; and if the distemper is not checked soon, grows delirous and frantic. The off-side of the belly is sometimes hard and distended; and in old horses, when the liver has been long diseased, the cure is not practicable, and ends fatally with a wasting diarrhæa: but when the distemper is recent, and in young horses, there is no fear of a recovery, if the following directions are observed.

First of all bleed plentifully; and give the laxative glyster (p. 547. col. 1. par. 2. from the bottom) as horses are apt to be very costive in this distemper; and the next day give him this purge.

Take of Indian rhubarb powdered one ounce and a half, saffron two drams, succotrine aloes six drams, syrup of buckthorn a sufficient quantity.

If the rhubarb should be found too expensive, omit it, and add the same quantity of cream of tartar, and half an ounce of Castile soap, with four drams more of aloes. This may be repeated two or three times, giving intermediately the following balls and drink.

Take of Æthiop's mineral half an ounce, millepedes the same quantity, Castile soap one ounce; make into a ball, and give one every day, and wash it down with a pint of this decoction.

Take madder-root and turmerick of each four ounces, burdock root sliced half a pound, Monk's rhubarb four ounces, liquorice sliced two ounces; boil in a gallon of forge-water to three quarts; strain off, and sweeten with honey.

Balls of Castile soap and turmerick may be given also for this purpose, to the quantity of three or four ounces a day, and will in most recent cases succeed.

By these means the distemper generally abates in a week, which may be discovered by an alteration in the horse's eyes and mouth; but the medicines must be continued till the yellowness is intirely removed. Should the distemper prove obstinate, and not submit to this treatment, you must try more potent remedies, *viz.* mercurial physic, repeated two or three times at proper intervals; and then the following balls.

Take salt of tartar two ounces, cinnabar of antimony four ounces, live millepedes and filings of steel of each three ounces, saffron half an ounce, Castile or Venice soap half a pound: make into balls, the size of a pullet's egg, with honey; and give one, night and morning, with a pint of the above drink.

It will be proper, on his recovery, to give two or three mild purges; and if a fat full horse, to put in a rowel.

Of the Disorders of the Kidneys *and* Bladder.

The signs of the kidneys being hurt or affected are, a weakness of the back and loins, difficulty of staling, faintness, loss of appetite, and deadness in the eyes; the urine is thick, foul, and sometimes bloody, especially after a violent strain. A horse diseased in his kidneys can seldom *back*, that is, move strait backwards without pain, which is visible as often as he is put to the trial: the same thing is observable indeed in horses, whose backs have been wrung and wrenched; but with this difference, that in the latter there is seldom any defect or alteration in the urine, except that it is higher coloured.

Bleeding is the prime remedy, and that plentifully, in order to prevent inflammation; and the more so, if a fever attends a difficulty in staling, for then we may suspect the kidneys already inflamed. A rowel in the belly has been found useful; and the following balls may be given twice or thrice a-day, with a pint of marshmallow decoction, in which half an ounce of gum arabic is dissolved, with an ounce of honey.

Take lucatellus-balsam one ounce, spermaceti six drams,

drams; ſal prunella half an ounce; mix into a ball with honey: if the urine is bloody, add half an ounce of Japan earth.

Should the fever continue, bleed largely, give emollient glyſters, and the cooling opening drink, (p. 547. col. 1. par. 3.) till it abates.

If the urine paſſes with difficulty and pain, notwithſtanding theſe means, give this ball, and repeat it twice or thrice a-day till the horſe ſtales freer and without pain, his urine become of a right conſiſtence, and free from any purulent ſettlement.

Take balſam of copivi or Straſburgh turpentine, and Venice ſoap, of each one ounce, nitre ſix drams, myrrh powdered two drams; make into a ball with honey, and waſh it down with the marſhmallow decoction.

As a ſuppreſſion of urine ariſes ſometimes from an inflammation of the kidney; ſo at others, from a paralytic diſorder, diſabling them in their office of ſeparating the urine from the blood: in this latter caſe, the bladder is uſually empty, ſo that a horſe will make no motion to ſtale; and if he continues a few days in this condition, his body will ſwell to a great degree, breaking out in blotches all over, and death will ſoon cloſe the ſcene.

If it ariſes from inflammation, bleed largely, and treat the horſe as above recommended; but if not, give ſtimulating glyſters, and ſtrong diuretics, ſuch as the following balls, once in four hours: for if a horſe ſtales not in thirty hours, his danger muſt be great.

Take juniper-berries powdered one ounce, ſal prunella ſix drams, ætherial oil of turpentine half an ounce, camphor one dram, oil of juniper two drams; make into a ball with honey, and give after it three or four horns of the marſhmallow decoction and honey.

Or,

Take ſquills powdered two or three drams, nitre half an ounce or ſix drams; make into a ball with honey.

If the complaint is not removed by theſe means, rub the horſe's reins well with two parts of oil of turpentine, and one of oil of amber; and apply a poultice of garlick, horſe raddiſh, muſtard-ſeed, camphor, and green ſoap, ſpread on thick cloth, over them. Give the horſe alſo two drams of calomel over night, and a moderate purge the next morning. Theſe perhaps are the chief and beſt remedies that can be given in this generally fatal diſorder.

When the ſtrangury in a horſe does not ariſe from wind, or dung preſſing on the neck of the bladder (as was obſerved in the Section on Cholicks) the cauſe is from inflammation, or too long a retention of the urine. Such horſes make frequent motions to ſtale, ſtand wide and ſtraddling, are full, and have their flanks diſtended. In this caſe bleed largely; give the following drink, and repeat it every two hours, for two or three times, till the horſe is relieved.

Take Venice turpentine, broke with the yolk of an egg, one ounce, nitre or ſal prunella ſix drams, half a pint of ſweet oil, and a pint of white wine.

If this drink ſhould not have the deſired effect, the diuretic ball above mentioned may be given in the ſame manner, omitting the myrrh.

Give the horſe plenty of the marſhmallow decoction, in a quart of which diſſolve an ounce of nitre and gum arabic, and two of honey.

Horſes ſubject to a *diabetes*, or profuſe ſtaling, if old, or of a weak conſtitution, are ſeldom cured; they ſoon loſe their fleſh and appetite, grow feeble, their coat ſtaring, and they die rotten. Of a young horſe there are more hopes; but he muſt not be indulged with too much water, or moiſt food. Give him the following:

Take jeſuit's bark four ounces, biſtort and tormentil-root of each two ounces; boil in two gallons of lime-water to the conſumption of half, and give a pint three times a-day.

As this diſorder generally proceeds from too violent exerciſe, over-ſtraining, *&c.* repeated bleedings in ſmall quantities are abſolutely neceſſary, till the mouths of the veſſels cloſe up.

Of Molten-grease.

By molten-greaſe is meant a fat or oily diſcharge with the dung, and ariſes from a colliquation, or melting down of the fat of a horſe's body by violent exerciſe in very hot weather. It is always attended with a fever, heat, reſtleſſneſs, ſtarting and tremblings, great inward ſickneſs, ſhortneſs of breath, and ſometimes with the ſymptoms of a pleuriſy. His dung will be extremely greaſy, and he will fall into a ſcouring; his blood will have a thick ſkin or fat over it when cold, of a white or yellow hue, but chiefly the latter; the congealed part or ſediment is commonly a mixture of ſize and greaſe, which makes it ſo extremely ſlippery, that it will not adhere to the fingers, and the ſmall portion of ſerum feels alſo ſlippery and clammy. The horſe ſoon loſes his fleſh and fat, which probably is diſſolved and abſorbed into blood; and thoſe that ſurvive this ſhock, commonly grow hidebound for a time, their legs ſwelling both before and behind, and continue in this ſtate till the blood and juices are rectified; and if this is not done effectually, the farcy, or ſome obſtinate ſurfeit, generally follows, very difficult to remove.

In the firſt place bleed plentifully, and repeat it for two or three days ſucceſſively in ſmaller quantities; two or three rowels ſhould alſo be immediately put in, and the cooling emollient glyſters (p. 547. col. 1. par. 2. from the bottom) daily thrown up to abate the fever, and drain off the greaſy matter from the inteſtines. By the mouth give plenty of warm water or gruel, with cream of tartar or nitre, to dilute and attenuate the blood, which in this caſe is greatly diſpoſed to run into grumes, and endanger a total ſtagnation.

When the fever is quite gone off, and the horſe has recovered his appetite, gentle aloetic purges ſhould be given once a-week, for a month or ſix weeks, in order to bring down the ſwelled legs. To this end give the following, which, reapeated for ſome time, will entirely remove this diſorder.

Take of ſuccotrine aloes ſix drams, of gum guaiacum powdered

powdered half an ounce, of diaphoretic antimony and powder of myrrh of each two drams; make into a ball with ſyrup of buckthorn.

Theſe will ſeldom take a horſe from his buſineſs above two or three days in a week; neither will he loſe his fleſh or appetite with them, but on the contrary mend in both; which cannot be obtained by any other method of purging, and gives this greatly the preference in many caſes.

Of Surfeits, Mange, *and* Hide-bound.

Surfeits ariſe from various cauſes; but are commonly the effects of ſome diſeaſes not attended to, or that have been ill cured.

A horſe is ſaid to be ſurfeited, when his coat ſtares, and looks ruſty and dirty, though proper means has not been wanting to keep him clean. The ſkin is full of ſcales and dander, that lies thick and meally among the hair, and is conſtantly ſupplied with a freſh ſucceſſion of the ſame, for want of due tranſpiration. Some horſes have hurdles of various ſizes like peas or tares; ſome have dry fixed ſcabs all over their limbs and bodies; others a moiſture, attended with heat and inflammation; the humours being ſo ſharp, and violently itching, that the horſes rub ſo inceſſantly, as to make themſelves raw. Some have no eruptions at all, but an unwholeſome look, and are dull, ſluggiſh and lazy; ſome appear only lean and hide-bound: others have flying pains and lameneſs, reſembling a rheumatiſm; ſo that in the ſurfeits of horſes, we have almoſt all the different ſpecies of the ſcurvy and other chronical diſtempers.

The following method is uſually attended with ſucceſs in the dry ſpecies. Firſt take away about three or four pounds of blood, and then give the following mild purge, which will work as an alterative, and ſhould be repeated once a-week, or ten days, for ſome time.

Take ſuccotrine aloes ſix drams or one ounce, gum guaiacum half an ounce, diaphoretic antimony and powder of myrrh of each two drams; make into a ball with ſyrup of buckthorn.

In the intermediate days, an ounce of the following powder ſhould be given, morning and evening, in his feeds.

Take native cinnabar, or cinnabar of antimony, finely powdered, half a pound; crude antimony, in fine powder, four ounces; gum guaiacum, alſo in powder, four ounces: make into ſixteen doſes for eight days.

This medicine muſt be repeated till the horſe coats well, and all the ſymptoms of ſurfeit diſappear.

The wet furfeit, which is no more than a moiſt running ſcurvy, appears on different parts of the body of a horſe, attended ſometimes with great heat and inflammation; the neck oftentimes ſwells ſo in one night's time, that great quantities of a hot briny humour iſſues forth, which, if not allayed, will be apt to collect on the poll or withers, and produce the poll-evil or fiſtula. This diſeaſe alſo frequently attacks the limbs, where it proves obſtinate and hard to cure: and in ſome horſes ſhews itſelf ſpring and fall.

In this caſe bleed plentifully, avoid externally all repellers, and give cooling phyſic twice a-week; as, four ounces of lenitive electuary, with the ſame quantity of cream of tartar; or the latter, with four ounces of Glauber's ſalts, quicked, if thought proper, with two or three drams of powder of jallap, diſſolved in water-gruel, and given in a morning faſting.

After three or four of theſe purges. two ounces of nitre made into a ball with honey may be given every morning for a fortnight; and if attended with ſucceſs, repeated for a fortnight longer.

The powders above-mentioned may be alſo given with the horſe's corn; or a ſtrong decoction of guaiacum ſhavings or logwood may be given alone to the quantity of two quarts a-day. Theſe, and indeed all alterative medicines, muſt be continued for a long time, where the diſorder proves obſtinate.

The diet ſhould be cool and opening, as ſcalded bran or barley; and if the horſe is hide-bound, an ounce of fenugreek-ſeeds ſhould be given in his feeds for a month or longer; and, as this diſorder often proceeds from worms, give the mercurial phyſic too, and afterwards the cinnabar powders, as above directed; but as in general, it is not an original diſeaſe, but a ſymptom only of many, in the cure regard muſt be had to the firſt cauſe: thus, as it is an attendant on ſurfeits, fevers, worms, *&c.* the removal of this complaint muſt be variouſly effected.

In a mangy horſe the ſkin is generally tawny, thick, and full of wrinkles, eſpecially about the mane, the loins and tail; and the little hair that remains in thoſe parts ſtands almoſt always ſtrait out or briſtly: the ears are commonly naked and without hair, the eye and eyebrows the ſame; and when it affects the limbs, it gives them the ſame aſpect; yet the ſkin is not raw, nor peels off, as in the hot inflamed ſurfeit.

Where this diſtemper is caught by infection, if taken in time it is very eaſily cured: and we would recommend a ſulphur ointment as moſt effectual for that purpoſe, rubbed in every day. To purify and cleanſe the blood, give antimony and ſulphur for ſome weeks after. There are a great variety of external remedies for this purpoſe, ſuch as train-oil and gun-powder, tobacco ſteeped in chamber-lye, *&c.* Solleyſell recommends the following.

Take burnt alum and borax in fine powder of each two ounces, white vitriol and verdegreaſe powdered of each four ounces; put them into a clean pot, with two pounds of honey, ſtirring till they are incorporated; when cold, add two ounces of ſtrong aqua-fortis.

But when this diſorder is contracted by low feeding, and poverty of blood, the diet muſt be mended, and the horſe properly indulged with hay and corn. The following ointments are effectually uſed for this diſorder, rubbed into the parts affected every day.

Take powdered brimſtone, train-oil, and tar, of each equal quantities; to which may be added ginger, or white hellebore.

Or,

Take ſulphur vivum half a pound, crude ſal armoniac one ounce, hogs lard or oil a ſufficient quantity to form into an ointment.

Theſe

Theſe are both very powerful remedies for this diſorder, and can ſcarce fail of ſucceſs.

Of the Farcin *or* Farcy.

The true farcy is properly a diſtemper of the blood-veſſels, which generally follows the tract of the veins, and, when inveterate, thickens their coats and integuments, ſo that they become like ſo many chords. We ſhall not deſcribe the different ſorts of farcies, ſeeing they are only degrees of one and the ſame diſtemper; but proceed to paint the diſtemper by its ſymptoms, which are pretty manifeſt to the eye.

At firſt, one or more ſmall ſwellings, or round buds like grapes or berries, ſpring out over the veins, and are often exquiſitely painful to the touch; in the beginning they are hard, but ſoon turn into ſoft bliſters, which when broke diſcharge an oily or bloody ichor, and turn into very foul and ill-diſpoſed ulcers. In ſome horſes it appears on the head only; in ſome on the external jugular; in others on the plate vein, and runs downwards on the inſide of the fore-arm towards the knee, and very often upwards towards the briſket: in ſome the farcy ſhews itſelf on the hind-parts, about the paſterns, and along the large veins on the inſide of the thigh, riſing upwards into the groin, and towards the ſheath; and ſometimes the farcy makes its appearance on the flanks, and ſpreads by degrees towards the lower belly, where it often becomes very troubleſome.

When the farcy appears on the head only, it is eaſily cured; eſpecially when it is ſeated in the cheeks and forehead, the blood-veſſels being here ſmall: but it is more difficult when it affects the lips, the noſtrils, the eyes, the kernels under the jaws, and other ſoft and looſe parts, eſpecially if the neck-vein becomes chorded. When it begins on the outſide of the ſhoulder or hips, the cure is ſeldom difficult: but when the farcy ariſes on the plate-vein, and that vein ſwells much, and turns corded, and the glands or kernels under the arm-pit are affected, it is hard to cure; but more ſo when the crural veins within ſide of the thigh are corded, and beſet with buds, which affects the kernels of the groin and the cavernous body of the yard. When the farcy begins on the paſterns or lower limbs, it often becomes very uncertain, unleſs a timely ſtop is put to it; for the ſwelling in thoſe dependant parts grows ſo exceſſively large in ſome conſtitutions, and the limbs ſo much disfigured thereby with foul ſores and callous ulcerations, that ſuch a horſe is ſeldom fit for any thing afterwards but the meaneſt drudgery: but it is always a promiſing ſign, wherever the farcy happens to be ſituate, if it ſpreads no further. It is uſual to affect only one ſide at a time; but when it paſſes over to the other, it ſhews great malignancy: when it ariſes on the ſpines, it is then for the moſt part dangerous, and is always more ſo to horſes that are fat and full of blood, than to thoſe that are in a more moderate caſe. When the farcy is epidemical, as ſometimes happens, it riſes on ſeveral parts of the body at once, forms naſty foul ulcers, and makes a profuſe running of greeniſh bloody matter from both noſtrils; and ſoon ends in a miſerable rot.

When the farcy makes its firſt appearance on the head, it riſes on the cheeks and temples, and looks like a net-work, or ſmall creeping twigs full of berries. Sometimes it inflames the eye, and ſometimes little bliſters or buds run along the ſide of the noſe. It ariſes often on the outſide of the ſhoulder, running along the ſmall veins with heat and inflammation; and ſometimes a few ſmall buds appear near the withers, and on the outſide of the hip. In all theſe appearances, the diſeaſe being ſuperficial, and affecting only the ſmaller veſſels, is eaſily conquered by the following method, when taken in time; for the ſimpleſt farcy, if neglected, may degenerate into the worſt ſort.

This diſtemper, then, being of an inflammatory nature, and in a particular manner affecting the blood veſſels, muſt neceſſarily require large bleeding, particularly where the horſe happens to be fat and full of blood. This always checks the beginning of a farcy, but is of ſmall ſervice afterwards; and if a horſe is low in fleſh, the loſs of too much blood ſometimes proves injurious. After bleeding, let the horſe have four ounces of cream of tartar and lenitive electuary; which may be given every other day for a week, to cool the blood, and open the body; and then give nitre three ounces a-day for three weeks or a month, and anoint the buds and ſwellings with the following ointment twice a-day.

Take ointment of elder four ounces, oil of turpentine two ounces, ſugar of lead half an ounce, white vitriol powdered two drams; mix together in a gally-pot.

The buds ſometimes by this method are diſperſed, leaving only little bald ſpots, which the hair ſoon covers again. When they break and run, if the matter be thick and well digeſted, they will ſoon be well: but in order to confirm the cure, and to diſperſe ſome little lumps which often remain for ſome time on the ſkin without hair, give the liver of antimony for a month; two ounces a-day for a fortnight, and then one ounce a-day for the other fortnight: by following this method, a farcy which affects only the ſmall veſſels, may be ſtopped in a week or ten days, and ſoon after totally eradicated.

When the farcin affects the larger blood-veſſels, the cure is more difficult; but let it always be attempted early: therefore on the plate, thigh, or neck veins appearing chorded, bleed immediately on the oppoſite ſide, and apply the following to the chorded vein.

Take oil of turpentine in a pint bottle ſix ounces, oil of vitriol three ounces; drop the oil of vitriol into the oil of turpentine by little at a time, otherwiſe the bottle will burſt; when it has done ſmoaking, drop in more oil of vitriol, and ſo on till all is mixed.

This mixture is one of the beſt univerſals in a beginning farcy; but where it is ſeated in looſe fleſhy parts, as flanks or belly, equal parts of the oil of vitriol and turpentine are neceſſary.

Rub the parts firſt with a woollen cloth; and then apply ſome of the mixture over the buds, and where-ever there is any ſwelling, twice a-day. Give the cooling phyſic every other day, and then three ounces of nitre every day for ſome time.

When the farcy begins on the flanks, or towards the lower belly, it often takes its riſe from a ſingle puncture of

of a sharp spur. The pain and smarting is one sure sign to distinguish the farcy from common accidents; the staring of the hair, which stands up like a tuft all round the buds or blisters, and the matter that issues from the buds, which is always purulent and of a clammy greasy consistence, are other certain signs. After bathing with the mixture above mentioned till the ulcers are smooth and healing, should the swelling not subside, to prevent the spreading of the buds, and to disperse them, bathe with either of these mixtures as far as the centre of the belly; and at the same time give a course of antimonials, as will presently be prescribed.

Take spirits of wine four ounces, oil of vitriol and turpentine, of each two ounces, white-wine vinegar, or verjuice, six ounces.

Or the following:

Take spirits of wine rectified four ounces, camphor half an ounce, vinegar or verjuice six ounces, white vitriol, dissolved in four ounces of spring water, one ounce; mix together.

In the lower limbs the farcy lies sometimes concealed for a great while, and makes so slow a progress, that it is often mistaken for grease, or for a blow or kick, and goes by the general appellation of a humour settled there. In order to distinguish the one from the other, we shall observe that a kick, or bruise, is generally attended with a sudden swelling, or a contused wound, which for the most part digests easily: the grease is also a smooth swelling that breaks out above the bending of the pasterns backwards; but the farcy begins on the pastern joint usually with one bud, and runs upwards like a knotty crab-tree.

Very simple means have sometimes stopped it, before it has begun to spread; a poultice with bran and verjuice bound round the part, and renewed once a-day, will often alone succeed; and if proud flesh should arise, touch it with oil of vitriol, or aqua fortis, an hour before you apply the poultice; for when the distemper is local, as we suppose it here, it is to be conquered by outward applications.

When the distemper grows inveterate, and resists the above method, and the vessels continue chorded, Gibson recommends the following mixture.

Take linseed oil half a pint; oil of turpentine and salt-petre, of each three ounces; tincture of euphorbium and hellebore, of each two drams; the soldiers ointment two ounces; or oil of bays, or oil of origanum, half an ounce; double aqua fortis half an ounce: after the ebullition is over, add two ounces of Barbadoes tar.

Rub this into the chorded veins, and where-ever there is a swelling, once in two or three days; but if the orifices are choaked up with proud flesh, or the skin so much thickened over the ulcers as to confine the matter, in either case it is necessary to make an open passage with a small hot iron, and destroy the proud flesh, after which it may be kept down by touching with oil of vitiol, aqua fortis, or butter of antimony. A salve may also be prepared with quicksilver and aqua fortis, rubbing any quantity of the former with enough of the latter, to the consistence of a liniment; smear the ulcers with this whenever they appear foul, and you will find it preferable to most other eating medicines.

Our farriers, after opening the buds, put in usually a small quantity of corrosive sublimate or arsenic, which they call coring out the farcy; this may answer where the buds are few, and not situated near large blood-vessels, joints, or tendons: others use Roman vitriol, or sublimate and vitriol, in equal quantities: but let it be remembered, that many a horse has been poisoned by these medicines ignorantly used, and in too large quantities.

The following balls are proper in every state of the farcy; and when the distemper has been in its infancy, before the skin was much defaced, has often cured it in a week or two, by giving them only once or twice a-day: but in an old farcy they should be given for two or three months together.

Take of native cinnabar, or cinnabar of antimony, eight ounces; long bithwort and gum guaiacum powdered, of each four ounces: make into a paste with honey, and form into balls of the size of a large walnut, and roll them into liquorice powder.

The tediousness of this course has encouraged the giving of mercurials; and indeed where they are directed with skill, they must be attended with success: the stronger preparations, as the red and white precipitates, and turbith, being combined with sharp saline parts, may be hazardous and injurious; but the latter given in small quantities have been found very successful in such kind of inveterate disorders. Mr Gibson says, he has given it to a dram at a doze, where the limbs have been greatly swelled; that in forty-eight hours the sores were all dried up, and the limbs reduced; but that it made the horse so violently sick for several days, and scoured him to such a degree, that it could not be repeated.

One would have thought that the success attending this medicine so suddenly, might have encouraged Gibson to have made further trials in smaller quantities; which had he done, it is more than probable he would not have been disappointed: for the grand secret in giving mercurials as alteratives, is the introducing them into the blood, without operating on the stomach and bowels; and to do this effectually, they must be given in small quantities, and so bridled as to controul their force on the first passages; taken in this manner, they will mix gradually with the blood and juices, and operate both effectually and safely.

Dr Bracken recommends the knots and chords to be rubbed with the mercurial ointment before they break, in order to disperse them; and after breaking, to dress the sores with equal parts of Venice turpentine and quicksilver: if by these means the mouth should become sore, treat as above.—This method seems to be effectual with proper care.

The following is also recommended by the same gentleman:

Take butter of antimony and bezoar mineral, of each one ounce; beat up with half a pound of cordial ball, and give the bigness of a walnut, or three quarters of an ounce, every day for two or three weeks, fasting two or three hours after it.

We ſhall here take notice of what is called the water-farcy, which has no reſemblance to a true farcy, either in its cauſe, ſymptoms, or effects, but has only obtained this name through cuſtom and ignorance.

This water farcy then is of two kinds; one the product of a feveriſh diſpoſition, terminating on the ſkin, as often happens in epidemical colds; the other is dropſical, where the water is not confined to the belly and limbs, but ſhews itſelf in ſeveral parts of the body by ſoft ſwellings yielding to the preſſure of the finger. This laſt kind uſually proceeds from foul feeding, or from the latter graſs and fog, that often comes up in great plenty with continued cold rains, and breeds a ſluggiſh viſcid blood. In the former caſe, we have ſeen the limbs and whole body enormouſly ſwelled, and very hard, the belly and ſheath greatly diſtended; which were as ſurpriſingly reduced in four and twenty hours, by ſlight ſcarifications within ſide the leg and thigh, with a ſharp penknife, and three or four ſtrokes on the ſkin of the belly on each ſide the ſheath; from theſe ſcarifications there was a conſtant and ſurpriſing large dripping of water, which ſoon relieved the horſe; when a few purges compleated his recovery.

In the other ſpecies of dropſy the curative intentions are to diſcharge the water, recover the craſis or ſtrength of the blood, and brace up the relaxed fibres throughout the whole body. To this end, purge once a-week or ten days; and give intermediately either of the following.

Take black hellebore freſh gathered, two pounds; waſh, bruiſe, and boil in ſix quarts of water, to four; and then ſtrain out the liquor, and put two quarts of white-wine on the remaining hellebore, and let it infuſe warm forty-eight hours; then ſtrain off, mix both together, and give the horſe a pint night and morning.

Take nitre two ounces, ſquills powdered three drams or half an ounce, camphor one dram, honey enough to form into a ball, to be given once a-day alone, or waſhed down with a horn or two of the above drink.

Before we cloſe this ſection, it is proper to lay down the ſymptoms of an incurable farcy, that the owners of ſuch horſes may ſave themſelves unneceſſary expence and trouble in their endeavours to obtain a cure.

When a farcy, by improper applications, or by neglect, has ſpread and increaſed, or after long continuance reſiſted the medicines above recommended; if freſh buds are continually ſprouting forth, while the old ones remain foul and ill conditioned; if they riſe on the ſpines of the back and loins; if the horſe grows hide-bound, and runs at the noſe; if abſceſſes are formed in the fleſhy parts between the interſtices of the large muſcles; if his eyes look dead and lifeleſs; if he forſakes his food, and ſcours often, and his excrements appear thin and of a blackiſh colour; if the plate or thigh vein continues large and chorded after firing, and other proper applications: theſe ſymptoms denote the diſtemper to have penetrated internally, and that it will degenerate into an incurable conſumption: it is moſt probable alſo, that the whole maſs of fluids are tainted, and become irremediable by art.

Of Alterative Medicines.

By alteratives, or altering medicines, are to be underſtood ſuch as, having no immediate ſenſible operation, gradually gain upon the conſtitution, by changing the humours or juices from a ſtate of diſtemperature to health. This intention in ſome caſes may perhaps be effected by correcting the acrimony of the juices, and accelerating the blood's motion; and in others by attenuating, or breaking its particles, and dividing thoſe coheſions which obſtruct the capillaries or finer veſſels; and ſo promote the due ſecretions of the various fluids. It is certain, that many have but an indifferent opinion of a medicine that does not operate externally, and gratify their ſenſes with a quantity of imagined humours ejected from the body: but let ſuch people remember, that there are good humours as well as bad, which are thrown off together; that no evacuating medicine has a power of ſelecting, or ſeparating the bad from the good; and conſequently that they are thrown out only in a proportionate quantity. Theſe few hints may be ſufficient to convince the judicious reader of the great advantages ariſing from alteratives, and the preference due to them in moſt caſes over purgatives; unleſs it could be proved, as already mentioned, that the latter could cull out and ſeparate from the blood the bad humours ſolely, leaving the good behind; but this ſelective power has long been juſtly exploded as ridiculous and uncertain, ſince it is plain, that all kinds of purging medicines differ only in degree of ſtrength, and operate no otherwiſe upon different humours than as they ſtimulate more or leſs.

We ſhall therefore take this opportunity of recommending ſome alterative medicines, which are not ſo generally known as they ought to be; and that too on the ſureſt grounds, a proper experience of their good effects in repeated trials. The firſt then is nitre or purified ſalt-petre, which has long been in great eſteem, and perhaps is more to be depended on in all inflammatory fevers than any other medicine whatever: but beſides this extenſive power of allaying inflammatory diſorders, it is now offered as a remedy, taken in proper quantities, as an alterative for ſurfeits, molten-greaſe, hide-bound, greaſe-heels, *&c.* And as it has been known to ſucceed even in the cure of the farcy, what other diſtempers in horſes, ariſing from vitiated fluids, may it not be tried on, with a ſtrong probability of ſucceſs? This great advantage will ariſe from the uſe of this medicine over moſt others, that, as its operation is chiefly by urine, it requires no confinement or cloathing; but the horſe may be worked moderately throughout the whole courſe. This medicine has been found equally efficacious (by many trials made in one of our hoſpitals) in correcting the acrimony of the juices, and diſpoſing the moſt obſtinate and inveterate ſores to heal up; and hence probably it came recommended as an alterative to our horſes.

The quantity of nitre given at a time ſhould be from two to three ounces a-day; let it be finely powdered, and then mix with it by little at a time as much honey as will

will form it into a ball; give it every morning fasting for a month; or it may be given at first for a fortnight only, intermitting a fortnight, and then repeat it. If it be observed that the horse shews an uneasiness at the stomach after taking it, a horn or two of any liquor should be given after it, or it may be dissolved at first in his water, or mixed with his corn; though the ball, where it agrees, is the easiest method of giving.

When horses take drinks with great reluctance, powders must be given in their feeds; thus crude antimony, or liver of antimony finely powdered, may be given to the quantity of half an ounce, night and morning; but in all surfeits, gum guaiacum mixed with antimony is found more efficacious. Thus,

TAKE of crude antimony finely powdered, or, where it can be afforded, cinnabar of antimony, and gum guaiacum, of each a pound: mix together with an oily pestle to prevent the gum's caking: divide the whole into thirty-two dozes, *viz.* an ounce each doze; let one be given every day in the evening feed.

Or,

TAKE of cinnabar of antimony, gum guaiacum, and Castile or Venice soap, of each half a pound, salt of tartar four ounces; beat them up into a mass, and give an ounce every day. To these may be added very advantageously, an ounce and an half of camphor.

Æthiops mineral given to the quantity of half an ounce a-day, is a very good sweetener and corrector of the blood and juices; but it has been observed, after having been taken a week or ten days, to make some horses slabber, and unable to chew their hay and oats; and the same symptoms have arose, where only two drams of crude mercury has been given, and continued about the same space of time.

Diet Drinks.—1. A decoction of logwood, prepared like that of guaiacum, is also succesfsully given in surfeits.

2. Lime-water, prepared with shavings of sassapharas and liquorice, is a good diet-drink, to sweeten and correct a horse's blood; and may be given with the nitre balls for that purpose.

3. Tar-water also, as has before been hinted, may in many cases be well worth trial: but let it be remembered, that all medicines of this kind should be continued a considerable time in obstinate cases.

Of ROWELLING.

THERE seems to be no remedy so much made use of, and so little understood by farriers in general, as rowels; for which reason we shall endeavour to set the whole affair in a clearer light, than hitherto it has appeared in.

We shall begin then by describing rowelling, which is an artificial vent made between the skin and flesh, in order to unload and empty the vessels in general, and thereby relieve particular parts, when too much oppressed by a fulness or redundancy.

The general and absurd reasoning of farriers on the effects and use of rowelling, in some measure makes this section the more necessary, as it is too notorious how impertinently they talk on this subject: for in short, with them, a rowel is to draw off all the bad and corrupt humours from the blood by a sort of magic.

It is necessary to observe, that the matter generally discharged by a rowel, is nothing more than an ouzing from the extremities of the vessels divided in the making of it; in fact then, it is blood, which loses its colour, by being shed out of the vessels, the warmth of the part, and its confinement.

If this is granted, it will evidently appear, that the good effects ensuing this operation, must be owing to a gradual depletion or emptying of the vessels in general; by which means the surcharge or load on a particular part, is taken off and removed, and impurities or bad juices (generally called humours) run off with the good in proportion to their quantity in the blood.

Thus, to lean hide-bound horses, and those of a dry hot constitution, the discharge, by depriving the constitution of so much blood and fluids, is daily exhausting the strength of the animal; and may be productive of bad consequences, by defrauding the constitution of a necessary fluid.

But in disorders from fulness, attended with acrimony, or sharpness of the juices, and with defluxions on the eyes, lungs, or any part of consequence; the gradual discharge, brought on by these means, will contribute to lessen the fulness on the parts affected, and give the vessels an opportunity of recovering their tone, while evacuating and alterative medicines are doing their office.

It may be necessary, however, to observe, that there is a wonderful communication between the vessels of the cellular membrane under the skin, which remarkably appears, by inflating those of sheep, calves, *&c.* by the butchers; hence probably it is that some disorders of this integument, are so apparently relieved by issues, or rowels, without our having any recourse to that general depletion of the vessels, we have just observed, to account for it; and hence also may be deduced their utility, sometimes in draining off any extravasated fluids, which may lodge between the interstices of the muscles, after violent strains of the shoulder; also in discharging such vitious or sharp fluids as are thrown on the membranes, and occasion those flying pains and lamenesses, which we find are often removed by this local remedy.

Of STRAINS *in* VARIOUS PARTS.

IT is necessary to observe, that in all strains, the muscular or tendinous fibres are overstretched; and sometimes ruptured, or broke. To form therefore a true idea of these disorders, let us first consider every muscle and tendon as composed of springy elastic fibres, which have a proper power of their own to contract and extend themselves; or, to make their action more familiar, let us compare them to a piece of catgut, that we may the better judge with what propriety oily medicines are directed for their cure. Thus then, if by a violent extension of this catgut, you had so overstretched it as to destroy its springiness or elasticity, and was inclined to recover its lost tone; would you for that purpose think of soaking it in oil? And is not the method of treating strains, or overstretched

ftretched mufcles and tendons, full as prepofterous, when you bathe or foak them in oily medicines, at a time that they want reftringents to brace them up? Yet cuftom has fo eftablifhed this practice, and fallacious experience feemingly fo confirmed it, that it would be a difficult tafk to convince the illiterate and prejudiced of the abfurdity, who, by atributting effects to wrong caufes, are led into this error, and the oils ufurp the reputation that is due only to reft and quiet: they feem, however, to be aware of the ill confequences, by their adding the hot oils, as fpike, turpentine, and origanum; which, though they in fome meafure guard againft the too fuppling quality of the other oils, yet the treatment is ftill too relaxing to be of real fervice.

And indeed, in all *violent* ftrains of either tendons or mufcles, whatever opinion we may entertain of bathing and anointing with favourite noftrums, which often fucceed in flight cafes, where perhaps bandage alone would have done; yet it is the latter, with proper refting the relaxed fibres, till they have thoroughly recovered their tone, that are the chief things to be depended on; and frequently fome months are neceffary for effecting the cure.

All violent ftrains of the ligaments, which connect the bones together, efpecially thofe of the thigh, require time, and turning out to grafs, to a perfect recovery. External applications can avail but little here, the parts affected lying too deep, and fo furrounded with mufcles that medicine cannot penetrate to them. The fooner, in thefe cafes, a horfe is turned out to grafs, the better; as the gentle motion in the field will prevent the ligaments and joint oil from thickening, and of courfe the joint itfelf from growing ftiff.

When a horfe's fhoulder is overftrained, he does not put out that leg as the other; but to prevent pain, fets the found foot hardily on the ground to fave the other; even though he be turned fhort on the lame fide, which motion tries him the moft of any. When trotted in hand, inftead of putting his leg forward in a right line, he forms a circle with the lame leg; and when he ftands in the ftable, that leg is advanced before the other.

In order to cure this lamenefs, firft bleed him, and let the whole fhoulder be well bathed three times a day with hot verjuice or vinegar, in which may be diffolved a piece of foap; but if the lamenefs continues without fwelling, or inflammation, after refting two or three days, let the mufcles be well rubbed for a confiderable time, to make them penetrate, with good opodeldoch, or either of the following mixtures:

Take camphorated fpirit of wine, two ounces; oil of turpentine, one ounce; this proportion will prevent the hair coming off.

Or,

Take the beft vinegar, half a pint; fpirit of vitriol, and camphorated fpirit of wine, of each two ounces.

When the fhoulder is very much fwelled, it fhould be fomented with woollen cloths (large enough to cover the whole) wrung out of hot verjuice and fpirit of wine; or a fomentation prepared with a ftrong decoction of wormwood, bay-leaves, and rofemary, to a quart of which may be added half a pint of fpirit of wine.

A rowel in the point of the fhoulder in this cafe often does great fervice; efpecially if the ftrain has been very violent, and the fwelling very large: but as to boring up the fhoulder with a hot iron, and afterwards inflating it, is both a cruel and abfurd treatment; and the pegging up the found foot, or fetting on a patten-fhoe, to bring the lame fhoulder on a ftretch, is a moft prepofterous practice, and directly calculated to render a horfe incurably lame; for it can only be neceffary in cafes the very oppofite to this, where the mufcles have been long contracted, and we want to ftretch them out.

Where poultices can be applied, they are at firft undoubtedly very effectual, after bathing with hot vinegar or verjuice, and are to be preferred greatly to cold charges, which, by drying fo foon on the part, keep it ftiff and uneafy: let them be prepared with oat-meal, rye flour, or bran boiled up in vinegar, ftrong beer or red-wine lees, with lard enough to prevent their growing ftiff; and when by thefe means the inflammation and fwelling is brought down, bathe the part twice a-day with either of the above mixtures, opodeldoch, or camphorated fpirit of wine; and roll the part three or four inches, both above and below, with a ftrong linen roller, of about two fingers width; which contributes not a little to the recovery, by bracing up the relaxed tendon; and perhaps is more to be depended on than the applications themfelves.

In ftrains of the *coffin joint*, that have not been difcovered in time, there will grow fuch a ftiffnefs in the joint, that the horfe will only touch the ground with his toe; and the joint cannot be played with the hand; the only method here is repeated bliftering, and then firing fuperficially.

Strains of the *back finews* are very common, and are eafily difcovered by the fwelling, which extends fometimes from the back-fide of the knee down to the heel, but for the moft part the horfe fets that leg before the other. The tendon fhould be well bathed three or four times a-day with hot vinegar; and if much fwelled, apply the poultices above recommended; and when the fwelling is down, bathe with the mixtures above, or with camphorated fpirit of wine and oil of amber, in which is diffolved as much camphor as the fpirits will take up, and roll up the tendon with a proper bandage, or laced ftocking; which laft, properly fitted to the limb, might be wore to great advantage, not only in thefe fort of injuries, but in moft others, where there is a difpofition to the greafe, or other fwellings of the limbs, from weak and relaxed fibres. Curriers fhavings wetted with vinegar have been found ufeful for this purpofe; as has alfo tar and fpirit of wine: but where the tendons have fuffered by repeated injuries of this kind, the cafe will demand bliftering, firing, and proper reft.

Strains of the *knees* and *pafterns* arife frequently from kicks or blows; if they are much fwelled, apply firft the poultices; and when the fwelling is abated, bathe with the above, or the following.

Take vinegar, one pint; camphorated fpirits of wine, four ounces; white vitriol, diffolved in a little water, two drams.

Or,

Take the white of three or four eggs, beat them into a froth with a fpoon; to which add an ounce of rock

rock allum, finely powdered; ſpirit of turpentine, and wine, of each half an ounce; mix them well together.

As great weakneſs remains in the paſterns after violent ſtrains, the beſt method is to turn the horſe out to graſs till he is perfectly recovered; when this cannot be complied with, the general way is to bliſter and fire.

When a horſe is lame in the *ſtifle*, he generally treads on his toe, and cannot ſet the heel to the ground. Treat him at firſt with the vinegar and cooling reſtringents; but if a large ſwelling, with puffineſs, enſues, foment it well with the diſcutient fomentation till it diſperſes; and then bathe the part with any of the above medicines.

A lameneſs in the *whirl-bone* and hip, is diſcovered by the horſe's dragging his leg after him, and dropping backward on his heel when he trots. If the muſcles of the hip are only injured, this kind of lameneſs is cured eaſily; but when the ligaments of the joint are affected, the cure is often very difficult, tedious, and uncertain. In either caſe, at firſt bathe the parts well with the cooling medicines, four or five times a-day; in the muſcular ſtrain, this method alone may ſucceed; but in the ligamentous, it is reſt and time only can reſtore the injured parts to their proper tone.

Strains in the *hock* are to be treated by ſoaking the parts with coolers and repellers; but when the ligaments are hurt, and they are attended with great weakneſs and pain, uſe the fomentation. If a hardneſs ſhould remain on the outſide, it may be removed by repeated bliſtering; if within, it may be out of the power of any external applications to remove; however, the joint ſhould be fired gently with ſmall razes or lines pretty cloſe together, and then covered with a mercurial plaiſter. To the diſcutient fomentation above mentioned may be added crude ſal armoniac, with a handful of wood-aſhes boiled in it.

The bliſtering ointment for the above purpoſes may be found in the Section of Bone-ſpavin; but the ſublimate ſhould be omitted.

The *firing*, uſed for the ſtrengthening relaxed ſinews or tendons, ſhould act only on the ſkin, which, by contracting and hardening it all round the ſinews, compreſſes them more firmly like a bandage. The bow-men of old ſubmitted to this operation, in order to give ſtrength to the muſcles and tendons of their arms. A proper degree of ſkill is very requiſite to perform it effectually on a horſe; for a due medium ſhould be obſerved, and the inſtrument neither ſo ſlightly applied, as to ſcarify the ſkin only ſuperficially, nor ſo deep as to wound or cauterize the ſinew or its ſheath. The lines ſhould be drawn pretty cloſe together, on each ſide of the joint or ſinew, following the courſe of the hair; no croſs lines ſhould be made, as they but disfigure the horſe afterwards, without any real uſe. The firing inſtrument, or knife, ought to be a little rounded on the edge, gradually thickening to the back, that it may retain the heat for ſome time, but ſhould not be applied till the flaming redneſs is partly gone off. The cauterized parts may be bathed with ſpirit of wine at firſt, and anointed afterwards with bees-wax and oil, which alone is ſufficient to complete the cure.

Of Tumours *and* Imposthumes.

Tumours, or ſwellings, ariſe either from external injuries, or internal cauſes.

Swellings, cauſed by external accidents, as blows and bruiſes, ſhould at firſt be treated with reſtringents; thus, let the part be bathed frequently with hot vinegar or verjuice, and, where it will admit of bandage, let a flannel wetted with the ſame be rolled on: if by this method the ſwelling does not ſubſide, apply, eſpecially on the legs, a poultice with red-wine lees, ſtrong-beer grounds, and oatmeal, or with vinegar, oil, and oatmeal; either of theſe may be continued twice a-day, after bathing, till the ſwelling abates; when, in order to diſperſe it entirely, the vinegar ſhould be changed for camphorated ſpirit of wine, to four ounces of which may be added one of ſpirit of ſal armoniac; or it may be bathed with a mixture of two ounces of crude ſal armoniac boiled in a quart of chamber-lye, twice a day, and rags dipped in the ſame may be rolled on.

Fomentation made by boiling worm-wood, bay-leaves, and roſemary, and adding a proper quantity of ſpirits, are often of great ſervice to thin the juices, and fit them for tranſpiration; eſpecially if the injury has affected the joints.

But in bruiſes, where the extravaſated blood will not by theſe means be diſperſed, the ſhorteſt way is to open the ſkin, and let out the grumes.

Critical tumours, or ſwellings, which terminate fevers, ſhould by no means be diſperſed; except when they fall on the paſtern or coffin-joint, ſo as to endanger them: in this caſe the diſcutient fomentation, (p. 568. col. 1. bottom) ſhould be applied three or four times a-day, and a cloth or flannel frequently wrung out of the ſame ſhould be bound on, in order to keep the joint continually breathing.

But if the ſwelling fixes under the jaws, behind the ears, on the poll, withers, or in the groins and ſheath, *&c.* it ſhould be encouraged and forwarded by ripening poultices where-ever they can be applied; oatmeal boiled ſoft in milk, to which a proper quantity of oil and lard is added, may anſwer this purpoſe; or the poultice recommended in the Section of Strangles: theſe muſt be applied twice a-day, till the matter is perceived to fluctuate under the fingers, when it ought to be let out; for which purpoſe, let the tumour be opened with a knife or ſtrong lancet, the whole length of the ſwelling, if it can be done ſafely; for nothing contributes ſo much to a kind healing, as the matter's having a free diſcharge, and the openings being big enough to dreſs to the bottom.

Pledgets of tow, ſpread with black or yellow baſilicon (or the wound ointment) and dipped in the ſame, melted down with a fifth part of oil of turpentine, ſhould be applied to the bottom of the ſore, and filled up lightly with the ſame, without cramming; it may be thus dreſſed once or twice a-day, if the diſcharge is great, till a proper digeſtion is procured, when it ſhould be changed for pledgets ſpread with the red precipitate ointment, applied in the ſame manner.

Should the fore not digeft kindly, but run a thin water and look pale, foment, as often as you drefs, with the above fomentation; and apply over your dreffing the ftrong-beer poultice, and continue this method till the matter grows thick, and the fore florid.

The following ointments will generally anfwer your expectations in all common cafes, and may be prepared without, as well as with, the verdegreafe.

TAKE Venice turpentine and bees-wax of each a pound, oil of olives one pound and a half, yellow rofin twelve ounces; when melted together, two or three ounces of verdegreafe, finely powdered, may be ftirred in, and kept fo till cold, to prevent its fubfiding.

TAKE of yellow bafilicon, or the above ointment, without verdigreafe, four ounces; red precipitate, finely powdered, half an ounce: mix them together cold with a knife or fpatula.

This laft, applied early, will prevent a fungus, or proud flefh, from fhooting out; for if you drefs too long with the above digeftive, the fungus will rife faft, and give fome trouble to fupprefs it; when it will be neceffary to wafh the fore as often as you drefs, with a folution of blue vitriol in water, or to fprinkle it with burnt alum and precipitate. If thefe fhould not be powerful enough, touch with a cauftic, or wafh with the fublimate water, made by diffolving half an ounce of corrofive fublimate in a pint of lime-water.

But this trouble may in a great meafure be prevented, if the fore is on a part where bandages can be applied with compreffes of linen cloath: for even when thefe excrefcences regerminate, as it were under the knife, and fpring up in fpite of the cauftics above mentioned, they are to be fubdued by moderate compreffion made on the fprouting fibres, by thefe means.

Authors on farriery have given in general very proper receipts to anfwer every intention of this kind by medicines; but as they have not laid down fufficient rules for their application in thofe cafes where they are moft wanted, the following general directions will not be unacceptable; as the difficulty in healing fome kinds of fores arifes frequently from the unfkilful manner of dreffing them.

It may be neceffary then to obferve here, once for all, that the cures of moft fores are affected by the fimpleft methods, and that it is often of much more confequence to know how to drefs a fore, than what to drefs it with; and in this confifts indeed the chief art of this branch of furgery; for the moft eminent in that profeffion have long fince difcovered, that variety of ointments and falves are unneceffary in the cure of moft wounds and fores, and they have accordingly difcarded the greateft part, formerly in repute for that purpofe; repeated obfervations having taught them, that after the digeftion, nature is generally difpofed to heal up the wound faft enough herfelf, and that the furgeon's chief care is to prevent a luxuriancy, commonly called proud flefh; which all ointments, wherein lard or oil enters, are but too prone to encourage, as they keep the fibres too lax and fupple; and which dry lint alone, early applied, as eafily prevents, by its abforbing quality, and light compreffion on the fprouting fibres.

Thus, if a hollow wound or fore is crammed with tents, or the dreffings are applied too hard, the tender fhoots of flefh from the bottom are prevented pufhing up; and the fides of the fore in time from this diftenfion may grow horny, and turn fiftulous; nor has the matter by this method a free difcharge.

On the other hand, if fores of any depth are dreffed fuperficially, the external parts being more difpofed to heal and come together than the internal, they will fall into contact, or heal too foon; and the fore, not filling up properly from the bottom, will break out afrefh.

Hence we may juftly conceive how little ftrefs is to be laid on famous ointments, or family falves, unfkilfully applied; for unlefs this due medium is obferved, or obtained in the dreffing, no hollow fore can heal up properly.

As foon then as a good digeftion is procured (which is known by the thicknefs and whitenefs of the matter difcharged, and the florid red colour at the bottom of the fore) let the dreffings be changed for the precipitate medicine; or the fore may be filled up with dry lint alone, or dipped in lime-water with a little honey and tincture of myrrh, or brandy, about a fifth part of the latter to one of the former; a pledget of lint dipped in this mixture fhould alfo be applied to the bottom of the fore, which fhould be filled up with others to the furface or edges, but not crammed in too hard, as before obferved, nor yet applied too loofely.

By this method, the fore would incarn, or heal up properly, and foft fpongy flefh would be prevented, or fuppreffed in time; whereas when ointments or falves are too long continued, a fungus, or proud flefh, is thereby fo encouraged in its growth, that it requires fome time to deftroy and eat it down again: a proper comprefs of cloth, and a linen roller, is abfolutely neceffary both for this purpofe, and to fecure on the dreffings, where ever they can conveniently be applied.

Of WOUNDS *in General.*

IN all frefh wounds made by cutting inftruments, there is nothing more required than bringing the lips of the wound into contact by future or bandage, provided the part will allow of it; for on wounds of the hips, or other prominent parts, and acrofs fome of the large mufcles, the ftitches are apt to burft on the horfe's lying down and rifing up in the ftall; in fuch cafes the lips fhould not be brought clofe together: one ftitch is fufficient for a wound two inches long; but in large wounds, they fhould be at an inch or more diftance; and if the wound is deep in the mufcles, care fhould be taken to pafs the needles proportionably deep, otherwife the wound will not unite properly from the bottom.

Should the wound bleed much from an artery divided, the firft ftep fhould be to fecure it, by paffing a crooked needle underneath, and tying it up with a waxed thread: if the artery cannot be got at this way, apply a button of lint or tow to the mouth of the bleeding veffel, dipped in a ftrong folution of blue vitriol, ftyptic water, oil of vitriol, or hot oil of turpentine, powdered vitriol, or colcothar, *&c.* and remember always to apply it clofe to the mouth of the bleeding veffels,

veffels, and take care that it is kept there by proper comprefs and bandage, till an efchar is formed; otherwife it will elude your expectations, and frequently alarm you with frefh bleedings.

In a memoir prefented to the Royal Academy of Sciences by M. La Foffe, he gives an account of the fuccefs he had met with in ftopping the bleedings of very confiderable arteries in horfes, by the application of the powder of puff-balls, the arteries cicatrizing by this means only, without any fucceeding hæmorrhage. This Lycoperdon, or puff-ball, was made ufe of for this purpofe in human fubjects, about 160 years ago, by Felix Wurtz, a famous old furgeon in Germany; but he does not feem to have a thought of trufting to it in fuch confiderable arteries as M. La Foffe mentions, *viz.* thofe of the leg and thigh, the bleedings from which divided veffels he ftopt in a few minutes by the ufe of this powder only. The agaric of the oak may alfo be ufed for this purpofe, where it can be retained by a proper bandage.

Thefe applications, as indeed all ftyptics, feem to act by conftringing the extremity of the veffel, or choaking it up, till a grume of blood is formed internally, which plugs up the orifice; and has been found to adhere to it fo, as to conftitute one body with the veffel.

We avoid fetting down any famous receipts for frefh wounds, whether ointments, or Fryar's balfams, being well affured, that in a healthy found conftitution, nature furnifhes the beft balfam, and performs herfelf the cure, which is fo often attributed to the medicine; when it is otherwife, and the blood is deprived of its balfamic ftate, as will appear from the afpect of the wound, and its manner of healing, it muft be rectified by proper internal medicines, before a good foundation for healing can be laid by any external applications whatever.

The lips of the wound then being brought together by the needle or bandage, it needs only to be covered with rags dipped in brandy, or a pledget of tow fpread with the wound ointment, (fee p. 570. col. 1. par. 3.) the directions in the preceding fections being obferved, and the wounded part kept as much as poffible from motion.

Punctured wounds from thorns, or any other accidents, fhould be treated in the fame manner; applying the beer, or bread and milk poultice over the dreffing, till fome figns of digeftion appear; and fomenting the part well every day. This method is alfo very fuccefsfully ufed to thofe fwellings, which often arife on the neck from bleeding, the fores being fprinkled with precipitate, and burnt alum powdered, to fetch out the core, or fungus, which choaks up the orifice. The ufual method is to introduce a piece of vitriol, or fublimate, which often brings on a plentiful difcharge, fetches out the core, and makes a cure; but it is often with the lofs of the vein, and it fometimes leaves a large fwelling and impofthumation.

In gun-fhot wounds, when the ball has not penetrated too deep, it fhould be extracted, if it can be fetched away without difturbance, together with any extraneous bodies that might pafs in with it; the wound fhould be dreffed with the old digeftive of Venice or common turpentine, divided with the yolks of eggs, to which may be added fome honey and tincture of myrrh. The entrance of thefe wounds frequently requires to be enlarged, and a depending orifice fhould always be procured if poffible; and if the wound fhould not digeft kindly, apply the beer poultice, and foment with the difcutient fomentation, p. 569. col. 2. par. 3.

In fcalds, or burns from gun-powder, or any other caufe, when the fkin remains entire, bathe the part well, and keep it foaked with rags dipped in fpirit of wine camphorated: falt bound thick on the part has been found very effectual for this purpofe: and indeed all faline and fpirituous applications excel others, while the fkin is yet unbroke; but when the fkin is feparated, anoint the part, and keep it conftantly fupple with linfeed or fallad oil, and a plaifter fpread with bees-wax and oil; if the fkin is fo fcorched, that floughs muft be digefted out, drefs with the wound-ointment and oil of turpentine, and finifh the cure with any drying ointment. Should the horfe be feverifh from the pain, bleed him, give cooling glyfters, and treat him as we have directed in fimple fevers.

Of ULCERS *in General.*

WE fhall not here enter into a defcription of each particular fpecies of ulcers, but only lay down fome directions for their general treatment; by which means we fhall avoid the ufual proxility of authors on this fubject, and yet give fo general an idea of the nature of ulcers, as we hope will be fufficiently inftructive both of the application and of the proper remedy to each.

It may be neceffary to obferve, that we may often in vain purfue the beft methods of cure by external applications, unlefs we have recourfe to proper internal remedies; for as all ulcers, difficult to heal, proceed from a particular indifpofition of the blood and juices, before the former can be brought into any order, the latter muft be corrected by alteratives and fweetening medicines.

The firft intention in the cure of ulcers is bringing them to digeft, or difcharge a thick matter; which will, in general, be effected by the green ointment, or that with precipitate; but fhould the fore not digeft kindly by thefe means, but difcharge a gleety thin matter, and look pale, you muft then have recourfe to warmer dreffings, fuch as balfam, or oil of turpentine, melted down with your common digeftive, and the ftrong beer poultice over them; it is proper alfo in thefe kind of fores where the circulation is languid, and the natural heat abated, to warm the part, and quicken the motion of the blood, by fomenting it well at the time of dreffing; which method will thicken the matter, and roufe the native heat of the part, and then the former dreffings may be re-applied.

If the lips of the ulcer grow hard or callous, they muft be pared down with a knife, and afterwards rubbed with the cauftic.

Where foft fungous flefh begins to rife, it fhould carefully be fuppreffed in time, otherwife the cure will go on but flowly; if it has already fprouted above the furface, pare it down with a knife, and rub the remainder with a bit of cauftic; and, to prevent its rifing again, fprinkle the fore with equal parts of burnt alum, and red precipitate; or wafh with the fublimate water, and drefs with dry lint even to the furface, and then roll over a comprefs of linen as tight as can be borne; for a proper degree of preffure,

preſſure, with mild applications, will always oblige theſe ſpongy excreſcences to ſubſide, but without bandage the ſtrongeſt will not ſo well ſucceed.

All ſinuſes, or cavities, ſhould be laid open as ſoon as diſcovered, after bandages have been ineffectually tried; but where the cavity penetrates deep into the muſcles, and a counter opening is impracticable or hazardous; where, by a continuance, the integuments of the muſcles are conſtantly dripping and melting down; in theſe caſes injections may be uſed, and will frequently be attended with ſucceſs. A decoction of colcothar boiled in forge-water; or ſolution of lapis medicamentoſus in lime water, with a fifth part of honey and tincture of myrrh, may be firſt tried, injected, three or four ounces twice a-day; or ſome reſin melted down with oil of turpentine, may be uſed for this purpoſe: if theſe ſhould not ſucceed, the following, which is of a ſharp and cauſtic nature, is recommended on Mr Gibſon's experience.

TAKE of Roman vitriol half an ounce; diſſolve in a pint of water, then decant and pour off gently into a large quart-bottle: add half a pint of camphorated ſpirit of wine, the ſame quantity of the beſt vinegar, and two ounces of Ægyptiacum.

This mixture is alſo very ſucceſsfully applied to ulcerated greaſy heels, which it will both cleanſe and dry up.

Theſe ſinuſes, or cavities, frequently degenerate into *fiſtulæ*, that is, grow pipey, having the inſide thickened, and lined, as it were, with a horny callous ſubſtance. In order to their cure, they muſt be laid open, and the hard ſubſtance all cut away; where this is impracticable, ſcarify them well, and truſt to the precipitate medicine made ſtrong, rubbing now and then with cauſtic, butter of antimony, or equal parts of quickſilver and aquafortis.

When a rotten or foul bone is an attendant on an ulcer, the fleſh is generally looſe and flabby, the diſcharge oily, thin, and ſtinking, and the bone diſcovered to be carious, by its feeling rough to the probe paſſed through the fleſh for that purpoſe. In order to a cure, the bone muſt be laid bare, that the rotten part of it be removed; for which purpoſe, deſtroy the looſe fleſh, and dreſs with dry lint; or the doſſils may be preſſed out of tincture of myrrh or euphorbium: the throwing off the ſcale is generally a work of nature, which is effected in more or leſs time, and in proportion to the depth the bone is affected; though burning the foul bone is thought by ſome to haſten its ſeparation.

Where the cure does not properly ſucceed, mercurial phyſic ſhould be given, and repeated at proper intervals: and to correct and mend the blood and juices, the antimonial and alterative powders, with a decoction of guaiacum and lime-waters, are proper for that purpoſe.

Of a BONE-SPAVIN.

WITHOUT entering at all into the cauſe of this diſorder, which is a bony excreſcence, or hard ſwelling, growing on the inſide of the hock of a horſe's leg, we ſhall content ourſelves with deſcribing the different kinds thereof, by their ſymptoms; and then enter on their cure.

A ſpavin, that begins on the lower part of the hock, is not ſo dangerous as that which puts out higher, between the two round proceſſes of the leg-bone; and a ſpavin near the edge is not ſo bad as that which is more inward toward the middle, as it does not ſo much affect the bending of the hock.

A ſpavin, that comes by a kick or blow, is at firſt no true ſpavin, but a bruiſe on the bone, or membrane which covers it; therefore not of that conſequence, as when it proceeds from a natural cauſe: and thoſe that put out on colts, and young horſes, are not ſo bad as thoſe that happen to horſes in their full ſtrength and maturity; but in very old horſes they are generally incurable.

The uſual method of treating this diſorder is by bliſters and firing, without any regard to the ſituation, or cauſe whence it proceeds. Thus, if a fulneſs on the fore-part of the hock comes upon hard riding, or any other violence, which threatens a ſpavin; in that caſe, ſuch coolers and repellers are proper, as are recommended in ſtrains and bruiſes. Thoſe happening to colts and young horſes are generally ſuperficial, and require only the milder applications; for it is better to wear them down by degrees, than to remove them at once by ſevere means.

Various are the preſcriptions for the bliſtering ointment; but the following, on proper experience, ſtands well recommended by Mr Gibſon.

TAKE nerve and marſh-mallow ointment, of each two ounces; quickſilver, one ounce, thoroughly broke with an ounce of Venice turpentine; Spaniſh flies powdered, a dram and a half; ſublimate, one dram; oil of origanum, two drams.

The hair is to be cut as cloſe as poſſible, and then the ointment applied pretty thick over the part; this ſhould be done in the morning, and the horſe kept tied up all day without any litter till night; when he may be untied, in order to lie down; and a pitch or any ſticking plaiſter may be laid over it, and bound on with a broad tape or bandage to keep all cloſe.

After the bliſter has done running, and the ſcabs begin to dry and peel off, it may be applied a ſecond time, in the ſame manner as before; this ſecond application generally taking greater effect than the firſt, and in colts and young horſes makes a perfect cure.

When the ſpavin has been of long ſtanding, it will require to be renewed, perhaps, five or ſix times; but after the ſecond application, a greater diſtance of time muſt be allowed, otherwiſe it might leave a ſcar, or cauſe a baldneſs; to prevent which, once a-fortnight or three weeks is often enough; and it may in this manner be continued ſix or ſeven times, without the leaſt blemiſh, and will generally be attended with ſucceſs.

But the ſpavins that put out on older, or full-aged horſes, are apt to be more obſtinate, as being ſeated more inward; and when they run among the ſinuoſities of the joint, they are for the moſt part incurable, as they then lie out of the reach of applications, and are arrived to a degree of impenetrable hardneſs.

The uſual method in theſe caſes is to fire directly, or to uſe the ſtrongeſt kind of cauſtic bliſters; and ſometimes to fire and lay the bliſter immediately over the part; but this way ſeldom ſucceeds farther than putting a ſtop to

to the growth of the ſpavin, and is apt to leave both a blemiſh and ſtiffneſs behind; beſides the great riſk run (by applications of theſe fiery and cauſtic medicines to the nervous and tendinous parts about the joints) of exciting violent pain and anguiſh, and deſtroying the limb.

The beſt and ſafeſt way therefore, is to make trial of the bliſtering ointment above, and to continue it according to the directions there laid down, for ſome months, if found neceſſary; the horſes in the intervals working moderately: the hardneſs will thus be diſſolved by degrees, and wear away inſenſibly.

Where the ſpavin lies deep, and runs ſo far into the hollow of the joint, that no application can reach it, neither firing nor medicines can avail, for the reaſons abovementioned; though bold ignorant fellows have ſometimes ſucceeded in caſes of this ſort (by men of judgment deemed incurable) by the application of cauſtic ointments with ſublimate, which act very forcibly, enter deep, and make a large diſcharge, and by that means deſtroy a great part of the ſubſtance, and diſſolve away the remainder: Tho', whoever is at all acquainted with the nature of theſe medicines, muſt know how dangerous in general their operation is on theſe occaſions; and that a proper prepared cautery made like a fleam, under the direction of a ſkilful hand, may be applied with leſs danger of injuring either tendons or ligaments. After the ſubſtance of the ſwelling has been properly penetrated by the inſtrument, it muſt be kept running by the precipitate medicine, or mild bliſtering ointment. Where the ſpavin lies not deep in the joint, and the bliſtering method will not ſucceed, the ſwelling may be ſafely fired with a thin iron forced pretty deep into the ſubſtance, and then ſhould be dreſſed, as is above directed.

Of a Curb *and* Ring-bone.

As a ſpavin riſes among the bones on the fore-part of the hock, ſo a curb takes its origin from the junctures of the ſame bones, and riſes on the hind part, forming a pretty large tumour over the back part of the hind-leg, attended with ſtiffneſs, and ſometimes with pain and lameneſs.

A curb proceeds from the ſame cauſes that produce ſpavins; *viz.* hard riding, ſtrains, blows, or kicks. The cure at firſt is generally eaſy enough effected by bliſtering, repeated two or three times, or oftener. If it does not ſubmit to this treatment, but grows exceſſively hard, the quickeſt and ſureſt way is to fire with a thin iron, making a line down the middle from top to bottom, and drawing ſeveral lines in a penniform manner pretty deep; and then to apply a mild bliſtering plaiſter or ointment over it.—This method will entirely remrove it.

There is another ſwelling taken notice of on the outſide of the hock, which is called a *jardon*. This commonly proceeds from blows and kicks of other horſes; but frequently happens to menaged horſes, by ſetting them on their haunches: it is ſeldom attended with much lameneſs, unleſs it has been neglected, or ſome little proceſs of the bone be broke. It ſhould firſt be treated with the coolers and repellers in (p. 574. and 575.); but if any ſwelling continues hard, and inſenſible, the beſt way is to bliſter or fire; but the mild bliſters alone generally ſucceed.

The *ring-bone* is a hard ſwelling on the lower part of the paſtern, which generally reaches half-way round the fore-part thereof, and from its reſemblance to a ring has its denomination. It often ariſes from ſtrains, *&c.* and when behind, from putting young horſes too early upon their haunches; for in that attitude a horſe throws his whole weight as much, if not more, upon his paſterns, than on his hocks.

When it appears diſtinctly round the paſtern, and does not run downwards toward the coronet, ſo as to affect the coffin-joint, it is eaſily cured; but if it takes its origin from ſome ſtrain or defect in the joint originally, or if a calloſity is found under the round ligament that covers that joint, the cure is generally dubious, and ſometimes impracticable; as it is apt to turn to a quittor, and in the end to form an ulcer upon the hoof.

The ring-bones that appear on colts and young horſes, will often inſenſibly wear off of themſelves, without the help of any application; but when the ſubſtance remains, there needs no other remedy beſides bliſtering, unleſs when by long continuance it is grown to an obſtinate hardneſs, and then it may require both bliſtering and firing.

To fire a ring-bone ſucceſsfully, let the operation be performed with a thinner inſtrument than the common one, and let the lines or razes be made not above a quarter of an inch diſtant, croſſing them obliquely, ſomewhat like a chain: apply a mild bliſter over all, and, when quite dried up, the rupture-plaiſter; and then turn the horſe to graſs for ſome time.

Of Splents.

These are hard excreſcences that grow on the ſhank-bone, and are of various ſhapes and ſizes. Some horſes are more ſubject to ſplents than others; but young horſes are moſt liable to theſe infirmities, which often wear off and diſappear of themſelves. Few horſes put out ſplents after they are ſeven or eight years old, unleſs they meet with blows or accidents.

A ſplent that ariſes in the middle of the ſhank bone is no ways dangerous; but thoſe that ariſe on the back part of this bone, when they grow large and preſs againſt the back ſinew, always cauſe lameneſs or ſtiffneſs, by rubbing againſt it: the others, except they are ſituated near the joints, ſeldom occaſion lameneſs.

As to the cure of ſplents, the beſt way is not to meddle with them, unleſs they are ſo large as to disfigure a horſe, or are ſo ſituated as to endanger his going lame.

Splents in their infancy, and on their firſt appearance, ſhould be well bathed with vinegar, or old verjuice; which, by ſtrengthening the fibres, often put a ſtop to their growth: for the membrane covering the bone, and not the bone itſelf, is here thickened: and in ſome conſtitutions purging, and afterwards diuretic drinks, will be a great means to remove the humidity and moiſture about the limbs, which is what often gives riſe to ſuch excreſcences.

Various are the remedies preſcribed for this diſorder; the uſual way is to rub the ſplent with a round ſtick or the handle of a hammer, till it is almoſt raw, and then touch it with oil of origanum. Others lay on a pitch-plaiſter,

plaister, with a little sublimate, or arsenic, to destroy the substance: some use oil of vitriol; some tincture of cantharides: all which methods have at times succeeded; only they are apt to leave a scar with the loss of hair. Those applications that are of a more caustic nature, often do more hurt than good, especially when the splent is grown very hard, as they produce a rottenness, which keeps running several months before the ulcer can be healed, and then leaves an ugly scar.

Mild blisters often repeated, as recommended in the section upon the *Bone-Spavin*, should first be tried as the most eligible method, and will generally succeed, even beyond expectation: but if they fail, and the splent be near the knee or joints, you must fire and blister in the same manner as for the bone-spavin.

Splents on the back part of the shank-bone are difficult to cure, by reason of the back sinews covering them: the best way is to bore the splent in several places with an iron not very hot; and then to fire in the common way, not making the lines too deep, but very close together.

Of the Poll-evil.

The poll-evil is an abscess near the poll of a horse, formed in the sinuses between the poll-bone, and the uppermost vertebræ of the neck.

If it proceeds from blows, bruises, or any external violence, at first bathe the swelling often with hot vinegar; and if the hair be fretted off with an ouzing through the skin, make use of two parts of vinegar, and one of spirit of wine; but if there be an itching, with heat and inflammation, the safest way is to bleed, and apply poultices with bread, milk, and elder-flowers: this method, with the assistance of physick, will frequently disperse the swelling, and prevent this evil.

But when the tumour is critical, and has all the signs of matter, the best method then is to forward it by applying the ripening poultices already taken notice of, till it comes to maturity, and bursts of itself; or if opened with a knife, great care should be taken to avoid the tendinous ligament that runs along the neck under the mane: when matter is on both sides, the opening must be made on each side, and the ligament remain undivided.

If the matter flows in great quantities, resembles melted glue, and is of an oily consistence, it will require a second incision, especially if any cavities are discovered by the finger or probe; these should be opened by the knife, the orifices made depending, and the wound dressed with the common digestive of turpentine, honey, and tincture of myrrh, and, after digestion, with the precipitate ointment; or wash the sore with the following, made hot, and fill up the cavity with tow soaked in it.

Take vinegar or spirit of wine half a pint, white vitriol dissolved in spring-water half an ounce, tincture of myrrh four ounces.

This may be made sharper by adding more vitriol; but if the flesh is very luxuriant, it should first be pared down with a knife before the application; with this wash alone Mr Gibson has cured this disorder without any other formality of dressing, washing with it twice a-day, and laying over the part a quantity of tow soaked in vinegar and the white of eggs beat together.

But the most compendious method of cure, is found by observation to be by *scalding*, as the farriers term it; and is thus prosecuted when the sore is foul, of a bad disposition, and attended with a profusion of matter.

Take corrosive sublimate, verdegrease in fine powder, and Roman vitriol, of each two drams; green copperas half an ounce, honey or Ægyptiacum two ounces, oil of turpentine and train oil of each eight ounces, rectified spirit of wine four ounces; mix together in a bottle.

The manner of scalding is first to clean the abscess well with a piece of sponge dipped in vinegar; then put a sufficient quantity of the mixture into a ladle with a spout, and when it is made scalding hot, pour it into the abscess, and close the lips together with one or more stitches. This is to remain in several days; and if good matter appears, and not in an over great quantity, it will do well without any other dressing, but bathing with spirit of wine; if the matter flows in great abundance, and of a thin consistence, it must be scalded again, and repeated till the matter lessens and thickens.

Of a Fistula, *and* Bruises *on the* Withers; Warbles *on the Back, and* Sit-fasts.

Bruises on the withers frequently imposthumate, and for want of care turn fistulous. They arise often from pinches of the saddle, and should be treated with repellers: for this purpose bathe the tumour well with hot vinegar three or four times a day; if that does not succeed alone, an ounce of oil of vitriol may be put to a quart of vinegar, or half an ounce of white vitriol dissolved in a little water, and added to the same quantity. These are generally very effectual repellers for this purpose in horses, and will frequently prevent imposthumation: when the swelling is attended with heat, smarting, and little hot watery pimples, the following mixture will then be more proper to bathe with.

Take two ounces of crude sal ammoniac, boiled in a quart of lime-water; where that cannot be had, a handful of pearl or wood-ashes may be boiled in common water: pour off the decoction when settled, and mix with it half a pint of spirit of wine: anoint the part afterwards with linseed oil, or elder ointment, to soften and smooth the skin.

But when the swellings are critical, the consequence of a fever settled on this part, you must avoid the repelling method, and assist in bringing the swelling to matter, by means of suppurating poultices: experienced farriers advise, never to open these tumours till they break of themselves; for if they are opened before they are ripe, the whole sore will be spongy, and discharge a bloody ichor, which soon degenerates into a sordid ulcer. But take care to enlarge the openings and pare away the lips, that your dressings may be applied easily; and avoid the ligament which runs along the neck to the withers: if a gathering forms on the opposite side, open it in the same manner, but take care they incline downwards, for the sake of depending orifices, and letting the matter flow off

off eafily. For the method of dreffing, we muft refer to the preceding Section; and if the bones fhould be found foul, they muft be dreffed with tincture of myrrh till they fcale off: if the fungus is very troublefome, and the difcharge oily, yellow and vifcid, pledgets foaked in the following, made hot, have been found very effectual, bathing the fwelling round with fpirit of wine and vinegar.

Take half an ounce of blue vitriol diffolved in a pint of water; oil of turpentine, and rectified fpirit of wine, of each four ounces; white-wine vinegar, fix ounces; oil of vitriol and Ægyptiacum, of each two ounces.

When the cavities are truly fiftulous, the callofities muft be cut out, where it can be done, with a knife; and the remainder deftroyed by corrofives, *viz.* precipitate, burnt alum, and white vitriol, as we have already obferved in the Section on Ulcers.

Warbles are fmall hard tumours under the faddle-part of the horfe's back, occafioned by the heat of the faddle in travelling, or its uneafy fituation. A hot greafy difhclout at firft frequently applied, will fometimes remove them. Camphorated fpirits of wine are alfo very effectual for this purpofe to difperfe them, to which a little fpirit of fal armoniac may be added. The repellers abovementioned are fuccefsfully applied in thefe cafes; and if you are obliged to work the horfe, take care your faddle is nicely chambered.

A *fit-faft* proceeds generally from a warble, and is the horfe's hide turned horny, which, if it cannot be diffolved and foftened by rubbing with the mercurial ointment, muft be cut out, and treated then as a frefh wound.

Of Wind-galls, Blood *and* Bog Spavins.

A Wind-gall is a flatulent fwelling, which yields to the preffure of the finger, and recovers its fhape on the removal thereof: the tumour is vifible to the eye, and often feated on both fides of the back finew, above the fetlocks, on the fore-legs, but moft frequently on the hind legs; though they are met with in various parts of the body, where-ever membranes can be fo feparated, that a quantity of air and ferofities may be included within their duplicatures.

When they appear near the joints and tendons, they are generally caufed by ftrains, or bruifes on the finews, or the fheath that covers them; which, by being overftretched, have fome of their fibres ruptured; whence probably may ouze out that fluid which is commonly found with the included air: though where thefe fwellings fhew themfelves in the interftices of large mufcles, which appear blown up like bladders, air alone is the chief fluid; and thefe may fafely be opened, and treated as a common wound.

On the firft appearance of wind-galls, their cure fhould be attempted by reftringents and bandage; for which purpofe, let the fwelling be bathed twice a-day with vinegar, or verjuice alone; or let the part be fomented with a decoction of oak-bark, pomegranate, and alum boiled in verjuice, binding over it, with a roller, a woollen cloth foaked in the fame. Some, for this purpofe, ufe red-wine lees, others curriers fhavings wetted with the fame, or vinegar, bracing the part up with a firm bandage.

If this method, after a proper trial, fhould not be found to fucceed, authors have advifed the fwelling to be pierced with an awl, or opened with a knife: but mild bliftering has in general the preference given to thefe methods; the including fluids being thereby drawn off, the impacted air difperfed, and the tumour gradually diminifhed.

A *blood-fpavin* is a fwelling and dilatation of the vein that runs along the infide of the hock, forming a little foft fwelling in the hollow part, and is often attended with a weaknefs and lamenefs of the hock.

The cure fhould be firft attempted with the reftringents and bandage above recommended, which will contribute greatly to ftrengthen all weakneffes of the joints, and frequently will remove this diforder, if early applied: but if by thefe means the vein is not reduced to its ufual dimenfions, the fkin fhould be opened, and the vein tied with a crooked needle and wax-thread paffed underneath it, both above and below the fwelling, and the turgid part fuffered to digeft away with the ligatures: for this purpofe, the wound may be daily dreffed with turpentine, honey, and fpirit of wine, incorporated together.

A *bog-fpavin* is an encyfted tumour on the infide the hough; or, according to Dr Bracken, a collection of brownifh gelatinous matter, contained in a bag, or cyft, which he thinks to be the lubricating matter of the joint altered, the common membrane that inclofes it forming the cyft. This cafe he has taken the pains to illuftrate in a young colt of his own, where he fays, When the fpavin was preffed hard on the infide the hough, there was a fmall tumour on the outfide, which convinced him the fluid was within-fide the joint: he accordingly cut into it, difcharged a large quantity of this gelatinous matter, dreffed the fore with doffils dipped in oil of turpentine, putting into it, once in three or four days, a powder made of calcined vitriol, alum, and bole: by this method of dreffing, the bag floughed off, and came away, and the cure was fuccefsfully compleated without any vifible fcar.

This diforder, according to the above defcription, will fcarcely fubmit to any other method, except firing, when the cyft ought to be penetrated to make it effectual; but in all obftinate cafes that have refifted the above methods, both the cure of this and of the fwellings called wind-galls fhould be attempted in this manner. If, through the pain attending the operation or dreffings, the joint fhould fwell and inflame, foment it twice a-day, and apply a poultice over the dreffings till it is reduced.

Of Mallenders *and* Sallenders.

Mallenders are cracks in the bend of the horfe's knee, that difcharge a fharp indigefted matter; they are often the occafion of lamenefs, ftiffnefs, and the horfe's tumbling.

Sallenders are the fame diftemper, fituate on the bending of the hough, and occafion a lamenefs behind.

They are both cured by wafhing the parts with a lather of foap warmed, or old chamber-lye; and then apply o-

ver the cracks a ſtrong mercurial ointment ſpread on tow, with which they ſhould be dreſſed, night and morning, till all the ſcabs fall off: if this ſhould not ſucceed, anoint them night and morning with a little of the following, and apply the above ointment over it.

TAKE hogs lard, two ounces; ſublimate mercury, two drams.

Or,

TAKE hogs lard, two ounces; oil of vitriol, two drams.

Take the next from Gibſon, which is to be depended on:

ÆTHIOPS mineral, half an ounce; white vitriol, one dram; ſoft green ſoap, ſix ounces.

Anoint with this often; but firſt clip away the hair, and clear the ſcabs. On their drying up, it may be proper to give a gentle purge or two; or the nitre balls may be taken advantageouſly, for a fortnight or three weeks.

Of LAMPAS, BARBS, *and* WOLVES TEETH.

THE *lampas* is an excreſcence in the roof of the horſe's mouth, which is ſometimes ſo luxuriant, that it grows above the teeth, and hinders his feeding. The cure is in lightly cauteriſing the fleſh with a hot iron, taking care that it does not penetrate too deep, ſo as to ſcale off the thin bone that lies under the upper bars; the part may be anointed with burnt alum and honey, which is proper for moſt ſores in the mouth.

This operation is by ſome thought to be entirely unneceſſary; it being a general obſervation with them, that all young horſes have their mouths more or leſs full of what are called lampas; and that ſometimes they riſe higher than the fore-teeth; but they further obſerve, in proportion as a horſe grows older, the roof flattens of itſelf, and the teeth then appear to riſe. We are obliged to the ingenious M. La Foſſe for this remark, and hope it will be the means of aboliſhing this cruel and unneceſſary operation.

Barbs are ſmall excreſcences under the tongue, which may be diſcovered by drawing it aſide, and are cured by cutting cloſe off, and waſhing with brandy or ſalt and water.

A horſe is ſaid to have *wolves-teeth*, when the teeth grow in ſuch a manner, that their points prick, or wound either the tongue, or gums, in eating. Old horſes are moſt liable to this infirmity, and whoſe upper overſhoot the under teeth in a great degree.

To remedy this evil, you may either chop off the ſuperfluous parts of the teeth with a chizzel and mallet, or file them down, which is the better way, till you have ſufficiently waſted them.

Of the GREASE.

IN order to treat this diſorder with ſome propriety; we ſhall conſider it as ariſing from two different cauſes; a fault or relaxation in the veſſels, or a bad diſpoſition in the blood and juices. We muſt here obſerve, that the blood and juices (or humours, for there are always ſome in the beſt ſtate of blood) are brought to the extreme parts by the arteries, and returned by the veins; in which latter, the blood is to riſe in perpendicular columns, to return the circulating fluids from the extremities: hence ſwellings in the legs of horſes may eaſily be accounted for, from a partial ſtagnation of the blood and juices in the finer veſſels, where the circulation is moſt languid; and eſpecially when there is want of due exerciſe, and a proper muſcular compreſſion on the veſſels, to puſh forward the returning blood, and propel the inert and half ſtagnating fluids through their veſſels; in ſhort, the blood in ſuch caſes cannot ſo readily aſcend as deſcend, or a greater quantity is brought by the arteries than can be returned by the veins.

The greaſe then, conſidered in this light, muſt be treated as a local complaint, where the parts affected are alone concerned, the blood and juices being yet untainted, and in good condition; or as a diſorder where they are both complicated: but when it is an attendant on ſome other diſtemper, as the farcy, yellows, dropſy, *&c.* ſuch diſeaſes muſt firſt be cured before the greaſe can be removed. In the former caſe, moderate exerciſe, proper dreſſing, cleanlineſs, and external application, will anſwer the purpoſe; in the latter, internals muſt be called in to our aſſiſtance, with proper evacuations.

When a horſe's heels are firſt obſerved to ſwell in the ſtable, and ſubſide or go down on exerciſe; let care be taken to waſh them very clean every time he comes in, with ſoap-ſuds, chamber-lye, or vinegar and water, which, with proper rubbing, will frequently prevent, or remove this complaint: or let them be well bathed twice a-day with old verjuice, or the following mixture, which will brace up the relaxed veſſels; and if rags dipped in the ſame are rolled on, with a proper bandage, for a few days, it is moſt likely the ſwellings will ſoon be removed by this method only, as the bandage will ſupport the veſſels, till they have recovered their tone. To anſwer this end alſo, a laced ſtocking made of ſtrong canvas or coarſe cloth, neatly fitted to the part, would be found extremely ſerviceable, and might eaſily be contrived by an ingenious mechanic.

TAKE rectified ſpirit of wine, four ounces; diſſolve in it half an ounce of camphor; to which add wine-vinegar, or old verjuice, ſix ounces; white vitriol, diſſolved in a gill of water, one ounce; mix together, and ſhake the phial when uſed.

But if cracks or ſcratches are obſerved, which ouze and run, let the hair be clipped away, as well to prevent a lodgment (which becomes ſtinking and offenſive by its ſtay) as to give room for waſhing out dirt or gravel, which, if ſuffered to remain there, would greatly aggravate the diſorder.

When this is the caſe, or the heels are full of hard ſcabs, it is neceſſary to begin the cure with poultices, made either of boiled turnips and lard, with a handful of linſeed powdered; or oatmeal and rye-flour, with a little common turpentine and hogs lard, boiled up with ſtrong-beer grounds or red-wine lees. The digeſtive ointment being applied to the ſores for two or three days, with either of theſe poultices over it, will, by ſoftening them, promote a diſcharge, unload the veſſels, and take down the ſwelling; when they may be dried up with the following:

Take white vitriol and burnt alum, of each two ounces; Ægyptiacum, one ounce; lime-water, a quart or three pints: wash the sores with a sponge dipped in this, three times a-day, and apply the common white ointment spread on tow; to an ounce of which may be added two drams of sugar of lead.

This method is generally very successful, when the distemper is only local, and requires no internal medicines; but if the horse be full and gross, his legs greatly gorged, so that the hair stares up, and is what some term pen-feathered, and has a large stinking discharge from deep foul sores, you may expect to meet with great trouble, as these disorders are very obstinate to remove, being often occasioned by a poor dropsical state of blood, or a general bad disposition in the blood and juices.

The cure in this case, if the horse is full and fleshy, must be begun by bleeding, rowels, and repeated purging; after which, diuretic medicines are frequently given with success. Thus,

Take four ounces of yellow rosin, one of sal prunellæ; grind them together with an oiled pestle, add a dram of oil of amber, and give a quart of forge-water every morning, fasting two hours before and after taking, and ride moderately.

As this drink is found very disagreeable to some horses, I would recommend the nitre-balls in its stead, given to the quantity of two ounces a-day, for a month or six weeks, mixed up with honey, or in his feeds: take the following also for that purpose.

Yellow rosin, four ounces; salt of tartar, and sal prunellæ, of each two ounces; Venice soap, half a pound; oil of juniper, half an ounce; make into balls of two ounce weight, and give one every morning.

The legs, in this case, should be bathed or fomented, in order to breathe out the stagnant juices, or to thin them, so that they may be able to circulate freely in the common current. For this purpose, foment twice a-day with the discutient fomentation, p. 569. col. 2. par. 3. in which a handful or two of wood-ashes has been boiled; apply then the above poultices, or the following, till the swelling has subsided, when the sores may be dressed with the green ointment till they are properly digested, and then dried up with the water and ointment above recommended.

Take honey, one pound; turpentine, six ounces; incorporate with a spoon; and add of the meal of fenugreek and linseed, each four ounces; boil in three quarts of red-wine lees to the consistence of a poultice; to which add, when taken from the fire, two ounces of camphor in powder; spread it on thick cloths, and apply warm to the legs, securing it on with a strong roller.

If the sores are very foul, dress them with two parts of the wound-ointment, and one of Ægyptiacum; and apply the following, spread on thick cloths, and rolled on.

Take of black soap, one pound; honey, half a pound; burnt alum, four ounces; verdigrease powdered, two ounces; wheat-flour, a sufficient quantity.

If the diuretic balls should not succeed, they must be changed for the antimonial and mercurial alteratives, already mentioned: but turning a horse out in a field, where he has a hovel or shed to run to at pleasure, would greatly contribute to quicken the cure, and indeed would in general effect it alone; but if this cannot be complied with, let him be turned out in the day-time.

If the horse is not turned out, a large and convenient stall is absolutely necessary, with good dressing and care.

The last thing we shall recommend, is a method to oblige a horse to lie down in the stable. This undoubtedly is of the utmost consequence, as it will not a little contribute to the removal and cure of this disorder; for by only changing the position of his legs, a freer circulation would be obtained, and the swelling taken down: whereas in general it is greatly aggravated by the obstinacy of the horse, who refuses to lie down at all (probably from the pain it gives him to bend his legs for that purpose) by which means the stiffness and swelling increases, till the over-gorged and distended vessels are obliged to give way, and by bursting, discharge the fluids, which should circulate through them.

Of Scratches, Crown Scabs, Rat-Tails, *and* Capellets.

Scratches in the heels have so much affinity with the grease, and are so often concomitants of that distemper, that the method of treating them may be selected chiefly from the preceding section; which at first should be by the linseed and turnip poultice, with a little common turpentine to soften them, and relax the vessels; the green ointment may then be applied for a few days to promote a discharge, when they may be dried up with the ointments and washes recommended in the above section. It is best afterwards to keep the heels supple, and softened with currier's dubbing, which is made of oil and tallow. This will keep the hide from cracking, and be as good a preservative as it is to leather; and by using it often before exercise, will prevent the scratches, if care is taken to wash the heels with warm water, when the horse comes in. When they prove obstinate, and the sores are deep, use the following; but if any cavities or hollow places are formed, they should first be laid open; for no foundation can be laid for healing, till you can dress to the bottom.

Take Venice turpentine, four ounces; quicksilver, one ounce; incorporate well together by rubbing some time, and then add honey and sheeps suet, of each two ounces.

Anoint with this once or twice a day; and if the horse is full or fleshy, you must bleed and purge; and if the blood is in a bad state, the alteratives must be given to rectify it.

The *crown-scab* is an humour that breaks out round the coronet, which is very sharp and itching, and attended with a scurfiness: sharp waters prepared with vitriol are generally used for the cure; but the safest way is first to mix marshmallow and yellow basilicon, or the wound ointment, equal parts, and to spread them on tow, and lay all round the coronet. A doze or two of physic may be very proper, with the diuretic medicines, (par. 4. 5. 6. of the preced. col. and the alteratives above recommended

commended, in rebellious cafes. *Vid.* the Section on ALTERATIVES.

Rat-tails are excrefcences, which creep from the paftern to the middle of the fhanks, and are fo called from the refemblance they bear to the tail of a rat. Some are moift, others dry; the former may be treated with the drying ointment and wafhes, p. 577. col. 1. par. 1. the latter with the mercurial ointment, p. 555. col. 2. par. 6. If the hardnefs does not fubmit to the laft medicine, it fhould be pared off with a knife, and dreffed with turpentine, tar and honey, to which verdigreafe or white vitriol may occafionally be added; but before the ufe of the knife, you may apply this ointment.

TAKE black foap, four ounces; quick-lime, two ounces; vinegar enough to make an ointment.

There are particular fwellings which horfes are fubject to, of a wenny nature, which grow on the heel of the hock, and on the point of the elbow, and are called by the French and Italians capellets: they arife often from bruifes and other accidents; and when this is the cafe, fhould be treated with vinegar and other repellers: but when they grow gradually on both heels, or elbows, we may then fufpect the blood and juices in fault that fome of the veffels are broke, and juices extravafated; in this cafe, the fuppuration fhould be promoted, by rubbing the part with marfhmallow ointment, and when matter is formed, the fkin fhould be opened with a lancet, in fome dependent part towards one fide, to avoid a fcar: the dreffings may be turpentine, honey, and tincture of myrrh. The relaxed fkin may be bathed with equal parts of fpirit of wine and vinegar, to which an eighth part of oil of vitriol may be added. The contents of thefe tumours are various, fometimes watery, at others fuety, or like thick pafte; which, if care be not taken to digeft out properly with the cyft, will frequently collect again; was it not for the disfigurement, the fhorteft method would be to extirpate them with a knife, which, if artfully executed, and the fkin properly preferved, would leave very little deformity.

Of the Difeafes of the FEET.

Of NARROW HEELS, *and* BINDING *of the* HOOF, *&c.*

THOUGH narrow heels in general arife from a natural defect, yet they are often rendered incurable by bad fhoeing; for fome farriers hollow the quarters fo deep and thin, that they may be pinched in with the fingers, and think by that method to widen them out by a ftrong broad webbed fhoe; but this turns them narrow above, wires their heels, and dries, or rots the frog. The beft way in all fuch cafes is not to hollow the foot in fhoeing, and to pare nothing out but what is rotten or foul; if the foot be hard and dry, or inclined to be rotten, bathe it often with chamber-lye, or boil two pounds of linfeed bruifed in two quarts of the fame, to the confiftence of a poultice, then add fix ounces of foft green foap, and anoint the foot with it every day, rubbing a little of it upon the fole.

Or,

TAKE bees-wax two ounces; frefh butter or lard, fix ounce; tar, one ounce; as much linfeed, or neatsfoot oil, as will make it the confiftence of a fmooth ointment.

The hoofs, if too dry, may be anointed with the above, or with lard only; fome for this purpofe ufe tar, tallow, and honey, but moft greafy and unctuous applications will anfwer this intention; the feet alfo, if too dry, may be ftuffed with bran and lard heated or worked up together in the hand, which is very proper alfo to apply every night, when your horfe is travelling in hot weather on roads that are dry and hard; cow-dung likewife is a proper ftuffing for the feet, but vinegar fhould cautioufly be mixed with it; for though it is a known cooler, it is a remarkable reftringent, which in this cafe would be extremely prejudicial; inftead of which, a print of frefh butter may be firft applied to the fole, and the cow-dung laid over it.

There is another diforder the hoofs are fubject to, which is their being too foft and moift; this may be conftitutional, or proceed from going much in wet and marfhy grounds, ftanding conftantly on wet litter, or any infirmity that may bring too great a moifture into the feet. In this cafe the horfe's hoofs may be bathed every day with warm vinegar, verjuice, copperas-water, and fuch like reftringents; to which may be added galls, alum, *&c.* remembring to let the horfe ftand conftantly dry.

We fay a horfe is *hoof-bound*, when the hoof is fo tight round the inftep, that it turns the foot fomewhat into the fhape of a bell. This is caufed fometimes by fhoeing as above, to widen the heel, and fometimes by cutting the toes down too much, which gives that fhape to the foot, and caufes the horfe to go lame.

To remedy this diforder, Mr Gibfon recommends the following method: let the foot be drawn down from the coronet almoft to the toe with a drawing knife, making feven or eight lines or razes through the hoof, almoft to the quick; afterwards keep it charged with pitch rofin, till the lines are wore out in fhoeing, which will require feveral months.

Of SAND-CRACKS *and* QUITTORS.

WHAT is called a fand-crack, is a little cleft on the outfide of the hoof: if it runs in a ftrait line downwards, and penetrates through the bony part of the hoof, it often proves troublefome to cure; but if it paffes through the ligament that unites the hoof with the coronet, it is then apt to breed a quittor, or falfe quarter, which is dangerous.

When the crack only penetrates through the hoof, without touching the ligament, unlefs the hoof be hollow, it may eafily be cured, by rafping only the edges fmooth, and applying thick pledgets of bafilicon, and binding them down with a piece of foft lift; if fome precipitate be added to it, this medicine will be improved thereby, and in general anfwers the end, without any other application But if you perceive any hollownefs under the hoof, and that the cleft has a tendency to penetrate through the griftle or ligament, the beft method, in that cafe, is to fire out of hand with irons that are not made

made too hot, firſt raſping very thin and wide from both ſides of the cleft: the horſe muſt not carry any weight for ſome time, but be turned out to graſs, or wintered in a good farm yard.

A quittor is an ulcer formed between the hair and hoof, uſually the inſide quarter of a horſe's foot; it ariſes often from treads and bruiſes, ſometimes from gravel, which, by working its way upwards, lodges about the coronet: if it is only ſuperficial, it may be cured with cleanſing dreſſings, bathing the coronet every day with ſpirit of wine, and dreſſing the ſore with the precipitate medicine.

But if the matter forms itſelf a lodgment under the hoof, there is no way then to come at the ulcer, but by taking off part of the hoof; and if this be done artfully and well, the cure may be affected without danger.

When the matter happens to be lodged near the quarter, the farrier is ſometimes obliged to take off the quarter of the hoof, and the cure is then, for the moſt part, but palliative; for when the quarter grows up, it leaves a pretty large ſeam, which weakens the foot; this is what is called a falſe quarter, and a horſe with this defect ſeldom gets quite ſound.

If the matter, by its confinement, has rotted the coffin bone, which is of ſo ſoft and ſpongy a nature, that it ſoon becomes ſo, you muſt enlarge the opening, cut away the rotten fleſh, and apply the actual cautery, or hot iron pointed pyramidically, and dreſs the bone with doſſils of lint, dipped in tincture of myrrh, and the wound with the green or precipitate ointment. When the ſore is not enlarged by the knife, which is the beſt, and leſs painful method, pieces of ſublimate are generally applied, which bring out with them cores, or lumps of fleſh; blue vitriol powdered, and mixed with a few drops of the oil, is uſed alſo for this purpoſe, and is ſaid to act as effectually, and with leſs pain and danger; during the operation of theſe medicines, the foot ſhould be kept in ſome ſoft poultice, and care ſhould be taken, during the whole dreſſing, to prevent proud fleſh riſing, which otherwiſe will not only retard the cure, but prevent a firm and ſound healing.

Of Wounds *in the* Feet, *from* Nails, Gravel, *&c.*

Accidents of this ſort are very common, and ſometimes for want of early care, prove of bad conſequence; for the parts, being naturally tender, are very ſuſceptible of inflammation; and when matter is once formed, if a free diſcharge is not procured, the bone, which is ſpungy, ſoon becomes affected, and the whole foot is then in danger.

When any extraneous bodies, ſuch as nails, ſtubs, thorns, *&c.* have paſſed into the horſe's foot, you ſhould endeavour to get them out as ſoon as poſſible; and after waſhing the part with oil of turpentine, dreſs the hole with lint dipped in the ſame, melted down with a little tar; the foot may be ſtopped up with bran and hogs-lard heated together, or put it into the turnip, or any ſoft poultice; this method is generally ſucceſsful, when the nail, *&c.* is entirely removed; but if any piece, or particle, ſhould remain behind, which may be ſuſpected by the degree of pain, and diſcharge of matter; after paring away the ſole as thin as poſſible, introduce a bit of ſponge tent, in order to enlarge the hole, that it may be drawn out by a ſmall pair of forceps, or brought away by digeſtion: if this method ſhould not ſucceed, but the lameneſs continues, with a diſcharge of a thin bloody, or ſtinking matter, you muſt no longer delay opening the wound with a drawing-knife to the bottom, and then dreſs as above directed, or with the turpentine digeſtive, divided with the yolk of an egg, and a little tincture of myrrh; afterwards with the precipitate medicine.

If the lameneſs proceeds from pricking in ſhoeing, the foot ſhould be pared thin on the wound ſide, and after dreſſing with the tar and turpentine, let it be ſtopped with the poultices above mentioned, or with two ounces of common turpentine, melted down with four of lard; ſhould this method not ſucceed, follow the above directions.

If the nail penetrates to the joint of the foot, where matter may be formed, and by its long continuance putrify, ſo as to erode the cartilages of the joint, the caſe is incurable.

If the nail has paſſed up to the nut-bone, it is incurable, becauſe this little bone cannot exfoliate, and becauſe the cartilaginous part of it is deſtroyed, as ſoon as injured.

If the nail has not paſſed to the tendon, the horſe will do well, without a neceſſity for drawing the ſole; but if the tendon is wounded, the ſole muſt be carefully drawn, becauſe a ſinovia and gleet is diſcharged.

When gravel is the cauſe, it for the moſt part follows the nail-holes, and if it gets to the quick cannot return, unleſs it is ſcraped out; for the make of the hoof, which is ſpiral like an ear of corn, favours its aſcent, ſo that the gravel continues working upwards towards the coronet, and forms what the farriers call a quittor-bone.

The nature of this diſorder points out the method of cure, which is to be as expeditious and careful as poſſible, in getting out the gravel; if it is found difficult to effect this, let the ſole or hoof be pared thin, and, if neceſſary, the wound enlarged to the bottom, and then dreſſed up as uſual. Should the coffin-bone be affected, you muſt follow the directions laid down in the preceding ſection, remembering always to bathe the hoof with vinegar, or repellers, in order to allay the heat and inflammation, which often happen on ſuch occaſions; and ſhould the pain and anguiſh affect the legs, treat them in the ſame manner, or charge the leg and paſtern with a mixture of wine-lees and vinegar.

Figs are ſpongy ſwellings on the bottom of horſes feet, generally on the ſides of the fruſh. Theſe, or any other kind of excreſcences, ſuch as warts, corns, grapes, *&c.* are beſt removed by the knife; and if any part of them be left behind, or ſhould ſhoot up afreſh, touch them with the cauſtic, or oil of vitriol, and dreſs with Ægyptiacum; to which may be added, when they are very rebellious, a ſmall quantity of ſublimate; when the roots are quite deſtroyed, you may incarn with the precipitate medicines, and dry up the ſore with the following waſh.

Take of white vitriol, alum, and galls in powder, of each two ounces; diſſolve them by boiling a little in two quarts of lime-water, and keep in a bottle for uſe, which ſhould be ſhook when uſed.

Of

Of the Running Thrush, Canker, *and* Loss *of* Hoof.

The *thrush* or *frush* is an imposthume that sometimes gathers in the frog; or a scabby and ulcerous disposition, which sometimes causes it to fall off: when the discharge is natural, the feet should be kept clean, but no drying washes made use of, it being thought as unsafe to repel some of these discharges, as to cure some sweaty feet.

When an imposthume, or gathering appears, the safest way is to pare out the hard part of the frog, or whatever appears rotten; and wash the bottom of the foot two or three times a-day with old chamber-lye; this is the safest and best way of treating them. But when a horse has been neglected, and there is is a strong flux to the part, it is apt to degenerate into a canker; to prevent which, use the following wash.

Take spirit of wine and vinegar of each two ounces, tincture of myrrh and aloes one ounce, Ægyptiacum half an ounce; mix together.

Bathe the thrush with this, where ever there appears a more than ordinary moisture, and lay over the ulcer a little tow dipped in the same. The purges and diuretics recommended in the grease, should be given at this time, to prevent the inconveniencies that the drying up these discharges frequently occasion.

A *canker* in the foot proceeds, for the most part, from thrushes, when they prove rotten and putrid, though many other causes may produce this disorder. The method used by farriers for the cure is generally with hot oils, such as vitriol, aqua-fortis, and butter of antimony, which are very proper to keep down the rising flesh, and should be used daily, till the fungus is suppressed, when once in two days will be sufficient, strewing fine precipitate powder over the new-grown flesh, till the sole begins to grow.

There is one great error committed often in this cure, that is, in not having sufficient regard to the hoof; for it should not only be cut off, where-ever it presses on the tender parts, but should be kept soft with linseed oil; and as often as it is dressed, bathe the hoof all round the coronet with chamber-lye. Purging is very proper to complete the cure.

The *loss of the hoof* may be occasioned by whatever accident may bring an imposthumation in the feet, whereby the whole hoof becomes loosened, and falls off from the bone. If the coffin-bone remains uninjured, a new hoof may be procured by the following method.

The old hoof should by no means be pulled off, unless some accident happens that requires its removal; for it serves as a defence to the new one, and makes it grow more smooth and even; and indeed nature will generally do this office at her own proper time.—On the removal of the hoof, a boot of leather, with a strong sole, should be laced about the pastern, bolstering and stopping the foot with soft flax, that the tread may be easy: dress the sore with the wound ointment, to which should be added the fine powders of myrrh, mastich, and olibanum. If this medicine should not be sufficient to prevent a fungus, burnt alum or precipitate may be added to it, and the luxuriant flesh may be daily washed with the sublimate water.

Of Ruptures, Anticor, Colt-evil *or* Gonorrhoea, *and Diseases of the* Mouth.

In regard to ruptures, though they are generally divided into particular classes, we shall only observe, that by violent efforts of the horse, or other accidents, the guts or caul may be forced between the muscles of the belly at the navel, and through the rings of the muscles into the scrotum or cod. The swellings are generally about the size of a man's fist, sometimes much larger, descending to the very hock; they are frequently soft, and yield to the pressure of the hand, when they will return into the cavity of the belly with a rumbling noise; and, in most, the vacuity may be felt through which they passed.

On their first appearance, endeavours should be made to return them by the hand; but if the swelling should be hard and painful, in order to relieve the stricture, and relax the parts, through which the gut or caul has passed, let a large quantity of blood be immediately taken away, and the part fomented twice or thrice a-day, applying over it a poultice made with oatmeal, oil and vinegar, which should be continued till the swelling grows soft and easier, or the gut is returned. In the mean time it would be proper to throw up emollient oily glysters twice a-day, and to let the horse's chief diet be boiled barley, scalded malt, or bran.

Should the swelling afterwards return, we apprehend the restringent applications, usually recommended on these occasions, will avail little without a suspensory bandage; so that an ingenious mechanic in that art is chiefly to be relied on for any future assistance; though it has been observed, that with moderate feeding, and gentle exercise, some horses have continued to be very useful under this complaint.

The *anticor* is a disorder not very common among our horses, or those in northern climates; but is particularly taken notice of by the French, Spanish, and Italian writers; who describe it a malignant swelling in the breast, which extends sometimes to the very sheath under the belly; it is attended with a fever, great depressions, and weakness, and a total loss of appetite.

The cure should first be attempted by large and repeated bleedings, to abate the inflammation; emollient glysters should be injected twice or thrice a-day, with an ounce of sal prunella in each, and the cooling drink in the Section on Fevers should be given inwardly; the swelling should be bathed with the marshmallow ointment, and a ripening poultice, with onions boiled in it, should be daily applied over it. If by this method, continued four or five days, the inflammation in the throat and gullet is removed, our attention should more particularly turn to encourage the swelling at the breast, and bring it, if possible, to matter; to which end, continue the poultice, and give two ounces of Venice treacle dissolved in a pint of beer every night; when the swelling is grown soft, it must be opened with the knife, and dressed with turpentine digestive, the danger now being over.

But

But ſhould it be found impracticable to bring the ſwelling to matter, and it increaſes upwards, ſo as to endanger ſuffocation; authors have adviſed to pierce the tumour with a hot pointed cautery in five or ſix places, to dreſs with the above digeſtive; and in order to ſtimulate and promote a greater diſcharge, to add to it a ſmall quantity of Spaniſh flies and euphorbium in powder; fomenting at the ſame time, and bathing the circumjacent parts with ointment of marſhmallows. M. Gueriniere, as well as Soleyſell, have adviſed opening the ſkin, when the tumour cannot be brought to matter, in order to introduce a piece of black hellebore-root ſteeped in vinegar, and to confine it there for twenty-four hours; this alſo is intended as a ſtimulant, and is ſaid to anſwer the intention, by occaſioning ſometimes a ſwelling as big as a man's head.

Beſides the diſorders of the mouth, which we have already animadverted on, there are frequently obſerved on the inſide the lips and palate, little ſwellings or bladders called *giggs*: ſlitting them open with a knife, or lancet, and waſhing them afterwards with ſalt and vinegar, is in general their cure; but when they degenerate into what are called cankers, which are known by little white ſpecks, that ſpread and occaſion irregular ulcers, the beſt method then is to touch them daily with a ſmall flat cautery, moderately heated, till the ſpreading is ſtopped, and to rub the ſores three or four times a-day with Ægyptiacum, and tincture of myrrh, ſharpened with oil, or ſpirit of vitriol; when by this dreſſing the ſloughs are ſeparated, they may be waſhed frequently with a ſponge dipped in copperas, or ſublimate water, if they continue to ſpread; or a tincture made by diſſolving half an ounce of burnt alum, and two ounces of honey, in a pint of tincture of roſes. Either of theſe will dry them up, and are very uſeful in moſt diſorders of the mouth.

A relaxation and ſwelling of the palate ſometimes happens to horſes on catching cold. To remedy this diſorder, blow pepper on the part, or anoint it with the ſame mixed up with honey. The tincture above-mentioned may be uſed for this purpoſe, to which may be added half an ounce of ſpirit of ſal armoniac.

The colt-evil is ſuppoſed to ariſe from ſtoned colts having full liberty with mares, before they are able to cover them; whence frequently enſues an excoriation or fretting on the glands, and a ſwelling on the ſheath; this laſt diſorder frequently proceeds too from dirt, or filth lodging there, and is often removed by waſhing the part clean with butter and beer: but when the yard itſelf is ſwelled, foment it twice a day with marſhmallows boiled in milk, to which may be added a little ſpirit of wine; anoint the excoriation with the white ointment, or waſh it with a ſponge dipped in lime, to a pint of which may be added two drams of ſugar of lead: the yard ſhould be ſuſpended up to the belly; and if the ſwelling ſhould increaſe with the inflammation, bleed, and give the cooling phyſic, anoint with ointment of elder, and apply the bread and milk poultice.

If a ſimple gonorrhœa or ſeminal gleet is obſerved to drip from the yard, (which is often the caſe in high-fed young horſes, where a relaxation of the glands and ſeminal veſſels has been brought on by frequent emiſſions) let the horſe be plunged every day into a river or pond; give him two or three rhubarb purges, at proper diſtances; and intermediately the following balls.

> Take of balſam of copivi, or Venice turpentine, olibanum, and maſtich powdered, of each two drams; bole armoniac half an ounce: mix up into a ball with honey, and give it night and morning, till the diſcharge leſſens, and then every night, till it goes off.

Balls prepared with rhubarb and turpentine may alſo be given for this purpoſe; two drams of the former, with half an ounce of the latter.

F A S

FASCES, in Roman antiquity, axes bound up together with rods or ſtaves, and carried before the Roman magiſtrates as a badge of their authority and office.

FASCETS, in the art of making glaſs, are the irons thruſt into the mouths of bottles, in order to convey them into the annealing tower.

FASCIA, in architecture, ſignifies any flat member having a conſiderable breadth and but a ſmall projecture, as the band of an architrave, larmier, *&c.*

Fascia lata, in anatomy. See Anatomy, p. 206.

FASCIÆ, in aſtronomy, certain parts on Jupiter's body reſembling belts or ſwaths. They are more lucid than the reſt of that planet, and are terminated by parallel lines, ſometimes broader and ſometimes narrower.

FASCIALIS, in anatomy. See Sartorius.

FASCINATION, a kind of witchcraft or enchantment ſuppoſed to operate by the influence either of the eye or tongue.

FASCINES, in fortification, faggots of ſmall wood, of about a foot diameter and ſix feet long, bound in the middle and at both ends. They are uſed in raiſing batteries, making chandeliers, in filling up the moat to facilitate the paſſage to the wall, in binding the ramparts where the earth is bad, and in making parapets of trenches to ſcreen the men.

F A T

FASHION-pieces, in the ſea-language, are two compaſſing pieces of timber, into which is fixed one on each ſide the tranſom. See Transom.

FAST, or Fasting, in general, denotes the abſtinence from food; but is more particularly uſed for ſuch abſtinence on a religious account.

FASTERMANS, among our Saxon anceſtors, were pledges or bondſmen, who were anſwerable for each other's good behaviour.

FASTI, in Roman antiquity, the calendar wherein were expreſſed the ſeveral days of the year, with their feaſts, games, and other ceremonies.

FAT, in anatomy, an oleaginous or butyraceous matter, ſecreted from the blood, and filling up the cavity of the adipoſe cells. Fat, properly and diſtinctly ſo called,

ed, is not secreted from glandules, but from the little arteries of the adipose membrane. Authors distinguish it into two kinds, which they express by the words *sevum* or *adeps*, and *pinguedo*. According to this distinction, there is no such thing as sevum or hard fat in the human body, its fat being all of that sort expressed by pinguedo, or soft and oily. That this oleaginous matter has a circulatory motion, or an egress into the veins, is very evident from the sudden consumption of it in many diseases, and from its vast diminution by exercise or labour.

FAT, in the sea-language, signifies the same with broad. Thus a ship is said to have a fat quarter, if the trussing in or tuck of her quarter be deep.

FAT is used also for several utensils; as, 1. A great wooden vessel, used for the measuring of malt, and containing a quarter or eight bushels. 2. A large brewing vessel, used by bewers to run their wort in. 3. A leaden pan or vessel for the making of salt at Droitwich.

FAT likewise denotes an uncertain measure of capacity. Thus a fat of ising-glass contains from $3\frac{1}{4}$ hundred weight to 4 hundred weight; a fat of unbound books, half a maund or four bales; of wire, from 20 to 25 hundred weight; and of yarn, from 220 to 221 bundles.

FATE, denotes an inevitable necessity depending upon a superior cause. It is also used to express a certain unavoidable designation of things, by which all agents, both necessary and involuntary, are swayed and directed to their ends.

FATES, in mythology. See PARCÆ.

FATHOM, a long measure containing six feet, used chiefly at sea for measuring the length of cables and cordage.

FATUUS IGNIS, in physiology, a meteor otherwise called Will-with-a-wisp. See WILL.

FAVIFORM, in general, something resembling a honeycomb. Surgeons give this appellation to certain ulcers, which emit a sanies through little holes, especially in the head.

FAVISSÆ, in antiquity, were, according to Festus and Gellius, cisterns to keep water in: but the favissæ in the Capitol at Rome were dry cisterns or subterraneous cellars, where they laid up the old statues, broken vessels, and other things used in the temple. These were much the same with what, in some of the modern churches, are called the archives and treasury.

FAUNALIA, in Roman antiquity, three annual festivals in honour of the god Faunus; the first of which was observed on the ides of February, the second on the 16th of the calends of March, and the third on the nones of December. The principal sacrifices on this occasion were lambs and kids. Faunus was a deity of the Romans only, being wholly unknown to the Greeks.

FAUNS, a kind of rural deities, among the ancient Romans, represented with horns on their heads, sharp-pointed ears, and the rest of their bodies like goats.

FAWN, among sportsmen, a buck or doe of the first year; or the young one of the buck's breed in its first year.

FE, or *St* FE, the capital of New Mexico: W. long. 109°, N. lat. 36°.

St FE *de bagota*, the capital of the kingdom of New Granada: W. long. 73°, N. lat. 4°. It is an archbishoprick and the seat of the governor of the province, *&c.*

St FE is also a town of Spain, in the province of Granada, situated on the river Xemil: W. long. 3° 45′, N. lat. 37° 20′.

St FE is also the capital of a province of the same name, in Terra Firma in South America, situated on the river of St Martha, 200 miles south of Carthagena: W. long. 77°, N. lat. 7° 25′.

FEALTY, in law, an oath taken on the admittance of any tenant, to be true to the lord of whom he holds his land.

FEAST, or FESTIVAL, in a religious sense, is a day of feasting and thanksgiving.

Among the ancients, feasts were instituted upon various accounts, but especially in memory of some favourable interposition of Providence. Thus, the Jews had their feast of passover, pentecost, and tabernacles; the Greeks their cerealia, panathenæa, *&c.* and the Romans their saturnalia, ambarvalia, *&c.* See PASSOVER, CEREALIA, *&c.*

FEATHER, in physiology, a general name for the covering of birds; it being common to all the animals of this class to have their whole body, or at least the greatest part of it, covered with feathers or plumage.

FEBRIFUGE, in medicine, an apellation given to such medicines as mitigate, or remove a fever.

FEBRIS, FEVER, in medicine. See FEVER.

FEBRUARY, in chronology, the second month of the year, reckoning from January, first added to the calendar of Romulus by Numa Pompilius.

February derives its name from Februa, a feast held by the Romans in this month, in behalf of the manes of the deceased; at which ceremony sacrifices were performed, and the last offices were paid to the shades of the defunct.

February, in a common year, consists only of twenty-eight days; but in the bissextile year, it has twenty-nine, on account of the intercallary day, added that year.

FECIALES, or FOECIALES, a college of priests instituted at Rome by Numa, consisting of twenty persons, selected out of the best families. Their business was to be arbitrators of all matters relating to war and peace, and to be the guardians of the public faith.

FEE, in Scots law, signifies a complete feudal property. See SCOTS LAW, title 10. Hence, where the bare liferent of any feudal subject is meant to be conveyed to A, and the absolute property to B; that meaning is expressed thus, to A in liferent, and to B in fee.

FEELERS, in natural history, a name used by some for the horns of insects.

FEELING, one of the five external senses, by which we obtain the ideas of solid, hard, soft, rough, hot, cold, wet, dry, and other tangible qualities.

FEINT, in fencing, a shew of making a thrust at one part

Fig. 1. Felis Leo
or
Lion

Fig. 2. Felis Tigris
or
Tiger

A Bell Sculp

part, in order to deceive the enemy, that you may really ftrike him in another.

A fimple feint is a mere motion of the wrift, without ftirring the foot.

FELAPTON, in logic, one of the fix firft modes of the third figure of fyllogifms; whereof the firft propofition is an univerfal negative, the fecond an univerfal affirmative, and the third a particular negative.

FELIN, a town of Livonia, about an hundred miles north-eaft of Riga.

FELIS, the CAT, a genus of quadrupeds belonging to the order of feræ, the characters of which are thefe: The fore teeth are equal; the molares or grinders have three points; the tongue is furnifhed with rough fharp prickles, and pointing backwards; and the claws are fheathed, and retractile. This genus comprehends feven genera, *viz.*

1. The LEO, or LION. The largeft lions are from eight to nine feet in length, and from four to eight feet high: thofe of a fmaller fize are generally about $5\frac{1}{2}$ feet long, and about $3\frac{1}{2}$ high. His head is very thick, and his face is befet on all fides with long bufhy yellowifh hair; this fhaggy hair extends from the top of the head to below the fhoulders, and hangs down to his knees: the belly and breaft are likewife covered with long hair. The reft of the body is covered with very fhort hair, excepting a bufh at the point of the tail. The ears are roundifh, fhort, and almoft entirely concealed under the hair of his front. The fhagginefs of the fore-part of his body makes the hinder part have a naked appearance. The tail is long and very ftrong; the legs are thick and flefhy; and the feet are fhort; the length of the claws is about an inch and a quarter, are of a whitifh colour, very crooked, and can be extended or retracted into the membranous fheath at pleafure: Their points are feldom blunted, as they are never extended but when he feizes his prey.

The female, or lionnefs, has no mane, or long hair about her head or fhoulders; in her we fee diftinctly the whole face, head, ears, neck, fhoulders, breaft, *&c.* all thefe parts being in fome meafure concealed under the long hair of the male, give the female a very different appearance: befides, fhe is confiderably lefs than the male. The hair of both male and female is of a yellowifh colour, and whitifh on the fides and belly.

In warm countries, quadrupeds in general are larger and ftronger than in the cold or temperate climates. They are likewife more fierce and hardy; all their natural qualities feem to correfpond with the ardour of the climate. The lions nourifhed under the fcorching fun of Africa or the Indies, are the moft ftrong, fierce, and terrible. Thofe of mount Atlas, whofe top is fometimes covered with fnow, are neither fo ftrong or fo ferocious as thofe of Biledulgerid or Zaara, whofe plains are covered with burning fand. It is in thefe hot and barren defarts, that the lion is the dread of travellers, and the fcourge of the neighbouring provinces. But it is a happy circumftance, that the fpecies is not very numerous: they even appear to diminifh daily. The Romans, fays Mr Shaw, brought many more lions out of Lybia for their public fhews, than are now to be found in that country. It is likewife remarked, that the lions in Turkey, Perfia, and the Indies are lefs numerous than formerly. As this formidable and courageous animal makes a prey of moft other animals, and is himfelf a prey to none, this diminution in the number of the fpecies can be owing to nothing but an increafe in the number of mankind: for it muft be acknowledged, that the ftrength of this king of animals is not a match for the dexterity and addrefs of a Negro or Hottentot, who will often dare to attack him face to face, and with very flight weapons.

The ingenuity of mankind augments with their number; that of other animals continues always the fame. All the noxious animals, as the lion, are reduced to a fmall number, not only becaufe mankind are become more numerous, but likewife becaufe they have become more ingenious, and have invented weapons which nothing can refift. This fuperiority in the numbers and induftry of mankind, at the fame time that it has broke the vigour of the lion, feems likewife to have enervated his courage. This quality, though natural, is exalted or lowered according to the good or bad fuccefs with which any animal has been accuftomed to employ his force. In the vaft defarts of Zaara; in thofe which feem to feparate two very different races of men, the Negroes and Moors, between Senegal and the boundaries of Mauritania; in thofe uninhabited regions above the country of the Hottentots; and, in general, in all the meridional parts of Africa and Afia, where mankind have difdained to dwell, lions are ftill as numerous, and as ferocious as ever. Accuftomed to meafure their ftrength by that of all other animals which they encounter, the habit of conquering renders them haughty and intrepid. Having never experienced the ftrength of man, or the power of his arms, inftead of difcovering any figns of fear, they difdain and fet him at defiance. Wounds irritate, but do not terrify them: they are not even difconcerted at the fight of numbers. A fingle lion of the Defart has been known to attack a whole caravan; and if, after a violent and obftinate engagement, he found himfelf weakened, he retreats fighting, always keeping his face to the enemy. On the other hand, the lions which live near the villages or huts of the Indians or Africans, being acquainted with man and the force of his arms, are fo daftardly as to fly and leave their prey at the fight of women or children.

This foftening in the temper and difpofition of the lion, fhews that he is capable of culture, and fufceptible, at leaft to a certain degree, of the impreffions that he receives: accordingly, hiftory informs us of lions yoked in triumphal chariots, trained to war, or the chace; and that, faithful to their mafters, they never employed their ftrength or courage but againft their enemies. It is, however, certain, that a lion taken young and brought up among domeftic animals, will eafily be accuftomed to live and fport with them; that he is mild and careffing to his mafter, efpecially when he is young; and that, if his natural ferocity fometimes breaks out, it

is

is rarely turned againſt thoſe who have been kind to him. But, as his paſſions are impetuous and vehement, it is not to be expected that the impreſſions of education will at all times be ſufficient to balance them: for this reaſon it is dangerous to l t him ſuffer hunger long, or to vex him by ill-timed teazings: bad treatment not only irritates him, but he remembers it long, and meditates revenge. On the other hand, he is exceedingly grateful, and ſeldom forgets benefits received. He has been often obſerved to diſdain weak or inſignificant enemies, to deſpiſe their inſults, and to pardon their offenſive liberties. When led into captivity, he will diſcover ſymptoms of uneaſineſs, without anger or peeviſhneſs: on the contrary, his natural temper ſoftens, he obeys his maſter, careſſes the hand that gives him food, and ſometimes gives life to ſuch animals as are thrown to him alive for prey; by this act of generoſity he ſeems to conſider himſelf as for ever bound to protect them; he lives peacably with them, allows them a part, and ſometimes the whole of his food, and will rather ſubmit to the pangs of hunger than fill his ſtomach with the fruit of his beneficence. We may likewiſe obſerve, that the lion is not a cruel animal; he kills rather from neceſſity than choice, never deſtroying more than he eats, and whenever his appetite is ſatisfied he is mild and peaceable.

The aſpect of the lion does not detract from the noble and generous qualities of his mind. His figure is reſpectable; his looks are determined; his gate is ſtately; and his voice is tremenduous. In a word, the body of the lion appears to be the beſt model of ſtrength joined to agility. The force of his muſcles is expreſſed by his prodigious leaps and bounds, often 20 feet at once; by the briſk motion of his tail, a ſingle ſweep of which is ſufficient to throw a man to the ground; by the eaſe with which he moves the ſkin of his face, and particularly of his forehead; and, laſtly, by the faculty of erecting and agitating the hair of his main when irritated.

Lions are very ardent in their amours: when the female is in ſeaſon, ſhe is often followed by eight or ten males, who roar inceſſantly, and enter into furious engagements, till one of them completely overcomes the reſt, takes peaceable poſſeſſion of the female, and carries her off to ſome ſecret receſs. The lionneſs brings forth her young in the ſpring, and produces but once every year.

All the paſſions of the lion, the ſoft paſſion of love not excepted, are exceſſive; the love of offſpring is extreme: the lionneſs is naturally weaker, leſs bold, and more gentle than the lion; but ſhe becomes perfectly rapacious and terrible when ſhe has young. Then ſhe exhibits more courage than the male; ſhe knows no danger; ſhe attacks indifferently men and all other animals, kills them, and carries them to her young ones, whom ſhe thus early inſtructs to ſuck their blood and tear their fleſh. She generally brings forth in the moſt ſecret and inacceſſible places; and, when afraid of a diſcovery, ſhe endeavours to conceal the traces of her feet, by returning frequently on her ſteps, or rather by effacing them with her tail; and, when the danger is great, ſhe carries off her young and conceals them ſome where elſe. But, when an actual attempt is made to deprive her of her young, ſhe becomes perfectly furious, and defends them till ſhe be torn to pieces.

The lion ſeldom goes abroad in the middle of the day; he goes round in the evening and night, in queſt of prey. He is afraid of fire, never approaches the artificial fires made by the ſhepherds for the protection of their flocks; he does not trace other animals by the ſcent, but is obliged to truſt to his eyes. Many hiſtorians have even miſrepreſented him as incapable of finding out his prey; but that he is obliged to the jackal, an animal of exquiſite ſcent, in order to provide for him, and that this animal either accompanies or goes before him for this purpoſe. The jackal is a native of Arabia, Lybia, *&c.* and, like the lion, lives upon prey; perhaps ſometimes he follows the lion, but it is with a view to pick up what he leaves behind, not to provide for him; for, being a ſmall and feeble animal, he ought rather to fly than to ſerve the lion.

The lion, when hungry, will attack any animal that preſents itſelf: but he is ſo very formidable, that all endeavour to avoid his rencountre; this circumſtance often obliges him to conceal himſelf, and lie in wait till ſome animal chances to paſs. He lies ſquat on his belly in a thicket; from which he ſprings with ſuch force and velocity, that he often ſeizes them at the firſt bound. He endures hunger longer than thirſt; he ſeldom paſſes water without drinking, which he does by lapping like a dog. For his ordinary ſubſiſtence, he requires about 15 pounds of raw fleſh each day.

The roaring of the lion is ſo ſtrong and loud, that it reſembles the rumbling of diſtant thunder. His roaring is his ordinary voice: but when he is irritated, his cry is ſhorter, repeated more ſuddenly, and is ſtill more terrible than the roaring: beſides he beats his ſides with his tail, ſtamps with his feet, erects and agitates the hair of his head and main, moves the ſkin of his face, ſhows his angry teeth, and lolls out his tongue.

The gait of the lion is ſtately, grave, and ſlow, though always in an oblique direction. His movements are not equal or meaſured, but conſiſt of leaps and bounds; which prevents him from ſtopping ſuddenly, and makes him often over-leap his mark. When he leaps upon his prey, he makes a bound of 12 or 15 feet, falls above it, ſeizes it with his fore-feet, tears the fleſh with his claws, and then devours it with his teeth.

The lion, however terrible, is hunted by large dogs, well ſupported by men on horſeback: they diſlodge him, and oblige him to retire. But it is neceſſary that both the dogs and horſes be trained before-hand; for almoſt every animal frets and flies as ſoon as he feels the very ſmell of a lion. His ſkin, although hard and firm, does not reſiſt either a ball or a javelin: however, he is ſeldom killed by a ſingle ſtroke; and is more frequently taken by addreſs than force. They put a live animal above a deep pit covered with light ſubſtances, and thus decoy him into the ſnare.

2. The Tiger. The ſize of this animal, according to ſome authors, is larger, and, according to others, ſomewhat leſs than the lion. M. de la Landemagon aſſures us, that he has ſeen a tiger in the Eaſt-Indies 15 feet long, including undoubtedly the length of the

Plate LXXIX.

Fig. 1. Felis Pardus *or* Panther

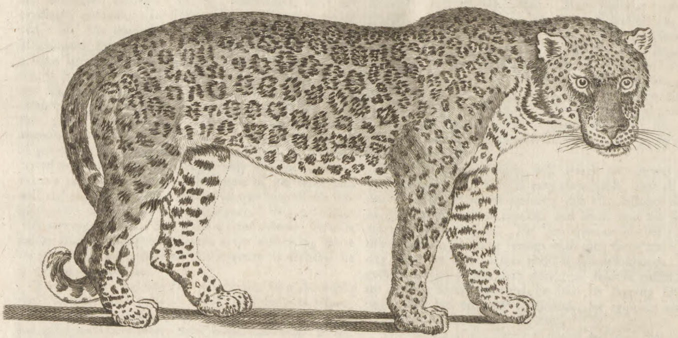

Fig. 2. Felis Leopardus *or* Leopard

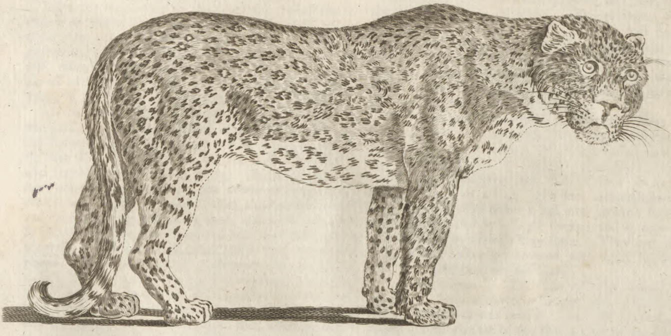

A. Bell Sculpt.

the tail, which, ſuppoſing it to be four feet, makes the body of the tiger about 10 feet in length. The ſkeleton preſerved in the cabinet of the French king, indicates that the animal was about 7 feet long from the point of the muzzle to the origin of the tail; but then it muſt be conſidered that he was caught young, and lived all his days in confinement. The head of the tiger is large and roundiſh; and the ears are ſhort, and at a great diſtance from each other. The form of the body has a great reſemblance to that of the panther. The ſkin is of a darkiſh yellow colour, ſtriped with long black ſtreaks; the hair is ſhort, excepting on the ſides of the head, where it is about four inches long. The point of the tail is black, and the reſt of it is interſperſed with black rings. His legs and claws reſemble thoſe of the lion, only the legs are much ſhorter in proportion to the ſize of the animal.

The tiger is more ferocious, cruel, and ſavage than the lion. Although gorged with carnage, his thirſt for blood is not appeaſed; he ſeizes and tears in pieces a new prey with equal fury and rapacity, the very moment after devouring a former one; he lays waſte the country he inhabits; he neither dreads the aſpect nor the weapons of men; puts to death whole troops of domeſtic animals; and attacks young elephants, rhinoceros's, and ſometimes even braves the lion himſelf. The tiger ſeems to have no other inſtinct but a conſtant thirſt after blood, a blind fury which knows no bounds or diſtinction, and which often ſtimulates him to devour his own young, and to tear the mother in pieces for endeavouring to defend them. He lies in wait at the banks of rivers, *&c.* where the heat of the climate obliges the other animals to repair for drink. Here he ſeizes his prey, or rather multiplies his maſſacres: for he no ſooner kills one animal, than he flies with equal fury upon the next, with no other view but to plunge in his head into their bodies and drink their blood. However, when he kills a large animal, as a horſe or a buffalo, he ſometimes does not tear out the entrails on the ſpot; but, to prevent any interruption, he drags them off to the wood, which he executes with incredible ſwiftneſs. This is a ſufficient ſpecimen of the ſtrength of this rapacious animal.

Neither force, reſtraint, or violence can tame the tiger. He is equally irritated with good as with bad treatment: he tears the hand which nouriſhes him with equal fury as that which adminiſters blows: he roars, and is enraged at the ſight of every living creature. Almoſt every natural hiſtorian agrees in this horrible character. When viewing the beautiful tiger which is at preſent exhibiting in the city of Edinburgh, we at firſt ſuſpected that his character was not ſo bad or ferocious as repreſented by hiſtorians: he allowed the keeper not only to come near him, but to ſtroke his head and take his paw in his hand. However, this appeared to be only a forced complaiſance; he was chained ſo cloſe to the floor, that he had only juſt room to ſtand: he ſnarled and roared when his maſter troubled him more than he inclined; and, upon throwing him a piece of fleſh, his eyes inſtantly ſparkled with rage; he put himſelf in a poſture of defence, ſet up the moſt horrible roarings, and made ſeveral bounds to get at the keeper as well as the ſpectators.

It is happy for other animals, that the ſpecies of the tiger is not numerous, and that they are confined to the warm climates. They are found in Malabar, Siam, Bengal, the interior parts of Africa, and, in general, in all the regions that are inhabited by the elephant and rhinoceros.

The tiger has always been a more rare animal than the lion, and yet brings forth an equal number of young, namely, four or five at a litter. The female is furious at all times; but, when her young are attempted to be taken from her, her rage is redoubled: ſhe braves every danger; ſhe purſues the raviſhers, who are obliged, when hard preſſed, to drop one of the young in order to retard her motion; ſhe ſtops, takes it up, and carries it into ſome ſecret part of the foreſt; but ſhe inſtantly returns and purſues the hunters into their villages or boats.

The tiger moves the ſkin of his face, grinds his teeth, and roars, like the lion; but the ſound of his voice is different.

3. The PANTHER.—It is about the ſize of a large dog, and has a great reſemblance to a domeſtic cat. The tongue is rough and remarkably red; the teeth are ſtrong and ſharp; the ſkin is exceedingly beautiful, being of a yellow colour, variegated with roundiſh black ſpots, and the hair is ſhort.

The panther has a cruel and ferocious aſpect; his motions are briſk and lively; his cry reſembles that of an enraged dog, but more ſtrong and rough. He is not ſo perfectly ungovernable as the tiger: but, notwithſtanding all attempts to render him obedient and tractable, he may rather be ſaid to be ſubdued than tamed; for he never entirely loſes his natural ferocity. Accordingly, when kept with a view to hunting bucks, goats, or other animals, great care is neceſſary in training him, and ſtill greater in conducting him. When leading out to the field, they put him in a cage and carry him on a cart. When the game is ſprung, they open the door of the cage; he inſtantly ſprings towards the animal, often ſeizes him in a few bounds, throws him to the ground, and ſtrangles him. But, if he happens to miſs his aim, he becomes mad with rage, and ſometimes falls upon his maſter, who, in order to prevent accidents of this kind, generally carries along with him pieces of fleſh, or perhaps a lamb or a kid, which he throws to him in order to appeaſe his fury.

The panther is no where to be found but in Africa, and the regions of the Indies.

4. The ONCA or ONCE, is leſs than the panther; the tail is longer; the hair is likewiſe longer, and of a whitiſh grey colour. The once is eaſily tamed; and is employed in hunting in ſeveral parts of Aſia, where dogs are very ſcarce. He has not the delicate ſcent of a dog; does not trace other animals by the ſmell; neither can he run them down in a fair chaſe; but lies in wait for their approach, and then darts upon them unawares. He leaps ſo nimbly, that he eaſily clears a ditch or a wall ſeveral feet high: beſides, he often climbs trees, waits till ſome animal paſſes, and inſtantly leaps down upon them. This method of catching their prey, is practiſed by the panther and leopard, as well as the once.

5. The LEOPARD differs from the panther and the once in the beauty of his colour, which is a lively yellow, with ſmaller ſpots than thoſe of the two latter, and

difpofed in groups. He is larger than the once, and lefs than the panther. The manners and difpofition of the leopard are nearly the fame with thofe of the panther. He is never tamed or employed in hunting. The panther, once, and leopard, are inhabitants of Africa and the warmer regions of Afia. In general, thefe animals delight in thick forefts, and frequent the banks of rivers, and the neighbourhood of folitary villages, where they lie in wait to furprife domeftic animals and the wild beafts that come in queft of water. They feldom attack men, even when provoked. With regard to their fkins, they are all valuable, and make excellent furs.

6. The LYNX is about $2\frac{1}{2}$ feet long and 15 inches high. He has a great refemblance to the cat; but his ears are longer, and his tail is much fhorter; his hair is ftreaked with yellow, white, and black colours. The lynx is an inhabitant of Mufcovy, Poland, Canada, *&c.* his eyes are brilliant, his afpect is foft, and his air is gay and fprightly; like the cat, he covers his urine with earth; he howls fomething like the wolf, and is heard at a confiderable diftance; he does not run like the dog or wolf, but walks and leaps like a cat; he purfues his prey even to the tops of trees; neither wild-cats nor fquirrels can efcape him; he lies in wait for ftags, goats, hares, *&c.* and darts fuddenly upon them; he feizes them by the throat and fucks their blood, then opens the head and eats the brain; after this, he frequently leaves them and goes in queft of frefh prey; the colour of his fkin changes according to the feafon or the climate; the winter furs are more beautiful than thofe of fummer.

7. The CAT, is a well-known domeftic animal, and therefore requires no particular defcription. The wild-cat, the cat of Angora, *&c.* differ only in the length of their hair, and fome fmall varieties arifing from climate and their manner of living.

Of all domeftic animals, the character of the cat is the moft equivocal and fufpicious. He is kept, not for any amiable qualities, but purely with a view to banifh rats, mice, and other noxious animals from our houfes, granaries, *&c.* Although cats, when young, are playful and gay, they poffefs at the fame time an innate malice and perverfe difpofition, which increafes as they grow up, and which education learns them to conceal, but never to fubdue. Conftantly bent upon theft and rapine, though in a domeftic ftate, they are full of cunning and diffimulation; they conceal all their defigns; feize every opportunity of doing mifchief, and then fly from punifhment. They eafily take on the habits of fociety, but never its manners; for they have only the appearance of friendfhip and attachment. This difingenuity of character is betrayed by the obliquity of their movements, and the ambiguity of their looks. In a word, the cat is totally deftitute of friendfhip; he thinks and acts for himfelf alone. He loves eafe, fearches for the fofteft and warmeft places to repofe himfelf. The cat is likewife extremely amorous; and, which is very fingular, the female is more ardent than the male; fhe not only invites, but fearches after and calls upon him to fatisfy the fury of her defires; and, if the male difdains or flies from her, fhe purfues, bites, and in a manner compels him. This heat of paffion in females lafts but nine or ten days, and happens twice in the year, namely in the fpring and autumn; however, in fome it happens thrice or four times in the year. The female goes with young 55 or 56 days, and generally produces four or five at a litter. As the male has an inclination to deftroy the young, the female takes care to conceal them from him; and, when fhe is apprehenfive of a difcovery, fhe takes them up in her mouth one by one, and hides them in holes or inacceffible places. When fhe has nurfed a few weeks, fhe brings them mice, fmall birds, *&c.* in order to learn them to eat flefh. But, it is worth notice, that thefe careful and tender mothers fometimes become unnaturally cruel, and devour their own offspring.

The cat is incapable of reftraint, and confequently of being educated to any extent. However, we are told, that the Greeks in the ifland of Cyprus trained this animal to catch and devour ferpents, with which that ifland was greatly infefted. This however was not the effect of obedience, but of a general tafte for flaughter; for he delights in watching, attacking, and deftroying all kinds of weak animals indifferently. He has no delicacy of fcent, like the dog; he hunts only by the eye: neither does he properly purfue; he only lies in wait, and attacks animals by furprife: and after he has caught them, he fports with and torments them a long time, and at laft kills them (when his belly is full) purely to gratify his fanguinary appetite.

The eye of the cat differs greatly from that of moft other animals. The pupil is capable of a great degree of contraction and dilatation; it is narrow and contracted like a line during the day, round and wide in the dark; it is from this conformation of the eye that the cat fees beft in the night, which gives him a great advantage in difcovering and feizing his prey.

Although cats live in our houfes, they can hardly be called domeftic animals; they may rather be faid to enjoy full liberty; for they never act but according to their own inclination. Befides, the greateft part of them are half wild; they do not know their mafters, and frequent only the barns, out-houfes, *&c.* unlefs when preffed with hunger.

Cats have a natural antipathy at water, cold, and bad fmells. They love to bafk in the fun, and lie in warm places. They likewife have an affection for certain aromatic fmells; they are tranfported with the root of the valerian.

Cats take about eighteen months before they come to their full growth; but they are capable of propagation in twelve months, and retain this faculty all their life, which generally extends to nine or ten years. They eat flowly, and are peculiarly fond of fifhes. They drink frequently; their fleep is light; and they often affume the appearance of fleeping, when in reality they are meditating mifchief. They walk foftly, and without making any noife. As their hair is always dry, it eafily gives out an electrical fire, which becomes vifible when rubbed a-crofs in the dark. Their eyes likewife fparkle in the dark like diamonds.

The wild, or favage cat, couples with the domeftic one, and is confequently the fame fpecies. It is not unufual for domeftic cats, both male and female, when ftimulated by love, to repair to the woods in queft of thefe

favage

vage cats. The only difference between them is, that the ſavage cat is ſtronger, larger, and more ferocious. The cat is a native of almoſt every country in the world; and all the varieties in their appearance may be reaſonably enough attributed to the climates which produce them. See figures of the principal ſpecies of the FELIS, on Plate LXXVIII, LXXIX, and LXXX.

FELKIRK, a town of Auſtria, in Germany, thirty-five miles ſouth eaſt of Conſtance.

FELLOWSHIP, or COMPANY, in arithmetic. See ARITHMETIC, p. 386.

FELO DE SE, in law, a perſon that lays deliberately violent hands on himſelf, and is the occaſion of his untimely death, whether by hanging, drowning, ſtabbing, ſhooting, or any other way.

FELON, in law, a perſon guilty of felony. See FELONY.

FELONY, in law, a capital crime, next in degree to petit treaſon, and committed with an evil intention; ſuch are murder, theft, ſuicide, ſodomy, rape, *&c.*

FELT, in commerce, a ſort of ſtuff deriving all its conſiſtence merely from being fulled, or wrought with lees and ſize, without either ſpinning or weaving.

Felt is made either of wool alone, or of wool and hair. Thoſe of French make, $3\frac{1}{2}$ yards long, and $1\frac{1}{2}$ broad, for cloaks, pay each 2 l. 14 s. $1\frac{80}{100}$ d. on importation; and draw back 1 l. 12 s. 3 d. on exporting them again.

FELTRI, a town of Italy, ſubject to Venice, thirty-five miles north of Padua.

FELUCCA, in ſea-affairs, a little veſſel with ſix oars, frequent in the Mediterranean, which has this peculiarity, that its helm may be applied either in the head or ſtern, as occaſion requires.

FEMALE, a term peculiar to animals, ſignifying that ſex which conceives and generates its young within itſelf.

FEMININE, in grammar, one of the genders of nouns. The feminine gender ſerves to intimate that the noun belongs to the female. In Latin, the femine gender is moſt commonly diſtinguiſhed by the article *hæc*, as it is in the Greek by ἡ. In the French, the article *la* commonly denotes this gender; but we have no ſuch diſtinction by articles in the Engliſh language.

FEMUR, OS FEMORIS, in anatomy. See ANATOMY, p. 182.

FEN, a place overflowed with water, or abounding with bogs.

FENCE, in country-affairs, a hedge, wall, ditch, bank, or other incloſure, made around gardens, woods, cornfields, *&c.*

The chief reaſon why wood-lands and plantations ſo ſeldom proſper, is in a great meaſure owing to the neglect of fencing them round to keep out the cattle. This neglect prevails much in the northern parts of this iſland, though the uſe of fences is certainly more neceſſary there than in the ſouth, as the lands require more ſhelter and warmth. There are ſeveral ways of fencing lands, but the uſual is that of hedging it with either white or black thorn, crab, holly, alder, or furze, *&c.*

FENCE MONTH, the month wherein deer begin to fawn, during which it is unlawful to hunt in the foreſt.

It commences fifteen days before mid-ſummer, and ends fifteen days after it. This month, by ancient foreſters is called defence-month.

FENCING, the art of making a proper uſe of the ſword, as well for attacking an enemy, as for defending one's ſelf.

FENNEL, in botany. See ANETHUM.

FEOD, the ſame with fee. See FEE.

FEODAL, and FEODATORY. See FEUDAL, and FEUDATORY.

FEOFFMENT, in law, is a gift or grant of any manors, meſſuages, lands, or tenements, to another in fee; that is, to him and his heirs for ever, by delivery of ſeiſin, and poſſeſſion of the eſtate granted.

FERÆ, in zoology, an order of quadrupeds, the diſtinguiſhing characters of which are, that all the animals belonging to it have ſix fore-teeth in each jaw, and the canine, or dog-teeth, conſiderably long.

Under this order are comprehended the following genera, *viz.* the phoca, canis, felis, viverra, muſtela, urſus, didelphis, talpa, ſorex, and erinaceus. See CANIS, FELIS, *&c.*

FERALIA, in antiquity, a feſtival obſerved among the Romans on February 21ſt, or, according to Ovid, on the 17th of that month, in honour of the manes of their deceaſed friends and relations. During the ceremony, which conſiſted in making preſents at their graves, marriages were forbidden, and the temples of the divinities ſhut up; becauſe they fancied that, during this feſtival, the ghoſts ſuffered no pains in hell, but were permitted to wander about their graves, and feaſt upon the meats prepared for them.

FER DE FOURCHETTE, in heraldry, a croſs having at each end a forked iron, like that formerly uſed by ſoldiers to reſt their muſquets on. It differs from the croſs fourché, the ends of which turn forked, whereas this has that ſort of fork fixed upon the ſquare end. See Plate LXXX. fig. 4.

FER DE MOULIN, *milrinde, inke de moulin*, in heraldry, is a bearing ſuppoſed to repreſent the iron-ink or ink of a mill, which ſuſtains the moving mill-ſtone.

FERDEN, or VERDEN, a city of Germany, ſubject to Hanover; it is ſituated in lower Saxony, on the river Aller, twenty ſix miles ſouth eaſt of Bremen: E. lon. 9°, and N. lat. 53° 24′.

FERENTARII, in Roman antiquity, were auxiliary troops, lightly armed; their weapons being a ſword, bow, arrows, and a ſling.

FERETINO, a city and biſhop's ſee of Italy, about fifty miles eaſt of Rome: E. long. 14° 5′, and N. lat. 41° 45′.

FERIÆ, in Roman antiquity, holidays, or days upon which they abſtained from work.

The Romans had two kinds of feriæ: 1. The public, common to all the people in general. 2. The private, which were only kept by ſome private families.

The public feriæ were fourfold: 1. Stativæ feriæ, holidays which always fell out upon the ſame day of the

the month, and were marked in the calendar; of these the chief were the agonalia, carmentalia, and lupercalia. 2. Conceptivæ feriæ, holidays appointed every year upon certain or uncertain days by the magiſtrates or the pontiff; ſuch were the latinæ, paganalia, compitalia, *&c.* See PAGANALIA, *&c.* 3. Imperativæ feriæ, holidays commanded or appointed by the authority of the conſuls or prætors; of this kind we may reckon the lectiſternium. See LECTISTERNIUM. 4. Nundinæ, the days for fairs. See NUNDINÆ.

FERIÆ LATINÆ were inſtituted by Tarquinius Superbus, who having overcome the Tuſcans, made a league with the Latins, and propoſed to them to build a temple in common to Jupiter Latialis, in which both nations might meet, and offer ſacrifice for their common ſafety. At this feſtival a white bull was ſacrificed; and each town, both of the Latins and Romans, provided a certain quantity of meat, wine, and fruits. At firſt the ſolemnity continued but one day; after the expulſion of the kings, the ſenate added a third, a fourth, and ſo on to ten days.

FERIA, in the Romiſh breviary, is applied to the ſeveral days of the week; thus Monday is the feria ſecunda, Tueſday the feria tertia; though theſe days are not working days, but holidays. The occaſion of this was, that the firſt Chriſtians were uſed to keep the eaſter week holy, calling Sunday the prima feria, *&c.* whence the term feria was given to the days of every week. But beſides theſe, they have extraordinary feriæ, *viz.* the three laſt days of paſſion-week, the two following eaſter-day, and the ſecond feriæ of rogation.

FERMANACH, a county of Ireland, in the province of Ulſter, the chief town of which is Inniſkilling.

FERMENT, any body which, being applied to another, produces fermentatton.

Ferments are either matters already in the act of fermentation, or that ſoon run into this act. Of the firſt kind are the flowers of wine, yeaſt, fermenting beer, or fermenting wine, *&c.* and of the ſecond are the new expreſſed vegetable juices of ſummer-fruit.

Among diſtillers, ferments are all thoſe bodies which, when added to the liquor, only correct ſome fault therein, and, by removing ſome obſtacle to fermentation, forward it by ſecondary means; as alſo ſuch as, being added in time of fermentation, make the liquor yield a larger proportion of ſpirit, and give it a finer flavour.

FERMENTATION, may be defined a ſenſible internal motion of the conſtituent particles of a moiſt, fluid, mixt or compound body; by the continuance of which motion, theſe particles are gradually removed from their former ſituation or combination, and again, after ſome viſible ſeparation is made, joined together in a different order and arrangement. See CHEMISTRY. p. 94.

FERMO, a port-town of Italy, ſituated on the gulf of Venice, about thirty miles ſouth of Ancona. It is an archbiſhop's ſee.

FERN, *filix*, in botany. See FILIX, OSMUNDA, ACROSTICUM, *&c.*

FERNANDO, or FERNANDES, an iſland in the Pacific ocean: W. long. 83°, S. lat. 33°.

FERRARA, a city and archbiſhop's ſee of Italy: E. long. 12° 6′, N. lat. 44° 50′.

FERRE, or *le* FERRE, a city of Picardy, in France, forty miles ſouth-eaſt of Amiens: E. long. 3° 26′, N. lat. 49° 45′.

FERRET, in zoology. See MUSTELA.

FERRETS, among glaſs-makers, the iron with which the workmen try the melted metal, to ſee if it be fit to work.

It is alſo uſed for thoſe irons which make the rings at the mouth of bottles.

FERRETTO, in glaſs-making, a ſubſtance which ſerves to colour glaſs.

This is made by a ſimple calcination of copper, but it ſerves for ſeveral colours: there are two ways of making it, the firſt is this. Take thin plates of copper, and lay them on a layer of powdered brimſtone, in the bottom of a crucible; over theſe lay more brimſtone, and over that another lay of the plates, and ſo on alternately till the pot is full. Cover the pot, lute it well, place it in a wind furnrce, and make a ſtrong fire about it for two hours. When it is taken out and cooled, the copper will be found ſo calcined, that it may be crumbled to pieces between the fingers, like a friable earth. It will be of a reddiſh, and, in ſome parts, of a blackiſh colour. This muſt be powdered and ſifted fine for uſe.

FERRO, W. long. 19.°, N. lat. 28°, the moſt weſterly of the Canary iſlands, near the African coaſt, where the firſt meridian was lately fixed in moſt maps; but now, the geographers of almoſt every kingdom make their reſpective capitals the firſt meridian, as we do London.

FERRO, ſome little iſlands ſituated in the northern ocean, 200 miles north-weſt of the Orcades, and as many ſouth-eaſt of Iceland: W. long. 7°, N. lat. 63°.

FERROL, a ſea-port-town of Spain, in the principality of Galicia, ſituated on a bay of the Atlantic ocean, twenty miles north-eaſt of the Groyne, and fifty miles north of Compoſtella, a good harbour, where the Spaniſh ſquadrons frequently ſecured themſelves in the late war: W. long 8° 40′, N. lat. 43° 30′.

FERRUGINOUS, any thing partaking of iron, or which contains particles of that metal.

FERRUGO, RUST. See RUST.

FERRUM, IRON. See IRON.

FERRY, a liberty by preſcription, or the king's grant, to have a boat for paſſage, on a firth or river, for carrying paſſengers, horſes, *&c.* over the ſame for a reaſonable toll.

FERTILITY, that quality which denominates a thing fruitful or prolific.

FERULA, in botany, a genus of the pentandria digynia claſs. The fruit is oval, compreſſed, and has three furrows on each ſide. There are nine ſpecies, none of them natives of Britain.

FESSE, in heraldry, one of the nine honourable ordinaries, consisting of a line drawn directly across the shield, from side to side, and containing the third part of it, between the honour-point and the nombril.

It represents a broad girdle or belt of honour, which knights at arms were anciently girded with. See Plate LXXX. fig. 5.

FESSE POINT, is the exact centre of the escutcheon. See POINT.

FESSE-WAYS, or *in* FESSE, denotes any thing borne after the manner of a fesse; that is, in a rank across the middle of the shield.

Party per FESSE, implies a parting across the middle of the shield, from side to side, through the fesse point.

FESTI DIES, in Roman antiquity, certain days in the year, devoted to the honour of the gods.

Numa, when he distributed the year into twelve months, divided the same into the dies festi, dies profesti, and dies intercisi.

The festi were again divided into days of sacrifices, banquets, games and feriæ. See SACRIFICE, EPULÆ, LUDI, and FERIÆ.

The profesti were those days allowed to men for the administration of their affairs, whether of a public or private nature: these were divided into fasti, comitiales, comperendini, stati, and præliares See FASTI, COMITIALES, *&c.*

The intercisi were days common both to gods and men, some parts of which were allotted to the service of the one, and some to that of the other.

FESTINO, in logic, the third mood of the second figure of the syllogism, the first proposition whereof is an universal negative, the second a particular affirmative, and the third a particular negative: as in the following example:

FES No bad man can be happy,
TI Some rich men are bad men:
NO *Ergo*, some rich men are not happy.

FESTIVAL, the same with feast. See FEAST.

FESTOON, in architecture and sculpture, *&c.* an ornament in form of a garland of flowers, fruits and leaves, intermixed or twisted together.

FESTUCA, in botany, a genus of grasses, belonging to the triandria digynia class. The calix has two valves; and the spica is oblong and cylindrical. There are sixteen species, eleven of which are natives of Britain, *viz.* the ovina, or sheep's fescue-grass; the rubiuscula, or hard fescue-grass; the rubra, or purple fescue-grass; the bromoides, or barren fescue-grass; the myuros, or wall fescue-grass; the pratensis, or meadow fescue-grass; the elatior, or tall fescue-grass; the decumbens, or small fescue-grass; the fluitans, or flat fescue grass; the loliacea, or spiked fescue-grass; and the sylvatica, or wood fescue grass.

FETIPOUR, a city of the hither India, twenty-five miles west of Agra: E. long. 78° 40′, N. lat. 27°.

FETLOCK, in the menage, a tuft of hair growing behind the pastern joint of many horses; for those of a low size have scarce any such tuft.

FEUD, the same with fee. See FEE.

FEUDAL, or FEODAL, denotes any thing belonging to a fee. See FEE.

FEUDATORY, or FEODATORY, a tenant who formerly held his estate by feodal service.

FEU DUTY, in Scots law, is the annual rent or duty which a vassal, by the tenor of his right, becomes bound to pay to his superior. See SCOTS LAW, title 11.

FEU-HOLDING, in Scots law, is that particular tenor by which a vassal is taken bound to pay an annual rent or feu-duty to his superior. See SCOTS LAW, tit. 11.

FEVER, in medicine. See MEDICINE.

FEVERFEW, in botany. See MATRICARIA.

FEVERSHAM, a port-town of Kent, and one of the cinqueports See CINQUEPORT.

It stands seven miles west of Canterbury.

FEZ, the capital of the empire of Fez and Morocco, in Africa: W. long 6°, N. lat. 33° 30′.

It is a large and populous city, and the usual residence of the emperor.

FIAR, in Scots law, the person vested in the feudal property of a subject. See FEE.

FIASCONE, a city and bishop's see of Italy, about twelve miles south of Orvietto.

FIAT, in law, a short order or warrant signed by a judge, for making out and allowing certain processes.

FIBRARIÆ, a class of fossils, naturally and essentially simple, not inflammable nor soluble in water, and composed of parallel fibres, some shorter, others longer; their external appearance being bright, and in some degree transparent: add to this, that they never give fire with steel, nor ferment with, or are soluble in acid menstrua.

FIBRE, in anatomy, a perfectly simple body, or at least as simple as any thing in the human structure; being fine and slender like a thread, and serving to form other parts. Hence some fibres are hard, as the bony ones; and others soft, as those destined for the formation of all the other parts.

The fibres are divided also, according to their situation, into such as are straight, oblique, transverse, annular, and spiral; being found arranged in all these directions, in different parts of the body.

FIBROSE, something consisting of fibres, as the roots of plants. See ROOT.

FIBULA, in anatomy. See ANATOMY, p. 184.

FICARIA, in botany. See RANUNCULUS.

FICEDULA, in ornithology. See MOTACILLA.

FICOIDEA, in botany. See AIZOON.

FICOIDES, a name given to several distinct plants, as the mesembryanthemum musa, and opuntia. See MESEMBRYANTHEMUM.

FICTION. See FABLE.

FICUS, the FIG-TREE, in botany, a genus of the polygamia polyœcia class. The common receptacle is turbinated, fleshy, and conceals the floscules. The calix of the male consists of three segments; it has no corolla, but has three stamina: the calix of the female consists of five segments; it has no corolla, and but one pistil, and one seed. There are seven species, all of them natives of warm climates. The fruit of the fig-tree is a soft emollient sweet, and as such enters into several compositions.

FIDA, a town on the flave-coaft of Guinea: E. long. 3°, N. lat. 6°.

FIDD, in the fea-language, an iron, or wooden pin, to fplice and faften ropes together.

FIDD-HAMMER, one whofe handle is a fidd, or made taper-wife.

FIDDLE. See VIOLIN.

FIDEI COMMISSUM, in Roman antiquity, an eftate left in truft with one perfon, for the ufe of another. See TRUSTEE.

FIDICINALES, mufcles of the fingers. See LUMBRICALES.

FIEF, or FEE. See FEE.

FIELD, in agriculture, a piece of ground inclofed, whether for tillage or pafture.

FIELD, in heraldry, is the the whole furface of the fhield, or the continent, fo called becaufe it containeth thofe atchievements anciently acquired in the field of battle. It is the ground on which the colours, bearings, metals, furs, charges, *&c.* are reprefented. Among the modern heralds, field is lefs frequently ufed in blazoning than fhield or efcutcheon. See the article SHIELD, *&c.*

FIELD-BOOK, in furveying, that wherein the angles, ftations, diftances, *&c.* are fet down.

FIELD-COLOURS, in war, are fmall flags of about a foot and half fquare, which are carried along with the quarter-mafter general, for marking out the ground for the fquadrons and battalions.

FIELD-FARE, in ornithology. See TURDUS.

FIELD-OFFICERS, in the art of war. See OFFICER.

FIELD-PIECES, fmall cannons, from three to twelve pounders, carried along with an army in the field.

FIELD-STAFF, a weapon carried by the gunners, about the length of a halbert, with a fpear at the end; having on each fide ears fcrewed on, like the cock of a match-lock, where the gunners fcrew in lighted matches, when they are upon command; and then the field-ftaffs are faid to be armed.

FIELD WORKS, in fortification, are thofe thrown up by an army in befieging a fortrefs, or by the befieged to defend the place. Such are the fortifications of camps, highways, *&c.*

Elyfian FIELDS. See ELYSIAN.

FIERI FACIAS, in law, a writ that lies where a perfon has recovered judgment for debt or damages in the king's courts againft one, by which the fheriff is commanded to levy the debt and damages on the defendant's goods and chattels.

FIFE, in mufic, is a fort of wind-inftrument, being a fmall pipe. See PIPE.

FIFE, in geography, a county of Scotland bounded by the Frith of Tay on the north; by the German fea on the eaft; by the Frith of Forth on the fouth; and by Monteeth and Stirling on the weft.

FIFE-RAILS, in a fhip, are thofe that are placed on banifters, on each fide of the top of the poop, and fo along with hances or falls.

They reach down to the quarter-deck, and to the ftair of the gang-way.

FIFTH, in mufic, one of the harmonical intervals or concords. See MUSIC.

FIG, or fig-tree. See FICUS.

FIGWORT, a plant called by the botanifts fcrophularia. See SCROPHULARIA.

FIGURAL, FIGURATE, or FIGURATIVE, a term applied to whatever is expreffed by obfcure refemblances. The word is chiefly applied to the types and myfteries of the Mofaic law; as alfo to any expreffion whch is not taken in its primary and literal fenfe.

FIGURE, in phyfics, expreffes the furface or terminating extremities of any body.

FIGURES, in arithmetic, are certain characters whereby we denote any number which may be expreffed by any combination of the nine digits, *&c.* See ARITHMETIC.

FIGURE, among divines, is ufed for the myfteries reprefented under certain types.

FIGURE, in dancing, denotes the feveral fteps which the dancer makes in order and cadence, confidered as they mark certain figures on the floor.

FIGURE, in painting and defigning, denotes the lines and colours which form the reprefentation of any animal, but more particularly of a human perfonage.

FIGURE, in compofition. See ALLEGORY, APOSTROPHE, HYPERBOLE, PERSONIFICATION, *&c.*

FIGURED, in general, fomething marked with figures.

The term figured is chiefly applied to ftuffs, whereon the figures of flowers, and the like, are either wrought or ftamped.

FILAMENT, in phyfiology and anatomy. See FIBRE.

FILAMENTS, among botanifts, is particularly ufed for the ftamina. See BOTANY, Sect. II.

FILBERT, or FILBERD, the fruit of the corylus, or hazel. See CORYLUS.

FILE, among mechanics, a tool ufed in metal, *&c.* in order to fmooth, polifh, or cut.

This inftrument is of iron, or forged fteel, cut in little furrows, with chiffels and a mallet, this and that way, and of this or that depth, according to the grain or touch required. After cutting the file, it muft be tempered with a compofition of chimney foot, very hard and dry, diluted, and wrought up with urine, vinegar, and falt; the whole being reduced to the confiftence of muftard. Tempering the files confifts in rubbing them over with this compofition, and covering them in loam; after which they are put in a charcoal fire, and taken out by that time they have acquired a cherry colour, which is known by a fmall rod of the fame fteel put in along with them. Being taken out of the fire, they are thrown into cold fpring-water; and when cold, they are cleaned with charcoal and a rag; and being clean and dry, are kept from ruft by laying them up in wheat bran. Iron files require more heating than fteel ones. Files are of different forms, fizes, cuts, and degrees of finenefs, according to the different ufes and occafions for which they are made.

FILE, in the art of war, a row of foldiers, ftanding one behind another, which is the depth of the battalion or

or ſquadron. The files of a battalion of foot are generally three deep; as are ſometimes thoſe of a ſquadron of horſe. The files muſt be ſtraight, and parallel one to another.

FILIGRANE, or FILIGREE-WORK, any piece of gold or ſilver-work that is curiouſly done with grains or drops on the filaments or threads.

FILIPENDULA, in botany. See SPIRÆA.

FILIX, in botany, an order of the cryptogamia claſs of plants. See BOTANY, p. 636.

FILLET, in anatomy. See FROENUM.

FILLET, or FILET, in architecture, a little ſquare member, ornament, or moulding, uſed in divers places, and upon divers occaſions, but generally as a crowning over a greater moulding.

FILLET, in heraldry, a kind of orle or bordure, containing only a third or fourth part of the breadth of the common bordure. It is ſuppoſed to be withdrawn inwards, and is of a different colour from the field. It runs quite round, near the edge, as a lace over a cloak.

FILLET, in the menage, the loins of an horſe, which begin at the place where the hinder part of the ſaddle reſts.

FILLER HORSE, one yoked immediately to a cart.

FILLY, a term among horſe-dealers, to denote the femaleor mare-colt.

FILM, a thin ſkin or pellicle. In plants, it is uſed for that thin, woody ſkin, which ſeparates the ſeeds in the pods, and keeps them apart.

FILTER, or FILTRE, in chemiſtry, a ſtrainer commonly made of bibulous or filtering paper in the form of a funnel, through which any fluid is paſſed, in order to ſeparate the groſs particles from it, and render it limpid.

FIMBRIÆ, denotes appendages diſpoſed by way of fringe round the border of any thing.

FIMBRIATED, in heraldry, an ordinary with a narrow bordure or hem of another tincture.

FIN, in natural hiſtory, a well-known part of fiſhes, conſiſting of a membrane ſupported by rays, or little bony or cartilaginous oſſicles.

FINAL, in general, whatever terminates or concludes a thing.

FINAL LETTERS, among Hebrew grammarians, five letters ſo called, becauſe they have a different figure at the end of words from what they have in any other ſituation.

FINAL, in geography, a port town of Italy, ſubject to Genoa, and ſituated on the Mediterranean, about thirty-ſeven miles ſouth-weſt of that city.

FINANCES, in the French polity, ſignify the revenues of the king and ſtate.

FINCH-KIND, in ornithology, an appellation given to a genus of birds, known among authors by the name of fringilla. See FRINGILLA.

FINE, in law, has divers ſignifications, it being ſometimes taken for a ſum of money advanced and paid for the income of lands. It is likewiſe uſed in another ſenſe, where a ſum is paid as an amends, or by way of puniſhment for an offence committed.

FINERS *of gold and ſilver*, are thoſe who ſeparate theſe metals from coarſer ores. See REFINERS.

FINERY, in the iron works, one of the forges at which the iron is hammered and faſhioned into what they call a bloom, or ſquare bar.

FINGERS, in anatomy, the extreme part of the hand divided into five members. See ANATOMY, part I. and II.

FINISTERRA, the moſt weſterly cape or promontory of Spain, in 10° 15′ W. long. and 43° N. lat. This cape is likewiſe the moſt weſterly part of the continent of Europe.

FINITE, ſomething bounded or limited, in contradiſtinction to infinite See INFINITE.

FINLAND, a province of Sweden, lying northward of the gulph of Finland, and eaſtward of the Bothnick gulph. It is a frontier province, bounded by Ruſſia on the eaſt.

FIR-TREE, in botany. See PINUS.

FIRE, a general name, by which men ſeem to underſtand a certain ſenſation or complex notion of light, heat, burning, melting, *&c.*

The power of fire is ſo great, its effects ſo extenſive, and the manner of its acting ſo wonderful, that ſome of the wiſeſt nations of old reverenced and worſhipped it, as the ſupreme deity. Some of the chemiſts alſo, after they had diſcovered its ſurpriſing operations, ſuſpected it to be an uncreated being: and indeed the moſt famous of them have acknowledged it as the ſource of all their knowledge; and hence have profeſſed themſelves philoſophers by fire, nor thought they could be honoured with a nobler title. Now, amongſt all the wonderful properties of fire, there is none more extraordinary than this, that though it is the principal cauſe of almoſt all the ſenſible effects that continually fall under our obſervation, yet it is itſelf of ſo infinitely a ſubtile nature, that it illudes the moſt ſagacious enquiries, nor ever comes within the cognizance of our ſenſes. Fire is generally divided into three kinds or ſpecies, *viz.* celeſtial, ſubterraneous, and culinary.

By celeſtial fire is principally underſtood that of the ſun, without regard to that of the fixed ſtars, though this perhaps may be of the ſame nature.

By ſubterraneous fire we underſtand that which maniſeſts itſelf in fiery eruptions of the earth, volcanoes, or burning mountains; or by any other effects it produces in mines, or the more central parts of the earth.

By culinary fire we mean that employed in all chemical operations, and the common occaſions of life.

The ſun's heat appears to be the actuating principle, or general inſtrument of all the operations in the animal, vegetable, atmoſpherical, marine, and mineral kingdoms.

Fire, conſidered in itſelf, ſeems to exiſt in the greateſt purity and perfection in the celeſtial regions; at leaſt we are inſenſible of any conſiderable ſmoke it yields;

yields: for the rays of light come to us from the ſun, unmixed with any of that groſs, feculent, or terreſtrial matter, found in culinary and ſubterranean fires: but, allowing for this difference, the effects of the ſolar fire appear the ſame as thoſe of culinary fire.

If we to examine the effects of ſubterraneous fires, we ſhall find them the ſame with thoſe produced by culinary fire. Thus, burnt coals, cinders, and melted minerals, are thrown up by Veſuvius and other burning mountains. Warm nephritical exhalations, natural hot ſprings, ſteams, vapours, ſmoke, *&c.* are found in ſeveral parts of the globe, riſing nearly in the ſame manner as if they were produced by the heat of a furnace. Whence it appears, that ſubterraneous fires are of the ſame nature with the culinary.

As men generally affix to the word fire, a complex idea of burning, light, heat, melting, *&c.* this idea ſhould be analyſed, in order to ſee what parts are eſſential, and what precarious or arbitrary.

We frequently find the effects of fire produced where no viſible fire appeared. Thus the fingers are eaſily burnt by an iron heated below the degree of ignition, or ſo as to be no ways viſibly red-hot or fiery: whence it follows, that the eye is no judge of fire.

So likewiſe the touch gives no poſitive notice of any degree of fire below the natural heat of the body, or any ſo great as to deſtroy the organ.

Again, the effects of fire are often produced without any manifeſt ſigns of burning, melting, *&c.* as in evaporations, *&c.* If this method of excluſion and rejection were purſued to its due length, we ſhould perhaps find no criterion, infallible mark, or characteriſtic of fire in general, but that of a particular motion ſtruggling among the minute parts of bodies, and tending to throw them off at the ſurface. If this ſhould prove the caſe, then ſuch a motion will be the form and eſſence of fire; and which, being preſent, makes fire alſo preſent: and, when abſent, makes fire alſo abſent: whence to produce fire, and produce this motion in bodies, will be one and the ſame thing.

The great and fundamental difference in reſpect to the nature of fire is, whether it be originally ſuch, formed thus by the Creator himſelf at the beginning of things; or whether it be mechanically producible from other bodies, by inducing ſome alterations in the particles thereof. The former opinion is mantained by Homberg, Boerhaave, the younger Lemery, and s'Graveſande; the latter is chiefly ſupported by the Engliſh philoſophers, lord Bacon, Mr Boyle, and Sir Iſaac Newton.

Bacon, in the treatiſe De Forma Calicli, deduces, from a great number of particulars, that heat in bodies is no other than motion ſo and ſo circumſtanced; ſo that to produce heat in a body, nothing is required but to excite a certain motion in the parts thereof.

Boyle ſeconds him in an expreſs treatiſe of the mechanical origin of heat and cold, and maintains the ſame doctrine with new obſervations and experiments; as a ſpecimen of which, we ſhall hear give the two following.

1. In the production of heat, ſays that able philoſopher, there appears nothing on the part either of the agent or patient, but motion and its natural effects. When a ſmith briſkly hammers a piece of iron, the metal thereby becomes exceedingly hot; yet there is nothing to make it ſo, except the forcible motion of the hammer impreſſing a vehement and variouſly determined agitation on the ſmall parts of the iron, which, being a cold body before, grows, by that ſuper-induced commotion of its ſmall parts, hot: firſt, in a more looſe acceptation of the word, with regard to ſome other bodies, compared with which it was cold before; then ſenſibly hot, becauſe this agitation ſurpaſſes that of the points of our fingers; and in this inſtance oftentimes the hammer and anvil continue cold after the operation; which ſhews, that the heat acquired by the iron was not communicated by either of thoſe implements, as heat; but produced in it by a motion, great enough ſtrongly to agitate the parts of ſo ſmall a body as the piece of iron, without being able to have the like effect upon ſo much greater maſſes of metal as the hammer and the anvil: though if the percuſſions were often and briſkly renewed, and the hammer were ſmall, this alſo might be heated: whence it is not neceſſary that a body itſelf be hot to give heat.

2. If a large nail be driven by a hammer into a plank of wood, it will receive ſeveral ſtrokes on its head before it grows hot; but when it is once driven to the head, a few ſtrokes ſuffice to give it a conſiderable heat; for while, at every blow of the hammer, the nail enters further into the wood, the motion produced is chiefly progreſſive, and is of the whole nail tending one way; but when that motion ceaſes, the impulſe given by the ſtroke being unable to drive the nail further on, or break it, muſt be ſpent in making a various, vehement, and inteſtine commotion of the parts among themſelves, wherein the nature of heat conſiſts.

Agreeable to this is the opinion of Sir Iſaac Newton, who conceives that groſs bodies may be converted into light, by the agitation of their particles; and light, again, into groſs bodies, by being fixed therein.

On the other hand, M. Homberg, in his Eſſai du Souffre Principe, holds, that the chemical principle, or element ſulphur, which is ſuppoſed one of the ſimple, primary, pre-exiſtent ingredients of all natural bodies, is real fire, and conſequently that fire is coeval with bodies.

Dr s'Graveſande goes on much the ſame principle: fire, according to him, enters the compoſition of all bodies, is contained in all bodies, and may be ſeparated or procured from all bodies, by rubbing them againſt each other; and thus putting their fire in motion: but fire, he adds, is by no means generated by ſuch motion.

Mr Lemery, the younger, agrees with theſe two authors in aſſerting this abſolute and ingenerable nature of fire: but he extends it farther. Not contented to confine it as an element to bodies, he endeavours to ſhew, that it is equally diffuſed through all ſpace, and that it is preſent in all places; in the void ſpaces between bodies, as well as in the inſenſible interſtices between their parts.

This

This laft fentiment falls in with that of Boerhaave and the celebrated M. Muffchenbroek. But notwithftanding what thofe able philofophers have advanced, it is evident that fire, heat, flame, *&c.* are only the different modifications of the particles of light, and that the particles of light themfelves depend entirely on velocity for their lucific quality; fince, by many experiments, we know, that the particles of bodies become lucid, or particles of light, by only producing in them a requifite degree of velocity: thus the particles in a rod of iron, being hammered very nimbly, fhine and become red-hot: thus alfo the violent ftroke of the flint againft the fteel, in ftriking fire, puts the particles of the fteel, which it takes off, into fuch a motion as caufes them to melt, and become red-hot, which makes the fparks of fire produced by each ftroke: as, therefore, fire confifts in the great velocity of the particles, fo it may be communicated from one body in which it is, to another in which it is not, after the fame manner that one body in motion will communicate motion to another that has got none.

Fire differs from heat only in this, that heat is a motion in the particles of a body, with a leffer degree of velocity; and fire, a motion with a greater degree of velocity, *viz.* fuch as is fufficient to make the particles fhine; though we often call fuch a ftate as will burn, *fire*, though it does not actually fhine; and we feldom call thofe lucid bodies fires, which only fhine, and do not burn. Thefe are a fort of phofphori, which, though they have no heat, yet feem to owe their lucidity to the motion of their parts.

There feems to be no other difference between fire and flame, than this; that fire confifts in a glowing degree of velocity in the parts of a body, while yet fubfifting together in the mafs; but flame is the fame degree of velocity in the particles diffipated and flying off in vapours: or, to ufe Sir Ifaac Newton's expreffion, flame is nothing elfe but a red-hot vapour. See FLAME.

FIRE, in chemiftry. See CHEMISTRY, p. 67. and 110. Vol. II.

Electrical FIRE. See ELECTRICITY.

Walking FIRE, in meteorology. See WILL-WITH-A WHISP.

FIRE, in theology. See HELL.

We read of the facred fire in the firft temple of Jerufalem, concerning which the Jews have a tradition that it came down from heaven: it was kept with the utmoft care, and it was forbidden to carry any ftrange fire into the temple. This fire is one of the five things which the Jews confefs were wanting in the fecond temple.

The Pagans had their facred fires, which they kept in their temples with the moft religious care, and which were never to be extinguifhed. Numa was the firft who built a temple to Fire as a goddefs, at Rome, and inftituted an order of priefteffes for the prefervation of it. See VESTALS.

Fire was the fupreme god of the Chaldæans; the magi were worfhippers of fire; and the Greeks and Armenians ftill keep up a ceremony called the Holy Fire, upon a perfuafion that every Eafter-day a miraculous fire defcends from heaven into the holy fepulchre, and kindles all the lamps and candles there.

FIRE-LOCK. See GUN, MUSQUET, *&c.*

FIRE-POTS, in the military art, fmall earthern pots, into which is put a charged grenade, and over that powder enough till the grenade is covered; then the pot is covered with a piece of parchment, and two pieces of match acrofs lighted: this pot being thrown by a handle of matches where it is defigned, it breaks and fires the powder, and burns all that is near it, and likewife fires the powder in the grenade, which ought to have no fufe, to the end its operations may be the quicker.

FIRE-WORKS. See PYROTECHNIA.

FIRE-SHIP, in the navy, a veffel charged with artificial fire-works, which having the wind of an enemy's fhip, grapples her, and fets her on fire.

FIRE-OFFICE, an office of infurance from fire. See ASSURANCE.

Wild-FIRE, a kind of artificial or factitious fire, which burns even under water, and that with greater violence than out of it. It is compofed of fulphur, naphtha, pitch, gum, and bitumen; and is only extinguifhable by vinegar mixed with fand and urine, or by covering it with raw hides. Its motion or tendency is faid to be contrary to that of natural fire, and it always follows the direction in which it is thrown, whether it be downwards, fideways, or otherwife.

FIRING-IRON, in farriery, an inftrument not unlike the blade of a knife; which being made red-hot, is applied to a horfe's hams, or other places ftanding in need of it, as in preternatural fwellings, farcy, knots, *&c.* in order to difcufs them.

FIRKIN, an Englifh meafure of capacity, for things liquid, being the fourth part of the barrel: it contains 8 gallons of ale, foap, or herrings; and 9 gallons of beer. See MEASURE and BARREL.

FIRLOT, a dry meafure ufed in Scotland. The oat-firlot contains $21\frac{1}{4}$ pints of that country; the wheat-firlot contains about 2211 cubical inches; and the barley-firlot, 31 ftandard pints. Hence it appears that the Scotch wheat-firlot exceeds the Englifh bufhel by 33 cubical inches.

FIRMAMENT, in the Ptolemaic aftronomy, the eighth heaven or fphere, with refpect to the feven fpheres of the planets which it furrounds. It is fuppofed to have two motions; a diurnal motion, given to it by the primum mobile, from eaft to weft, about the poles of the ecliptic; and another oppofite motion from weft to eaft; which laft it finifhes, according to Tycho, in 25412 years, according to Ptolemy in 36000, and according to Copernicus in 25800, in which time the fixed ftars return to the fame points in which they were at the beginning. This period is commonly called the Platonic year, or the great year.

FIRMAMENT is alfo ufed in divers places of fcripture, to denote the middle region of the air.

FIRMAN is a paffport or permit granted by the great mogul to foreign veffels, to trade within the territories of his jurifdiction.

FIRMNESS, denotes the confiftence of a body, or that ftate

ſtate wherein its ſenſible parts cohere in ſuch a manner, that the motion of one part induces a motion of the reſt.

FIRST-FRUITS, among the Hebrews, were oblations of part of the fruit of the harveſt, offered to God as an acknowledgment of his ſovereign dominion.

FIRST-FRUITS, in the church of England, are the profits of every ſpiritual benefice for the firſt year, according to the valuation thereof in the king's books.

FISC, in the civil law, the treaſury of a prince. It differs from the ærarium, which was the treaſury of the public or people: thus, when the money ariſing from the ſale of condemned perſons goods was appropriated for the uſe of the public, their goods were ſaid *publicari;* but when it was deſtined for the ſupport of the prince, they were called *confiſcari.*

FISCAL, in the civil law, ſomething relating to the pecuniary intereſt of the prince or people. The officers appointed for the management of the fiſc, were called *procuratores fiſci*, and *advocati fiſci*; and among the caſes enumerated in the conſtitutions of the empire where it was their buſineſs to plead, one is againſt thoſe who have been condemned to pay a fine to the fiſc on account of their litigiouſneſs, or frivolous appeals.

FISH, in natural hiſtory. See NATURAL HISTORY.

Breeding of FISHES may be turned to great advantage; for beſides furniſhing your table, obliging your friends, and raiſing money, your land will be thereby greatly improved, ſo as to yield more this way than by any other employment whatever.

When fiſh are fed in large pools or ponds, either malt boiled, or freſh grains, is the beſt food; thus carps may be raiſed and fed like capons, and tenches will feed as well. The care of feeding them is beſt committed to a gardener or the butler, who ſhould be always at hand. In a ſtew, any ſort of grain boiled, eſpecially peas, and malt coarſe ground; alſo the grains after brewing, while freſh and ſweet: but one buſhel of malt not brewed, will go as far as of grains. See FISH-POND, *infra.*

FISH, in a ſhip, a plank or piece of timber, faſtened to a ſhip's maſt or yard, to ſtrengthen it, which is done by nailing it on with iron ſpikes, and woulding or winding ropes hard about them.

FISHES, in heraldry, are the emblems of ſilence and watchfulneſs; and are borne either upright, imbowed, extended, endorſed reſpecting each other, ſurmounting one another, fretted, *&c.*

In blazoning fiſhes, thoſe borne feeding, ſhould be termed devouring; all fiſhes borne upright and having fins, ſhould be blazoned hauriant; and thoſe borne tranſverſe the eſcutcheon, muſt be termed naiant.

FISH-PONDS, thoſe made for the breeding or feeding of fiſh.

Fiſh-ponds are no ſmall improvement of watery and boggy lands, many of which are fit for no other uſe. In making of a pond, its head ſhould be at the loweſt part of the ground, that the trench of the flood-gate or ſluice, having a good fall, may not be too long in emptying. The beſt way of making the head ſecure, is to drive in two or three rows of ſtakes above ſix feet long, at about four feet diſtance from each other, the whole length of the pond-head, whereof the firſt row ſhould be rammed at leaſt about four feet deep. If the bottom is falſe, the foundation may be laid with quicklime; which ſlacking, will make it as hard as a ſtone. Some lay a layer of lime, and another of earth dug out of the pond, among the piles and ſtrakes; and when theſe are well covered, drive in others as they ſee occaſion, ramming in the earth as before, till the pond-head be of the height deſigned.

The dam ſhould be made ſloping on each ſide, leaving a waſte to carry off the over-abundance of water in times of floods or rains; and as to the depth of the pond, the deepeſt part need not exceed ſix feet, riſing gradually in ſhoals towards the ſides, for the fiſh to ſun themſelves, and lay their ſpawn. Gravelly and ſandy bottoms, eſpecially the latter, are beſt for breeding; and a fat ſoil with a white fat water, as the waſhings of hills, commons, ſtreets, ſinks, *&c.* is beſt for fattening all ſorts of fiſh. For ſtoring a pond, carp is to be preferred for its goodneſs, quick growth, and great increaſe, as breeding five or ſix times a-year. A pond of an acre, if it be a feeding and not breeding one, will every year feed two hundred carps of three years old, three hundred of two years old, and four hundred of a year old. Carps delight in ponds that have marl or clay bottoms, with plenty of weeds and graſs, whereon they feed in hot months.

Your pond ſhould be drained every three or four years, and your fiſh ſorted. If it is a breeding one, the ſmaller ones are to be taken out, to ſtore other ponds with; leaving a good ſtock of females, at leaſt eight or nine years old, as they never breed before that age. In feeding ponds, it is beſt to keep them pretty near of a ſize.

FISHERY, a place where great numbers of fiſh are caught.

The principal fiſheries for ſalmon, herring, mackrel, pilchards, *&c.* are along the coaſts of Scotland, England, and Ireland; for cod, on the banks of Newfoundland; for whales, about Greenland; and for pearls, in the Eaſt and Weſt-Indies.

FISHERY denotes alſo the commerce of fiſh, more particularly the catching them for ſale.

Were we to enter into a very minute and particular conſideration of fiſheries, as at preſent eſtabliſhed in this kingdom, this article would ſwell beyond its proper bounds; becauſe to do juſtice to a ſubject of that concernment to the Britiſh nation, requires a very ample and diſtinct diſcuſſion. We ſhall, however, obſerve, that ſince the Divine Providence has ſo eminently ſtored the coaſts of Great Britain and Ireland with the moſt valuable fiſh; and ſince fiſheries, if ſucceſsful, become permament nurſeries for breeding expert ſeamen: it is not only a duty we owe to the Supreme Being, not to deſpiſe the wonderful plenty he hath afforded us, by neglecting to extend this branch of commerce to the utmoſt; but it is a duty we owe to our country, for its natural ſecurity, which depends upon the ſtrength of our royal navy. No nation can have a navy, where there

there is not a fund of bufinefs to breed and employ feamen, without any expence to the public; and no trade is fo well calculated for training up thefe ufeful members of this fociety, as fifheries.

The fituation of the Britifh coafts is the moft advantageous for catching fifh in the world: the Scottifh iflands, particularly thofe to the north and weft, lie moft commodious for carrying on the fifhing trade to perfection; for no country in Europe can pretend to come up to Scotland in the abundance of the fineft fifh, with which its various creeks, bays, rivers, lakes, and coaft are replenifhed. King Charles I. was fo fenfible of the great advantage to be derived from fifheries, that he began the experiment, together with a company of merchants; but the civil wars foon occafioned that project to be fet afide. King Charles II. made a like attempt; but his preffing wants made him withdraw what money he had employed that way, whereupon the merchants that joined with him did fo too. Since the union, feveral attempts have been made to retrieve the fifheries, and a corporation fettled to that effect, entitled the Royal Britifh Fifhery.

In the year 1750, the parliament of Great Britain taking the ftate of the fifheries into confideration, an act was paffed for the encouragement of the white-herring fifhery, granting a charter, whereby a corporation is created, to continue twenty one years, by the name of the Society of the Free Britifh Fifhery, to be under the direction of a governor, prefident, viceprefident, council, *&c.* who are to continue in office the fpace of three years, with power to make bye-laws, *&c.* and to raife a capital of 500,000 l. by way of fubfcription. And any number of perfons, who, in any part of Great Britain, fhall fubfcribe 10,000 l. into the ftock of this fociety, under the name of the Fifhing Chamber, and carry on the faid fifhery on their own account of profit and lofs, fhall be entitled to the fame bounty allowed to the fociety. The bounty is 30 s. the tun, to be paid yearly, for fourteen years, befides 3 *per cent.* for the money advanced by each chamber. The act contains other proper regulations relative to the nets, marks on the herring-barrels, number of hands, and the quantity of falt that is entitled to the bounty, *&c.* It is then by the encouragement given by this act, that we now fee a laudable emulation prevailing all over the two kingdoms, and fifhing buffes fitted out from almoft every port, in order to repair to the Shetland iflands, where the herring-fifhery is carried on with an ardor becoming fo important a branch of trade. Scotland, which fuffered incredibly from the neglect of this valuable and natural produce of the feas, has not been backward to join in a fcheme that tends fo evidently to its own advantage; for the cities of Edinburgh and Glafgow, the towns of Montrofe, Dundee, Perth, Invernefs, and fome other boroughs, have raifed the proper fum, and chambers have been erected in each of them; the gentlemen of eftates adjoining to the refpective places above-mentioned, liberally contributing with merchants, towards the profecution of an undertaking fo vifibly tending to the good of their country in general.

Cod-FISHERY. There are two kinds of cod-fifh, the one green or white cod, and the other dried or cured cod; though it is all the fame fifh differently prepared; the former being fometimes falted and barrelled, then taken out for ufe; and the latter, having lain fome competent time in falt, dried in the fun or fmoke. We fhall therefore fpeak of each of thefe apart; and firft of

Green-cod FISHERY. The chief fifheries for green cod are in the bay of Canada, on the great bank of Newfoundland, and on the ifle of St Peter, and the ifle of Sable, to which places veffels refort from divers parts both of Europe and America. They are from 100 to 150 tuns burden, and will catch between thirty and forty thoufand cod each. The moft effential part of the fifhery is, to have a mafter who knows how to cut up the cod, one who is fkilled to take off the head properly, and above all a good falter, on which the preferving of them, and confequently the fuccefs of the voyage, depends. The beft feafon is from the beginning of February to the end of April; the fifh, which in the winter retire to the deepeft water, coming then on the banks, and fattening extremely. What is caught from March to June keeps well; but thofe taken in July, Auguft, and September, when it is warm on the banks, are apt to fpoil foon. Every fifher takes but one at a time: the moft expert will take from 350 to 400 in a day; but that is the moft, the weight of the fifh and the great coldnefs on the bank fatiguing very much. As foon as the cod are taken, the head is taken off; they are opened, gutted, and falted; and the falter ftows them in the bottom of the hold, head to tail, in beds a fathom or two fquare; laying layers of falt and fifh alternately, but never mixing fifh caught on different days. When they have lain thus three or four days to drain off the water, they are replaced in another part of the fhip, and falted again; where they remain till the veffel is loaded. Sometimes they are cut in thick pieces, and put up in barrels for the conveniency of carriage.

Dry-cod FISHERY. The principal fifhery for dry cod is, from Cape Rofe to the Bay des Exports, along the coaft of Placentia, in which compafs there are divers commodious ports for the fifh to be dried in. Thefe, though of the fame kind with the frefh cod, are much fmaller, and therefore fitter to keep, as the falt penetrates more eafily into them. The fifhery of both is much alike; only this latter is moft expenfive, as it takes up more time, and employs more hands, and yet fcarce half fo much falt is fpent in this as in the other. The bait is herrings, of which great quantities are taken on the coaft of Placentia. When feveral veffels meet and intend to fifh in the fame port, he whofe fhalloop firft touches ground, becomes entitled to the quality and privileges of admiral: he has the choice of his ftation, and the refufal of all the wood on the coaft at his arrival. As faft as the mafters arrive, they unrig all their veffels, leaving nothing but the fhrouds to fuftain the mafts, and in the mean time the mates provide a tent on fhore, covered with branches of trees, and fails over them, with a fcaffold of great trunks of pines, twelve, fifteen, fixteen, and often

often twenty feet high, commonly from forty to fixty feet long, and about one third as much in breadth. While the fcaffold is preparing, the crew are a fifhing; and as faft as they catch, they bring their fifh afhore; open and falt them upon moveable benches; but the main falting is performed on the fcaffold. When the fifh have taken falt, they wafh and hang them to drain on rails; when drained, they are laid on kinds of ftages, which are fmall pieces of wood laid a-crofs, and covered with branches of trees, having the leaves ftripped off for the paffage of the air. On thefe ftages, they are difpofed, a fifh thick, head againft tail, with the back uppermoft, and are turned carefully four times every twenty four hours. When they begin to dry, they are laid in heaps ten or twelve thick, in order to retain their warmth; and every day the heaps are enlarged, till they become double their firft bulk; then two heaps are joined together, which they turn every day as before; laftly, they are falted again, beginning with thofe firft falted; and being laid in huge piles, they remain in that fituation till they are carried on board the fhips, where they are laid on the branches of trees difpofed for that purpofe, upon the ballaft, and round the fhip, with mats to prevent their contracting any moifture.

There are four kinds of commodities drawn from cod, *viz.* the zounds, the tongues, the roes, and the oil extracted from the liver. The firft is falted at the fifhery, together with the fifh, and put in barrels from 6 to 700 pound. The tongues are done in like manner, and brought in barrels from 4 to 500 pounds. The roes are alfo falted in barrels, and ferve to caft into the fea to draw fifh together, and particularly pilchards. The oil comes in barrels, from 400 to 520 pounds, and is ufed in dreffing leather.—In Scotland, they catch a fmall kind of cod on the coafts of Buchan, and all along the Murray frith on both fides; as alfo in the frith of Forth, Clyde, *&c.* wich is much efteemed. They falt and dry them in the fun upon rocks, and fometimes in the chimney. They alfo cure fkait, and other fmaller fifh in the fame manner; but moft of thefe are for home-confumption.

Coral-Fishery. See Coral-*fifhery*.

Herring-Fishery. See Clupea.

Pilchard-Fishery. The chief pilchard-fifheries are along the coafts of Dalmatia on the coaft of Bretagne, and along the coafts of Cornwall and Devonfhire. That of Dalmatia is very plentiful: that on the coafts of Bretagne employs annually about 300 fhips. The pilchards caught on our coafts, though bigger, are not fo much valued as thofe on the coafts of France, owing principally to their not being fo thoroughly cured. They naturally follow the light, which contributes much to the facility of the fifhery: the feafon is from June to September. On the coafts of France they make ufe of the roes of the cod-fifh as a bait, which thrown into the fea, makes them rife from the bottom, and run into the nets. On our coafts there are perfons pofted afhore, who, fpying by the colour of the water where the fhoals are, make figns to the boats to go among them to caft their nets. When taken, they are brought on fhore to a warehoufe, where they are laid up in broad piles, fupported with backs and fides; and as they are piled, they falt them with bay-falt, in which lying to foak for thirty or forty days, they run out a deal of blood, with dirty pickle and bittern: then they wafh them clean in fea-water; and, when dry, barrel and prefs them hard down to fqueeze out the oil, which iffues out at a hole in the bottom of the cafk. The Cornifhmen obferve of the pilchard, that it is the leaft fifh in fize, moft in number, and greateft for gain, of any they take out of the fea.

Salmon-Fishery. The chief falmon fifheries in Europe are in England, Scotland, and Ireland, in the rivers, and fea-coafts adjoining to the river-mouths. The moft diftinguifhed for falmon in Scotland are, the river Tweed, the Clyde, the Tay, the Dee, the Don, the Spey, the Nefs, the Bewley, *&c.* in moft of which it is very common, about the height of fummer, efpecially if the weather happen to be very hot, to catch four or five fcore of falmon at a draught. The chief rivers in England for falmon are, the Tyne, the Trent, the Severn, and the Thames. The fifhing ufually begins about January; and in Scotland they are obliged to give over about the middle of Auguft; becaufe, as it is then fuppofed the fifh come up to fpawn, it would be quite depopulating the rivers to continue fifhing any longer. It is performed with nets, and fometimes with a kind of locks or wears made on purpofe, which in certain places have iron or wooden grates fo difpofed, in an angle, that being impelled by any force in a contrary direction to the courfe of the river, they may give way and open a little at the point of contact, and immediately fhut again, clofing the angle. The falmon, therefore, coming up into the rivers, are admitted into thefe grates, which open, and fuffer them to pafs through, but fhut again, and prevent their return. Salmon are alfo caught with a fpear, which they dart into him when they fee him fwimming near the furface of the water. It is cuftomary likewife to catch them with a candle and lanthorn, or wifp of ftraw fet on fire; for the fifh naturally following the light, are ftruck with the fpear, or taken in a net fpread for that purpofe, and lifted with a fudden jerk from the bottom. We make no mention of the method of catching falmon with a line or hook, becaufe it is much the fame with that explained under the article *Trout*-Fishing.

Curing Salmon. When the falmon are taken, they open them along the back, take out the guts and gills, and cut out the greateft part of the bones, endeavouring to make the infide as fmooth as poffible; then falt the fifh in large tubs for the purpofe, where they lie a confiderable time foaking in brine; and about October, they are packed clofe up in barrels, and fent to London, or exported up the Mediterranean. They have alfo in Scotland, a great deal of falmon falted in the common way, which after foaking in brine a competent time, is well preffed, and then dried in fmoke: this is called *kipper*, and is chiefly made for home confumption, and, if properly cured and prepared, is reckoned very delicious.

Sturgeon-

Sturgeon-Fishery. The greateſt ſturgeon-fiſhery is in the mouth of the Volga, on the Caſpian ſea, where the Muſcovites employ a great number of hands, and catch them in a kind of incloſure formed by huge ſtakes repreſenting the letter Z, repeated ſeveral times. Theſe fiſheries are open on the ſide next the ſea, and cloſe on the other; by which means the fiſh aſcending in its ſeaſon up the river, is embarraſſed in theſe narrow angular retreats, and ſo is eaſily killed with a harping-iron. Sturgeons, when freſh, eat deliciouſly; and in order to make them keep, they are ſalted or pickled in large pieces, and put up in cags from thirty to fifty pounds. But the great object of this fiſhery is the roe, of which the Muſcovites are extremely fond, and of which is made the cavear, or kavia, ſo much eſteemed by the Italians. See Cavear.

Whale-Fishery. Whales are chiefly caught in the north ſea: the largeſt ſort are found about Greenland, or Spitzbergen. At the firſt diſcovery of this country, whales not being uſed to be diſturbed, frequently came into the very bays, and were accordingly killed almoſt cloſe to the ſhore, ſo that the blubbler being cut off was immediately boiled into oil on the ſpot. The ſhips in theſe times took in nothing but the pure oil and the fins, and all the buſineſs was executed in the country, by which means a ſhip could bring home the product of many more whales than ſhe can according to the preſent method of conducting this trade. The fiſhery alſo was then ſo plentiful, that they were obliged ſometimes to ſend other ſhips to fetch off the oil they had made, the quantity being more than the fiſhing ſhips could bring away. But time and change of circumſtances have ſhifted the ſituation of this trade. The ſhips coming in ſuch numbers from Holland, Denmark, Hamburgh, and other northern countries, all intruders upon the Engliſh, who were the firſt diſcoverers of Greenland, the whales were diſturbed, and gradually, as other fiſh often do, forſaking the place, were not to be killed ſo near the ſhore as before; but are now found, and have been ſo ever ſince, in the openings and ſpace among the ice, where they have deep water, and where they go ſometimes a great many leagues from the ſhore.

The whale-fiſhery begins in May, and continues all June and July; but whether the ſhips have good or bad ſucceſs, they muſt come away, and get clear of the ice, by the end of Auguſt; ſo that in the month of September at fartheſt, they may be expected home; but a ſhip that meets with a fortunate and early fiſhery in May, may return in June or July.

The manner of taking whales at preſent is as follows. As ſoon as the fiſhermen hear the whale blow, they cry out, *Fall! fall!* and every ſhip gets out its long boat, in each of which there are ſix or ſeven men: they row till they come pretty near the whale, then the harpooner ſtrikes it with his harpoon. This requires great dexterity; for through the bone of his head there is no ſtriking, but near his ſpout there is a ſoft piece of fleſh, into which the iron ſinks with eaſe. As ſoon as he is ſtruck, they take care to give him rope enough, otherwiſe, when he goes down, as he frequently does, he would inevitably ſink the boat: this rope he draws with ſuch violence, that, if it were not well watered, it would, by its friction againſt the ſides of the boat, be ſoon ſet on fire. The line faſtened to the harpoon is ſix or ſeven fathom long, and is called the fore-runner; it is made of the fineſt and ſofteſt hemp, that it may ſlip the eaſier: to this they join a heap of lines of 90 or 100 fathoms each; and when there are not enough in one long boat, they borrow from another. The man at the helm obſerves which way the rope goes, and ſteers the boat accordingly, that it may run exactly out before; for the whale runs away with the line with ſo much rapidity, that he would overſet the boat, if it were not kept ſtreight. When the whale is ſtruck, the other long boats row before, and obſerve which way the line ſtands, and ſometimes pull it; if they feel it ſtiff, it is a ſign the whale ſtill pulls in ſtrength; but if it hangs looſe, and the boat lies equally high before and behind upon the water, they pull it in gently, but take care to coil it ſo, that the whale may have it again eaſily if he recovers ſtrength: they take care, however, not to give him too much line, becauſe he ſometimes entangles it about a rock, and pulls out the harpoon. The fat whales do not ſink as ſoon as dead, but the lean one's do, and come up ſome days afterwards. As long as they ſee whales, they loſe no time in cutting up what they have taken, but keep fiſhing for others: when they ſee no more, or have taken enough, they begin with taking off the fat and whiſkers in the following manner. The whale being laſhed along-ſide, they lay it on one ſide, and put two ropes, one at the head, and the other in the place of the tail, which, together with the fins, is ſtruck off as ſoon as he is taken, to keep thoſe extremities above water. On the off-ſide of the whale are two boats, to receive the pieces of fat, utenſils, and men, that might otherwiſe fall into the water on that ſide. Theſe precautions being taken, three or four men with irons at their feet, to prevent ſlipping, get on the whale, and begin to cut out pieces of about three feet thick, and eight long, which are hauled up at the capſtane or windlaſs. When the fat is all got off, they cut off the whiſkers of the upper jaw with an ax. Before they cut, they are all laſhed to keep them firm, which alſo facilitates the cutting, and prevents them from falling into the ſea: when on board, five or ſix of them are bundled together, and properly ſtowed; and after all is got off, the carcaſe is turned a-drift, and devoured by the bears, who are very fond of it. In proportion as the large pieces of fat are cut off, the reſt of the crew are employed in ſlicing them ſmaller, and picking out all the lean. When this is prepared, they ſtow it under the deck, where it lies till the fat of all the whales is on board; then cutting it ſtill ſmaller, they put it up in tubs in the hold, cramming them very full and cloſe. Nothing now remains but to ſail homewards, where the fat is to be boiled and melted down into train oil. See Train Oil.

It were in vain to ſpeak in this place of the advantages that may be derived to Great Britain from the whale-fiſhery. We ſhall only remark, that the legiſla-

ture think that trade of fo great importance, as to grant a very confiderable bounty for the encouragement of it; for every Britifh veffel of 200 tuns or upwards, bound to the Greenland feas on the whale-fifhery, if found to be duly qualified according to the act, obtains a licence from the commiffioners of the cuftoms to proceed on fuch voyage: and on the fhip's return, the mafter and mate making oath that they proceeded on fuch voyage and no other, and ufed all their endeavours to take whales, &c. and that all the whale fins, blubber, oil, &c. imported in their fhip, were taken by their crew in thofe feas, there fhall be allowed 40 s. for every ton according to the admeafurement of the fhip.

Befides thefe fifheries, there are feveral others both on the coafts of Great Britain and in the North Seas, which, although not much the fubject of merchandize, neverthelefs employ great numbers both of fhips and men; as, 1. The oyfter-fifhing at Colchefter, Feverfham, the Ifle of Wight, in the Swales of the Medway, and in all the creeks between Southampton and Chichefter, from whence they are carried to be fed in pits about Wevenhoe and other places. See OYSTER. 2. The lobfter-fifhing all along the Britifh Channel, the Frith of Edinburgh, on the coaft of Northumberland, and on the coaft of Norway, from whence great qantities are brought to London. And laftly, the fifhing of the pot-fifh, fin-fifh, fea-unicorn, fea horfe, and the feal, or dog-fifh; all which are found in the fame feas with the whales, and yield blubber in a certain degree; befides, the horn of the unicorn is as eftimable as ivory, and the fkins of the feals are particularly ufeful to trunkmakers.

Trout FISHING. The baits for this purpofe are either natural or artificial, as earth, worms, minnows, and fifhing flies, both natural and artificial. Whatever worms are ufed, they anfwer beft if kept fome time in an earthen pot, with mofs often changed in fummer. If you fifh for trout with hand on the ground, the hook is to be introduced into the worm a little above the middle, coming out again a little below; then draw the worm above the arming of the hook, making your firft entrance at the tail-end, that the point of the hook may come out at the head-end. When you fifh with minnows, take the whiteft and middle fized; and after putting the hook in at the mouth, and out at the gills, and drawing it through about three inches, flip it again into his mouth, fo as the point and beard may come out at the tail. This done, tie the hook and tail together with a fine white thread, and let the body of the minnow be almoft ftreight upon the hook.

FISSURE *of the bones*, in furgery, is when they are divided either tranfverfely or longitudinally, not quite through, but cracked after the manner of glafs, by any external force. See SURGERY.

FISTULA, in the ancient mufic, an inftrument of the wind-kind, refembling our flute, or flageolet.

The principal wind-inftruments of the ancients, were the tibia and fiftula. But how they were conftituted, wherein they differed, or how they were played on, does not appear.

FISTULA, in medicine and furgery. See MEDICINE and SURGERY.

FISTULA, in farriery. See FARRIERY.

FISTULAR, or FISTULOUS, appellations given by furgeons to wounds and ulcers, which degenerate into fiftulas.

FIT, in medicine. See PAROXYSM.

FITCHEE', in heraldry, a term applied to a crofs, when the lower end of it is fharpened into a point, as in Plate LXXX. fig. 6.

FITCHES, in hufbandry, a fort of pulfe, more generally known by the name of chick-pea, or cicer. See CICER.

FITZ, makes part of the furname of fome of the natural fons of the kings of England, as Fitz-roy; which is purely French, and fignifies the king's fon.

FIVE CHURCHES, a bifhop's fee of lower Hungary, 76 miles fouth of Buda.

FIVES, or VIVES, in farriery. See FARRIERY, p. 555.

FIXATION, in chemiftry, the rendering any volatile fubftance fixed, fo as not to fly off upon being expofed to a great heat; hence,

FIXED BODIES are thofe which bear a confiderable degree of heat without evaporating, or lofing any of their weight.

FLACCIDITY, among phyficians, a diforder of the folids, cured by aftringent and cardiac medicines, joined with exercife and good air.

FLAG, a general name for colours, ftandards, ancients, banners, enfigns, &c.

The fafhion of pointed or triangular flags, as now ufed, Rod. Toletan affures. came from the Mahometan Arabs, or Saracens, upon their feiznre of Spain, before which time all the enfigns of war were ftretched or extended on crofs pieces of wood, like the banners of a church. The pirates of Algiers, and throughout the coafts of Barbary, bear an hexonal flag.

FLAG is more particularly ufed at fea; for the colours, ancients, ftandards, &c. borne on the top of the mafts of veffels, to notify the perfon who commands the fhip, of what nation it is, and whether it be equipped for war or trade, fee Plate LXXXI.

The admiral in chief carries his flag on the main top, the vice-admiral on the fore-top, and the rear-admiral on the mizzen-top.

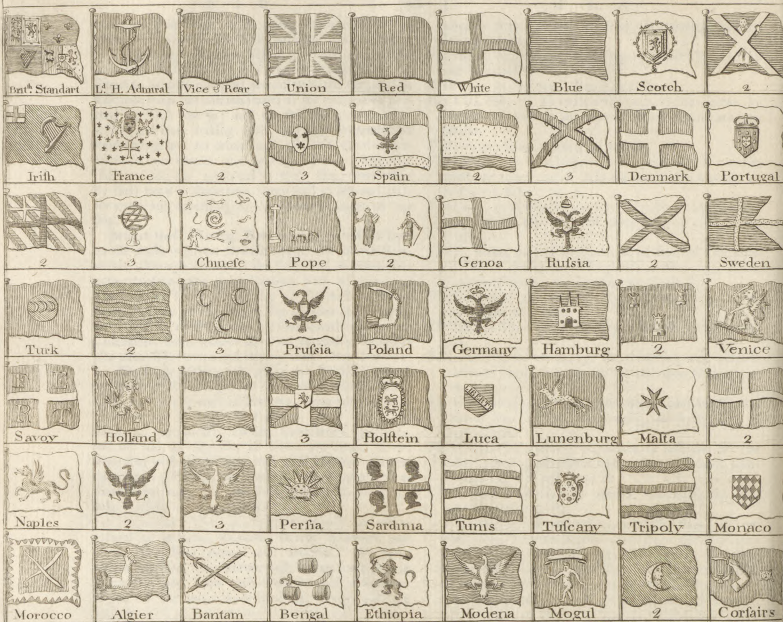
When a council of war is to be held at fea, if it be on board the admiral, they hang a flag in the main fhrouds; if in the vice-admiral, in the fore-fhrouds; and if in the rear-admiral, in the mizzen fhrouds.

Befides the national flag, merchant-fhips frequently bear leffer flags on the mizzen-maft, with the arms of the city where the mafter ordinarily refides; and on the fore-maft, with the arms of the place where the perfon who freights them lives.

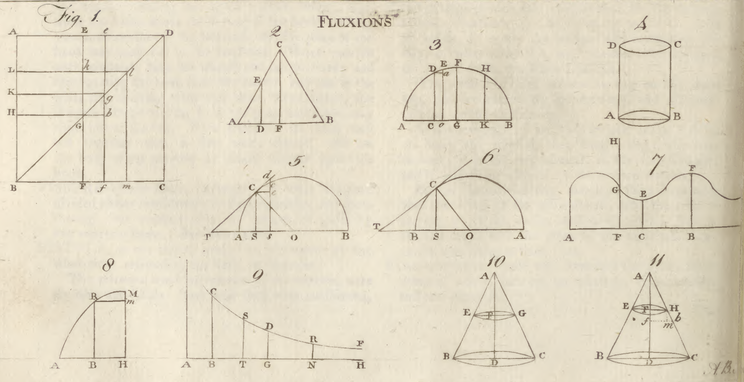
FLAG-OFFICERS, thofe who command the feveral fquadrons of a fleet, fuch are the admirals, vice-admirals, and rear-admirals.

The

FLAGS



FLUXIONS



The flag officers in our pay, are the admiral, vice-admiral, and rear-admiral of the white, red, and blue. See ADMIRAL.

FLAG-SHIP, a ſhip commanded by a general or flag-officer, who has a right to carry a flag, in contradiſtinction to the ſecondary veſſels under the command thereof.

FLAG-FLOWER, in botany. See IRIS.

Corn FLAG, in botany. See GLADIOLUS.

FLAGELLARIA, in botany, a genus of the hexandria trigynia claſs. The calix conſiſts of ſix ſegments; it has no corolla; and the berry contains but one ſeed. There is but one ſpecies, a native of the Eaſt-Indies.

FLAGEOLET, or FLAJEOLET, a little flute, uſed chiefly by ſhepherds and country people. It is made of box, or other hard wood, and ſometimes of ivory, and has ſix holes beſides that at the bottom, the mouth-piece, and that behind the neck.

FLAIL, an inſtrument for threſhing corn.

A flail conſiſts of the following parts. 1. The hand-ſtaff, or piece held in the threſher's hand. 2. The ſwiple, or that part which ſtrikes out the corn. 3. The caplins, or ſtrong double leathers, made faſt to the tops of the hand-ſtaff and ſwiple. 4. The middle-band, being the leather thong, or fiſh ſkin, that ties the cap-lins together.

FLAMBEAU, a kind of large taper, made of hempen wicks, by pouring melted wax on their top, and letting it run down to the bottom. This done, they lay them to dry; after which they roll them on a table, and join four of them together by means of a red-hot iron; and then pour on more wax, till the flambeau is brought to the ſize required.

Flambeaus are of different lengths, and made either of white or yellow wax. They ſerve to give light in the ſtreets at night, or on occaſion of illuminations.

FLAMBOROUGH-HEAD, in geography, a cape or promontory of Yorkſhire, five miles eaſt of Burlington: E. long. 20′, N. lat. 54° 15′.

FLAME, the ſmall parts of an inflammable body, that are ſet on fire, or briſkly agitated and thrown off, with a certain vibrative motion at the ſurface of that body into the open air: or, in Sir Iſaac Newton's words, the flame of a body is only the ſmoke thereof heated red hot; and the ſmoke is only the volatile part of the body ſeparated by the fire. See FIRE.

FLAMEN, in Roman antiquity, the name of an order of prieſts, inſtituted by Romulus or Numa; authors not being agreed on this head.

They were originally only three, *viz.* the flamen dialis, flamen martialis, and flamen quirinus. They were choſen by the people, and inſtalled by the ſovereign pontiff. Afterwards, their number was increaſed to fifteen; the three firſt of whom were ſenators, and called flamines majores; the other twelve, taken from among the people, being denominated flamines minores.

The flamen dialis, or prieſt of Jupiter, was a conſiderable perſon at Rome; the flamen martialis, or prieſt of Mars, was the ſecond in dignity; and the flamen quirinalis, was the next to him.

FLANDERS, a province of the Netherlands, bounded by the German ſea and the United provinces on the north; by the province of Brabant, on the eaſt; by Hainault and Artois, on the ſouth; and by another part of Artois and the German ſea, on the weſt; being about ſixty miles long, and fifty broad, and divided between the Auſtrians, the French, and the Dutch.

Flanders is a perfectly champaign country, with not a riſing ground or hill in it, and watered with many fine rivers and canals. Its chief commodities are fine lace, linen, and tapeſtry.

FLANEL, or FLANNEL, a looſe ſort of woollen ſtuff, not croſſed, and woven on a loom like bays.

FLATS, in muſic, a kind of additional notes, which, together with ſharps, ſerve to remedy the defects of muſical inſtruments, wherein temperament is required. See MUSIC.

FLATULENCY, in medicine. See MEDICINE.

FLAW, in the ſea-language, ſignifies a ſudden guſt of wind.

FLAX, in botany. See LINUM.

The following particulars with regard to the manner of raiſing flax has been for ſome years paſt warmly commended by the Truſtees for fiſheries, manufactures, and improvements in Scotland.

Of the choice of the Soil, and Preparing the Ground for FLAX. A ſkilful flax-raiſer always prefers a free open deep loam, and all grounds that produced the preceding year a good crop of turnip, cabbage, potatoes, barley, or broad clover; or has been formerly laid down rich, and kept for ſome years in paſture.

A clay ſoil, the ſecond or third crop after being limed, will anſwer well for flax; provided, if the ground be ſtill ſtiff, that it be brought to a proper mould, by tilling after harveſt, to expoſe it to the winter froſts.

All new grounds produce a ſtrong crop of flax, and pretty free of weeds. When a great many mole-heaps appear upon new ground, it anſwers the better for flax after one tilling.

Flax-ſeed ought never to be ſown on grounds that are either too wet or dry; but on ſuch as retain a natural moiſture: and ſuch grounds as are inclined to weeds ought to be avoided, unleſs prepared by a careful ſummer-fallow.

If the lintſeed be ſown early, and the flax not allowed to ſtand for ſeed, a crop of turnip may be got after the flax that very year; the ſecond year a crop of bear or barley may be taken; and the third year, graſs-ſeeds are ſometimes ſown along with the lintſeed. This is the method moſtly practiſed in and about the counties of Lincoln and Somerſet, where great quantities of flax and hemp are every year raiſed, and where theſe crops have long been capital articles. There, old ploughed grounds are never ſown with lintſeed, unleſs the ſoil be very rich and clean. A certain worm, called in Scotland the Coup-worm, abounds in new broke up grounds, which greatly hurts every crop but flax. In ſmall incloſures ſurrounded with trees or high hedges, the flax, for want of free air, is ſubject to fall before it be ripe, and the droppings of rain and

dew.

dew from the trees prevent the flax within the reach of the trees from growing to any perfection.

Of preceding crops, potatoes and hemp are the beſt preparation for flax. In the fens of Lincoln, upon proper ground of old tillage, they ſow hemp, dunging well the firſt year; the ſecond year hemp without dung; the third year flax without dung; and that ſame year a crop of turnip eat on the ground by ſheep; the fourth year hemp with a large coat of dung, and ſo on for ever.

If the ground be free and open, it ſhould be but once ploughed, and that as ſhallow as poſſible, not deeper than $2\frac{1}{2}$ inches. It ſhould be laid flat, reduced to a fine garden-mould by much harrowing, and all ſtones and ſods ſhould be carried off.

Except a little pigeon's dung for cold or ſour ground, no other dung ſhould be uſed preparatory for flax, becauſe it produces too many weeds, and throws up the flax thin and poor upon the ſtalk.

Before ſowing, the bulky clods ſhould be broken, or carried off the ground; and ſtones, quickenings, and every other thing that may hinder the growth of the flax, ſhould be removed.

Of the choice of Lintſeed. The brighter in colour, and heavier the feed is, ſo much the better: that which when bruiſed appears of a light or yellowiſh green, and freſh in the heart, oily and not dry, and ſmells and taſtes ſweet, and not fuſty, may be depended upon.

Dutch ſeed of the preceding year's growth, for the moſt part, anſwers beſt; but it ſeldom ſucceeds if kept another year. It ripens ſooner than any other foreign ſeed. Philadelphia ſeed produces fine lint and few bolls, becauſe ſown thick, and anſwers beſt in wet cold ſoils. Riga ſeed produces coarſer lint, and the greateſt quantity of ſeed. Scots ſeed, when well winned and kept, and changed from one kind of ſoil to another, ſometimes anſwers pretty well; but ſhould be ſown thick, as many of its grains are bad, and fail. It ſprings well, and its flax is ſooner ripe than any other; but its produce afterwards is generally inferior to that from foreign ſeed.

A kind has been lately imported, called memmelſeed, which looks well, is ſhort and plump, but ſeldom grows above eight inches, and on that account ought not to be ſown.

Of Sowing Lintſeed. The quantity of lintſeed ſown, ſhould be proportioned to the condition of the ſoil; for if the ground be in good heart, and the ſeed ſown thick, the crop will be in danger of falling before it is ready for pulling. From eleven to twelve pecks Linlithgow meaſure of Dutch or Riga ſeed, is generally ſufficient for one Scots acre; and about ten pecks of Philadelphia ſeed, which being the ſmalleſt grained, goes fartheſt. Riga lintſeed, and the next year's produce of it, is preferred in Lincolnſhire.

The time for ſowing lintſeed is from the middle of March to the end of April, as the ground and ſeaſon anſwers; but the earlier the ſeed is ſown, the leſs the crop interferes with the corn-harveſt.

Late ſown lintfeed may grow long, but the flax upon the ſtalk will be thin and poor.

After ſowing, the ground ought to be harrowed till the ſeed is well covered, and then (ſuppoſing the ſoil as before mentioned to be free and reduced to a fine mould) the ground ought to be rolled.

When a farmer ſows a large quantity of lintſeed, he may find it proper to ſow a part earlier and part latter, that in the future operations of weeding, pulling, watering, and graſſing, the work may be the eaſier and more conveniently gone about.

It ought always to be ſown on a dry bed.

Of Weeding Flax. It ought to be weeded when the crop is about four inches long. If longer deferred, the weeders will ſo much break and crook the ſtalks, that they will never perhaps recover their ſtraightneſs again; and when the flax grows crooked, it is more liable to be hurt in the rippling and ſwingling.

Quickening-graſs ſhould not be taken up; for, being ſtrongly rooted, the pulling of it always looſens a deal of the lint.

If there is an appearance of a ſettled drought, it is better to defer the weeding, than by that operation to expoſe the tender roots of the flax to the drought.

How ſoon the weeds are got out, they ought to be carried off the field, inſtead of being laid in the furrows, where they often take root again, and at any rate obſtruct the growth of the flax in the furrows.

Of Pulling Flax. When the crop grows ſo ſhort and branchy, as to appear more valuable for ſeed than flax, it ought not to be pulled before it be thoroughly ripe; but if it grows long and not branchy, the ſeed ſhould be diſregarded, and all the attention given to the flax. In the laſt caſe it ought to be pulled after the bloom has fallen, when the ſtalk begins to turn yellow, and before the leaves fall, and the bolls turn hard and ſharp-pointed.

When the ſtalk is ſmall, and carries few bolls, the flax is fine; but the ſtalk of coarſe flax is groſs, rank, branchy, and carries many bolls.

When flax has fallen and lies, ſuch as lies ought to be immediately pulled, whether it has grown enough or not, as otherwiſe it will rot altogether.

When parts of the ſame field grow unequally, ſo that ſome parts are ready for pulling before other parts; only what is ready ſhould be pulled, and the reſt ſhould be ſuffered to ſtand till ready.

The flax-raiſer ought to be at pains to pull, and keep by itſelf, each different kind of lint which he finds in his field; what is both long and fine, by itſelf; what is both long and coarſe, by itſelf; what is both ſhort and fine, by itſelf; what is both ſhort and coarſe, by itſelf; and in like manner every other kind by itſelf that is of the ſame ſize and quality. If the different kinds be not thus kept ſeparate, the flax muſt be much damaged in the watering, and the other ſucceeding operations.

What is commonly called under growth, may be neglected as uſeleſs.

Few perſons that have ſeen flax pulled, are ignorant of the method of laying it in handfuls acroſs other: which gives the flax ſufficient air, and keeps the handfuls ſeparate and ready for the rippler.

Of Stacking up Flax *during the winter, and Winning the*

the Seed. If the flax be more valuable than the feed, it ought by no means to be ftacked up; for its own natural juice affifts it greatly in the watering: whereas, if kept long unwatered, it lofes that juice, and the harle adheres fo much to the boon, that it requires longer time to water, and even the quality of the flax becomes thereby harfher and coarfer. Befides, the flax ftacked up over year, is in great danger from vermin and other accidents; the water in fpring is not fo foft and warm as in harveft; and near a year is thereby loft of the ufe of the lint: but if the flax be fo fhort and branchy as to appear moft valuable for feed, it ought, after pulling, to be ftooked and dried upon the field, as is done with corn, then ftacked up for winter, rippled in fpring, and after fheeling the feed fhould be well cleaned from bad feeds, *&c.*

Of Rippling FLAX. After pulling, if the flax is to be regarded more than the feed, it fhould be allowed to lie fome hours upon the ground to dry a little, and fo gain fome firmnefs, to prevent the fkin or harle, which is the flax, from rubbing off in the rippling; an operation which ought by no means to be neglected, as the bolls, if put into the water along with the flax, breed vermin there, and otherwife fpoil the water. The bolls alfo prove very inconvenient in the graffing and breaking.

In Lincolnfhire and Ireland, they think that rippling hurts the flax; and therefore, in place of rippling, they ftrike the bolls againft a ftone.

The handfuls for rippling fhould not be great, as that endangers the lint in the rippling comb.

After rippling, the flax-raifer will perceive, that he is able to affort each fize and quality of the flax by itfelf more exactly than he could before.

Of Watering FLAX. A running ftream waftes the lint, makes it white, and frequently carries it away. Lochs, by the great quantity and motion of the water, alfo wafte and whiten the flax, though not fo much as running ftreams. Both rivers and lochs water the flax quicker than canals.

But all flax ought to be watered in canals, which fhould be digged in clay ground if poffible, as that foil retains the water beft: but if a firm retentive foil cannot be got, the bottom or fides of the canal, or both the bottom and fides, may be lined with clay; or, inftead of lining the fides with clay, which might fall down, a ditch may be dug without the canal, and filled with clay, which will prevent both extraneous water from entering, and the water within from running off.

A canal of forty feet long, fix broad, and four deep, will generally water the growth of an acre of flax.

It ought to be filled with frefh foft water from a river or brook, if poffible two or three weeks before the flax is put in, and expofed all that time to the heat of the fun. The greater way the river or brook has run, the fofter, and therefore the better will the water be. Springs, or fhort runs from hills, are too cold, unlefs the water is allowed to ftand long in the canal. Water from coal or iron, is very bad for flax. A little of the powder of galls thrown into a glafs of water, will immediately difcover if it comes from minerals of that kind, by turning it into a dark colour, more or lefs tinged in proportion to the quantity of vitriol it contains.

The canal ought not to be under any fhade; which, befides keeping the fun from foftening the water, might make part of the canal cooler than other parts, and fo water the flax unequally.

The flax-raifer will obferve, when the water is brought to a proper heat, that fmall plants will be rifing quickly in it, numbers of fmall infects and reptiles will be generating there, and bubbles of air rifing on the furface. If no fuch figns appear, the water muft not be warm enough, or is otherwife unfit for flax.

Mofs-holes, when neither too deep nor too fhallow, frequently anfwer well for watering flax, when the water is proper, as before defcribed.

The proper feafon for watering flax is, from the end of July to the end of Auguft.

The adavntage of watering flax as foon as poffible, after pulling, has been already mentioned.

The flax being forted after rippling, as before mentioned, fhould next be put in beets, never larger than a man can grafp with both his hands, and tied very flack, with a band of a few ftalks. Dried rufhes anfwer exceedingly well for binding flax, as they do not rot in the water, and may be dried and kept for ufe again.

The beets fhould be put into the canals flope-ways, or half ftanding upon end, the root-end uppermoft. Upon the crop-ends, when uppermoft, there frequently breeds a deal of vermin, deftructive of the flax, which is effectually prevented by putting the crop-end downmoft.

The whole flax in the canal ought to be carefully covered from the fun with divots; the graffy fide of which fhould be next the flax, to keep it clean. If it is not thus covered, the fun will difcolour the flax, though quite covered with water. If the divots are not weighty enough to keep the flax entirely under water, a few ftones may be laid above them. But the flax fhould not be preffed to the bottom.

When the flax is fufficiently watered, it feels foft to the grip, and the *harle* parts eafily with the *boon* or *fhow*, which laft is then become brittle, and looks whitifh. When thefe figns are found, the flax fhould be taken out of the water, beet after beet; each gently rinfed in the water, to cleanfe it of the naftinefs which has gathered about it in the canal; and as the lint is then very tender, and the beet flackly tied, it muft be carefully and gently handled.

Great care ought to be taken that no part is overdone; and as the coarfeft waters fooneft, if different kinds be mixed together, a part will be rotted, when the reft is not fufficiently watered.

When lint taken out of the canal is not found fufficiently watered, it may be laid in a heap, for twelve, eighteen, or twenty-four hours, which will have an effect like more watering; but this operation is nice, and may prove dangerous in unfkilful hands.

After the flax is taken out of the canal, frefh lint fhould not be put a fecond time into it, until the former water be run off, and the canal cleaned, and fupplied with frefh water.

Of graffing FLAX. Short heath is the beft field for graffing flax, as, when wet, it faftens to the heath, and is thereby prevented from being blown away by the wind. The heath alfo keeps it a little above the earth,

earth, and ſo expoſes it the more equally to the weather. When ſuch heath is not to be got, links, or clean old lea-ground is the next beſt. Long graſs-grounds ſhould be avoided, as the graſs growing thro' the lint frequently ſpots, tenders, or rots it; and grounds expoſed to violent winds ſhould alſo be avoided.

The flax, when taken out of the water, muſt be ſpread very thin upon the ground; and being then very tender, it muſt be gently handled. The thinner it is ſpread the better, as it is then the more equally expoſed to the weather. But it ought never to be ſpread during a heavy ſhower, as that would waſh and waſte the harle too much, which is then exceſſively tender, but ſoon after becomes firm enough to bear the rains, which, with the open air and ſunſhine, cleans, ſoftens, and purifies the harle to the degree wanted, and makes it bliſter from the boon. In ſhort, after the flax has got a little firmneſs by being a few hours ſpread in dry weather, the more rain and ſunſhine it gets the better.

If there be little danger of high winds carrying off the flax, it will be much the better of being turned about once a-week. If it is not to be turned, it ought to be very thin ſpread. The ſpreading of flax and hemp requires a deal of ground, and enriches it greatly.

The ſkilful flax-raiſer ſpreads his firſt row of flax at the end of the field oppoſite to the point from from whence the moſt violent wind commonly comes, placing the root-ends foremoſt; he makes the root-ends of every other row overlap the crop-ends of the former row three or four inches, and binds down the laſt row with a rope; by which means the wind does not eaſily get below the lint to blow it away: and as the crop-ends are ſeldom ſo fully watered as the root-ends, the aforeſaid overlapping has an effect like giving the crop-ends more watering. Experience only can fully teach a perſon the ſigns of flax being ſufficiently graſſed: then it is of a clearer colour than formerly; the harle is bliſtered up, and eaſily parts with the boon, which is then become very brittle. The whole ſhould be ſufficiently graſſed before any of it is lifted; for if a part be lifted ſooner than the reſt, that which remains is in great danger from the winds.

A dry day ought to be taken for taking up the flax; and if there is no appearance of high wind, it ſhould be looſed from the heath or graſs, and left looſe for ſome hours, to make it thoroughly dry.

As a great quantity of flax can ſcarcely be all equally watered and graſſed, and as the different qualities will beſt appear at lifting the flax off the graſs; therefore at that time each different kind ſhould be gathered together, and kept by itſelf; that is, all of the ſame colour, length, and quality.

The ſmaller the beets lint is made up in, the better for drying, and the more convenient for ſtacking, houſing, *&c.* and in making up theſe beets, as in every other operation upon flax, it is of great conſequence that the lint be laid together as it grew, the root-ends together, and the crop-ends together.

Of keeping FLAX *after it is graſſed.* Nothing needs be ſaid here, but that if the flax is to be ſtacked, it ſhould be ſet in an airy place, upon a dry foundation, ſuch as pob-middings, or the like, and well covered from the weather; and if houſed, the floor muſt be dry, and the houſe well aired, and water-tight.

Follows an Eſtimate of the Expence, Produce, and Profit of a Scots acre of FLAX,—*ſuppoſing the ſeaſon favourable, that no accidental loſſes happen, and that the farmer is neither unſkilful nor negligent.*

There-

There is nothing ftated here as expence of the canal in which the flax is watered; becaufe that varies much according to the conveniencies people have for making it: and a canal once made requires for after-years only to be repaired and cleanfed.

It is a certain fact, that the greater the crop is, the better is the quality of the fame kind of flax.

The advantage of having both a crop of flax and a crop of turnip the fame year—or of fowing grafs-feeds along with the lintfeed—and of reducing the ground to a fine garden mould, free of weeds, ought to be attended to.

For Cambrick and fine Lawn. The ground muft be a rich light foil, rather fandy, but cannot be too rich.

It ought to be ploughed in September, or the beginning of October, firft putting a little hot rotten dung upon it.

Second ploughing in January after a hard froft; and when you intend to fow it, plough it a third time, or rather hoe it, reducing the clods very fine; but make no furrows: the land muft be made level like a garden; but never work the land when wet.

The feed fhould be fown the beginning of April, and about double the quantity that is generally fown by our farmers; if the land be very rich, it will require rather more than double.

As foon as fown (if the weather be dry) it will be neceffary to roll the ground.

The lint muft be weeded very clean when about three inches high; directly after which you muft fet forked fticks, of about one and half inch thick (which ought to be prepared before) every four or five feet, according to the length of the poles you are to lay upon them; they fhould be well fixed in the ground, the forked part to receive the poles about fix or feven inches above the lint; each row of poles fhould be two, three, or four feet afunder, according to the length of the brufhwood you are to lay upon them.

The poles ought to be from ten to fifteen feet long, and ftrong enough to fupport the brufh acrofs the poles; take the longeft brufhwood you can get, the more branchy the better, very thick, filling up the vacancies with fmaller brufh, and any of the branches that rife higher than eighteen or twenty inches ought to be lopt off to make the brufh lie as level as poffible: any fort of brufh will do except oak, as that tinges the lint.

Your lint muft be pulled as foon as the feed is fully formed, which is a few days after it is out of the bloom before the lint turn yellow.

It muft be pulled above the brufhwood, and every handful laid upon it as foon as poffible: if it is fine weather, leave it four or five hours in that manner; then carry it to a fcreen near a barn, to put it under cover in cafe of rain; there it muft be fpread four or five days, and always put in the barn at night, or when it appears to rain: the bundles muft be opened in the barn, or made hollow, to prevent it from heating.

Thefe operations muft be performed until the lint is perfectly dry, and out of danger of heating; taking care all the time to keep the roots as even as poffible, and if poffible, keep it from rain or wet: if you cannot prevent it from being wet, it will be better to leave it on the grafs till dry; becaufe when once wet, the putting it under cover before dry will make it turn black; a thing which muft be prevented at all events.

If any of the lint upon the border, or through the piece of ground, be coarfer than another, it muft be feparated from the reft.

The utmoft care muft be taken to preferve the lint entire, or unbroke; for this reafon they beat off the feed with a round mell or bittle.

The moft proper ground is fummer fallow, or after potatoes, or lea; if poffible near a wood, to prevent the expence of carrying brufh.

As foon as the feed is off, if you intend to water it that feafon, it muft be tied in bundles about as large as you can grafp with your two hands.

The water proper for it, is a very fmall rivulet or foft fpring free of any metallic ore, and taking care that no flood or foul water enters your pit; which muft be at leaft five feet deep, about nine or ten broad at the top, and feven or eight at the bottom, the length will depend on the quantity of flax you have to water. A very fmall ftripe of water, when clear, fhould always be running in and off from your pit when the lint is in it.

The pit ought to be made three or four months before it be ufed.

You muft drive poles about four inches thick, with a hook inclining downwards, in this form 7, all along the fides of the pit, about five feet afunder. The hooks muft be level, or rather under the furface of the water. A long pole, the whole length of the pit, muft be fixed into thefe hooks on each fide; and crofs poles put under that, to keep the lint under water; but, the crofs poles are not ufed till the lint is put in. You muft order it fo, that all the lint fhould be three or four inches under water. You next bring your lint to the fides of the pit; then put your fheaves head to head, caufing each overlap the other about one third, and take as many of thefe as make a bundle of two or two and a half feet broad, laying the one above the other, till it is about four or four and a half feet high; then you tie them together in the middle, and at each root-end: after this, you wrap your bundle in ftraw, and lay it in the water, putting the thin or broad fide undermoft, taking care that none of your lint touch the earth; after it is fully preffed under water, put in your crofs poles to keep it under. The bundles ought to lie in the pit a foot feparate from each other. This renders it eafy to take out; for, if the bundles entangle, they will be too heavy to raife.

The time of watering depends fo much upon the weather, and foftnefs or hardnefs of the water, that it is impoffible to fix any certain time. This muft be left to the fkill of the farmer. If the flax be intended for fpinning yarn foft and fit for cambrick, it ought to be fpread upon fhort grafs for four or five days before you put it into the water; but if for lawns, lace, or thread, it is beft to dry it outright. In either cafe, avoid as much as poffible to let it get rain; as much rain blanches and wafhes

washes out the oil, which is neceſſary to preſerve the ſtrength.

The great property of this flax is to be fine and long. Thick ſowing raiſes all plants fine and ſlender, and when the ground is very rich, it forces them to a great length. Pulling green prevents that coarſe hardneſs which flax has when let ſtand till it be full ripe, and gives it the fine ſilky property. The bruſhwood, when the flax ſprings up, catches it by the middle, prevents it from lying down and rotting; infallible conſequences of ſowing thick upon rich ground. It likewiſe keeps it ſtraight, moiſt, and ſoft at the roots; and by keeping it warm, and ſhaded from the ſun, greatly promotes its length. The keeping it from rain, heating, taking proper care of your water, preſerves the colour, and prevents theſe bars in cloth ſo much complained off by bleachers.

FLAX-DRESSING. *The different methods of that operation.*

For many ages it was the practice to ſeparate the boon or core from the flax, which is the bark of the plant, by the following ſimple *hand-methods*. Firſt, for breaking the boon; the ſtalks in ſmall parcels were beat with a mallet; or, more dexterouſly, the *break* (Plate LXXXII. fig. 1. and 2.) was uſed thus: The flax being held in the left-hand a-croſs the three *under-teeth* or *ſwords* of the break (A, fig. 1. and *a*, fig. 2.), the *upper-teeth* (B, fig. 1. and *b*, fig. 2.) were with the right-hand quickly and often forced down upon the flax, which was artfully ſhifted and turned with the left-hand. Next, for clearing the flax of the broken boon; the workman with his left-hand held the flax over the *ſtock* (fig. 3. and 4.) while with his right-hand he ſtruck or threſhed the flax with the *ſcutcher* (fig. 5.).

Theſe methods of breaking and ſcutching the flax being flow and very laborious, a *water-mill* was invented in Scotland about forty years ago, which, with ſome late improvements, makes great diſpatch, and in ſkilful and careful hands gives ſatisfaction. It has been generally conſtructed to break the boon by three dented rollers, placed one above the other. The middle one of which being forced quickly round takes the other two along with it, and one end of handfuls of the flax being by the workman directed in between the upper and middle rollers, the flax is immediately drawn in by the rollers; a curved board or plate of tin behind the rollers directs the flax to return again between the middle and undermoſt rollers;—and thus the operation is repeated until the boon be ſufficiently broke. Great weights of timber or ſtone at the ends of levers, preſs the upper and under-rollers towards the middle one.

The ſcutching is next carried on by the mill in the following manner: Four arms, ſomething like the hand-ſcutchers before deſcribed, project from a perpendicular axle; a box around the axle incloſes theſe projecting ſcutchers; and this box is divided among the workmen, each having ſufficient room to ſtand and handle his flax, which, through ſlits in the upper-part and ſides of the box, they hold in to the ſtroke of the ſcutchers; which, moving round horizontally, ſtrike the flax a-croſs or at right angles, and ſo threſh out or clear it of the boon.

The breaking of the flax by *rollers* is ſcarcely ſubject to any objection, but that it is dangerous to workmen not ſufficiently on their guard, who ſometimes allow the rollers to take hold of their fingers, and thereby their whole arm is inſtantly drawn in: thus many have loſt their arms. To avoid this danger, a break upon the general principles of the hand-break before deſcribed, has been lately adapted to water-machinery, and uſed in place of rollers. The horizontal ſtroke of the ſcutchers was long thought too ſevere, and waſteful of the flax; but very careful experiments have diſcovered that the waſte complained of muſt be charged to the unſkilfulneſs or negligence of the workmen, as in good hands the mill carries away nothing but what, if not ſo ſcutched off, muſt be taken off in the heckling with more loſs both of time and flax. But to obviate this objection of the violence of the *horizontal ſcutchers*, an imitation of hand-ſcutching has lately been applied to water. The ſcutchers then project from an horizontal axle, and move like the arms of a check-reel, ſtriking the flax neither acroſs nor perpendicularly down, but ſloping in upon the parcel exactly as the flax is ſtruck by the hand-ſcutcher. This ſloping ſtroke is got by raiſing the ſcutching ſtock ſome inches higher than the centre of the axle; and by raiſing or lowering the ſtock, over which the flax is held, or ſcrewing it nearer to or farther from the ſcutchers, the workman can temper or humour the ſtroke almoſt as he pleaſes.

A lint-mill with horizontal ſcutchers upon a perpendicular axle, requires a houſe of two ſtories, the rollers or break being placed in the ground ſtory, and the ſcutchers in the loft above; but a mill with vertical ſcutchers on an horizontal axle, requires but one ground ſtory for all the machinery.

Another method of breaking and ſcutching flax, more expeditious than the old hand-methods, and more gentle than water-mills, has alſo been lately invented in Scotland. It is much like the break and ſcutcher giving the ſloping ſtroke laſt deſcribed, moved by the foot. The treddle is remarkably long, and the ſcutchers are fixed upon the rim of a fly-wheel. The foot-break is alſo aſſiſted in its motion by a fly. Theſe foot-machines are very uſeful where there are no water-mills, but they are far inferior to the mills in point of expedition.—[*See plans of the* water-mills, *and* foot-machine, *on the unnumbered plates betwixt the* LXXXII. *and* LXXXIII.]

The next operation that flax undergoes after ſcutching, is heckling. The *heckle* (fig. 6. Plate LXXXII.) is firmly fixed to a bench before the workman, who ſtrikes the flax upon the teeth of the heckle and draws it thro' the teeth. To perſons unacquainted with that kind of work this may ſeem a very ſimple operation; but, in fact, it requires as much practice to acquire the ſlight of heckling well, and without waſting the flax, as any other operation in the whole manufacture of linen. They uſe coarſer and wider teethed heckles, or finer, accord-

ing to the quality of the flax; generally putting the flax thro' two heckles, a coarser one first, and next thro' a fine heckle.

Flax for cambrick and fine lawn, thread and lace, is dressed in a manner somewhat different. It is not skutched so thoroughly as common flax; which from the skutch proceeds to the heckle, and from that to the spinner: whereas this fine flax, after a rough skutching, is scraped and cleansed with a blunt knife upon the workman's-knee covered with his leather apron; from the knife it proceeds to the spinner, who, with a brush made for the purpose, straights and dresses each parcel just before she begins to spin it.

Toad-FLAX. See LINARIA.

FLEA, in zoology. See PULEX.

FLEA-BANE, in botany. See CONYZA.

FLEA-BITTEN, that colour of a horse, which is white or grey, spotted all over with dark redish spots.

FLEAM, in surgery and farriery, an instrument for letting a man or horse blood. A case of fleams, as it is called by farriers, comprehends six sorts of instruments; two hooked ones, called drawers, and used for cleaning wounds; a pen-knife; a sharp pointed lancet, for making incisions; and two fleams, one sharp and the other broad pointed. These last are somewhat like the point of a lancet, fixed in a flat handle, only no longer than is just necessary to open the vein.

FLECHE, a town of France, under the meridian of London, twenty miles north-east of Angers.

FLEECE, the covering of wool, shorn off the bodies of sheep. See WOOL.

Order of the Golden FLEECE, an order of knighthood instituted by Philip II. duke of Burgundy. These knights at first were twenty-four, besides the duke himself, who reserved the nomination of six more: but Charles V. increased them to fifty. He gave the guardianship of this order to his son Philip king of Spain, since which the Spanish monarchs are chiefs of the order. The knights had three different mantles ordained them at the grand solemnity, the collar and fleece.

FLEET, commonly implies a company of ships of war, belonging to any prince or state: but sometimes it denotes any number of trading ships, employed in a particular branch of commerce.

In sailing, a fleet of men of war is usually divided into three squadrons: the admiral's, the vice admiral's, and the rear-admiral's squadron, all which, being distinguished by their flags and pendants, are to put themselves, and, as near as may be, to keep themselves in their customary places, *viz.* The admiral, with his squadron, to sail in the van, that so he may lead the way to all the rest in the day-time, by the sight of his flag in the main top-mast head; and in the night time, by his lights or lanterns. The vice-admiral and his squadron, is to sail in the centre or middle of the fleet. The rear-admiral, and the ships of his squadron, is to bring up the rear. But sometimes other divisions are made; and those composed of the lighter ships and the best sailors, are placed as wings to the van, centre, and rear.

FLEET is also a noted prison in London, where persons are committed for contempt of the king and his laws, particularly of his courts of justice: or for debt, where any person will not, or is unable to pay his creditors.

There are large rules and a warden belonging to the fleet prison, which had its name from the float or fleet of the river or ditch, on the side whereof it stands.

FLENSBURGH, a port town subject to Denmark, sixteen miles north of the city of Sleswick.

FLESH, in anatomy, a similar, fibrous part of an animal body, soft and bloody, being that whereof most of the other parts are composed, and whereby they are connected together: or more properly, it is such parts of the body where the blood-vessels are so small, as only to retain blood enough to preserve their colour red.

FLEURY, a town of Burgundy, in France, thirty miles north of Chalons.

FLEXIBLE, in physics, a term applied to bodies capable of being bent or diverted from their natural figure or direction.

FLEXOR, in anatomy, a name applied to several muscles, which are so called from their office, which is to bend the part to which they belong; in opposition to the extensors, which open or stretch them. See ANATOMY, part II.

FLINT, in natural history, a semipellucid stone, composed of crystal debased with earth, of one uniform substance, and free from veins; but of different degrees of colour, according to the quantity of earth it contains, and naturally surrounded with a whitish crust.

Flint is a stone of an extremely fine, compact, and firm texture, and very various, both in size and figure. It is of all the degrees of grey, from nearly quite black, to almost quite white. It breaks with a fine, even, glossy surface; and is moderately transparent, very hard, and capable of a fine polish. It readily strikes fire with steel, and makes not the least effervescence with aquafortis, and burns to a whiteness. Its uses in glass making, *&c.* are too well known to need a particular recital.

FLOATAGES, all things floating on the top of the sea or any water, a word much used in the commissions of water bailiffs.

FLOOD. See DELUGE.

FLORENCE, an archbishop's see and city of Italy, situated on the river Arno, in Tuscany, forty-five miles east of Leghorn: E. long. 12° 15′, and N. lat. 43° 30′. Florence is one of the most elegant towns in Italy, has an university, and is six miles in circumference. The statues, paintings, and curiosities in the grand duke's palace are the admiration of travellers.

FLORENTINE, a town of Champaign in France, twenty-eight miles south-west of Troyes.

FLORES, in geography, one of the Azores islands, subject to Portugal.

FLORID STYLE, is that too much enriched with figures and flowers of rhetoric.

FLORIDA, in geography, a name first given by the Spaniards to all that part of North America which lies north of the gulph of Mexico. However, all that retains the name Florida at present, is the peninsula between the British colony of Georgia and cape Florida,

viz. between 25° and 30° of N. latitude, and between 81° and 85° W. longitude.

FLORIN, is ſometimes uſed for a coin, and ſometimes for a money of account.

Florin, as a coin, is of different values, according to the different metals and different countries where it is ſtruck. The gold florins are moſt of them of a very coarſe alloy, ſome of them not exceeding thirteen or fourteen carrats, and none of them ſeventeen and a half. As to ſilver florins, thoſe of Holland are worth about 1 s. 8 d. thoſe of Genoa were worth $8\frac{1}{4}$ Sterling.

Florin, as a money of account, is uſed by the Italian, Dutch, and German merchants and bankers, but admits of different diviſions in different places. In Holland, it is on the footing of the coin of that name, containing 20 ſtivers At Frankfort and Nuremberg it is equivalent to 3s. Sterling, and is divided into creutzers, and pfinnings. At Liege, it is equivalent to 2s 3d. At Straſburg, to 1s. 8d. In Savoy, to 11d. At Genoa, to $8\frac{1}{4}$d. And at Geneva, to $6\frac{1}{2}$ d. See Coin.

FLORIST, a perſon well ſkilled in flowers, their kinds and cultivation.

FLORY, Flowry, or Fleury, in heraldry, a croſs that has the flowers at the end circumflex and turning down, differing from the potence, inaſmuch as the latter ſtretches out more like that which is called patee.

The croſs flory is repreſented in Plate LXXX. fig. 7

FLOS, Flower, in botany. See Flower.

Flos, in chemiſtry, the moſt ſubſtile part of bodies ſeparated from the more groſs parts by ſublimation, in a dry form. See Chemistry.

FLOTSON, or Flotsom, goods that by ſhipwreck are loſt, and floating upon the ſea; which, with jetſon and lagan, are generally given to the lord admiral: but this is the caſe only where the owners of ſuch goods are not known. And here it is to be obſerved, that jetſon ſignifies any thing that is caſt out of a ſhip when in danger, and afterwards is beat on the ſhore by the water, notwithſtanding which the ſhip periſhes Lagan is where heavy goods are thrown overboard, before the wreck of the ſhip, and ſink to the bottom of the ſea.

FLOUNDER, the Engliſh name of a ſpecies of pleuronectes. See Pleuronectes.

FLOUR, the meal of wheat-corn, finely ground and ſifted. See Meal.

FLOWER, among botaniſts and gardeners, the moſt beautiful part of trees and plants, containing the organs or parts of fructification. See Botany.

External Flower. See Xeranthemum.

Everlaſting Flower. See Gnaphalium.

Flower Fence. See Poinciana.

Flower de luce. See Iris.

Sultan-Flower. See Cyanus.

Sun-Flower. See Helianthus.

Trumpet Flower. See Bignonia.

Wind-Flower. See Anemone

Flower de lis, or Flower de luce, in heraldry, a bearing repreſenting the lily, called the queen of flowers, and the true hieroglyphic of royal majeſty; but of late it is become more common, being borne in ſome coats one, in others three, in others five, and in ſome ſemee, or ſpread all over the eſcutcheon in great numbers.

The arms of France are, three flower de lis or, in a field azure.

FLUDDER. See Colymbus.

FLUID, an appellation given to all bodies whoſe particles eaſily yield to the leaſt partial preſſure, or force impreſſed.

Laws and properties of Fluids. See Hydraulics and Hydrostatics.

FLUOR, in phyſics, a fluid; or, more properly, the ſtate of a body that was before hard or ſolid, but is now reduced by fuſion, or fire, into a ſtate of fluidity.

Fluor, in mineralogy, implies a ſort of mineral concretion, frequently found amongſt ores and ſtones, in mines and quarries.

Fluor albus, or Whites. See Medicine.

FLUSHING, or Vlissengen, a port town of Zealand in Holland, five miles ſouth of Middleburgh: E. long. 3° 25′, N. lat. 51° 30′. It is a town of great foreign trade, and has a good ſecure harbour.

FLUTE, an inſtrument of muſic, the ſimpleſt of all thoſe of the wind kind. It is played on by blowing it with the mouth, and the tones or notes are changed by ſtopping and opening the holes diſpoſed for that purpoſe along its ſide.

German Flute, is an inſtrument entirely different from the common flute. It is not, like that, put into the mouth to be played, but the end is ſtopt with a tampion or plug; and the lower lip is applied to a hole about two inches and a half, or three inches, diſtant from the end This inſtrument is uſually about a foot and a half long; rather bigger at the upper end than the lower; and perforated with holes, beſides that for the mouth, the loweſt of which is ſtopt and opened by the little finger's preſſing on a braſs or ſometimes a ſilver key, like thoſe in hautboys, baſſoons, &c. Its ſound is exceeding ſweet and agreeable; and ſerves as a treble in a concert.

Coarſe flutes, on importation, pay the gros, containing twelve dozen, 3 s. $10\frac{20}{100}$ d. and on exportation draw back 3s. $4\frac{50}{100}$ d.

Flutes, or Flutings. See Architecture.

FLUVIALIS, in botany. See Najas.

FLUX, in medicine, an extraordinary iſſue, or evacuation of ſome humours of the body. See Medicine.

Flux, in metallurgy, whatever can cauſe a body otherwiſe not at all, or hardly, fuſible by fire, to melt. See Chemistry.

FLUXIONS.

F L U X I O N S.

FLUXIONS, a method of calculation which greatly facilitates computations in the higher parts of mathematics. Sir Iſaac Newton and Mr Leibnitz contended for the honour of inventing it. It is probable they had both made progreſs in the ſame diſcovery unknown to each other, before there was any publication on the ſubject.

In this branch of mathematics magnitudes of every kind are ſuppoſed generated by motion: a line by the motion of a point, a ſurface by the motion of a line, and a ſolid by the motion of a ſurface. And ſome part of a figure is ſuppoſed generated by an uniform motion; in conſequence of which the other parts may increaſe uniformly or with an accelerated or retarded motion, or may decreaſe in any of theſe ways; and the computations are made by tracing the comparative velocities with which the parts flow.

Fig. 1. If the parallelogram ABCD be generated by an uniform motion of the line AB toward CD while it moves from FE towards *fe*, while the line BF receives the increment F*f*, and the figure will be increaſed by the parallelogram F*e*; the line FE in this caſe undergoes no variation.

The fluxion of any magnitude at any point is the increment that it would receive in any given time, ſuppoſing it to increaſe uniformly from that point; and as the meaſures will be the ſame, whatever the time be, we are at liberty to ſuppoſe it leſs than any aſſigned time.

The firſt letters in the alphabet are uſed to repreſent invariable quantities; the letters x, y, z variable quantities; and the ſame letters with points over them $\dot{x}$, $\dot{y}$, $\dot{z}$, repreſent their fluxions.

Therefore if AB$=a$, and BF$=x$; F*f*, the fluxion of BF, will be $=\dot{x}$, and F*e*, the fluxion of AF, $=a\dot{x}$.

If the rectangle be ſuppoſed generated by the uniform motion of FG towards CD, at the ſame time HG moves uniformly towards AD, the point G keeping always on the diagonal, the lines FG HG will flow uniformly; for while B*f* receives the increment F*f* and HB, the increment HK, FG will receive the increment *hg* and HG the increment *hg*, and they will receive equal increments in equal ſucceſſive times. But the parallelogram will flow with an accelerated motion; for while F flows to *f* and H to K, it is increaſed by the gnomon KG*f*; but while F and H flow through the equal ſpaces *fm* KL, it is increaſed by the gnomen L*gm* greater than KG*f*; conſequently when fluxions of the ſides of a parallelogram are uniform, the fluxion of the parallelogram increaſes continually.

The fluxion of the parallelogram BHGF is the two parallelograms KG and G*f*; for though the parameter receives an increment of the gnomen KG*f*, while its ſides flow to *f* and K, the part *g*G is owing to the additional velocity wherewith the parallelogram flows during that time; and therefore is no part of the meaſure of the fluxion, which muſt be computed by ſuppoſing the parameter to flow uniformly as it did at the beginning, without any acceleration.

Therefore if the ſides of a parallelogram be x and y, their fluxions will be $\dot{x}$ $\dot{y}$; and the fluxion of the parallelogram $x\dot{y}+y\dot{x}$; and if $x=y$, that is, if the figure be a ſquare, the fluxion of x^2 will be $2x\dot{x}$.

Fig. 2. Let the triangle ABC be deſcribed by the uniform motion of DE from A towards B, the point E moving in the line DF, ſo as always to touch the lines AC, CB; while D moves from A to F, DE is uniformly increaſed, and the increaſe of the triangle is uniformly accelerated. When DE is in the poſition FC, it is a maximum. As D moves from F to B, the line FC decreaſes, and the triangle increaſes, but with a motion uniformly retarded.

Fig. 3. If the ſemicircle AFB be generated by the uniform motion of CD from A towards B, while C moves from A to G, the line CD will increaſe, but with a retarded motion; the circumference alſo increaſes with a retarded motion, and the circular ſpace increaſes with an accelerated motion, but not uniformly, the degrees of acceleration growing leſs as CD approaches to the poſition GF. When C moves from G to B, it decreaſes with a motion continually accelerated, the circumference increaſes with a motion continually accelerated, and the area increaſes with a motion continually retarded, and more quickly retarded as CD approaches to B.

The fluxion of a quantity which decreaſes is to be conſidered as negative.

When a quantity does not flow uniformly, its fluxion may be repreſented by a variable quantity, or a line of a variable length; the fluxion of ſuch a line is called the ſecond fluxion of the quantity whoſe fluxion that line is: and if it be variable, a third fluxion may be deduced from it, and higher orders from theſe in the ſame manner: the ſecond fluxion is repreſented by two points, as $\ddot{x}$.

The increment a quantity receives by flowing for any given time, contains meaſures of all the different orders of fluxions; for if it increaſes uniformly, the whole increment is the firſt fluxion; and it has no ſecond fluxion. If it increaſes with a motion uniformly accelerated, the part of the increment occaſioned by the firſt motion meaſures the firſt fluxion, and the part occaſioned by the acceleration meaſures the ſecond fluxion. If the motion be not only accelerated, but the degree of acceleration continually increaſed, the two firſt fluxions are meaſured as before; and the part of the increment occaſioned by the additional degree of acceleration meaſures the third; and ſo on. Theſe meaſures require to be corrected, and are only mentioned here to illuſtrate the ſubject.

DIRECT METHOD.

Any flowing quantity being given, to find its fluxion.

Rule I. To find the fluxion of any power of a quantity

tity, multiply the fluxion of the root by the exponent of the power, and the product by a power of the same root less by unity than the given exponent.

The fluxion of x^3 is $3x^2\dot{x}$, of x^n $nx^{n-1}\dot{x}$; for the root of x^n is x, whose fluxion is $\dot{x}$; which multiplied by the exponent n, and by a power of x less by unity than n, gives the above fluxion.

If x receive the increment $\dot{x}$, it becomes $x+\dot{x}$; raise both to the power of n, and x^n becomes $x^n+nx^{n-1}\dot{x}+\frac{n.\overline{n-1}}{2}x^{n-2}\dot{x}^2+$, &c.; but all the parts of the increment, except the first term, are owing to the accelerated increase of x^n, and form measures of the higher fluxions. The first term only measures the first fluxion; the fluxion of $\overline{a^2+z^2}^{\frac{3}{2}}$ is $\frac{3}{2}\times 2z\dot{z}\times\overline{a^2+z^2}^{\frac{1}{2}}$; for put $x=a^2+z^2$, we have $\dot{x}=2z\dot{z}$, and the fluxion of $x^{\frac{3}{2}}$, which is equal to the proposed fluent, is $\frac{3}{2}x^{\frac{1}{2}}\dot{x}$, for which substituting the values of x and $\dot{x}$, we have the above fluxion.

Rule II. To find the fluxion of the product of several variable quantities multiplied together, multiply the fluxion of each by the product of the rest of the quantities, and the sum of the products thus arising will be the fluxion sought.

Thus the fluxion of xy, is $\dot{x}y+\dot{y}x$; that of xyz, is $xy\dot{z}+xz\dot{y}+yz\dot{x}$; and that of $xyzu$, is $xyz\dot{u}+xyu\dot{z}+xzu\dot{y}+yzu\dot{x}$.

Rule III. To find the fluxion of a fraction.—From the fluxion of the numerator multiplied by the denominator, subtract the fluxion of the denominator multiplied by the numerator, and divide the remainder by the square of the denominator.

Thus, the fluxion of $\frac{x}{y}$ is $\frac{y\dot{x}-x\dot{y}}{y^2}$; that of $\frac{x}{x+y}$, is $\frac{\dot{x}\times\overline{x+y}-\overline{\dot{x}+\dot{y}}\times x}{\overline{x+y}|^2}=\frac{y\dot{x}-x\dot{y}}{\overline{x+y})^2}$.

Rule IV. In complex cases, let the particulars be collected from the simple rules and combined together.

The fluxion of $\frac{x^2y^2}{z}$ is $\frac{\overline{2x^2y\dot{y}+2y^2x\dot{x}}\times z-x^2y^2\dot{z}}{z^2}$; for the fluxion of x^2 is $2x\dot{x}$, and of y^2 is $2y\dot{y}$, by Rule I. and therefore the fluxion of x^2y^2 (by Rule II.) $2x^2y\dot{y}+2y^2x\dot{x}$; from which, multiplied by z, (by Rule III.) and subtracting from it the fluxion of the denominator z, multiplied by the numerator, and dividing the whole by the square of the denominator, gives the above fluxion.

Rule IV. The second fluxion is derived from the first, in the same manner as the first from the flowing quantity.

Thus the fluxion of x^3, $3x^2\dot{x}$; its second, $6x\dot{x}^2+3x^2\ddot{x}$ (by Rule II.); and so on: but if $\dot{x}$ be invariable, $\ddot{x}=0$, and the second fluxion of $x^3=6x\dot{x}^2$.

Prob. 1. *To determine maxima and minima.*

When a quantity increases, its fluxion is positive; when it decreases, it is negative; therefore when it is just betwixt increasing and decreasing, its fluxion is $=0$.

Rule. Find the fluxion, make it $=0$, whence an equation will result that will give an answer to the question.

Fig. 4. Examp. To determine the dimensions of a cylindric measure ABCD, open at the top, which shall contain a given quantity (of liquor, grain, &c.) under the least internal superficies possible.

Let the diameter $AB=x$, and the altitude $AD=y$; moreover, let p (3,14159, &c.) denote the periphery of the circle whose diameter is unity, and let c be the given content of the cylinder. Then it will be $1:p::x:(px)$ the circumference of the base; which, multiplied by the altitude y, gives pxy for the concave superficies of the cylinder. In like manner, the area of the base, by multiplying the same expression into $\frac{1}{4}$ of the diameter x, will be found $=\frac{px^2}{4}$; which drawn into the altitude y, gives $\frac{px^2y}{4}$ for the solid content of the cylinder; which being made $=c$, the concave surface pxy will be found $=\frac{4c}{x}$, and consequently the whole surface $=\frac{4c}{x}+\frac{px^2}{4}$: Whereof the fluxion, which is $-\frac{4c\dot{x}}{x^2}+\frac{px\dot{x}}{2}$ being put $=0$, we shall get $-8c+px^3=0$; and therefore $x=2\sqrt[3]{\frac{c}{p}}$: further, because $px^3=8c$, and $px^2y=4c$, it follows, that $x=2y$; whence y is also known, and from which it appears, that the diameter of the base must be just the double of the altitude.

Fig. 7. To find the longest and shortest ordinates of any curve, DEF, whose equation or the relation which the ordinates bear to the abscissas is known.

Make AC the abscissa x, and CE the ordinate $=y$; take a value y in terms of x, and find its fluxion; which making $=0$, an equation will result whose roots give the value of x when y is a maximum or minimum.

To determine when it is a maximum and when a minimum, take the value of y, when x is a little more than the root of the equation so found, and it may be perceived whether it increases or decreases.

If the equation has an even number of equal roots, y will be neither a maximum nor minimum when its fluxion is $=0$.

Prob. 2. *To draw a tangent to any curve.*

Fig. 5. When the abscissa CS of a curve moves uniformly from A to B, the motion of the curve will be retarded if it be concave, and accelerated if convex towards AB; for a straight line TC is described by an uniform motion, and the fluxion of the curve at any point is the same as the fluxion of the tangent, because it would describe the tangent if it continued to move equally from that point. Now if Ss or Ce be the fluxion of the base, Cd will be the fluxion of the tangent, and *de* of the ordinate. And because the triangles TSC, *ced*, are equiangular, $de:ce::CS:ST$, wherefore

Rule. Find a fourth proportional to the fluxion of the

the ordinate valued in terms of the abſciſſa, the fluxion of the abſciſſa, and the ordinate, and it determines the line ST, which is called the ſemi-tangent, and TC joined is a tangent to the curve.

Fig. 6. EXAMP. To draw a right line CT, to touch a given circle BCA in a given point C.

Let CS be perpendicular to the diameter AB, and put AB$=a$, BS$=x$, and SC$=y$: Then, by the property of the circle, y^2 (CS²) =BS×AS $(=x\times\overline{a-x})=ax-x^2$; whereof the fluxion being taken, in order to determine the ratio of $\dot{x}$ and $\dot{y}$, we get $2y\dot{y}=a\dot{x}-2x\dot{x}$; conſequently $\frac{\dot{x}}{\dot{y}}=\frac{2y}{a-2x}=\frac{y}{\frac{1}{2}a-x}$; which multiplied by y, gives $\frac{y\dot{x}}{\dot{y}}=\frac{y^2}{\frac{1}{2}a-x}=$ the ſubtangent ST. Whence (O being ſuppoſed the centre) we have OS $(\frac{1}{2}a-x)$: CS (y) :: CS (y) : ST; which we alſo know from other principles.

PROB. 3. *To determine points of contrary flexure in curves.*

FIG. 7. Suppoſing C to move uniformly from A to B, the curve DEF will be convex towards AB when the celerity of E increaſes, and concave when it decreaſes; therefore at the point where it ceaſes to be convex and begins to be concave, or the oppoſite way, the celerity of E will be uniform, that is, CE will have no ſecond fluxion. Therefore,

RULE. Find the ſecond fluxion of the ordinate in terms of the abſciſſa, and make it $=0$; and from the equation that ariſes you get a value of the abſciſſa, which determines the point of contrary flexure.

Ex. Let the nature of the curve ARS be defined by the equation $ay=a^{\frac{3}{2}}x^{\frac{1}{2}}+xx$, (the abſciſſa AF and the ordinate FG being, as uſual, repreſented by x and y reſpectively). Then $\dot{y}$, expreſſing the celerity of the point r, in the line FH, will be equal to $\frac{\frac{1}{2}a^{\frac{3}{2}}x^{-\frac{1}{2}}\dot{x}+2x\dot{x}}{a}$: Whoſe fluxion, or that of $\frac{1}{2}a^{\frac{3}{2}}x^{-\frac{1}{2}}+2x$ (becauſe a and $\dot{x}$ are conſtant) muſt be equal to nothing; that is, $-\frac{1}{4}a^{\frac{3}{2}}x^{-\frac{3}{2}}\dot{x}+2\dot{x}=0$: Whence $a^{\frac{3}{2}}x^{-\frac{3}{2}}=8$, $a^{\frac{3}{2}}=8x^{\frac{3}{2}}$, $64x^3=a^3$, and $x=\frac{1}{4}a=$AF; therefore FG $\left(=\frac{a^{\frac{3}{2}}x^{\frac{1}{2}}+xx}{a}\right)=\frac{9}{16}a$: From which the poſition of the point G is given.

PROB. 4. *To find the radii of curvature.*

The curvature of a circle is uniform in every point, that of every other curve continually varying; and it is meaſured at any point by that of a circle whoſe radius is of ſuch a length as to coincide with it in curvature in that point.

All curves that have the ſame tangent have the ſame firſt fluxion, becauſe the fluxion of a curve and its tangent are the ſame. If it moved uniformly on from the point of contact, it would deſcribe the tangent. And the deflection from the tangent is owing to the acceleration or retardation of its motion, which is meaſured by its ſecond fluxion; and conſequently two curves which have not only the ſame tangent, but the ſame curvature at the point of contact, will have both their firſt and ſecond fluxions equal. It is eaſily proven from thence, that the radius of curvature is $=\frac{\dot{z}^3}{-\dot{x}\ddot{y}}$, where x, y, and z repreſent the abſciſſa, ordinate, and curve reſpectively.

EXAMP. Let the given curve be the common parabola, whoſe equation is $y=a^{\frac{1}{2}}x^{\frac{1}{2}}$: Then will $\dot{y}=\frac{1}{2}a^{\frac{1}{2}}x\dot{x}^{-\frac{1}{2}}=\frac{a^{\frac{1}{2}}\dot{x}}{2x^{\frac{1}{2}}}$, and (making $\dot{x}$ conſtant) $\ddot{y}=-\frac{1}{2}\times\frac{1}{2}a^{\frac{1}{2}}\dot{x}^2x^{-\frac{3}{2}}=\frac{-a^{\frac{1}{2}}\dot{x}^2}{4x^{\frac{3}{2}}}$: Whence $\dot{z}\left(\sqrt{\dot{x}^2+\dot{y}^2}\right)=\frac{\dot{x}}{2}\sqrt{\frac{4x+a}{x}}$, and the radius of curvature $\left(\frac{\dot{z}^3}{-\dot{x}\ddot{y}}\right)=\frac{\overline{a+4x}^{\frac{3}{2}}}{2\sqrt{a}}$: Which at the vertex, where $x=0$, will be $=\frac{1}{2}a$.

INVERSE METHOD.

From a given fluxion to find a fluent.

This is done by tracing back the ſteps of the direct method. The fluxion of x is $\dot{x}$; and therefore the fluent of $\dot{x}$ is x: but as there is no direct method of finding fluents, this branch of the art is imperfect. We can aſſign the fluxion of every fluent, but we cannot aſſign the fluent of a fluxion, unleſs it be ſuch a one as may be produced by ſome rule in the direct method from a known fluent.

GENERAL RULE. Divide by the fluxion of the root, add unity to the exponent of the power, and divide by the exponent ſo increaſed.

For, dividing the fluxion $nx^{n-1}\dot{x}$ by $\dot{x}$ (the fluxion of the root x) it becomes nx^{n-1}; and, adding 1 to the exponent $(n-1)$ we have nx^n; which, divided by n, gives x^n, the true fluent of $nx^{n-1}\dot{x}$.

Hence (by the ſame rule) the

Fluent of $3x^2\dot{x}$ will be $=x^3$;

That of $8x^2\dot{x}=\frac{8x^3}{3}$;

That of $2x^5\dot{x}=\frac{x^6}{3}$;

That of $y^{\frac{1}{2}}\dot{y}=\frac{2}{3}y^{\frac{3}{2}}$.

Sometimes the fluent ſo found requires to be corrected. The fluxion of x is $\dot{x}$, and the fluxion of $a+x$ is alſo $\dot{x}$, becauſe a is invariable, and has therefore no fluxion.

Now when the fluent of $\dot{x}$ is required, it muſt be determined, from the nature of the problem, whether any invariable part, as a, muſt be added to the variable part x.

When fluents cannot be exactly found, they can be approximated by infinite ſeries.

Ex. Let it be required to approximate the fluent of

$$\frac{\overline{a^2-x^2}^{\frac{1}{2}}\times x^n\dot{x}}{\overline{c^2-x^2}^{\frac{1}{2}}}$$ in an infinite ſeries.

The

The value of $\dfrac{\overline{a^2-x^2}|^{\frac{1}{2}}}{\overline{c^2-x^2}|^{\frac{1}{2}}}$, expreſſed in a ſeries, is $\dfrac{a}{c}+\overline{\dfrac{a}{2c^3}-\dfrac{1}{2ac}}\times x^2+\overline{\dfrac{3a}{8c^5}-\dfrac{1}{4ac^3}-\dfrac{1}{8a^3c}}\times x^4+\overline{\dfrac{5a}{16c^7}-\dfrac{3}{16ac}-\dfrac{1}{16a^3c^3}-\dfrac{1}{16a^5c}}\times x^6+$ &c. Which value being therefore multiplied by $x^n\dot{x}$, and the fluent taken (by the common method) we get $\dfrac{ax^{n+1}}{\overline{n+1}\times c}+\overline{\dfrac{a}{2c^3}-\dfrac{1}{2ac}}\times\dfrac{x^{n+3}}{n+3}+\overline{\dfrac{3a}{8c^5}-\dfrac{1}{4ac^3}-\dfrac{1}{8a^3c}}\times\dfrac{x^{n+5}}{n+5}+\overline{\dfrac{5a}{16c^7}-\dfrac{3}{16ac^5}-\dfrac{1}{16a^3c^3}-\dfrac{1}{16a^5c}}\times\dfrac{x^{n+7}}{n+7}+$ &c.

PROB. 1. *To find the area of any curve.*

RULE. Multiply the ordinate by the fluxion of the abſciſſa, and the product gives the fluxion of the figure, whoſe fluent is the area of the figure.

EXAMP. 1. Fig. 8. Let the curve ARMH, whoſe area you will find, be the common parabola. Let u repreſent the area, and $\dot{u}$ its fluxion.

In which caſe the relation of AB (x) and BR (y) being expreſſed by $y^2=ax$ (where a is the parameter) we thence get $y=a^{\frac{1}{2}}x^{\frac{1}{2}}$; and therefore $\dot{u}=$ RmHB $(=y\dot{x})$ $=a^{\frac{1}{2}}x^{\frac{1}{2}}\dot{x}$: whence $u=\frac{2}{3}\times a^{\frac{1}{2}}x^{\frac{3}{2}}=\frac{2}{3}a^{\frac{1}{2}}x^{\frac{1}{2}}\times x=\frac{2}{3}yx$ (becauſe $a^{\frac{1}{2}}x^{\frac{1}{2}}=y$) $=\frac{2}{3}\times$ AB $\times$ BR: hence a parabola is $\frac{2}{3}$ of a rectangle of the ſame baſe and altitude.

EXAMP. 2. Let the propoſed curve CSDR (fig. 9.) be of ſuch a nature, that (ſuppoſing AB unity) the ſum of the areas CSTBC and CDGBC anſwering to any two propoſed abſciſſas AT and AG, ſhall be equal to the area CRNBC, whoſe correſponding abſciſſa AN is equal to AT×AG, the product of the meaſures of the two former abſciſſas.

Firſt, in order to determine the equation of the curve, (which muſt be known before the area can be found) let the ordinates GD and NR move parallel to themſelves towards HF; and then having put GD$=y$, NR$=z$, AT$=a$, AG$=s$, and AN$=u$, the fluxion of the area CDGB will be repreſented by $y\dot{s}$, and that of the area CRNB by $z\dot{u}$: which two expreſſions muſt, by the nature of the problem, be equal to each other; becauſe the latter area CRNB exceeds the former CDGB by the area CSTB, which is here conſidered as a conſtant quantity: and it is evident, that two expreſſions, that differ only by a conſtant quantity, muſt always have equal fluxions.

Since, therefore, $y\dot{s}$ is $=z\dot{u}$, and $u=as$, by hypotheſis, it follows, that $\dot{u}=a\dot{s}$, and that the firſt equation (by ſubſtituting for $\dot{u}$) will become $y\dot{s}=az\dot{s}$, or $y=az$, or laſtly $ys=zas$, that is, GD×AG=NR×AN: therefore, GD : NR :: AN : AG; whence it appears, that every ordinate of the curve is reciprocally as its correſponding abſciſſa.

Now, to find the area of the curve ſo determined, put AB$=1$, BC$=b$, and BG$=x$: then, ſince AG ($1+x$) : AB (1) :: BC (b) : GD (y) we have $y=\dfrac{b}{1+x}$, and conſequently $\dot{u}\ (=y\dot{x})=\dfrac{b\dot{x}}{1+x}=b\times\overline{\dot{x}-x\dot{x}+x^2\dot{x}-x^3\dot{x}+x^4\dot{x}-\text{\&c.}}$ Whence, BGDC, the area itſelf will be $=b\times x-\dfrac{x^2}{2}+\dfrac{x^3}{3}-\dfrac{x^4}{4}+\dfrac{x^5}{5}$, &c. which was to be found.

Hence it appears, that as theſe areas have the ſame properties as logarithms, this ſeries gives an eaſy method of computing logarithms; and the fluent may be found by means of a table of logarithms, without the trouble of an infinite ſeries: and every fluxion whoſe fluent agrees with any known logarithmic expreſſion, may be found the ſame way. Hence the fluents of fluxions of the following forms are deduced.

The fluent of $\dfrac{\dot{x}}{\sqrt{x^2\pm a^2}}=$ hyp. log. of $x+\sqrt{x^2\pm a^2}$;

of $\dfrac{\dot{x}}{\sqrt{2ax+xx}}=$ hyp. log. $a\times x+\sqrt{2ax+x^2}$;

of $\dfrac{2a\dot{x}}{a^2-x^2}$ hyp. log. of $\dfrac{a+x}{a-x}$;

and of $\dfrac{2a\dot{x}}{x\sqrt{a^2\pm x^2}}=$ hyp. log. $\dfrac{a-\sqrt{a^2\pm x^2}}{a+\sqrt{a^2\pm x^2}}$.

PROB. 2. *To determine the length of curves.*

Fig. 5. Becauſe Cde is a right-angled triangle, Cd^2 $=$Ce^2+de^2; wherefore the fluxions of the abſciſſa and ordinate being taken in the ſame terms and ſquared, their ſum gives the ſquare of the fluxion of the curve; whoſe root being extracted, and the fluent taken, gives the length of the curve.

EXAMP To find the length of a circle from its tangent. Make the radius AO (fig. 5.) $=a$, the tangent of AC $=t$, and its ſecant $=s$, the curve $=z$, and its fluxion $=\dot{z}$; becauſe the triangles OTC, OCS, are ſimilar, OT : OC :: OC :: OS; whence OS $=\dfrac{a^2}{s}$, and SA $=a-\dfrac{a^2}{s}=a-\dfrac{a^2}{\sqrt{a^2+t^2}}$; whoſe fluxion is $\dfrac{a^2t\dot{t}}{\overline{a^2+t^2}|^{\frac{3}{2}}}$; and becauſe the triangles OTC, dCe are ſimilar, TC ($=t$): TO ($=\sqrt{a^2+t^2}$) :: Ce $=\left(\dfrac{a^2t\dot{t}}{\overline{a^2+t^2}|^{\frac{3}{2}}}\right)$: Cd $=\dfrac{a^2\dot{t}}{a^2+t^2}=$ fluxion of the curve.

Now by converting this into an infinite ſeries, we have the fluxion of the curve $=\dot{t}-\dfrac{t^2\dot{t}}{a^2}+\dfrac{t^4\dot{t}}{a^4}-\dfrac{t^6\dot{t}}{a^6}$, &c. and conſequently $z=t-\dfrac{t^3}{3a^2}+\dfrac{t^5}{5a^4}-\dfrac{t^7}{7a^6}+\dfrac{t^9}{9a^8}$, &c. $=$ AR.

Where, if (for example' ſake) AR be ſuppoſed an arch of 30 degrees, and AO (to render the operation more eaſy) be put $=$ unity, we ſhall have $t=\sqrt{\frac{1}{3}}=.5773502$ (becauſe O$b\sqrt{\frac{3}{4}}$: bR $(\frac{1}{2})$ :: OA (1) : AT (t) $=\sqrt{\frac{1}{3}}$) Whence,

$t^3\quad(=t\times t^2=t\times\frac{1}{3})=.1924500$

$t^5\quad\left(=t^3\times t^2=\dfrac{t^3}{3}\right)=.0641500$

t^7

$$t^{7}\ \left(=t^5\times t^2=\frac{t^5}{3}\right)=.0213833$$

$$t^{9}\ \left(=t^7\times t^2=\frac{t^7}{3}\right)=.0071277$$

$$t^{11}\ \left(=t^9\times t^2=\frac{t^9}{3}\right)=.0023759$$

$$t^{13}\ \left(=t^{11}\times t^2=\frac{t^{11}}{3}\right)=.0007919$$

$$t^{15}\ \left(=t^{13}\times t^2=\frac{t^{13}}{3}\right)=.0002639$$

&c.

And therefore $AR = .5773502 - \frac{.1934500}{3} + \frac{.0641500}{5} - \frac{.0213833}{7} \times \frac{0091277}{9} - \frac{.0023759}{11} + \frac{.0007919}{13} - \frac{.0002639}{15} + \frac{.0000879}{17} - \frac{.0000293}{19} + \frac{.0000097}{21} - \frac{.0000032}{23} = .5235987$: for the length of an arch of 30 degrees, which multiplied by 6 gives 3.141592 + for the length of the femi periphery of the circle whofe radius is unity.

Other feries may be deduced from the verfed fine, fine and fecant; and thefe are of ufe for finding fluents which cannot be expreffed in finite terms. For,

$$\text{the fluent of}\left\{\begin{array}{l} \dfrac{\dot{w}}{\sqrt{2aw-w^2}} \\[2ex] \dfrac{\dot{w}}{\sqrt{a^2-w^2}} \\[2ex] \dfrac{a\dot{w}}{a^2+w^2} \\[2ex] \dfrac{a\dot{w}}{w\sqrt{w^2-a^2}} \end{array}\right\}\text{is equal to the arch whofe}\left\{\begin{array}{l} \text{Verfed-fine} \\[2ex] \text{Right-fine} \\[2ex] \text{Tangent} \\[2ex] \text{Secant} \end{array}\right\}\text{is } \frac{w}{a}\text{, and Radius Unity.}$$

Prob. 3. *To find the contents of a folid.*

Let the furface of the generating plane be multiplied by the fpace it paffes through in any time, the product will give a folid which is the fluxion of the folid required: the furface muft therefore be computed in terms of x, which reprefents the line or axis on which it moves, and by its motion on which the fluxion is to be meafured, and the fluent found will give the contents of the folid.

Examp. Let it be propofed to find the content of a cone ABC, fig. 10.

Put the given altitude (AD) of the cone $=a$, and the femi-diameter (BD) of its bafe $=b$, the folid $=s$, its fluxion $=\dot{s}$, and the area of a circle, whofe radius is unity, $=p$: then the diftance (AF) of the circle EG, from the vertex A, being denoted by x, &c. we have, by fimilar triangles, as $a : b :: x : \text{EF}\ (y) = \frac{bx}{a}$. Whence in this cafe, $\dot{s}\ (=py^2\dot{x}) = \frac{pb^2x^2\dot{x}}{a^2}$; and confequently $s = \frac{pb^2x^3}{3a^2}$; which, when $x=a$ (=AD) gives $\frac{pb^2a}{3}$ ($=p\times \text{BD}^2\times \frac{1}{3}\text{AD}$) for the content of the whole cone ABC: which appears from hence to be juft $\frac{1}{3}$ of a cylinder of the fame bafe and altitude.

Prob. 4. *To compute the furface of any folid body.*

The fluxion of the furface of the folid is equal to the periphery of the furface, by whofe motion the folid is generated, multiplied by its velocity on the edge of the folid, and the computation is made as in the foregoing.

Examp. Fig. 11. Let it be propofed to determine the convex fuperficies of a cone ABC.

Then, the femi-diameter of the bafe (BD, or CD) being put $=b$, the flanting line, or hypothenufe AC$=c$, and FH (parallel to DC) $=y$, AG $=z$, the furface $=w$, its fluxion $=\dot{w}$, and $p=$ the periphery of a circle whofe diameter is unity, we fhall, from the fimilarity of the triangles ADC and Hmh, have $b : c :: \dot{y}\ (mh : \dot{z}\ (\text{H}h) = \frac{c\dot{y}}{b}$: whence $\dot{w}\ (2py\dot{z}) = \frac{2pcy\dot{y}}{b}$; and confequently $w = \frac{pcy^2}{b}$. This, when $y=b$, becomes $=pcb=p\times\text{DC}\times\text{AC}=$ the convex fuperficies of the whole cone ABC: which therefore is equal to a rectangle under half the circumference of the bafe and the flanting line.

The method of fluxions is alfo applied to find the centres of gravities, and ofcillation of different bodies; to determine the paths defcribed by projectiles and bodies acted on by central forces, with the laws of centrepetal force in different curves; the retardates given to motions performed in refifting medici; the attractions of bodies under different forms; the direction of wind, which has the greateft effect on an engine; and to folve many other curious and ufeful problems.

FLY

FLY in zoology. See Natural History.

Fly, in mechanics, a crofs with leaden weights at its ends; or rather a heavy wheel at right angles to the axis of a windlafs, jack, or the like; by means of which the force of the power, whatever it be, is not only preferved, but equally diftributed in all parts of the revolution of the machine. See Mechanics.

FLYING, the progreffive motion of a bird, or other winged animal, in the air.

The parts of birds chiefly concerned in flying are the wings, by which they are fuftained or wafted along. The tail, Meffrs Willughby, Ray, and many others, imagine to be principally employed in fteering and turning the body in the air, as a rudder: but Borelli has put it beyond all doubt, that this is the leaft ufe of it, which is chiefly to affift the bird in its afcent and defcent in the air; and to obviate the vacillations of the body and wings: for, as to turning to this or that fides, it is performed by the wings and inclinations of the body, and but very little by the help of the tail. The flying

flying of a bird, in effect, is quite a different thing from the rowing of a veffel. Birds do not vibrate their wings towards the tail, as oars are ftruck towards the ftern, but waft them downwards; nor does the tail of the bird cut the air at right angles, as the rudder does the water; but is difpofed horizontally, and preferves the fame fituation what way foever the bird turns.

In effect, as a veffel is turned about on its centre of gravity to the right, by a brifk application of the oars to the left, fo a bird in beating the air with its right wing alone, towards the tail, will turn its fore part to the left. Thus pigeons changing their courfe to the left, would labour it with their right wing, keeping the other almoft at reft. Birds of a long neck alter their courfe by the inclinations of their head and neck, which altering the courfe of gravity, the bird will proceed in a new direction.

The manner of FLYING is thus: the bird firft bends his legs, and fprings with a violent leap from the ground; then opens and expands the joints of his wings, fo as to make a right line perpendicular to the fides of his body: thus the wings with all the feathers therein, conftitute one continued lamina. Being now raifed a little above the horizon, and vibrating the wings with great force and velocity perpendicularly againft the fubject air, that fluid refifts thofe fucceffions, both from its natural inactivity and elafticity, by means of which the whole body of the bird is protruded. The refiftance the air makes to the withdrawing of the wings, and confequently the progrefs of the bird, will be fo much the greater, as the waft or ftroke of the fan of the wing is longer: but as the force of the wing is continually diminifhed by this refiftance, when the two forces continue to be in equilibrio, the bird will remain fufpended in the fame place; for the bird only afcends fo long as the arch of air the wing defcribes makes a refiftance equal to the excefs of the fpecific gravity of the bird above the air. If the air, therefore, be fo rare as to give way with the fame velocity as it is ftruck withal, there will be no refiftance, and confequently the bird can never mount. Birds never fly upwards in a perpendicular line, but always in a parabola. In a direct afcent, the natural and artificial tendency would oppofe and deftroy each other, fo that the progrefs would be very flow. In a direct defcent they would aid one another, fo that the fall would be too precipitate.

FLYING FISH, a name given by the Englifh writers to feveral fpecies of fifh, which, by means of their long fins, have a method of keeping themfelves out of water a long time. See EXOCOETUS.

FLYING PINION, is part of a clock, having a fly, or fan, whereby to gather air, and fo bridle the rapidity of the clock's motion, when the weight defcends in the ftriking part.

FOAL, or COLT, the young of the horfe kind. The word colt, among dealers, is underftood of the male kind. See EQUUS and HORSEMANSHIP.

FOCHEN, a town of China, capital of the province of Fokein: E. long. 118°, N. lat. 26° 20′.

FOCUS, in geometry and conic fections, is applied to certain points in the parabola, ellipfis and hyperbola, where the rays reflected from all parts of thefe curves concur and meet. See CONIC SECTIONS.

FOCUS, in optics, is the point wherein rays are collected after they have undergone reflection or refraction. See OPTICS.

FOENUGREEK, in botany. See TRIGONELLA.

FOETOR, in medicine, ftinking or fœtid effluvia, arifing from the body, or any part thereof.

FOETUS, denotes the child while it is contained in the mother's womb, but particularly after it is formed, till which time it is more properly called embryo. See MIDWIFERY.

FOG, or MIST, a meteor, confifting of grofs vapours, floating near the furface of the earth.

FOIL, among glafs-grinders, a fheet of tin, with quickfilver or the like, laid on the backfide of a lookingglafs, to make it reflect.

FOIL, among jewellers, a thin leaf of metal placed under a precious ftone, in order to make it look tranfparent, and give it an agreeable different colour, either deep or pale: thus, if you want a ftone to be of a pale colour, put a foil of that colour under it; or if you would have it deep, lay a dark one under it.

FOLIA, among botanifts, particularly fignify the leaves of plants; thofe of flowers being expreffed by the word petal. See BOTANY.

FOLIACEUM EXPANSUM, in anatomy, a term applied to the extreme part of the Fallopian tube, next the ovary, which is expanded like the mouth of a trumpet, and furrounded with a fort of fringe.

FOLIAGE, a clufter or affemblage of flowers, leaves, branches *&c.*

FOLIAGE is particularly ufed for the reprefentations of fuch flowers, leaves, branches, rinds, *&c.* whether natural or artificial, as are ufed for enrichments on capitals, friezes, pediments, *&c.*

FOLIO, in merchants books, denotes a page, or rather both the right and left hand pages, thefe being expreffed by the fame figure, and correfponding to each other. See BOOK-KEEPING.

FOLIO, among printers and bookfellers, the largeft form of books, when each fheet is fo printed, that it may be bound up in two leaves only.

FOLKSTONE, a market town of Kent, fix miles weft of Dover.

FOMAHANT, in aftronomy, a ftar of the firft magnitude, in the conftellation aquarius.

FOMENTATION, in medicine, the bathing any part of the body with a convenient liquor; which is ufually a decoction of herbs, water, wine, or milk; and the applying of bags ftuffed with herbs and other ingredients, which is commonly called dry fomentation.

FONDI, a city and bifhop's fee of Naples, in the province of Lavoro, about thirty-five miles north-weft of Capua: E. long. 14° 20′, and N. lat. 41° 55′.

FONT, among ecclefiaftical writers, a large bafon, in which water is kept for the baptizing of infants, or other perfons.

FON-

FONTAINE, a town of Hainalt, fifteen miles eaſt of Mons.

FONTAINEBLEAU, a village of the iſle of France, about thirty miles ſouth-eaſt of Paris; remarkable for an elegant royal palace.

FONTANELLA, in anatomy, the quadrangular aperture, between the os frontis and oſſa ſincipitis, in infants juſt born.

FONTARABIA, a port-town of Spain, in the province of Biſcay, twenty miles weſt of Bayonne: W. long. 1° 35′; and N. lat. 43° 20′.

FONTENAYLE, a town of Orleanois, in France, about forty-ſix miles weſt of Poictiers.

FONTENOY, a town of Hainalt, ſituated three miles ſouth eaſt of Tournay.

FONTEVRAUD, or *Order of* FONTEVRAUD, a religious order inſtituted about the latter end of the XIth century. By the rules of this order the nuns were to keep ſilence for ever, and their faces to be always covered with their veils; and the monks wore a leathern girdle, at which hung a knife and ſheath.

FONTICULUS, or FONTANELLA, in ſurgery, an iſſue, ſeton, or ſmall ulcer made in various parts of the body, in order to eliminate the latent corruption out of it.

FONTINALIS, in botany, a genus of the cryptogamia muſci claſs. The anthera is operculated, and the calyptra is ſeſſile. There are four ſpecies, all natives of Britain, *viz.* the antipyretica, or greater water-moſs; the minor, or leſſer water moſs; the ſquamoſa, or ſcaly water-moſs; and the pennata, or feathered water-moſs.

FOOD implies whatever aliments are taken into the body, to nouriſh it. See MEDICINE.

FOOL, according to Mr Locke, is a perſon who makes falſe concluſions from right principles; whereas a madman, on the contrary, draws right concluſions from wrong principles.

FOOL'S STONES, in botany. See ORCHIS.

FOOT, a part of the body of moſt animals whereon they ſtand, walk, *&c.* See NATURAL HISTORY.

FOOT, in anatomy. See ANATOMY, part I.

FOOT, in the Latin and Greek poetry, a metre or meaſure, compoſed of a certain number of long and ſhort ſyllables.

Theſe feet are commonly reckoned twenty eight, of which ſome are ſimple, as conſiſting of two or three ſyllables, and therefore called diſſyllabic or triſyllabic feet; others are compound, conſiſting of four ſyllables, and are therefore called tetraſyllabic feet.

The diſſylabic feet are four in number, *viz.* the pyrrhichius, ſpondeus, iambus, and trocheus. See PYRRHICHIUS, *&c.*

The triſyllabic feet are eight in number, *viz.* the dactylus, anapæſtus, tribrachys, moloſſus, amphybrachys, amphimacer, bacchius, and antibacchius. See DACTYL, *&c.*

The tetraſyllabic are in number ſixteen, *viz.* the procleuſmaticus, diſpondeus, choriambus, antiſpaſtus, diiambus, dichoreus, ionicus a majore, ionicus a minore, epitritus primus, epitritus ſecundus, epitritus tertius, epitritus quartus, pæon primus, pæon ſecundus, pæon tertius, and pæon quartus. See PROCLEUSMATICUS, *&c.*

FOOT is alſo a long meaſure, conſiſting of 12 inches.

Geometricians divide the foot into 10 digits, and the digit into 10 lines.

FOOT *ſquare*, is the ſame meaſure both in breadth and length, containing 144 ſquare or ſuperficial inches.

Cubic or *Solid* FOOT, is the ſame meaſure in all the three dimenſions, length, breadth, and depth or thickneſs, containing 1728 cubic inches.

FOOT *of a horſe*, in the menage, the extremity of the leg, from the coronet to the lower part of the hoof.

FOOT LEVEL, among artificers, an inſtrument that ſerves as a foot-rule, a ſquare, and a level. See LEVEL, RULE, and SQUARE.

FORAMEN, in anatomy, a name given to ſeveral apertures or perforations in divers parts of the body; as, 1. The external and internal foramina of the cranium or ſkull. 2. The foramina, in the upper and lower jaw. 3. Foramen lachrymale. 4. Foramen membranæ tympani. See ANATOMY.

FORCALQUIER, a town of Provence, in France, thirty miles north of Aix.

FORCE, in mechanics, denotes the cauſe of the change in the ſtate of a body when being at reſt it begins to move, or has a motion which is either not uniform or not direct. See MECHANICS.

Central FORCES. See MECHANICS.

FORCE, in law, ſignifies any unlawful violence offered to things or perſons.

FORCEPS, in ſurgery, *&c.* a pair of ſciſſars for cutting off, or dividing, the fleſhy membraneous parts of the body, as occaſion requires. See SURGERY.

FORE-CASTLE OF A SHIP, that part where the foremaſt ſtands. It is divided from the reſt by a bulkhead.

FOREIGN, ſome thing extraneous, or that comes from abroad.

FOREIGNER, the natural born ſubject to ſome foreign prince.

Foreigners, tho' made denizens, or naturalized, are diſabled to bear any office in the goverment, to be of the privy-council, or members of parliament, *&c.* This is by the acts of the ſettlement of the crown. Such perſons as are not freemen of a city, or corporation, are alſo called foreigners, to diſtinguiſh them from the members of the ſame.

FORELOCKS, in the ſea language, little flat wedges made with iron, uſed at the ends of bolts, to keep them from flying out of their holes.

FORELORN-HOPE, in the military art, ſignifies men detached from ſeveral regiments, or otherwiſe appointed, to make the firſt attack in day of battle; or, at a ſiege, to ſtorm the counterſcarpe, mount the breach, or the like.

They are ſo called from the great danger they are unavoidably expoſed to; but the word is old, and begins to be obſolete.

FORE-MAST OF A SHIP, a large round piece of timber, placed in her fore-part, or fore-castle, and carrying the fore-sail and fore top-sail yards. Its length is usually $\frac{8}{9}$ of the main-mast, and the fore top-gallant mast is $\frac{1}{2}$ the length of the fore-top.

FOREMAST-MEN, are those on board a ship that take in the top-sails, sling the yards, furl the sails, bowse, trice, and take their turn at the helm, *&c.*

FOREST, in general, a great wood, or a large extent of ground covered with trees.

FOREST, in law, is defined by Manwood, a certain territory of woody grounds, and fruitful pastures, privileged for wild beasts and fowls of forest, chace and warren, to rest and abide under the protection of the king, for his princely delight, bounded with unremoveable marks, and meres, either known by matter of record or prescription; replenished with wild beasts of venery, or chase, with great coverts of vert for the said beasts; for preservation and continuance whereof, with the vert and venison, there are certain particular laws, privileges, and officers.

Forests are of that antiquity in England, that, excepting the new forest in Hampshire erected by William the Conqueror, and Hampton Court erected by Henry VIII. it is said that there is no record or history which makes any certain mention of their erection, though they are mentioned by several writers, and in divers of our laws and statutes.

There are sixty-nine forests in England, thirteen chases, and 800 parks. The four principal forests are New Forest, Sherwood Forest, Dean Forest, and Windsor Forest.

FOREST-TOWNS, in geography, certain towns of Swabia, in Germany, lying along the Rhine and the confines of Switzerland, and subject to the house of Austria. Their names are Rhinefield, Seckingen, Laufenburg, and Waldshut.

FORE-STAFF, or CROSS-STAFF, an instrument used at sea for taking the altitude of the sun, moon or stars.

FORESTALLER, a person who is guilty of forestalling. See the next article.

FORESTALLING, in law, buying or bargaining for any corn, cattle, victuals, or merchandize, in the way as they come to fairs or markets to be sold, before they get thither, with an intent to sell the same again at a higher price.

The punishment for this offence, upon conviction at the quarter sessions, by two or more witnesses, is, for the first time, two months imprisonment and the loss of the goods, or the value; for the second offence, the offender shall be imprisoned six months, and lose double the value of the goods; for the third offence, he shall suffer imprisonment during the king's pleasure, forfeit all his goods and chattels, and stand on the pillory: but the statute does not extend to maltsters buying barley, or to badgers licensed.

FORESTER, a sworn officer of the forest, appointed by the king's letters-patent, to walk the forest at all hours, watch over the vert and venison; also to make attachments and true presentments of all trespasses committed within the forest.

FORETHOUGHT FELONY, in Scots law, signifies premeditated murder.

FORFAR, the capital of the county of Angus, in Scotland: W. long. 2° 32′, and N. lat. 56° 25′.

It is a parliament-town, classed with Perth, Dundee, Coupar, and St Andrews, which all together send one member.

FORFEITURE, properly signifies the effect of transgressing some penal law, and extends to lands or goods.

FORFICULA, the EAR-WIG, in zoology, a genus of insects belonging to the order of coleoptera. The antennæ are bristly; the elytra are dimidiated; the wings are covered; and the tail is forked. There are two species, *viz.* the auriculata, or common ear-wig, with the tops of the elytra white; and the minor, with testaceous and unspotted elytra.

FORGE, properly signifies a little furnace, wherein smiths and other artificers of iron or steel, *&c.* heat their metals red-hot, in order to soften them and render them more malleable and manageable on the anvil.

FORGE is also used for a large furnace, wherein iron-ore, taken out of the mine, is melted down: or it is more properly applied to another kind of furnace, wherein the iron-ore, melted down and separated in a former furnace, and then cast into sows and pigs, is heated and fused over again, and beaten afterwards with large hammers, and thus rendered more soft, pure, ductile, and fit for use.

FORGER, in law, one guilty of forgery. See the next article.

FORGERY, in a legal sense, is where a person fraudulently makes and publishes false writings to another's prejudice: or, it signifies the writ that lies against him who offends that way.

FORISFAMILIATION, in law, when a child, upon receiving a portion from his father, or otherwise renounces his legal title to any further share of his father's succession, he is said to be *forisfamiliated*. See SCOTS LAW, title 28

FORLI, a town of Romania, in the pope's territories, fifteen miles south-west of Ravenna.

FORM, in physics, the essential or distinguishing modification of the matter whereof a natural body is composed, so as thereby to give it such a particular manner of existence; being that which constitutes it such a particular body, and distinguishes it from every other body.

FORM is also used, in a moral sense, for the manner of being or doing a thing according to rules: thus we say, a form of government, a form of argument, *&c.*

FORM, in law, the rules established and requisite to be observed in legal proceedings.

FORM, in carpentry, is used to denote the long seats or benches in the choirs of churches or in schools, for the priests, prebends, religious, or scholars to sit on. At schools, the word form is frequently applied to what is otherwise termed a class. See CLASS.

FORM also denotes the external appearance or surface of a body, or the disposition of its parts, as to the length, breadth, and thickness.

Form is alſo uſed, among mechanics, for a ſort of mould whereon any thing is faſhioned or wrought: as the hatter's form, the paper-maker's form, *&c.*

Printer's Form, an aſſemblage of letters, words, and lines, ranged in order, and ſo diſpoſed into pages by the compoſitor; from which, by means of ink and a preſs, the printed ſheets are drawn.

Every form is incloſed in an iron-chaſe, wherein it is firmly locked by a number of pieces of wood; ſome long and narrow, and others of the form of wedges. There are two forms required for every ſheet, one for each ſide; and each form conſiſts of more or fewer pages, according to the ſize of the book.

FORMAL, ſomething belonging to, or conſtituting the form of a thing. See Form.

FORMICA, or the Ant, in zoology, a genus of inſects belonging to the order of hymenoptera, the characters of which are theſe: There is a ſmall ſcale betwixt the breaſt and belly, and the joint is ſo deep that the animal appears as if it were almoſt cut through the body. The females, and the neuters or working ants which have no ſexual characteriſtics, are furniſhed with a hidden ſting; and both the males and females have wings, but the neuters have none. There are eighteen ſpecies, moſt of them diſtinguiſhed by their colours.

Theſe inſects keep together in companies like the bees, and maintain a ſort of republic. Their neſt is not exactly ſquare, but longer one way than the other; and in it there are a ſort of paths, which lead to different magazines. Some of the ants are employed in making the ground firm, by mixing it with a ſort of glue, for fear it ſhould crumble, and fall down upon their heads. They may be ſometimes ſeen to gather ſeveral twigs, which ſerve them for rafters, which they place over the paths, to ſupport the covering; they lay others acroſs them, and upon them ruſhes, weeds, and dried graſs, which they heap up into a double declivity, which ſerves to turn off the water from their magazines. Some of theſe ſerve to lay up their proviſions in, and in others they lay their eggs.

As for the proviſions, they lay up every thing that is fit for them to eat; and you may often ſee one loaded with pippin, or grain of fruit, another with a dead flie, and ſeveral together with the carcaſe of a may-bug, or other inſect. If they meet with any they cannot bring away, they eat it upon the ſpot, or at leaſt ſo much of it, as may reduce it to a bulk ſmall enough for them to carry. They do not run about where they pleaſe, at all adventures: for ſome of them are ſent abroad to make diſcoveries; and if they bring back news they have met with a pear, or a ſugar-loaf, or a pot of ſweatmeats, they will run from the bottom of the garden, as high as the third ſtory of a houſe, to come at it. They all follow each other in the ſame path, without wandering to the right or the left; but in the fields they are more at their liberty, and are allowed to run about in ſearch of game. There is a ſort of green fly, that does a great deal of miſchief among the flowers, and which curl up the leaves of peach and pear trees; and theſe are ſurrounded with a ſort of glue, or honey, which the ants hunt after very greedily; for they touch neither the plant nor the flies themſelves.

Next to this, their greateſt paſſion is to lay up hoards of wheat, and other corn; and for fear the corn ſhould ſprout by the moiſture of the ſubterraneous cells, they gnaw off the end which would produce the blade. The ants are often ſeen puſhing along grains of wheat, or barley, much larger than themſelves.

In Africa, and particularly in Guiney, the ants are exceeding troubleſome, and do a great deal of miſchief. They make their neſts of earth in the fields, twice as high as a man; beſides which they build large neſts in high trees, from which places they advance in ſuch prodigious ſwarms to the houſes, that they frequently oblige the inhabitants to quit their beds in the night-time. They will ſometimes attack a living ſheep, which in a night's time they will reduce to a perfect ſkeleton, leaving not the leaſt thing except the bones. It is common for them to ſerve domeſtic fowls in the ſame manner, and even the rats themſelves cannot eſcape them. If you place a worm or a beetle where only one or two ants are, they will immediately depart, and bring with them above an hundred; after which they ſeize their prey, and march off with it in good order. Theſe ants are of various ſorts, ſome great, others ſmall, ſome black, and others red; the ſting of this laſt is very painful, and cauſes an inflammation; the white are as tranſparent as cryſtal, and have ſuch ſtrong teeth, that in a night's time they will eat their way through a thick wooden cheſt, and make it as full of holes as if it had been penetrated by hail-ſhot.

There are alſo ſeveral ſorts of ants in the Eaſt Indies, whoſe numbers are prodigious: ſome of them are exceeding large, and of a ruddy colour, inclining to black; and ſome have wings, but others have none. They are very pernicious to the fruits of the earth, and do a great deal of miſchief in houſes, unleſs great care is taken to prevent them. It is remarkable, that if one ant meets another that is loaden, it always gives way to let it paſs freely.

The ant lays eggs in the manner of the common flies, and from theſe eggs are hatched a ſort of ſmall maggots or worms without legs: theſe are ſharp at one end and blunt at the other; and are white, but ſo tranſparent, that the inteſtines are ſeen through the ſkin. Theſe, after a ſhort time, change into large white aureliæ, which are what are uſually called ants eggs. That end which is to be the tail is the largeſt, and that which is the head is ſomewhat tranſparent.

The ants move theſe about at pleaſure with their forceps. It is well known, that when a neſt of theſe creatures is diſturbed and the aureliæ ſcattered about, the ants are at infinite pains to get together all that are unhurt, and make a neſt for them again: nay, any ants will do this, and thoſe of one neſt will often take care of the aureliæ of another.

The affection of the ant for its offſpring is amazing. They carry the young worms about in their mouths, that nothing may injure them; and when the earth

earth of the neſt is dry, they carry them down to a greater depth, but when wet they bring them to the ſurface, that they may not be injured by the damps.

The common ant builds only with ſmall ſmall pieces of dry earth, and there is always found a vaſt quantity either of eggs, worms, or aureliæ, at the bottom of the neſt. The aureliæ are covered only with a thin ſkin; and when carefully opened, they ſhew the worm perfect, and in its ſeveral ſtages of perfection.

The forecaſt of ants in providing againſt the winter is a miſtake. They are ſuppoſed not to eat in the winter, but to ſpend that ſeaſon, like dormice and many other ſorts of animals, in a ſtate of ſleep. What confirms this is, that they have been obſerved, as the cold draws on in the autumn, to move very heavily, and in the vintage-time they can hardly ſtir at all; ſo that the proviſion they make ſeems intended not for themſelves, but for their young.

The care theſe creatures take of their offspring is remarkable. Whenever a hill is diſturbed, all the ants are found buſied in conſulting the ſafety, not of themſelves, but of the eggs or theſe larger bodies encloſing the maggot or young ant; they carry theſe down any way ſo as to get them out of ſight, and will do this over and over as often as they are diſturbed.

They carry away the eggs and vermicles together in their confuſion; but as ſoon as the danger is over, they carefully ſeparate them, and place each ſort in parcels by themſelves under ſhelter of different kinds, and at various depths, according to the different degrees of warmth and coverture the different ſtates require.

In the warm ſeaſon of the year, they every morning bring up the eggs, as they are uſually called, to the ſurface, or nearly ſo; and from ten in the forenoon to five in the afternoon or thereabouts, all theſe will be found juſt under the ſurface; and if the hills be examined toward eight in the evening, they will be found to have carried them all down; and if rainy weather be coming on, it will be neceſſary to dig a foot deep or more, in order to find them.

Theſe little creatures are very troubleſome in gardens, and in paſture-lands; as well by feeding on the fruit, as by making up hills for their habitation. In the hotter countries, as Italy, Spain, and the Weſt Indies, ants are the great peſt of the fields. Trees may be preſerved from them by encompaſſing the ſtem, for four fingers breadth, with a roll of wool, newly pulled from the ſheep's belly; or by laying ſaw-duſt all round the ſtump of it. Some anoint the tree with tar, which has the ſame effect.

The large, black, winged ants of America, to avoid the great rains which fall there at particular ſeaſons, make to themſelves large neſts on trees, with a covered way for them to go up and down on the leeſide of the tree. Theſe neſts are roundiſh on the outſide, made of light brown earth, plaiſtered ſmooth. They are larger than a buſhel; and in the inſide are many ſinous caverns or lodgings communicating with one another. See Plate LXXX. fig. 1. A, The ants neſt; B, The tubular paſſage, made of the ſame materials.

FORMICA, in medicine, a callous ſort of wart.

FORMICA-LEO, the ANT-LION, or ANT-EATER, in zoology, an inſect ſo called from its devouring great numbers of ants. It is the caterpillar or worm of a fly much reſembling the libellæ or dragon-flies.

The addreſs of this inſect in catching the ant is admirable; it makes a hole of a conical or funnel ſhape, in the looſe ſand; and is ſure to catch all the ants that come within the verge of this hole, by throwing up ſand on them, whereby they are forcibly carried into the power of the enemy at the bottom of the hole.

FORMOSA, an iſland in the pacific ocean, between 119° and 122° of E. long. and between 22° and 25′ N. lat. about 100 miles eaſt of Canton in China. It is ſubject to the Chineſe.

FORMULA, or FORMULARY, a rule or model, or certain terms preſcribed or decreed by authority, for the form and manner of an act, inſtrument, proceeding, or the like.

FORMULA, in church-hiſtory and theology, ſignifies a profeſſion of faith.

FORMULA, in medicine, imports the conſtitution of medicines, either ſimple or compound, both with reſpect to their preſcription and conſiſtence.

FORMULARY, a writing containing the form of an oath, declaration, atteſtation, abjuration, *&c.* to be made on certain occaſions.

FORNACALIA, or FORNICALIA, in Roman antiquity, a feſtival inſtituted by Numa in honour of Fornax, the goddeſs of ovens; wherein certain cakes were made, and offered in ſacrifice before the ovens.

FORNICATION, the act of incontinency between ſingle perſons; for when either of the parties is married, ſuch act is adultery. See ADULTERY.

FORNIX, in anatomy. See ANATOMY, p. 285.

FORRAGE, in the military art, denotes hay, oats, barley, wheat, graſs, clover, *&c.* brought into the camp by the troopers, for the ſuſtenance of their horſes.

It is the buſineſs of the quarter-maſter-general to appoint the method of forrage, and poſt proper guards for the ſecurity of the forragers.

FORRES, a parliament-town of Scotland in the county of Murray, about thirteen miles weſt of Elgin: W. long. 3° 20′, and N. lat. 57° 40′.

It is claſſed with Inverneſs, Fortroſe, and Nairn.

FORT, in the military art, a ſmall fortified place, environed on all ſides with a moat, rampart, and parapet. Its uſe is to ſecure ſome high ground or the paſſage of a river, to make good an advantageous poſt, to defend the lines and quarters of a ſiege, *&c.*

FORTALICE, in Scots law, ſignified anciently a ſmall place of ſtrength, originally built for the defence of the country; and which on that account was formerly reckoned *inter regalia*, and did not go along with the lands upon which it was ſituated without a ſpecial grant from the crown. Now, fortalices are carried by a general grant of the lands; and the word is become ſynonymous with manor-place, meſſuage, *&c.*

FORTIFICATION.

FORTIFCATION, the art of fortifying a town, or other place; or of putting them in ſuch a poſture of defence, that every one of its parts defends, and is defended by ſome other parts, by means of ramparts, parapets, moats, and other bulwarks; to the end, that a ſmall number of men within, may be able to defend themſelves for a conſiderable time againſt the aſſaults of a numerous army without; ſo that the enemy in attacking them, muſt of neceſſity ſuffer great loſs.

Fortification is either ancient or modern, regular or irregular. Ancient fortification, at firſt, conſiſted of walls or defences made of trunks and other branches of trees mixed with earth, to ſecure them againſt the attacks of the enemy. This was afterwards altered to ſtone walls, on which were raiſed breaſt-works, behind which they made uſe of their darts and arrows in ſecurity. Modern fortification is that which is flanked and defended by baſtions and out works, the ramparts of which are ſo ſolid, that they cannot be beat down but by the continual fire of ſeveral batteries of cannon. Regular fortification, is that built in a regular polygon, the ſides and angles of which are all equal, being commonly about a muſket-ſhot from each other. Irregular fortification, on the contrary, is that where the ſides and angles are not uniform, equidiſtant, or equal; which is owing to the irregularity of the ground, valleys, rivers, hills, and the like.

SECTION I. *Of Regular Fortification.*

THE art of regular fortification may be diſtinguiſhed into two parts, *viz.* the elementary or theoretical, and practical.

The elementary part conſiſts in tracing the plans and profiles of a fortification on paper, with ſcales and compaſſes; and to examine the ſyſtems propoſed by different authors, in order to diſcover their advantages and diſadvantages.

And the practical part conſiſts in forming a project of a fortification, according to the nature of the ground and other neceſſary circumſtances, to trace it on the ground, and to execute the project, together with all the military buildings, ſuch as magazines, ſtore-houſes, bridges, *&c.*

Notwithſtanding all the improvements which have been made in the art of fortifying ſince the invention of gunpowder, that of attacking is ſtill ſuperior to it: engineers have tried in vain to render the advantages of a fortification equal to thoſe of the attack; the ſuperiority of the beſiegers fire, together with the greater number of men, obliges generally, ſooner or later, the beſieged to ſubmit.

The greateſt improvement made in the art of attacking happened in the year 1697, when M. Vauban made firſt uſe of ricochet firing at the ſiege of Ath, whereby the beſieged placed behind the parapets were as much expoſed to the fire of the beſiegers as if there had been none; whereas before, they had been ſecure as long as the parapet was not demoliſhed: and the worſt is, that there can be no remedy found to prevent this enfilading without falling into inconveniencies almoſt as bad as thoſe which we endeavour to avoid.

Although authors agree as to the general form in the preſent manner of fortifying, yet they moſtly differ in particular conſtructions of the parts. As it would be both needleſs and ſuperfluous to treat of all the different methods hitherto propoſed, we ſhall content ourſelves with explaining thoſe only, which are moſt eſteemed by the beſt judges, and have been moſtly put in practice.

Conſtruction of M. VAUBAN'*s Method.*

This method is divided into little, mean, and great; the little is chiefly uſed in the conſtruction of citadels, the mean in that of all ſorts of towns, and the great in particular caſes only.

We ſhall give the conſtruction of the mean, as being moſt uſeful, and refer the reader to the table hereafter, for thoſe dimenſions which are different in theſe ſeveral fortifications.

[Plate LXXXIII. fig. 1.] Incribe in a circle a polygon of as many ſides as the fortification is deſigned to have fronts; let AB be one of the ſides of half an exagon, which biſect by the perpendicular CD: divide half AC of it into nine equal parts, and one of theſe into ten others; then theſe diviſions will ſerve as a ſcale to conſtruct all the parts of the fortification, and each of them is ſuppoſed to be a toiſe or fathom, that is ſix French feet; and therefore the whole ſide AB is ſuppoſed to be 180 toiſes.

As the dividing a line into ſo many equal parts, is troubleſome and tedious; it is more convenient to have a ſcale of equal parts by which the works may be conſtructed.

If therefore, in this caſe, the radius is taken equal to 180 toiſes; and the circle deſcribed with that radius being divided into ſix equal parts, or the radius being carried ſix times round, you will have an exagon inſcribed; AB being biſected by the perpendicular CD as before, ſet off 30 toiſes from C to D, and draw the indefinite lines ADG, BDF, in which take the parts AE, BH, each equal to 50 toiſes; from the centre E deſcribe an arc through the point H, meeting AD in G, and from the centre H deſcribe an arc through the point E, meeting BD in F; or which is the ſame, make each of the lines EG HF equal to the diſtance EH; then the lines joining the points A,E,F,G,H,B, will be the principal or outline of the front.

If the fame conftruction be performed on the other fides of the polygon, you will have the principal or outline of the whole fortification.

If, with a radius of 20 toifes, there be defcribed circular arcs, from the angular points B,A,M,T, and lines are drawn from the oppofite angles E, H, *&c.* fo as to touch thefe arcs, their parts a b, b, c, *&c.* together with thefe arcs will reprefent the outline of the ditch.

DEFINITIONS.

1. The part FEALN, is called the baftion.
2. AE, AL, the faces of the baftion.
3. EF, LN, the flanks.
4. FG, the curtain.
5. FN, the gorge of the baftion.
6. AG, BF, the lines of defence.
7. AB, the exterior fide of the polygon.
8. CD, the perpendicular.
9. Any line which divides a work into two equal parts, is called the capital of that work.
10. abc, the counterfcarp of the ditch.
11. A,M, the flanked angles.
12. H,E,L, the angles of the fhoulder, or fhoulder only.
13. G,F,N, the angles of the flank.
14. Any angle whofe point turns from the place is called a faliant angle, fuch as A, M; and any angle whofe point turns towards the place, re-entering angle, fuch as b, F, N.
15. If there be drawn two lines parallel to the principal or outline, the one at 3 toifes diftance, and the other at 8 from it; then the fpace yx included between the principal one and that fartheft diftant, is called the rampart.

And the fpace xx, contained by the principal line, and that next to it, and which is generally ftained black, is called the parapet.

16. There is a fine line drawn within four feet of the parapet, which expreffes a ftep called banquette.

N. B. All works have a parapet of three toifes thick, and a rampert of 8 to 10, befides their flopes. The rampart is elevated more or lefs above the level of the place, from 10 to 20 feet, according to the nature of the ground and the particular conftructions of engineers.

The parapet is a part of the rampart elevated from 6 to $7\frac{1}{2}$ feet above the reft, in order to cover the troops which are drawn up there from the fire of the enemy in a fiege; and the banquette is two or three feet higher than the rampart, or about four feet lower than the parapet; fo that when the troops ftand upon it, they may juft be able to fire over the parapet.

17. The body of the place, is all that which is contained within this firft rampart; for which reafon, it is often faid to conftruct the body of the place; which means properly, the conftruction of the baftions and curtains.

18. All the works which are conftructed beyond the ditch before the body of the place are called outworks.

TABLE.

	Forts.						Little Fortif.				Mean		Great.	
Side of Polyg.	80	90	100	110	120	130	140	150	160	170	180	190	200	260
Perpendicul.	10	11	$12\frac{1}{2}$	14	15	16	20	21	23	25	30	31	25	22
Faces baft.	22	25	28	30	33	35	40	42	45	47	50	53	55	60
Cap. of ravel.	25	28	30	35	38	40	45	50	50	52	55	55	60	50

In the firft vertical column are the numbers expreffing the lengths of the exterior fides from 80 to 260.

In the fecond, the perpendiculars anfwering to thefe fides.

In the third, the lengths of the faces of baftions; and in the fourth, the lengths of the capitals of the ravelins.

The forts are moftly, if not always, fquares; for which reafon, the perpendiculars are made one eighth of the exterior fides; becaufe if they were more, the gorges of the baftions would become too narrow.

The little fortification is chiefly defigned for citadels, and are commonly pentagons; the perpendiculars are made one feventh of the exterior fide; the mean is ufed in all kinds of fortifications from an exagon upwards to any number of fides: and the great is feldom ufed but in an irregular fortification, where there are fome fides that cannot be made lefs without much expence: or in a town which lies near a great river, where the fide next the river is made from 200 to 260 toifes; and as that fide is lefs expofed to be attacked than any other, the perpendicular is made fhorter, which faves much expence.

The faces of the baftions are all $\frac{2}{7}$ths of the exterior fides, or nearly fo, becaufe the fractions are neglected.

It may be obferved in general, that in all fquares the perpendicular is $\frac{1}{8}$th of the exterior fide, and all pentagons $\frac{1}{7}$th, and in all the reft upwards $\frac{1}{6}$th.

1. *Conftruction of Orillons and retired Flanks.*

Defcribe the front MPQRST as before, and divide the flank into three equal parts, of which fuppofe Sr to be one: from the oppofite flanked angle M draw a line Mr, in which take the part mr of 5 toifes; take likewife Rn in the line of defence MR, produced, equal to 5 toifes, and join nm, upon which as a bafe defcribe the equilateral triangle npm, and from the angle p, oppofite to the bafe as centre, is defcribed the circular flank nm.

And if Sr be bifected by the perpendicular 1, 2, and another be erected upon the face ST, at S; the interfection 2 of thefe two perpendiculars, will be the centre of the arc which forms the orillon.

The orillons are very ufeful in covering the retired flanks, which cannot be feen but directly in the front; and as thefe orillons are round, they cannot be fo eafily deftroyed as they would be, if they were of any other figure.

2. *Con-*

2. *Construction of Ravelins or Half-moons.*

Fig. 2. Set off 50 toises, from the re-entering angle O of the counterscarp, on the capital OL of the ravelin, or on the perpendicular produced, and from the point L draw lines to the shoulders A B; whose parts LM, LN, terminated by the counterscarp, will be the faces MO, ON, the semi-gorges of the ravelin required.

This is Mr Vauban's method of constructing ravelins, according to some authors; and others will have the faces of the ravelin to terminate on those of the bastions within 3 toises of the shoulders; which seems to be the best way, for the ravelins cover the flanks much better than the others.

The ditch before the ravelin is 12 toises, its counterscarp parallel to the faces of the ravelins, and is made in a circular arc, before the saliant angle; as likewise all ditches are in general.

When the ravelins are made with flanks, as in fig. 3. the faces should terminate off those of the bastions, at least 5 toises from the shoulders.

The flanks are made by setting off 10 toises from the extremities of the faces, from f to h, and from m to l, fig. 3. and from the points h, l, the flanks hk, lp, are drawn parallel to the capital LO of the ravelin.

There are sometimes redoubts made in the ravelin, such as in fig. 2. which is done by setting off 16 toises from the extremities of the faces on the semi-gorges from N to b, and from M to a; and from the points b, a, the faces are drawn parallel to those of the ravelin: the ditch before this redoubt is 6 toises, and its counterscarp parallel to the faces.

3. *Construction of Tenailles.*

A tenaille is a work made in the ditch before the curtains, the parapet of which is only 2 or 3 feet higher than the level ground of the ravelin. There are three different sorts: the first are those as in fig. 4. which are made in the direction of the lines of defence, leaving a passage of 3 toises between their extremities and the flanks of the bastions, as likewise another of 2 in the middle for a bridge of communication to the ravelin.

The second sort, are those as in fig. 5. Their faces are in the lines of defence, and 16 toises long, besides the passage of 3 toises between them and the flanks of the bastions; their flanks are found by describing arcs from one shoulder of the tenaille as centre thro' the other, on which are set off 10 toises for the flanks desired.

And the third sort, are those as in fig. 6. Their faces are 16 toises, as in the second sort, and the flanks are parallel to those of the bastions.

The use in general of tenailles, is to defend the bottom of the ditch by a grazing fire, as likewise the level ground of the ravelin, and especially the ditch before the redoubt within the ravelin, which can be defended from no where else so well as from them.

The first sort do not defend the ditch so well as the others, as being too oblique a defence; but as they are not subject to be enfiladed, M. Vauban has generally preferred them in the fortifying of places, as may be seen in the citadel of Lille, at Landau, New-Brisac, and in a great many other places.

The second sort defend the ditch much better than the first, and add a low flank to those of the bastions; but as these flanks are liable to be enfiladed, they have not been much put in practice. This defect might however be remedied, by making them so as to be covered by the extremities of the parapets of the opposite ravelins, or by some other work.

As to the third sort, they have the same advantage as the second, and are likewise liable to the same objections; for which reason they may be used with the same precautions which have been mentioned in the second.

Tenailles are esteemed so necessary, that there is hardly any place fortified without them; and it is not without reason; for when the ditch is dry, the part behind the tenailles serves as a place of arms, from which the troops may sally, destroy the works of the enemy in the ditch, oppose their descent, and retire with safety; and the communication from the body of the place to the ravelin becomes easy and secure; which is a great advantage; for by that means the ravelin may make a much better defence, as it can be supplied with troops and necessaries at any time. And if the ditch is wet, they serve as harbours for boats, which may carry out armed men to oppose the passage over the ditch whenever they please; and the communication from the tenailles to the ravelin, becomes likewise much easier than it would be without them.

4. *Construction of Lunettes.*

Fig. 7. Lunettes are placed on both sides of the ravelin, such as B, to increase the strength of a place: they are constructed, by bisecting the faces of the ravelin with the perpendicular LN; on which is set off 30 toises from the counterscarp of the ditch, for one of its faces; the other face PN, is found by making the semi-gorge TP of 25 toises; the ditch before the lunettes is 12 toises, the parapet 3, and the rampart 8; as in the ravelin.

There is sometimes another work made to cover the saliant angle of the ravelin; such as A, called *Bonnet*, whose faces are parallel to those of the ravelin, and when produced bisect those of the lunettes; the ditch before it is 10 toises.

There are likewise lunettes, such as D, in fig. 8, whose faces are drawn perpendicular to those of the ravelin, within a third part from the saliant angle; and their semi-gorges are only 20 toises.

These kind of works may make a good defence, and are no very great expence; for as they are so near the ravelin, the communication with it is very easy, and one cannot well be maintained till they are all three taken.

5. *Construction of Tenaillons.*

Fig. 9. Produce the faces of the ravelin beyond the counterscarp of the ditch, at a distance MN of 30 toises, and take on the counterscarp of the great ditch 15 toises from the re-entering angle p to q, and draw Nq; then qNMp will be the tenaillon required; its ditch is 12 toises, that is, the same as that of the ravelin. Sometimes there is made a retired battery in the front of the tenaillons, as in fig. B; this battery is 10 toises from the front to which it is parallel, and 15 toises long.

There are commonly retrenchments made in the tenaillons, such as O; their parapets are parallel to the fronts

fronts MN, or rather perpendicular to the ſide Nq, and biſect the ſide qN; the ditch before this retrenchment is 3 toiſes, and there is a banquette before the parapet next to the ditch of about 8 feet, called *Berm;* it ſerves to prevent the earth of the parapet (which ſeldom has any revetement) from falling into the ditch.

It is to be obſerved, that the ravelin, before which tenaillons are conſtructed, muſt have its ſaliant angle much greater than the former conſtruction makes them; otherwiſe the ſaliant angles of the tenaillons become too acute; for which reaſon we made the capital of this ravelin 45 toiſes, and the faces terminate within 3 toiſes of the ſhoulders.

6. *Conſtruction of Counterguards.*

Fig. 10. 11. When the counterguard is placed before the ravelin, ſet off 40 toiſes on the capital of the ravelin from the ſaliant angle A, to the ſaliant angle B, of the counterguard; and 10 from C to D, on the counterſcarp of the ditch.

When the counterguard is before the baſtion, ſuch as in fig. 2, its ſaliant angle F is 50 toiſes from the ſaliant angle E of the baſtion, and the breadth near the ditch of the ravelin is 10 toiſes as before.

The ditch before the counterguards is 12 toiſes, and its counterſcarp parallel to the faces.

Counterguards are made before the ravelin in ſome particular occaſions only, but are frequently conſtructed before the baſtions, as covering the flanks wonderfully well. Some authors, as Blondel, and Mr Coehorn, will have them much narrower than they are here.

7. *Conſtruction of Hornworks.*

Fig. 12. Produce the capital of the ravelin beyond the ſaliant angle A, at a diſtance AB of about 80 toiſes; draw DBE at right angles to AB; in which take BD, BE, each equal to 55 toiſes; and on the exterior ſide DE, trace a front of a polygon in the ſame manner as that of the body of the place, making the perpendicular BF 18 toiſes, and the faces 30.

The branches Da Eb of the hornwork, when produced, terminate on the faces of the baſtions, within 5 toiſes of the ſhoulders. The ditch of the hornwork is 12 toiſes, and its counterſcarp parallel to the branches; and in the front terminates at the ſhoulders, in the ſame manner as the great ditch before the baſtións.

The capital of the ravelin before the front of the hornwork is 35 toiſes, and the faces terminate on the ſhoulders, or rather 2 or 3 toiſes beyond them: and the ditch before the ravelin is 8 toiſes.

There are ſometimes retrenchments made within the hornwork, ſuch as S, S; which are conſtructed by erecting perpendiculars to the faces of the ravelins, within 25 toiſes of their extremities. This retrenchment, like all others, has a parapet turfed only with a berm of 8 feet before it; as likewiſe, a ditch from 3 to 5 toiſes broad.

Fig. 13. When a hornwork is made before the baſtion, the diſtance DL of the front from the ſaliant angle of the baſtion is 100 toiſes, and the branches terminate on the faces of the adjacent ravelins within 5 toiſes from their extremities; all the reſt is the ſame as before.

8. *Conſtruction of Crownworks.*

Plate LXXXIV. fig. 1. From the ſaliant angle of the ravelin, as a centre, deſcribe an arc of a circle with a radius of about 120 toiſes, cutting the capital of the ravelin produced at C; from the point C, ſet off the cords CB, CF, each of them equal to 110 toiſes; and on each of which, as an exterior ſide, conſtruct a front of a polygon of the ſame dimenſions as in the hornwork; that is, the perpendicular ſhould be 18 toiſes, the faces 30, and the branches terminate on the faces of the baſtions, within 25 toiſes of the ſhoulders.

The ditch is 12 toiſes, the capital of the ravelin 35, and its ditch 8; that is, the ſame as in the hornwork.

Sometimes the crownwork is made before the baſtion, as in fig. 2. the arc is deſcribed from the ſaliant angle A of the baſtion, with a radius of 120 toiſes, as before, and the branches terminate on the faces of the adjacent ravelins within 25 toiſes of their extremities; the reſt of the dimenſions and conſtructions are the ſame as before.

Hornworks, as well as crownworks, are never made but when a large ſpot of ground falls beyond the fortification, which might be advantageous to an enemy in a ſiege, or to cover ſome gate or entrance into a town;

9. *Conſtruction of Covert-ways and Glacis.*

Although we have not hitherto mentioned the covert-way, neverthelefs all fortifications whatſoever have one; for they are eſteemed to be one of the moſt eſſential parts of a modern fortification; and it is certain, the taking the covert-way, when it is in a good condition and well defended, is generally the moſt bloody action of the ſiege.

After having conſtructed the body of the place, and all the outworks which are thought neceſſary, lines are drawn parallel to the outmoſt counterſcarps of the ditches, at 6 toiſes diſtant from it; and the ſpace mnmn, included between that line and the counterſcarp, will be the covert-way required.

Fig. 3. There is in every re-entering angle of the counterſcarp a place of arms, m; which is found by ſetting off 20 toiſes from the re-entering angle a, on both ſides from a to b, and from a to c; and from the points b, c, as centres, arcs are deſcribed with a radius of 25 toiſes, ſo as to interſect each other in d; then the lines drawn from this interſection to the points b, c, will be the faces of the places of arms.

If lines are drawn, parallel to the lines which terminate the covert way, and the places of arms, at 20 toiſes diſtant from them, the ſpace x, x, x, between theſe lines and thoſe which terminate the covert-way, will be the glacis.

At the extremities of the places of arms, are traverſes made, ſuch as v, v, which ſerves to incloſe them; theſe traverſes are 3 toiſes thick, and as long as the covert-way is broad; and a paſſage is cut in the glacis round them, of about 6 or 8 feet, in order to have a free communication with the reſt of the covert-way.

There are alſo traverſes of the ſame dimenſions before every ſaliant angle of the baſtion and outworks, and are in the ſame direction of the faces of thoſe works produced; and the thickneſs lies at the ſame ſide as the parapets.

The paſſages round theſe laſt traverſes are likewiſe from 6 to 8 feet wide.

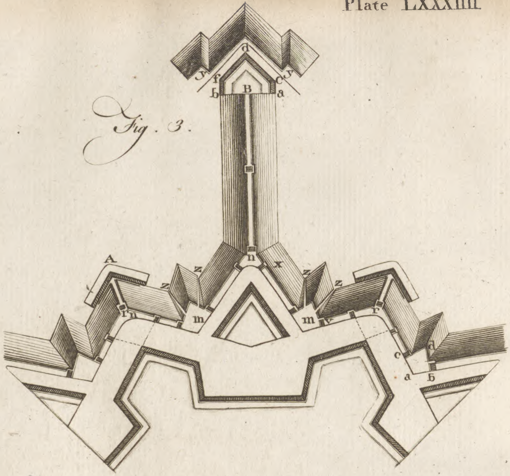

Fig. 2.

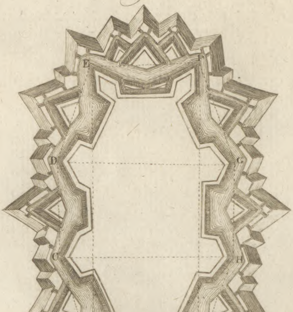

Fig. 3.

A. Bell Sc.

In each place of arms are two fally ports z. z, which are 10 or 12 feet wide, for the troops to fally out; in time of a fiege they are fhut up, with barriers or gates.

10. *Conftruction of Arrows and Detached Redoubts.*

An arrow is a work made before the faliant angles of the glacis, fuch as A, fig. 3.; it is compofed of a parapet of 3 toifes thick, and 40 long; and the ditch before it 5 toifes, terminating in a flope at both ends. The communication from the covert way into thefe arrows is 4 or 5 toifes wide, and there is a traverfe r at the entrance of 3 toifes thick, with a paffage of 6 or 8 feet round it.

A detatched redoubt is a kind of work much like a ravelin, with the flanks placed beyond the glacis; fuch as fig. B: they are made in order to occupy fome fpot of ground which might be advantageous to the befiegers; likewife to oblige the enemy to open their trenches farther off than they would do otherwife.

Their diftance from the covert-way ought not to exceed 120 toifes, that it may be defended by mufket fhot from thence.

The gorge ab is 40 toifes, the flanks ac, bf, which are perpendicular to the gorge 10, and the faces cd, fd 30; the ditch before it is 6 toifes, ending in flopes at both ends; the covert way 4; the branches of the covert-way are 42 toifes long, or thereabouts; the faces of the places of arms y, y, which are perpendicular to the branches, 10; and the other, which is parallel to them, 14.

The communication from the covert-way into the redoubt, is 5 or 6 toifes wide; and there is a traverfe made juft at the entrance; and another in the middle when it is pretty long. The parapets of this communication terminate in a flope or glacis.

If thefe redoubts are above 50 toifes diftant from the covert-way, the befiegers carry their trenches round, and enter through the gorge; by which the troops that are in them are made prifoners of war, if they do not retire betimes; to prevent this, fome other outworks fhould be made to fupport them.

11. *Conftruction of Second Ditches, and Covert-ways.*

Fig. 4. When the ground is low, and water to be found, there is often a ditch of about 10 or 12 toifes made round the glacis; and oppofite to the places of arms are conftructed lunettes, beyond the ditch; fuch as D, whofe breadth on the counterfcarp of the ditch is 10 toifes, from b to a, and from c to d; and the faces aL, dL, are parallel to thofe of the places of arms; the ditch before them is from 8 to ten toifes wide.

The fecond covert-way is 4 toifes, the femi-gorges of the places of arms, m, about 15, and the faces perpendicular to the counterfcarp; the fecond glacis is from 15 to 18 toifes broad.

This fecond covert-way has traverfes every where, in the fame manner as the firft.

12. *Conftruction of Profiles.*

Plate LXXXV. fig. 1. A profile is the reprefentation of a vertical fection of a work; it ferves to fhew thofe dimenfions which cannot be reprefented in plans, and are neceffary in the building of a fortification; they are generally conftructed upon a fcale of 30 feet to an inch. It would be needlefs to defcribe all their particular dimenfions, fince they are marked in the fchemes; we fhall therefore lay down the principal rules only, given by M. Vauban, on this fubject.

1. Every work ought to be at leaft 6 feet higher than that before it, fo that it may command thofe before it; that is, that the garrifon may fire from all the works at the fame time, with great and fmall arms, at the befiegers in their approaches: notwithftanding this fpecious pretence, there are feveral authors, who object againft it: For they fay, if you can difcover the enemy from all the works, they can difcover, by the fame reafon, all the works from their batteries; fo that they may deftroy them without being obliged to change their fituation, and thereby difmount all the guns of the place before they come near it.

But if all the works were of the fame height, thofe within cannot be deftroyed, till fuch time as thofe before them are taken; guns might be placed in the covert-way and outworks to obftruct the enemy's approach, and when they come near the place, they might be tranfported into the inner-works; and as the body of the place would be much lower, the expence would be confiderably diminifhed.

But when works are low, they are eafily enfiladed by the ricochet batteries, which is a kind of firing with a fmall quantity of powder, by giving the gun an elevation of 10 or 12 degrees: this might however be partly prevented, by making the parapets near the faliant angles, for the fpace of 8 toifes on each fide, 5 or 6 feet higher than the reft of the works.

2. The covert-way fhould be lower than the level-ground, otherwife the body of the place muft be raifed very high, efpecially when there are feveral outworks; this is to be underftood only when the works exceed each other in height, otherwife it need not be below the level.

3. The bafes of all inward flopes of earth fhould be at leaft equal to the height, if not more.

4. The bafes of all outward flopes of earth, two thirds of their heights.

5. The flopes of all walls or revetements fhould be one fifth of their height; but one fixth would be fufficient in our opinion: the height of a wall is eftimated from the bottom of the ditch, and not from the beginning of its foundation.

6. The flopes of all parapets and traverfes are one fixth of their breadth; that is, 3 feet towards the field, or the infide, where the banquettes fhould be, 3 feet higher than the outfide.

7. When the revetement of a rampart goes quite up to the top, 4 feet of the upper-part is a vertical wall of 3 feet thick, with a fquare ftone at the top of it, projecting 6 inches, and a circular one below, or where the flope begins, of 8 or 10 inches diameter; they go quite round the rampart, and the circular projection is called the *cordon*.

Where the ftraight part of the wall ends and the flope begins, the wall is always made 5 feet thick; and the counterforts or buttreffes reach no higher than that place.

7. When the rampart is partly walled, and partly turfed,

ed, then one fifth of the height which is turfed muſt be added to 5 feet, to get the thickneſs of the wall above.

And having the thickneſs of any wall above, by adding one fifth of its height from the bottom of the ditch, the ſum will be the thickneſs of the wall at the bottom; but if a ſixth part is only taken for the ſlope, then a ſixth part muſt be added.

For inſtance, ſuppoſe a rampart of 30 feet high from the bottom of the ditch, and that 10 of which are to be turfed; then the fifth part of 10, which is 2, added to 5, gives 7 for the wall above; and as this wall is 20 feet high, the fifth of which is 4, and 4 added to the thickneſs 7 above, gives 11 for the thickneſs near the foundation.

Plate LXXXV. fig. 1. Repreſents, in military perſpective, the profiles of the body of a place, the ravelin and covert-way; which gives a clear idea of what is meant by a profile, and from which thoſe of all other works may be eaſily conceived.

SECT. II. *Of Irregular Fortification.*

THE moſt eſſential principle in fortification, conſiſts in making all the fronts of a place equally ſtrong, ſo that the enemy may find no advantage in attacking either of the ſides; this can happen no otherwiſe but in a regular fortification ſituated in a plain or even ground; but as there are but few places which are not irregular, either in their works or ſituations, and the nature of the ground may be ſuch as makes it impracticable to build them regular, without too great expence; it is ſo much the more neceſſary to ſhew in what conſiſts the ſtrength or weakneſs of a town irregularly fortified, ſo that the weakeſt part may be made ſtronger by additional outworks; as likewiſe if ſuch a place is to be attacked, to know which is the ſtrongeſt or weakeſt.

1. *Conſtruction of an irregular place ſituated in an open country.*

If the place to be fortified is an old town incloſed by a wall or rampart, as it moſt frequently happens, the engineer is to conſider well all the different circumſtances of the figure, ſituation, and nature of the ground, to regulate his plan accordingly, ſo as to avoid the diſadvantages, and gain all the advantages poſſible; he ſhould examine, whether by cutting off ſome parts of the old wall or rampart, and taking in ſome ground, the place cannot be reduced into a regular figure, or nearly ſo; for, if that can be done without increaſing the expence conſiderably, it ſhould by no means be omitted; old towns have often towers placed from diſtance to diſtance, as Douay, Tournay, and many other places, which are generally made uſe of, and mended when it may be done; if there is a rampart without baſtions or towers, it muſt be well conſidered, whether baſtions may not be added, or if it is not better to make only ſome outworks; if the ditch about this rampart is not too wide and deep, it would be advantageous to make detached baſtions, otherwiſe ravelins and counterguards muſt be conſtructed; ſpecial care muſt be taken, to make all ſides of the polygon as nearly equal as poſſible, and that the length of the lines of defence do not exceed the reach of muſket-ſhot; but if that cannot be done, thoſe ſides which are on the narroweſt part ſhould be made the longeſt.

If it ſhould happen, that ſome of the ſides are inacceſſible or of very difficult approach, either on account of ſome precipice, marſhy ground, or inundation, they may be made much longer than the others, which are of eaſy acceſs, and the flanks need not be ſo large as the reſt; by doing ſo, there will be ſome expences ſaved, which may be uſed in making the other ſides ſtronger by adding more outworks.

There are few ſituations, but what are more advantageous in ſome parts than in others; it is therefore the buſineſs of an engineer to diſtinguiſh them, and to render thoſe ſides ſtrong by art, which are not ſo by nature.

If the ſituation is low and watery, lunettes or tenaillons, and ſuch other ſmall outworks ſhould be conſtructed, becauſe they are not of any great expence, and may make a very good defence; but if one ſide of the place is only low, and running water is to be had, a ſecond ditch and covert-way with lunettes may be made, by obſerving, that if the firſt glacis is made to ſlope, ſo as to become even with the level of the water in the ſecond ditch; or if the water can be ſwelled, by means of dykes or ſluices, ſo as to overflow the beſt part of the firſt glacis, it ſhould be done; for by ſo doing, theſe works will be able to make a very good defence, ſince the beſiegers will find it a difficult matter to lodge themſelves upon this glacis, which cannot be done but within a few toiſes of the firſt covert way, where the beſieged are ready to receive them, and to deſtroy their works with great advantage; whereas the enemy cannot ſupport their workmen but from the ſecond covert-way, which is too far off to be of any great ſervice to them.

But if the ſituation is of a dry nature, without any water about it, caponiers ſhould be made in the great ditch, from the curtains to the ravelin, and batteries raiſed in the entrance of the ditch before the ravelin, whoſe parapet muſt ſlope off into a glacis, ſo as to afford no cover for the enemy behind them; arrows, and detached redoubts are likewiſe very proper to be uſed in ſuch a caſe, and ſometimes horn or crown-works, if it ſhould be thought convenient; but theſe works ſhould never be conſtructed, without an abſolute neceſſity, either to occupy a ſpot of ground which might be advantageous to the enemy, or to cover ſome gate or entrance into the town, for they are of ſo great expence, that their defence ſeems not to be anſwerable to it.

Moſt of the places in Flanders are fortified with hornworks, ſuch as Ipres, Tournay, Lille, and others.

If the place to be fortified is new, and the ſituation will not admit of a regular conſtruction; particular care muſt be taken in chuſing ſuch a ſpot of ground as is moſt advantageous, and leaſt liable to any diſadvantages, either in the building or in the maintaining of it: all hills or riſing grounds ſhould be avoided, which might command any part of the works; marſhy grounds, becauſe ſuch ſituations are unwholeſome; or lakes and ſtanding waters, for the ſame reaſon, excepting a lake is, or may be made navigable: good water ſhould be had either within the place or near it, for it is abſolutely neceſſary for men and cattle;

cattle; the air ſhould be wholeſome, otherwiſe the continual ſickneſs that may reign in ſuch a place might prevent people to come and live in it, and the garriſon would not be in a condition to defend themſelves as they ought to do; in ſhort, all the different circumſtances attending ſuch an undertaking ſhould be maturely conſidered, before a reſolution is taken to fortify any place.

When a ſituation is pitched upon, the next thing to be conſidered is, the bigneſs of the town and the number of its outworks, which muſt abſolutely depend upon the conſequence ſuch a place is of to a nation; if it is only to guard a paſs, or entrance into a country, it need not be ſo large; but if it is to be a place either to promote or to protect trade, it ſhould be large and commodious; the ſtreets ſhould be wide, and the buildings regular and convenient: as to what regards the fortification, its conſtruction ſhould depend on the nature of the ſituation, and the number of the works on the funds or expence a prince or a nation will be at; which however ought to be according to the benefit ariſing from ſuch a place: for, as ſuch undertakings are of very great expence, an engineer cannot be too ſparing in his works; on the contrary, the greateſt œconomy ſhould be uſed, both in regard to the number of works, and to their conſtruction. The body of the place may have * revetements quite up to the top, or only in part, and the reſt turfed; but as to the outworks, they ſhould have half revetements, or they may be made with turf only; as being not ſo neceſſary to prevent the place from being ſurpriſed, and may nevertheleſs make a good defence.

On Plate LXXXV. fig. 2. is the plan of an octagon, one half of which is ſimilar and equal to the other half; it being ſuppoſed, that the ſituation would not admit of fortification quite regular; and the exterior ſides are each 180 toiſes, and the works are conſtructed according to our method; but becauſe the ſides AB, EF, are weaker than the reſt, as has been proved before, we have added tenailles, redoubts in the ravelins, and lunettes, to render them nearly equal in ſtrength with the others; and if counter guards were made before the baſtions A and B, it would effectually ſecure that front. Inſtead of lunettes, any other works may be made, as it may be thought convenient and according to the nature of the ground. If it ſhould be judged neceſſary to add other outworks to the ravelins all round the place, care muſt be taken to add likewiſe more to the fronts AB, EF, in order to render the advantages and diſadvantages of attacking on either ſide equal.

2. *Conſtruction of an irregular place, ſituated on a hill or rock.*

In the conſtruction of ſuch places, care muſt be taken that no neighbouring hill commands any part of the works; the town ſhould always be built on the higheſt part; but if it ſhould be thought more convenient to place it lower, then the upper part muſt be fortified with a fort; the ſituation ſhould be made level as near as poſſible, by removing the earth from ſome places to fill up others; and if it cannot well be levelled without extraordinary expence, works muſt be made on the higheſt part, ſo as to command and protect the lower; the works ought to occupy all the upper part of the hill, but if it ſhould be too extenſive to be all incloſed, or ſo irregular as not to be fortified without great inconvenience, the parts which fall without ſhould be fortified with ſome detached works, and a communication with the place muſt be made either above or under ground. There ſhould be no cavity or hollow roads, within cannon-ſhot, round about the place, where the enemy might be able to approach under cover; if there ſhould happen to be a ſpring, near the top of the hill, it ſhould be incloſed in the fortification, or if that cannot be done, by ſome work or other; for there is nothing more neceſſary, and at the ſame time ſcarcer in ſuch ſituations than water, for which reaſon there cannot be too much care taken in providing it; ſeveral ciſterns are to be made to receive the rain-water, and to preſerve it; wells ſhould be dug likewiſe, though ever ſo deep, the water of which will ſerve for common uſe.

Places built on hills or rocks, ſhould never be large, for their uſe is generally to guard paſſes or inlets into a country, and are ſeldom uſeful in traffic, and it is a difficult matter to provide for a large garriſon in ſuch ſituations, neither ſhould any ſuch place be built without ſome very material reaſons; but when it is abſolutely neceſſary, great care and precautions ſhould be taken to render the works as perfect as the ſituation will admit of, and at the ſame time to be as frugal in the expence as poſſible.

3. *Conſtruction of irregular fortifications, ſituated near rivers, lakes, or the ſea.*

As the intent of building theſe kind of places is chiefly to facilitate and protect trade, it is of much more importance than any other kind, eſpecially in maritime countries, where the principal ſtrength and power depends on it; for which reaſon, we ſhall treat of it more largely than any other part.

The firſt thing to be conſidered is their ſituations, which ought to be ſuch as to afford a good harbour for ſhipping, or a ſafe and eaſy entrance in ſtormy weather; but as it is hardly poſſible to find any, where ſhips may go in and lie ſecure with all winds, care ſhould be taken to make them ſafe to enter with thoſe winds which are moſt dangerous: but it is not ſufficient that the harbour is ſafe againſt ſtormy weather, they ſhould likewiſe be ſo againſt an enemy, both by land and water; for it often happens, that ſhips are deſtroyed where it was imagined they were ſecure, which is of too great a conſequence not to be provided againſt; for which reaſon, forts or batteries muſt be built in the moſt convenient places, to prevent the enemy's ſhips from coming too near, ſo as to be able to cannonade thoſe in the harbour, or fling ſhells amongſt them: and if there is any danger of an enemy's approach by land, high ramparts and edifices muſt be built, ſo as to cover them.

When a river is pretty large, and it is not convenient for

* Revetements are chiefly made to prevent a place from being ſurpriſed; outworks do not want to be made ſo, the taking them by ſurpriſe is of no great conſequence, except in a ſiege, when other cautions are uſed to prevent it.

for making a harbour without great expence, the ſhips may ride along the ſhore, which, for that reaſon, muſt be made acceſſible for ſhips of burden; this may be done by advancing the quay into the river, if the water is too ſhallow, or by digging the river ſufficiently deep for that purpoſe.

And to prevent any enemy from coming up the river, forts muſt be built on both ſides, eſpecially when there are any turnings or windings. Antwerp is ſuch a place; for the Scheld is ſufficiently deep to carry ſhips of great burden, which may come quite near the town-wall; and ſeveral ſorts are built below it on both ſides, ſo that it would not be an eaſy matter for an enemy to come up the river.

When the river is but ſmall, ſo that no ſhips of burden can come through it; it is ſufficient to make it run through ſome of the works, where proper landing places are contrived, from whence the goods may be carried into the place; as at Sarrelouis, where a horn-work is built beyond the Sarre, in the gorge of which the goods are landed.

If the breadth of the river does not exceed 200 yards, it commonly paſſes through the middle of the town, and proper quays are made on each ſide; in ſuch a caſe, the fortification is ſo contrived as that the river paſſes through the curtain, in order to have a baſtion on each ſide to defend the coming in and going out.

When M. Vauban fortified near rivers, he made always the exterior ſide near the water much longer than any of the others; ſuch is Hunningen on the Rhine, and Sarrelouis on the Sarre; but for what reaſon he fortified theſe places in that manner, has not been told by any author.

But it is plain, that the ſides which terminate at the river, are the weakeſt; becauſe the beſiegers trenches being ſecured by the river, they may draw moſt of their troops off, and act therefore with more vigour and ſtrength on the other ſide: beſides, as the ſtrength of a ſide increaſes in proportion as the angle of the polygon is greater, by making the ſide next the river longer, the angles at its extremities become wider, and conſequently the adjacent ſides ſtronger.

There are other advantages, beſides theſe mentioned already, which ariſe from the lengthening that ſide; for if the river is pretty deep ſo as not to be fordable, that ſide is not liable to be attacked; and by increaſing its length, the capacity of the place increaſes much more in proportion to the expence, than if more ſides were made; the centre of the place will be likewiſe nearer the river, which makes it more convenient for tranſporting the goods from the water-ſide to any part of the town.

Plate LXXXV. fig. 3. To illuſtrate this method of M. Vauban's we ſhall give the plan of Hunningen; this place was built for the ſake of having a bridge over the Rhine, for which reaſon he made it only a pentagon; the ſide AB next to the river is 200 toiſes, and each of the others but 180.

About the ſpace *a b c*, which lies before the front AB, is a ſtone-wall, and the paſſages *x*, *x*, are ſhut up with ſluices, to retain the water in the ditches in dry ſeaſons, and to prevent an enemy from deſtroying the ſluice near the point c, whereby the water would run out and leave the ditches dry; the redout y was built in the little iſland hard by, in order to cover that ſluice; without this precaution the place might be inſulted from the river-ſide, where the water is ſhallow in dry ſeaſons.

The hornwork K beyond the Rhine was built to cover the bridge; but as this work cannot be well defended croſs the river, the hornwork H was made to ſupport the other.

Before we finiſh the deſcription of this plan, we ſhall ſhew how to find the long ſide AB, as being uſeful in the following work.

After having inſcribed the two ſides GE, GF, in a circle, draw the diameter CD, ſo as to be equally diſtant from the line joining the points E, F, that is parallel to it; on this diameter ſet off 100 toiſes on each ſide of the centre, from theſe points draw two indefinite perpendiculars to the diameter; then if from the points E, F, as centres, two arcs are deſcribed with a radius of 180 toiſes, their interſections A and B, with the ſaid perpendiculars, will determine the long ſide AB, as likewiſe the other two FB and EA. In like manner may be found the long or ſhort ſide of any polygon whatſoever.

When a place near a river is to be fortified, for the ſafety of commerce, particular care ſhould be taken in leaving a good ſpace between the houſes and the water-ſide, to have a key or landing place for goods brought by water; it ſhould alſo be contrived to have proper places for ſhips and boats to lie ſecure in ſtormy weather, and in time of a ſiege; and as water-carriage is very advantageous for tranſporting goods from one place to another, as likewiſe for bringing the neceſſary materials, not only for building the fortification, but alſo the place itſelf, the expences will be leſſened conſiderably, when this convenience can be had; for which reaſon, places ſhould never be built any where elſe but near rivers, lakes, or near the ſea; excepting in extraordinary caſes, where it cannot be avoided.

FORTISSIMO, in muſic, ſometimes denoted by FFF, or *fff*, ſignifies to ſing or play very loud or ſtrong.

FORT-LEWIS, a fortreſs of Alſace, in Germany, ſituated on the weſtern ſhore of the Rhine, ſubject to France: E. long. 8°, and N. lat. 48° 46′.

FORTUNATE-ISLANDS in ancient geography, certain iſlands, concerning the ſituation of which authors are not agreed, famous for the golden apples of the Heſperides. See HESPERIDES.

The common opinion is, that they are the ſame with the Canary iſlands.

FORTUNE, a goddeſs worſhipped with great devotion by the ancient Greeks and Romans, who believed her to preſide over human affairs, and to diſtribute wealth and honour at her pleaſure.

FORUM, in Roman antiquity, a public ſtanding place within the city of Rome, where cauſes were judicially tried, and orations delivered to the people.

Forum, was alſo uſed for a place of traffic, anſwering to our market-place: of theſe there were vaſt numbers, as the *forum piſcarium, olitorium*, &c. Theſe were generally called *fora venalia*, in contradiſtinction to the former, which were called *fora civilia*.

Forum, is alſo uſed, among caſuiſts, *&c.* for juriſdiction; thus they ſay, *In foro legis*, &c.

FOSS, or Fossa, in anatomy, a kind of cavity in a bone, with a large aperture, but no exit or perforation.

Foss-way, one of the four principal highways of England, that anciently led through the kingdom; ſuppoſed to be made by the Romans, having a ditch upon one ſide thereof.

FOSSIL, in natural hiſtory, denotes, in general, every thing dug out of the earth, whether they be natives thereof, as metals, ſtones, ſalts, earths, and other minerals; or extraneous, repoſited in the bowels of the earth by ſome extraordinary means. See Natural History.

FOSSOMBRONE, a city and biſhop's ſee of Italy, ten miles ſouth-eaſt of Urbino.

FOUMART, in zoology. See Mustela.

FOUNDATION, in architecture, is that part of a building which is under ground. See Building.

The foundation is properly ſo much of the maſonry as reaches as high as the ſurface of the ground, and ought always to be proportioned to the load or weight of the building that it is to bear. Sometimes the foundation is maſſive, and continued under the whole building, as in the antique arches and aqueducts, and ſome amphitheatres; but it is more uſually in ſpaces or intervals, either to avoid expence, or becauſe the vacuities are at too great a diſtance, in which latter caſe they make uſe of inſulated pillars bound together by arches.

Palladio allows a ſixth part of the height of the whole building for the hollowing or under-digging; unleſs there be cellars under ground, in which caſe he would have it ſomewhat lower; and as to thickneſs, double the width of the wall is no bad rule.

Foundation *of Bridges*, is laid after different manners. The firſt is by incloſing all round the ſpace of ground you would build upon, by dams made with piles ſet deep in the ground in double rows, well ſtrengthened and bound together with croſs pieces and cords, and filling the vacant ſpaces between them with chalk or other earthy matter. This being done, the water muſt be emptied out, and the foundation dug according to the quality of the ground, driving down piles, if it be neceſſary, upon which the walls of the foundation muſt be laid. But this method is only practicable in building on ſuch rivers, where the water is neither very rapid, nor very deep. The ſecond is done by laying the foundation on grate-work, rafts of ſtout oak well bound together, and made faſt at the ſurface of the water with cables or machines, and building upon them large quarters of ſtone, cramped together, and joined with good mortar, or cement, and afterwards letting them deſcend ſoftly by theſe cables and machines perpendicularly to the bottom of the water. This was the method practiſed in laying the foundation of Weſtminſter Bridge, the grating being made of the bottom of a frame called by the French Caiſſon, the ſides of which were ſo contrived, that they might be taken off, after a pier was finiſhed. The third is by drawing off all, or the greateſt part of the water of the river into ſome other place.

FOUNDER, in a general ſenſe, the perſon who lays a foundation, or endows a church, ſchool, religious-houſe, or other charitable inſtitution.

Founder alſo implies an artiſt who caſts metals, in various forms, for different uſes, as guns, bells, ſtatues, printing characters, candleſticks, buckles, *&c.* whence they are denominated gun-founders, bell-founders, figure-founders, letter-founders, founders of ſmall works, *&c.* See Foundery.

Founder, in the ſea language: A ſhip is ſaid to founder, when by an extraordinary leak, or by a great ſea breaking in upon her, ſhe is ſo filled with water, that ſhe cannot be freed of it; ſo that ſhe can neither veer nor ſteer, but lie like a log; and not being able to ſwim long, will at laſt ſink.

FOUNDERY, or Foundry, the art of caſting all ſorts of metals into different forms. It likewiſe ſignifies the work-houſe or ſmelting-hut wherein theſe operations are performed.

Foundery *of ſmall-works, or caſting in ſand.* The ſand uſed for caſting ſmall works, is, at firſt, of a pretty ſoft, yellowiſh, and clammy nature: but it being neceſſary to ſtrew charcoal duſt in the mould, it at length becomes of a quite black colour. This ſand is worked over and over, on a board, with a roller, and a ſort of knife; being placed over a trough to receive it, after it is by theſe means ſufficiently prepared.

This done, they take a wooden board of a length and breadth proportional to the things to be caſt, and putting a ledge round it, they fill it with ſand, a little moiſtened, to make it duly cohere. Then they take either wood or metal models of what they intend to caſt, and apply them ſo to the mould, and preſs them into the ſand, as to leave their impreſſion there. Along the middle of the mould is laid half a ſmall braſs cylinder, as the chief canal for the metal to run through, when melted, into the models or patterns; and from this chief canal are placed ſeveral others, which extend to each model or pattern placed in the frame. After this frame is finiſhed, they take out the patterns, by firſt looſening them all round, that the ſand may not give way.

Then they proceed to work the other half of the mould with the ſame patterns in juſt ſuch another frame, only that it has pins, which, entering into holes that correſpond to it in the other, make the two cavities of the pattern fall exactly on each other.

The frame thus moulded, is carried to the melter, who, after extending the chief canal of the counterpart, and adding the croſs canals to the ſeveral models in both, and ſtrewing mill-duſt over them, dries them in a kind of oven for that purpoſe.

 Both

Both parts of the mould being dry, they are joined together by means of the pins; and to prevent their giving way, by reafon of the melted metal paffing through the chief cylindrical canal, they are fcrewed or wedged up like a kind of a prefs.

While the moulds are thus preparing, the metal is fufing in a crucible of a fize proportionate to the quantity of metal intended to be caft.

When the moulds are coolifh, the frames are unfcrewed, or unwedged, and the caft work taken out of the fand, which fand is worked over again for other caftings.

FOUNDERY *of ftatues*. The cafting of ftatues depends on the due preparation of the pit, the core, the wax, the outer mould, the inferior furnace to melt off the wax, and the upper to fufe the metal. The pit is a hole dug in a dry place fomething deeper than the intended figure, and made according to the prominence of certain parts thereof. The infide of the pit is commonly lined with ftone, or brick; or when the figure is very large, they fometimes work on the ground, and raife a proper fence to refift the impulfion of the melted metal.

The inner mould, or core, is a rude mafs to which is given the intended attitude and contours. It is raifed on an iron grate, ftrong enough to fuftain it, and is ftrengthened within by feveral bars of iron. It is generally made either of potter's clay, mixed with hair, and horfe dung; or of plafter of Paris mixed with brick-duft. The ufe of the core is to fupport the wax, the fhell, and leffen the weight of the metal. The iron bars and the core are taken out of the brafs figure through an aperture left in it for that purpofe, which is foldered up afterwards. It is neceffary to leave fome of the iron bars of the core, that contribute to the fteadinefs of the projecting part, within the brafs figure.

The wax is a reprefentation of the intended ftatue. If it be a piece of fculpture, the wax fhould be all of the fculptor's own hand, who ufually forms it on the core; though it may be wrought feparately in cavities, moulded on a model, and afterwards arranged on the ribs of iron over the grate; filling the vacant fpace in the middle with liquid plafter and brick duft, whereby the inner core is proportioned as the fculptor carries on the wax.

When the wax, which is the intended thicknefs of the metal, is finifhed, they fill fmall waxen tubes perpendicular to it from top to bottom, to ferve both as canals for the conveyance of the metal to all parts of the work; and as vent-holes, to give paffage to the air, which would otherwife occafion great diforder, when the hot metal came to encompafs it.

The work being brought thus far, muft be covered with its fhell, which is a kind of cruft laid over the wax, and which being of a foft matter, eafily receives the impreffion of every part, which is afterwards communicated to the metal upon its taking the place of the wax, between the fhell and the mould. The matter of this outer mould is varied according as different layers are applied. The firft is generally a compofition of clay, and old white crucibles well ground and fifted, and mixed up with water, to the confiftence of a colour fit for painting: accordingly they apply it with a pencil, laying it feven or eight times over, and letting it dry between whiles. For the fecond impreffion, they add horfe dung, and natural earth to the former compofition. The third impreffion is only horfe-dung and earth. Laftly, the fhell is finifhed by laying on feveral more impreffions of this laft matter, made very thick with the hand.

The fhell, thus finifhed, is fecured by feveral iron girts, bound round it, at about half a foot diftance from each other, and faftened at the bottom to the grate under the ftatue, and at top to a circle of iron where they all terminate.

If the ftatue be fo big that it would not be eafy to move the moulds with fafety, they muft be wrought on the fpot where it is to be caft. This is performed two ways: in the firft, a fquare hole is dug under ground, much bigger than the mould to be made therein, and its infide lined with walls of free-ftone, or brick. At the bottom is made a hole of the fame materials with a kind of furnace, having its aperture outwards: in this is a fire made to dry the mould, and afterwards melt the wax. Over this furnace is placed the grate, and upon this the mould, *&c.* formed as above. Laftly, at one of the edges of the fquare pit, is made another large furnace to melt the metal. In the other way, it is fufficient to work the mould above ground, but with the like precaution of a furnace and grate underneath. When finifhed, four walls are to be run around it, and by the fide thereof a maffive made for a melting-furnace. For the reft, the method is the fame in both. The mould being finifhed, and inclofed as defcribed, whether under ground or above it, a moderate fire is lighted in the furnace under it, and the whole covered with planks, that the wax may melt gently down, and run out at pipes contrived for that purpofe, at the foot of the mould, which are afterwards exactly clofed with earth, fo foon as the wax is carried off. This done, the hole is filled up with bricks thrown in at random, and the fire in the furnace augmented, till fuch time as both the bricks and mould become red hot. After this, the fire being extinguifhed, and every thing cold again, they take out the bricks and fill up their place with earth moiftened, and a little beaten to the top of the mould, in order to make it the more firm and fteady. Thefe preparatory meafures being duly taken, there remains nothing but to melt the metal, and run it into the mould. This is the office of the furnace above defcribed, which is commonly made in the form of an oven with three apertures, one to put in the wood, another for a vent, and a third to run the metal out at. From this laft aperture, which is kept very clofe, while the metal is in fufion, a fmall tube is laid, whereby the melted metal is conveyed into a large earthen bafon, over the mould, into the bottom of which all the big branches of the jets, or cafts, which are to convey the metal into all the parts of the mould, are inferted.

Thefe cafts, or jets, are all terminated with a kind of plugs, which are kept clofe, that, upon opening the furnace, the brafs, which gufhes out with violence, may

may not enter any of them, till the bason be full enough of matter to run into them all at once. Upon which occasion they pull out the plugs, which are long iron rods with a head at one end, capable of filling the whole diameter of each tube. The whole of the furnace is opened with a long piece of iron fitted at the end of each pole, and the mould filled in an instant. This completes the work in relation to the casting part; the rest being the sculptor's or carver's business, who, taking the figure out of the mould and earth wherewith it is encompassed, saws off the jets with which it appears covered over, and repairs it with chissels, gravers, puncheons, *&c.*

Foundery *of bells*. The metal, it is to be observed, is different for bells, from what it is for statues; there being no tin in the statue-metal: but there is a fifth, and sometimes more, in the bell-metal.

The dimensions of the core and the wax for bells, if a ring of bells especially, are not left to chance, but must be measured on a scale, or diapason, which gives the height, aperture, and thickness necessary for the several tones required. See Diapason.

It is on the wax that the several mouldings and other ornaments are formed to be represented in relievo, on the outside of the bell.

The business of bell-foundery is reducible to three particulars. 1. The proportion of a bell. 2. The forming of the mould; and, 3. The melting of the metal.

The proportions of our bells differ much from those of the Chinese: in ours, the modern proportions are, to make the diameter fifteen times the thickness of the brim, and twelve times the height.

There are two kinds of preparations, *viz.* the simple and the relative: the former are those proportions only that are between the several parts of a bell, to render it sonorous; the relative proportions establish a requisite harmony between several bells.

The particulars necessary for making the mould of a bell are, 1. The earth; the most cohesive is the best: it must be well ground and sifted, to prevent any chinks. 2. Brick-stone; which must be used for the mine, mould, or core, and for the furnace. 3. Horse dung, hair, and hemp, mixed with the earth, to render the cement more binding. 4. The wax for inscriptions, coats of arms, *&c.* 5. The tallow equally mixed with the wax, in order to put a slight lay of it upon the outer mould, before any letters are applied to it. 6. The coals to dry the mould.

For making the mould, they have a scaffold consisting of four boards, ranged upon tressels. Upon this they carry the earth, grossly diluted, to mix it with horse-dung, beating the whole with a large spatula.

The compasses of construction is the chief instrument for making the mould, which consist of two different legs joined by a third piece. And last of all, the founders shelves, on which are the ingravings of the letters, cartridges, coats of arms, *&c.*

They first dig a hole of a sufficient depth to contain the mould of the bell, together with the case, or cannon, under ground; and about six inches lower than the terreplain, where the work is performed. The hole must be wide enough for a free passage between the mould and walls of the hole, or between one mould and another, when several bells are to be cast. At the centre of the hole is a stake erected, that is strongly fastened in the ground. This supports an iron peg, on which the pivot of the second branch of the compasses turns. The stake is encompassed with a solid brick-work, perfectly round, about half a foot high, and of the proposed bell's diameter. This they call a mill-stone. The parts of the mould are, the core, the model of the bell, and the shell. When the outer surface of the core is formed, they begin to raise the core, which is made of bricks that are laid in courses of equal height upon a lay of plain earth. At the laying each brick, they bring near it the branch of the compasses, on which the curve of the core is shaped, so as that there may remain between it and the curve the distance of a line, to be afterwards filled up with layers of cement. The work is continued to the top, only leaving an opening for the coals to bake the core. This work is covered with a layer of cement, made of earth and horse dung, on which they move the compasses of construction, to make it of an even smoothness every where.

The first layer being finished, they put the fire to the core, by filling it half with coals, through an opening that is kept shut, during the baking, with a cake of earth, that has been separately baked. The first fire consumes the stake, and the fire is left in the core half or sometimes a whole day: the first layer being thoroughly dry, they cover it with a second, third, and fourth; each being smoothed by the board of the compasses, and thoroughly dried before they proceed to another.

The core being completed, they take the compasses to pieces, with intent to cut off the thickness of the model, and the compasses are immediately put in their place to begin a second piece of the mould. It consists of a mixture of earth and hair, applied with the hand on the core, in several cakes that close together. This work is finished by several layers of a thinner cement of the same matter smoothed by the compasses, and thoroughly dried, before another is laid on. The first layer of the model is a mixture of wax and grease spread over the whole. After which are applied the inscriptions, coats of arms, *&c.* besmeared with a pencil dipped in a vessel of wax in a chaffing-dish: this is done for every letter. Before the shell is begun, the compasses are taken to pieces, to cut off all the wood that fills the place of the thickness to be given to the shell.

The first layer is the same earth with the rest, sifted very fine; whilst it is tempering in water, it is mixed with cow's hair, to make it cohere. The whole being a thin cullis, is gently poured on the model, that fills exactly all the sinuosities of the figures, *&c.* and this is repeated till the whole is two lines thick over the model. When this layer is thoroughly dried, they cover it with a second of the same matter, but something thicker: when this second layer becomes of some consistence, they apply the compasses again, and light

light a fire in the core, fo as to melt off the wax of the infcriptions, &c.

After this, they go on with other layers of the fhell, by means of the compaffes. Here they add to the cow's hair a quantity of hemp, fpread upon the layers, and afterwards fmoothed by the board of the compaffes. The thicknefs of the fhell comes to four or five inches lower than the mill-ftone before obferved, and furrounds it quite clofe, which prevents the extravafation of the metal. The wax fhould be taken out before the melting of the metal.

The ear of the bell requires a feparate work, which is done during the drying of the feveral incruftations of the cement. It has feven rings; the feventh is called the bridge, and unites the others, being a perpendicular fupport to ftrengthen the curves. It has an aperture at the top, to admit a large iron peg, bent at the bottom; and this is introduced into two holes in the beam, faftened with two ftrong iron keys. There are models made of the rings, with maffes of beaten earth, that are dried in the fire, in order to have the hollow of them. Thefe rings are gently preffed upon a layer of earth and cow's hair, one half of its depth; and then taken out, without breaking the mould. This operation is repeated twelve times for twelve half-moulds, that two and two united may make the hollows of the fix rings: the fame they do for the hollow of the bridge, and bake them all, to unite them together.

Upon the open place left for the coals to be put in, are placed the rings that conftitute the ear. They firft put into this open place the iron-ring to fupport the clapper of the bell; then they make a round cake of clay, to fill up the diameter of the thicknefs of the core. This cake, after baking, is clapped upon the opening, and foldered with a thin mortar fpread over it, which binds the cover clofe to the core.

The hollow of the model is filled with an earth, fufficiently moift to fix on the place, which is ftrewed at feveral times upon the cover of the core; and they beat it gently with a peftle, to a proper height; and a workman fmooths the earth at top with a wooden trowel dipped in water.

Upon this cover, to be taken off afterwards, they affemble the hollows of the rings. When every thing is in its proper place, they ftrengthen the outfide of the hollows with mortar, in order to bind them with the bridge, and keep them fteady at the bottom, by means of a cake of the fame mortar, which fills up the whole aperture of the fhell. This they let dry, that it may be removed without breaking. To make room for the metal, they pull off the hollows of the rings, through which the metal is to pafs, before it enters into the vacuity of the mould. The fhell being unloaded of its ear, they range under the mill-ftone five or fix pieces of wood, about two feet long, and thick enough to reach almoft the lower part of the fhell; between thefe and the mould they drive in wooden wedges with a mallet, to fhake the fhell of the model whereon it refts, fo as to be pulled up, and got out of the pit.

When this and the wax are removed, they break the model and the layer of earth, through which the metal muft run, from the hollow of the rings, between the fhell and the core. They fmoke the infide of the fhell, by burning ftraw under it, that helps to fmooth the furface of the bell. Then they put the fhell in the place, fo as to leave the fame interval between that and the core; and before the hollows of the rings or the cap are put on again, they add two vents, that are united to the rings, and to each other, by a mafs of baked cement. After which they put on this mafs of the cap, the rings, and the vent, over the fhell, and folder it with thin cement, which is dried gradually by covering it with burning coals. Then they fill up the pit with earth, beating it ftrongly all the time, round the mould.

The furnace has a place for the fire, and another for the metal. The fire-place has a large chimney with a fpacious afh-hole. The furnace which contains the metal, is vaulted, whofe bottom is made of earth, rammed down; the reft is built with brick. It has four apertures; the firft, through which the flame revibrates; the fecond is clofed with a ftopple that is opened for the metal to run; the others are to feparate the drofs, or fcoriæ, of the metal by wooden rakes: through thefe laft apertures paffes the thick fmoke. The ground of the furnace is built floping, for the metal to run down.

FOUNDERY *of great guns and mortar pieces*. The method of cafting thefe pieces is little different from that of bells: they are run maffy, without any core, being determined by the hollow of the fhell; and they are afterwards bored with a fteel trepan, that is worked either by horfes, or a water-mill.

For the metal, parts, proportions, &c. of thefe pieces, fee CANNON.

Letter FOUNDERY, or *cafting of printing letters*. The firft thing requifite is to prepare good fteel-punches, on the face of which is drawn the exact fhape of the letter with pen and ink, if the letter be large, or with a fmooth blunted point of a needle, if fmall; and then, with proper gravers, the cutter digs deep between the ftrokes, letting the marks ftand on the punch; the work of hollowing being generally regulated by the depth of the counter-punch. then he files the outfide, till it is fit for the matrice.

They have a mould to juftify the matrices by, which confifts of an upper and under part, both which are alike, except the ftool and fpring behind, and a fmall roundifh wire in the upper part, for making the nick in the fhank of the letter. Thefe two parts are exactly fitted into each other, being a male and female gage, to flide backwards and forwards. See GAGE.

Then they juftify the mould, by cafting about twenty famples of letters, which are fet in a compofing-ftick, with the nicks towards the right hand; and comparing thefe every way with the pattern-letters, fet up in the fame manner, they find the exact meafure of the body to be caft.

Next they prepare the matrix, which is of brafs or copper, an inch and a half long, and of a proportionable thicknefs to the fize of the letter it is to contain. In

In this metal is funk the face of the letter, by ftriking the letter-punch the depth of an *n*. After this, the fides and face of the matrice are juftified, and cleared, with files, of all bunchings that have been made by finking the punch.

Then it is brought to the furnace, which is built upright of brick with four fquare fides, and a ftone at top, in which is a hole for the pan to ftand in.

Printing-letters are made of lead, hardened with iron or ftub-nails. To make the iron run, they mingle an equal weight of antimony, beaten fmall in an iron mortar, and ftub-nails together. They charge a proper number of earthen pots, that bear the fire, with the two ingredients, as full as they can hold, and melt it in an open furnace, built for that purpofe.

When it bubbles, the iron is then melted, but it evaporates very much. This melted compoft is ladled into an iron-pot, wherein is melted lead, that is fixed on a furnace clofe to the former, 3 ℔ of melted iron to 25 ℔ of lead; this they incorporate according to art.

The cafter taking the pan off the ftone, and having kindled a good fire, he fets the pan in again, and metal in it to melt. If it be a fmall-bodied letter, or a thin letter with great bodies, that he intends to caft, his metal muft be very hot, and fometimes red hot, to make the letter come. Then taking a ladle, of which he has feveral forts, that will hold as much as will make the letter and break, he lays it at the hole where the flame burfts out: then he ties a thin leather, cut with its narrow end againft the face, to the leather groove of the matrice, by whipping a brown thread twice about the leather groove, and faftening the thread with a knot. Then he puts both pieces of the mould together, and the matrice into the matrice-cheek; and places the foot of the matrice on the ftool of the mould, and the broad end of the leather on the wood of the upper haft of the mould, but not tight up, left it hinder the foot of the matrice from finking clofe down upon the ftool, in a train of work. Afterwards laying a little rofin on the upper part of the mould, and having his cafting-ladle hot, he, with the boilling fide, melts the rofin, and preffes the broad end of the leather hard down on the wood, and fo faftens it thereto. Now he comes to cafting, when placing the under half of the mould in his left hand, with the hook or jag forward, he holds the ends of its wood between the lower part of the ball of his thumb and his three hinder fingers; then he lays the upper half of the mould upon the under half, fo as the male gages may fall into the female; and, at the fame time, the foot of the matrice places itfelf upon the ftool, and clafping his left hand thumb ftrongly over the upper half, he nimbly catches hold of the bow or fpring, with his right hand fingers at the top of it, and his thumb under it, and places the point of it againft the middle of the notch in the backfide of the matrice, preffing it forwards as well towards the mould, as downwards, by the fhoulder of the notch, clofe upon the ftool, while, at the fame time, with his hinder fingers, as aforefaid, he draws the under half of the mould towards the ball of his thumb, and thrufts, by the ball of his thumb, the upper part towards his fingers, that both the regifters of the mould may prefs againft both fides of the matrice, and his thumb and fingers prefs both fides of the mould clofe together.

Then he takes the handle of his ladle in his right hand, and with the ball of it gives two or three ftrokes outwards upon the furface of the melted metal, to clear it of the fcum; then he takes up the ladle full, and having the mould in the left hand, turns his left fide a little from the furnace, and brings the geat of his ladle to the mouth of his mould; and turns the upper part of his right hand towards him, to pour the metal into it, while, at the fame inftant, he puts the mould in his left hand forwards, to receive the metal with a ftrong fhake, not only into the bodies of the mould, but, while the metal is yet hot, into the very face of the matrice, to receive its perfect form there as well as in the fhank. Then he takes the upper half of the mould off, by placing his right thumb on the end of the wood next his left thumb, and his two middle fingers at the other end of the wood: he toffes the letter, break and all, out upon a fheet of wafte paper, laid on a bench, a little beyond his left hand, and then is ready to caft another letter, as before, and likewife the whole number in that matrix.

Then boys, commonly employed for this purpofe, feparate the breaks from the fhanks, and rub them on a ftone, and afterwards a man cuts them all of an even height, which finifhes the fount for the ufe of the printer. See next article.

A workman will ordinarily caft 3000 of thefe letters in a day. The perfection of letters thus caft, confifts in their being all feverally fquare and ftraight on every fide; and all generally of the fame height, and evenly lined, without ftooping one way or other; neither too big in the foot, nor the head; well grooved, fo as the two extremes of the foot contain half the body of the letter; and well ground, barbed, and fcrapped, with a fenfible notch, *&c.* See PRINTING.

FOUNT, or FONT, among printers, a fet or quantity of letters, and all the appendages belonging thereto, as numeral characters, quadrates, points, *&c.* caft by a letter-founder, and forted.

FOUNTAIN, in philofophy, a fpring or fource of water rifing out of the earth. Among the ancients, fountains were held facred, and even worfhipped as a kind of divinities. For the phænomena, theory, and origin of fountains, fee HYDROSTATICS.

FOUNTAIN, or *Artificial* FOUNTAIN, called alfo a *jet d'eau*, is a contrivance by which water is violently fpouted upwards. See HYDROSTATICS.

FOURCHE'E, or FOURCHY, in heraldry, an appellation given to a crofs forked at the ends. See Plate LXXX. fig. 8.

FOWEY, a borough-town of Cornwall, which fends two members to parliament: W. long. 5°, and N. lat. 50° 26′.

FOWL, among zoologifts, denotes the larger forts of birds, whether domeftic or wild: fuch as geefe, pheafants, partridges, turkey, ducks, *&c.*

FOX, in zoology. See Canis.

Fox-glove, in botany. See Digitalis.

FOY, or St Foy, a town in Guienne, in France, thirty-two miles eaft of Bourdeaux; it is fituated under the meridian of London, in 44°, 50′, N. lat.

FRACTION, in arithmetic and algebra. See Arithmetic, p. 387. and Algebra, p. 83.

Decimal Fractions. See Arithmetic, p. 395.

FRACTURE, in furgery, a rupture of a bone, or a folution of continuity in a bone, when it is crufhed or broken by fome external caufe. See Surgery.

FRÆNUM, in anatomy, a term applied to fome membranous ligaments of the body.

Frænum linguæ. See Anatomy, p. 305.

Frænum penis. See Anatomy, p. 274.

FRAGA, a town of Arragon, in Spain, fituated under the meridian of London: N. lat. 41° 16′.

FRAGARIA, the Strawberry, in botany, a genus of the icofandria polygynia clafs. The calix is divided into ten fegments; the petals are five; and the receptacle is an oval deciduous berry. There are three fpecies, two of them natives of Britain, *viz.* the vefca, or common ftrawberry; and the fterilis, or baren ftrawberry.

FRANCE, a large kingdom of Europe, fituated between 5° W. and 7° E. long. and between 43° and 51° N. lat. being bounded by the Englifh channel and the Auftrian Netherlands, on the north; by Germany, Switzerland, Savoy, and Piedmont, in Italy, on the eaft; by the Mediterranean fea, and the Pyrenean mountains, which feparate it from Spain, on the fouth; and, by the bay of Bifcay, on the weft. This kingdom was formerly divided into twelve provinces; but at prefent it is divided into twenty-five general governments, over every one of which is an officer, called an intendant, appointed by the king, who has a power of controlling the governor, and all other officers of juftice; and prefides over the receivers-general of his generality.

FRANCFORT, a city of Germany, fituated on the confines of Heffe and Franconia, on both fides of the river Maine: E. lon. 7°20′, N. lat. 50° 10′.

Francfort *on the Oder*, a city of Germany, in the circle of Upper Saxony, and marquifate of Brandenburgh, fituated in E. long. 15°, N. lat. 52° 22′.

FRANCHE-comte, the fame with the county of Burgundy. See Burgundy.

Franche-comte, a province of France bounded by Lorrain on the north; by Alface and Switzerland, on the eaft; by La Brefs and Bugey, on the fouth; by the dukedom of Burgundy, on the weft.

FRANCHISE, in a general fenfe, a privilege or exemption from ordinary jurifdiction; as that for a corporation to hold pleas among themfelves to fuch a value, or the like.

FRANCISCAN monks, friars minor, or grey friars, religious of the order of St Francis, founded by him in the year 1709.

The rule of the Francifcans, as eftablifhed by St Francis himfelf, is briefly this: they are to live in common, to obferve chaftity, and to pay obedience to the pope and their fuperiors.

Before they can be admitted into the order, they are obliged to fell all they have, and give it to the poor: they are to perform a year's noviciate, and when admitted never to quit the order upon any account. They are to faft from the feaft of All-faints, to the Nativity. This order has produced four popes, forty-two cardinals, and an infinite number of patriarchs.

FRANCOLINI, a town of Italy, fituated on the river Po, about nine miles north-eaft of Ferrara.

FRANCONIA, a circle of the German empire, lying between Bohemia on the eaft, and the electorate of Mentz on the weft. Its capital is Nuremburg; and from this county the Franks, who conquered and gave name to the kingdom of France, are faid to have come.

FRANGULA, in botany. See Rhamnus.

FRANGULÆ species, in botany. See Maurocenia.

Frank language, or lingua franca, a kind of jargon fpoken on the Mediterranean, and particularly throughout the coafts and parts of the Levant, compofed of Italian, Spanifh, French, vulgar Greek, and other languages.

Frank, or Franc, an ancient coin, either of gold or filver, ftruck and current in France. The value of the gold frank was fomewhat more than that of the gold crown; the filver frank was a third of the gold one: this coin is long out of ufe, though the term is ftill retained as the name of a money of account; in which fenfe it is equivalent to the livre, or twenty fols.

FRANKENDAL, a city of Germany, in the palatinate of the Rhine, fituated on the weft fide of the river Rhine, in E. long. 8° 15′, N. lat. 49° 30′.

FRANCENIA, sea-heath, or sea-chickweed, a genus of the hexandria monogynia clafs. The calix is tunnel fhaped, and divided into five fegments; the petals are five; the ftigma has fix divifions; and the capfule confifts of one cell, with three valves. There are three fpecies, two of them natives of Britain, *viz.* the lævis, or fmooth fea-heath; and the pulverulenta, or broad leaved fea-heath.

FRANKENSTEIN, a town of Germany, in the palatinate of the Rhine, and dutchy of Zuebruggen, fituated twelve miles north-weft of Landau.

FRANKER, a town of the United Provinces in the province of Weft Friefland, nine miles weft of Lewarden.

FRANKS, Frankis, or Franquis, an appellation given by the Turks, and other nations of Afia, to all the people of the weftern parts of Europe, to which they give the name of *Frankiftan*.

FRANSTAT, or Fraustat, a town of Silefia, fituated twenty-five miles north-eaft of Glogaw, fubject to Pruffia.

FRASCATI, or Frescati, a town of Italy, in the campania of Rome, thirteen miles eaft of that city; near which place is the Tufculum of Cicero, called Grotto Ferrate.

FRATERNITY, in the Roman-catholic countries, fignifies

ſignifies a ſociety for the improvement of devotion.

Of theſe there are ſeveral ſorts; as, 1. The fraternity of the roſary, founded by St Dominic: it is divided into two branches, called the common roſary, and the perpetual roſary; the former of whom are obliged to confeſs and communicate every firſt Sunday in the month, and the latter to repeat the roſary continually. See ROSARY.

2. The fraternity of the ſcapulary, whom the bleſſed Virgin, according to the ſabbatin bull of pope John XXII. has promiſed to deliver out of hell the firſt Sunday after their death. See SCAPULARY.

3. The fraternity of St Francis's girdle, are cloathed with a ſack of a grey colour, which they tie with a cord; and, in proceſſions, walk bare-footed, carrying in their hands a wooden croſs.

4. That of St Auſtin's leathern girdle, comprehends a great many devotees.

Italy, Spain, and Portugal, are the countries where one ſees the greateſt number of theſe fraternities, ſome of which aſſume the name of arch-fraternities. Pope Clement VII. inſtituted the arch-fraternity of charity, which diſtributes bread every Sunday among the poor, and gives portions to forty poor girls on the feaſt of St Jerom their patron. The fraternity of death, buries ſuch dead as are abandoned by their relations, and cauſes maſſes to be celebrated for them.

FRATRICELLI, LITTLE BROTHERS, in church hiſtory, a ſect of heretics who appeared in Italy about the year 1298, and afterwards ſpread all over Europe. They wore the habit of the Franciſcan order, and pretended that eccleſiaſtics ought to have no poſſeſſions of their own.

FRATRIAGE, the partition among brothers or coheirs, coming to the ſame inheritance or ſucceſſion.

FRATRES ARVALES. See ARVALES.

FRATRICIDE, the crime of murdering one's brother. See PARRICIDE.

FRAUD, in law, ſignifies deceit in grants, or conveyances of lands, *&c.* or in bargains and ſales of goods, *&c.* to the damage of another perſon.

FRAXINUS, the ASH, in botany, a genus of trees, belonging to the polygamia diœcia claſs. The calix of the hermaphrodite is divided into four parts; it has no corolla; the ſtamina are two; and it has but one piſtil: the female has one piſtil, and one lanceolated ſeed. There are three ſpecies, only one of which, *viz.* the excelſior or common aſh, is a native of Britain.

The wood of this tree is in great uſe among ſeveral artificers, as wheel-wrights, cart-wrights, carpenters, turners, *&c.* alſo for making ploughs, harrows, axletrees, oars, balls, *&c.* It is ſaid to be as laſting for building as oak, and often preferred before it: though the timber of the trunk greatly excells that of a bough.

FRAY, among ſportſmen. A deer is ſaid to fray its head, when it rubs it againſt a tree, to cauſe the pills of the new horns to come off.

FREAM, a name given by farmers to plowed lands worn out of heart, and laid fallow till it recover.

FREDENBERG, a town of Germany, in the circle of Weſtphalia, fifty miles weſt of Caſſel.

FREDERICA, a town of Georgia, in North America, ſituated in W. long. 81° 30′, N. lat. 31°, on the iſland of St Simons, in the mouth of the river Alatamaha.

FREDERICKSBURG, a caſtle and palace of the king of Denmark, ſituated in the iſle of Zeland, twenty miles north-weſt of Copenhagen, built upon piles in the middle of a lake.

FREDERICKSBURG, a fort upon the gold-coaſt of Guinea, near cape Three-points, ſubject to the Danes. It lies in W. long. 2° N. lat 5°.

FREDERICKSHALL, a ſtrong town of Norway, in the province of Agerhuys, ſituated on the frontiers of Sweden, thirty miles north of Frederickſtat.

FREDERICKSODE, a town of Jutland, in the province of Reypen, ſituated on the little belt in the Baltick ſea, twenty miles weſt of Odenſee.

FREDERICKSTAT, a town of Sleſwick, or ſouth Jutland, ſituated on the river Eyder, near the German ocean, thirty-one miles weſt of Sleſwick.

FREDERICKSTAT, a town of Norway, in the principality of Agerhuys, ſituated on a bay of the ſea, called the Schaggerrack, near the frontiers of Sweden: E. long. 11° 24′, N. lat. 59°.

FREE, in a general ſenſe, is uſed in oppoſition to whatever is conſtrained or neceſſitated. When applied to things endowed with underſtanding, it more peculiarly relates to the liberty of the will.

FREE-HOLD, ſignifies lands or tenements which a perſon holds in fee-ſimple, fee-tail, or for term of life.

FREE-STONE, a whitiſh ſtone, dug up in many parts of Britain, that works like alabaſter, but is more hard and durable; being of excellent uſe in building, *&c.* It is a kind of the grit-ſtone, but finer ſanded, and a ſmoother ſtone; and is called free, from its being of ſuch a conſtitution as to cut freely in any direction.

FREE-THINKER. See DEIST.

FREEDOM, in general, the ſtate or quality of being free.

FREEDOM *of the will*, that power or faculty of the mind, whereby it is capable of acting or not acting, chuſing or rejecting whatever it judges proper. Of this every man muſt be ſenſible, who finds in himſelf a power to begin or forbear, continue or end ſeveral actions, barely by a thought or preference of the mind.

FREEZE, or FRIEZE, in commerce, a coarſe kind of woollen ſtuff, or cloth, for winter wear; ſo called, as being freezed or naped on each ſide.

FREEZING, in philoſophy, the ſame with congelation. See CONGELATION and FROST.

Philoſophers are by no means agreed as to the cauſe of this phænomenon. The Carteſians account for it by the receſs or going out of the etherial matter from the pores of the water. The corpuſcularians, on the other hand, attribute it to the ingreſs of frigorific particles, as they call them; and Hobbes aſſerts, that theſe particles

ticles are nothing elfe but common air, which entangling itfelf with the particles of water, prevents their motion. Others will have a kind of nitrous falt to be the caufe of congelation, by infinuating itfelf between the particles of water, and fixing them together, like nails. And, indeed, it feems probable that cold and freezing do arife from fome fubftance of a faline nature floating in the air; fince all falts, and particularly nitrous ones, when mixed with ice and fnow, greatly increafe their cold, and even bulk.

Boerhave obferves, that it is extremely difficult to exhibit to the eye the precife degree of cold wherein ice begins to form; fince heat and cold, once given to a body, adhere long to it before they quit it. When the air, therefore, is in fuch a ftate as keeps Fahrenheit's thermometer at 32 degrees, water will not freeze; becaufe water being 800 times denfer than air, retains the warmth confiderably longer than air. If any perfon, therefore, is curious to know in what degree of cold water begins to freeze, let him firft fufpend a thermometer in a free open air on all fides; and then wetting a thin linen cloth with clear water, and hanging it likewife in the open air, it will grow ftiff upon the firft accefs of the freezing cold, and thereby fhew when water is beginning to turn to ice. See THERMOMETER.

By means of freezing, wine, vinegar, and malt-liquors may be reduced to a fourth part of their quantity, without any confiderable lofs of their effential parts; fince only the aqueous parts freeze, leaving the vinous parts concentrated or brought into lefs compafs, and capable of being tranfported with lefs expence, and keeping for feveral years.

FREEZING MIXTURE. Mr Boyle fhews in his hiftory of cold, that not only all kinds of falts, but likewife fpirits, fugar, and faccharum faturni, mixed with fnow, are capable of freezing moft fluids; and the fame effect was alfo produced by the mixture of oil of vitriol, or fpirit of nitre with fnow.

FREIGHT, or FRAIGHT, in navigation and commerce, the hire of a fhip, or a part thereof, for the conveyance and carriage of goods from one port or place to another; or the fum agreed on between the owner and the merchant, for the hire and ufe of a veffel.

FRENCH, in general, fomething belonging to France: thus we fay, the French language, French cuftoms, polity, *&c.*

The French language is made up of Latin, Greek, Teutonic, and the language fpoken by the old Gauls. It is natural, and eafily pronounced, and therefore ufed by moft nations of Europe in converfing with foreigners. There are very few compound words in French, which is acknowledged to be its difadvantage. It has alfo few diminutives; but as to purity, eafinefs, and flexibility, it yields to none.

FRESCO, a method of painting in relievo on walls, fo as to endure the weather.

It is performed with water-colours on frefh plafter; or on a wall laid with mortar not yet dry. This fort of painting has a great advantage by its incorporating with the mortar, and, drying along with it, becomes very durable.

The compoft fhould be made of rubbifh ftones mixt with well-burnt flint, or lime, and water: but the faltnefs of the lime muft be wafhed out, by pouring water frequently on it. But this fhould not be done in moift weather.

To prevent the plafter from peeling, ftrike into the joints of the wall ftumps of horfe-nails fix inches diftant from each other. Firft plafter the walls pretty thick; then let it dry for fome time, the defign and colours being firft ready prepared. This painting is chiefly performed on walls and vaults newly plaftered with lime and fand; and the plafter is only to be put on in proportion as the painting proceeds.

Plafter the wall a fecond time, about the thicknefs of half a crown, only fo much as you intend to work upon; and while it is wet, work the colours therein, which will incorporate with the plafter fo as never to wafh out.

The painting muft be worked with a free hand, and your colours made high enough at firft, as there can be no alteration made after the firft painting.

In this work fcarce any thing elfe is ufed but earths, which ftill retain their colour, defending it from the burning and falt of the lime. The colours are white, made of lime flacked fome time, and white marble duft, red and yellow oker, violet red, verditer, lapis lazuli, fmalt, black Spanifh brown, Spanifh white, *&c.* all which are grounded and worked up with water.

The brufhes and pencils for this work muft be long and foft, or elfe they will rake and raze the painting: the colours muft be full and flowing from the brufh, and the defign or cartoon muft be perfect in the paper-copy.

FRESH, in general, fomething that is new, pure, and good; or, that has little or no falt in it.

FRET, or FRETTE, in architecture, a kind of knot or ornament, confifting of two lifts or fmall fillets varioufly interlaced or interwoven, and running at parallel diftances equal to their breadth.

FRET, in heraldry, a bearing compofed of fix bars, croffed, and varioufly interlaced, as reprefented in plate LXXX. fig. 9.

Some call it the true lover's knot.

FRET, in mufic, fignifies a kind of ftop on fome inftruments, particularly bafs-viols and lutes. Frets confift of ftrings tied round the neck of the inftrument, at certain diftances, within which fuch and fuch notes are to be found.

FRET-WORK, that adorned with frets. It is fometimes ufed to fill up and enrich flat empty fpaces; but is moftly practifed in roofs, which are fretted over with plafter work.

FREYSTAT, a town of Silefia, in Germany, E. long. 17° 55′, N. lat. 50°.

FRIABLE, among naturalifts, an appellation given to bodies that are eafily crumbled to pieces: fuch are the free-ftone, pumice-ftone, *&c.*

FRIAR, a term common to monks of all orders, founded

ed on this, that there is a kind of fraternity, or brotherhood, between the feveral religious perfons of the fame convent or monaftery.

Friars are generally diftinguifhed into thefe four principal branches, *viz.* 1. Minors, grey friars, or francifcans. 2. Auguftines. 3. Dominicans, or black friars. 4. White friars, or carmelites. From thefe four the reft of the orders defcend. See FRANCISCANS, AUGUSTINES, *&c.*

FRIBURG, the capital of a canton of the fame name in Switzerland, fituated eighteen miles fouth weft of Bern: E. long. 6° 55′, N. lat. 46° 50′.

FRIBURGH, a city of Swabia, in Germany, twenty-eight miles fouth of Strafburg.

FRICENTO, a town and bifhop's fee of Italy, forty-three miles eaft of the city of Naples.

FRICTION, in mechanics, the rubbing of the parts of engines and machines againft each other, by which means a great part of their effect is deftroyed. See MECHANICS.

FRIDBURG, an imperial city of Bavaria, in Germany: E. long. 10°, and N. lat. 48° 30′.

FRIDBURG is alfo the name of two other towns in Germany, both fituated in the circle of Upper Saxony, the one nine miles fouth-weft of Drefden, and the other thirty miles weft of Leipfic.

FRIEDBURG, an imperial city of Germany, fixteen miles north of Francfort on the main.

FRIESLAND, one of the moft northern provinces of the united Netherlands, bounded by the German ocean on the north, by Groningen and Overyffel on the eaft, by the Zuider-fea and Overyffel on the fouth, and by the fame ocean on the weft: its chief town is Lewarden.

Eaft-FRIESLAND, a province of Weftphalia, in Germany, being the north-weft part of Germany, bordering on Groningen.

FRIEZE, FREEZE, or FRISE, in architecture, a large flat face, or member, feparating the architrave from the corniche, being that part of the entablature between the architrave and the corniche. See ARCHITECTURE.

FRIGAT, among feamen, a fhip of war, light built, and that is a good failer.

A frigat has commonly two decks; whence that called a light frigat, is a frigat with only one deck.

FRIGID, is applied to a jejune ftyle, that is unanimated by any ornaments, and confequently without any force or vigour.

FRIGORIFIC, in phyfiology, fmall particles of matter, which, according to Gaffendus and others, being actually and effentially cold, and penetrating other bodies, produce in them that quality which we call cold.

FRILL, in falconry. When a hawk trembles, or fhivers, they fay fhe frills.

FRINGILLA, in ornithology, a genus belonging to the order of pafferes. The bill is conical, ftrait, and fharp-pointed. There are no lefs than thirty fpecies comprehended under this genus, diftinguifhed principally by varieties in their colour.

1. The brown fringilla with a tawny neck, and white fpots on the wings and hinder part of the back. It is the Carolina ortolan of Catefby, and is a bird of the ifland of Cuba; only the hens pafs into Carolina in the autumn. 2. The fringilla with black limbs, and the wings white on both fides; the three firft feathers of the tail are without fpots, but two of the chief are obliquely fpotted. It is the chaffinch of Englifh authors, and is a bird of Europe. 3. The fringilla, with the bafe of the wings underneath of a deep yellow colour. It is the brambling or mountain finch of Englifh authors, and is a bird of Europe. 4. The brown fringilla, with a reddifh breaft and fhoulders, and the black wings marked with a reddifh fpot: It is an inhabitant of Sweden. 5. The fringilla with a blackifh fpotted head, and a white fpot behind the eyes. It is the greater chaffinch of Albin, and is found in Lapland. 6. The fringilla with the limbs, wings, and tail black, only the outermoft from the middle externally white. It is a bird of Sweden. 7. The grey fringilla, fpotted with black, has a fpace running from the bill to the fides of the neck black. It is the fhomburgher, a-kin to the lark of Edwards, and is a bird of South America. 8. The black fringilla, with a reddifh glofs, and a reddifh belly, with a white fpot on the wings, is the American black fparrow with red eyes, of Catefby. 9. The fringilla, with the quill-feathers red forwards, and the outermoft without any fpots; the two outermoft are white in the middle, as the reft are at the point. This is the goldfinch of Englifh authors. 10. The fringilla with a red face and tail, the belly undulated with white and black, and the back green. It is the green goldfinch of Edwards, and is a Chinefe bird. 11. The fringilla with purple tail-feathers, with the hinder halves black. It is the amaduvad of Albin, and an inhabitant of the Eaft Indies. The cock is all over purple; but the hen is afh-coloured, except the bill and tail. 12. The green fringilla with a red head, a yellow collar, and a blue breaft. It is the red-headed green finch of Edwards. 13. The fringilla all over red, is the red fly-catcher of Catefby, and is a bird of America. 14. The yellow fringilla, with a black forehead and brown wings, is the American goldfinch of Catefby. 15. The fringilla with a black head, a tawny breaft, and a white ftreak on the wings and above and below the eyes, is the Bahama finch of Catefby. 16. The fringilla with a wedge-like tail, a reddifh body, a red bill, and the temples, rump and belly of a violet colour, is the red and blue Brafilian finch of Edwards. 17. The green fringilla, with the fupercilia, breaft and belly yellow, but the prime feathers of the wings are white on the outer edge. It is the Indian green finch of Edwards, and is found in Madera. 18. The fringilla with a whitifh body and bill, and the prime feathers of the wings and tail greenifh. This is the Canary bird of Englifh authors, and is found in the Canary iflands. 19. The fringilla with the prime feathers of the wings yellow in the middle, and the fore firft chief tail-feathers without fpots; but they are yellow at the bafe, and black at the points. It is the fifkin of Englifh authors, and haunts places where juniper-bufhes grow. 20. The brown fringilla, with a flame-coloured creft, is

is the brown linnet of Klein. 21. The brown fringilla, with a yellowifh bill, is an European bird, as are alfo the two former. 22. The fringilla, with the prime feathers of the wings, and the chief feathers of the tail black, but white on the edges. It is the greater red-headed linnet of Ray, and is a bird of Europe. 24. The fringilla, with a brown back, and a blue belly and tail, is the blue bellied finch of Edwards, and is found in Africa. 25. The violet-coloured fringilla, with the forehead and under part of the body of a deep yellow colour; the back, neck, prime feathers of the wings, and upper part of the tail are of a bluifh black colour; but the forehead, breaft, belly, and under part of the neck are of a deep yellow. The bill is exceeding fhort, triangular, black and crooked at the point. 26. The fringilla with the chief feathers of the tail brown, and the outermoft marked with a wedge-like fpot; the body is variegated with grey and black, and the head is black. It is the reed fparrow of Englifh authors, and is a bird of Europe. 27. The fringilla with the prime feathers of the wings and tail brown, the body variegated with grey and black, and a fingle white ftreak on the wings. This is the houfe-fparrow of Englifh authors, and is an European bird. 28. The fringilla with the prime feathers of the wings and tail brown, the body variegated with grey and black, and a double white ftreak on the wings. This is the mountain-fparrow of Ray, and is a bird of Europe. 29. The ferruginous fringilla, with a black head and a blue bill, is the Chinefe fparrow of Edwards. 30. The black fringilla, with a white belly, is the American fnow-fparrow of Catefby.

FRINWALT, or FRIDLAND, a town of Brandenburg, thirty miles north-eaft of Berlin, fituated on the weft fide of the river Oder.

FRIO, a cape or promontory of Brafil: W. long. 44°, and S. lat. 23° 30′.

FRISACH, a town of Bavaria, fixty miles fouth-eaft of Saltzburg: E. long. 14° 15′, and N. lat. 47° 20′.

FRISONE, in ornithology. See LOXIA.

FRIT, in the glafs-manufacture, the matter or ingredients whereof glafs is to be made, when they have been calcined or baked in a furnace; or it is the calcined matter to be run into glafs. See GLASS.

FRITH, in its moft ufual acceptation, fignifies an arm of the fea: fuch are the frith of Forth or of Edinburgh, the frith of Clyde, Murray frith, *&c.*

FRITILLARIA, in botany, a genus of the hexandria monogynia clafs. The corolla confifts of fix bell-fhaped petals, with a hollow nectarium above the unguis of each petal; and the ftamina are of an equal length with the petals. There are five fpecies, only one of which is a native of Britain, *viz.* the meleagris or common checkered daffodil.

FRIULI, a province of Italy, fubject to Venice, and bounded by Carinthia in Germany on the north, by Carniola on the eaft, by the gulph of Venice on the fouth, and by the Bellunefe and Feltrin on the weft.

FRIZING *of cloth*, a term, in the woollen manufactory, applied to the forming of the nap of a cloth, or ftuff, into a number of little hard burrs or prominences, covering almoft the whole ground thereof.

Some cloths are only frized on the back fide, as black cloths; others on the right fide, as coloured and mixed cloths, rateens, bays, freezes, *&c.*

Frizing may be performed two ways; one with the hand, that is, by means of two workmen, who conduct a kind of plank that ferves for a frizing inftrument.

The other way is by a mill, worked either by water, or a horfe, or fometimes by men. This latter is efteemed the better way of frizing, by reafon the motion being uniform and regular, the little knobs of the frizing are formed more equally and regularly.

FROBISHER's STRAITS, in weft Greenland, lie a little to the northward of Cape Farewel: W. long. 48°, and N. lat. 63°.

FRODINGHAM, a market-town of Yorkfhire, thirty miles eaft of York.

FRODSHAM, a market-town of Chefter, fourteen miles north eaft of Chefter.

FROG, in zoology. See RANA.

FRONTEIRA, a town of Portugal, in the province of Alentejo: W. long. 8° 6′, and N. lat. 38° 50′.

FRONTIER, the border, confine, or extremity of a kingdom or province, which the enemies find in front, when they would enter the fame: thus we fay, a frontier town, a frontier province, *&c.*

Frontiers were anciently called marches.

FRONTIS OS, in anatomy. See ANATOMY, p. 152.

FRONTIGNIAC, a town of Languedoc in France, fituated fixteen miles fouth-weft of Montpelier, and remarkable for producing excellent wine.

FROST, in phyfiology, fuch an exceffively cold ftate of the air as converts watery fluids into ice.

In very cold fnowy weather, not only water, but urine, beer, ale, milk, vinegar, and even wine, are either wholly or in part converted into ice, though the laft but flowly. As to the freezing of expreffed oils, a very intenfe cold may deprive them of their fluidity, fo as to be capable of being cut into portions of any figure; but whether they are convertible into real ice, is not yet determined. In Ruffia oil freezes much harder than with us, but does not even there become perfect ice. Common annifeed-water, and the like weak fpirits, are faid to be converted into an imperfect ice in Mufcovy; and the ftrong fpirits into a fubftance like that of oil. When brandy freezes, a liquid part, much ftronger than common brandy, retires to the centre of the veffel.

Even folid bodies are liable to be affected by froft: timber is often apparently frozen, and rendered exceedingly difficult to faw. Marle, chalk, and other lefs folid terreftrial concretions, will be fhattered by ftrong and durable frofts. Metals are contracted by froft: thus, an iron tube, twelve foot long, upon being expofed to the air in a frofty night, loft two lines of its length. On the contrary, it fwells or dilates fluids near one tenth of their bulk. Mr Boyle made feveral experiments with metalline veffels, exceeding thick and ftrong; which being filled with water clofe ftopped, and expofed to the cold, burft by the expanfion of the frozen fluid within them. Trees are frequently

quently burnt up with froſt, as with the moſt exceſſive heat; and in very ſtrong froſts, walnut-trees, aſhes, and even oaks, are ſometimes miſerably ſplit and cleft, ſo as to be ſeen through, and this with a terrible noiſe, like the exploſion of fire arms.

Froſt naturally proceeds from the upper parts of bodies downwards; but how deep it will reach in earth or water, is not eaſily known, becauſe this depth may vary with the degree of coldneſs in the air, by a longer or ſhorter duration of the froſt, the texture of the earth, the nature of the juices wherewith it is impregnated, the conſtitution of its more internal parts as to heat and cold, the nature of its effluvia, *&c.* Mr Boyle, in order to aſcertain this depth, after four nights of hard froſt, dug in an orchard, where the ground was level and bare, and found the froſt had ſcarce reached three inches and a half; and in a garden nearer the houſe, only two inches below the ſurface. Nine or ten ſucceſſive froſty nights froze the bare ground in the garden ſix inches and a half deep; and in the orchard, where a wall ſheltered it from the ſouth ſun, to the depth of eight inches and a half. He alſo dug in an orchard, near a wall, about a week afterwards, and found the froſt to have penetrated to the depth of fourteen inches. In a garden at Moſcow, the froſt in a hard ſeaſon only penetrates to two feet: and the utmoſt effect that capt. James mentions the cold to have had upon the ground of Charlton iſland, was to freeze it to ten feet deep: whence may appear the different degrees of cold of that iſland and Ruſſia. And as to the freezing of water at the above-mentioned iſland, the captain tells us, it does not naturally congeal above the depth of ſix feet, the reſt being by accident. Water alſo, expoſed to the cold air in large veſſels, always freezes firſt at the upper ſurface, the ice gradually increaſing and thickening downwards; for which reaſon frogs retire in froſty weather to the bottom of ditches: and it is ſaid, that ſhoals of fiſh retire in winter to thoſe depths of the ſea and rivers, where they are not to be found in ſummer. Water, like the earth, ſeems not diſpoſed to receive any very intenſe degree of cold at a conſiderable depth or diſtance from the air. The vaſt maſſes of ice found in the northern ſeas being only many flakes and fragments, which, ſliding under each other, are, by the congelation of the intercepted water, cemented together.

In cold countries, the froſt proves often fatal to mankind; not only producing cancers, but even death itſelf. Thoſe who die of it have their hands and feet firſt ſeized, till they grow paſt feeling it; after which the reſt of their bodies is ſo invaded, that they are taken with a drowſineſs, which if indulged, they awake no more, but die inſenſibly. But there is another way whereby it proves mortal, *viz.* by freezing the abdomen and viſcera, which on diſſection are found to be mortified and black.

Hoar-FROST, a cold moiſt vapour, that is drawn up a little way into the air, and in the night falls again on the earth, where it is congealed into icy cryſtals of various figures. Hoar-froſt therefore is nothing but dew, turned into ice by the coldneſs of the air.

FROTH, a white, light ſubſtance, formed on the ſurface of fluids, by vehement agitation, conſiſting of little ſpherules, or globules.

FROTH-SPIT, or CUCKOW-SPIT, a name given to a white froth, or ſpume, very common, in the ſpring and firſt months of the ſummer, on the leaves of certain plants, particularly on thoſe of the common white field lychnis or catch-fly, thence called by ſome ſpatling poppy.

All writers on vegetables have taken notice of this froth, though few have underſtood the cauſe or origin of it till of late; being formed by a little leaping animal, called by ſome the flea graſs-hopper, by applying its anus cloſe to the leaf, and diſcharging thereon a ſmall drop of a white viſcous fluid, which containing ſome air in it, is ſoon elevated into a ſmall bubble: before this is well formed, it depoſites ſuch another drop, and ſo on, till it is every way overwhelmed with a quantity of theſe bubbles, which form the white froth which we ſee.

FRUCTIFEROUS, ſignifies properly any thing that produces fruit.

FRUCTIFICATION, among botaniſts, in a more lax ſenſe, includes the flower and fruit, with their ſeveral coverings. See BOTANY.

FRUIT, in general, includes whatever the earth produces for the nouriſhment and ſupport of man, and other animals; as herbs, grain, hay, corn, *&c.*

FRUIT, more properly, ſignifies the production of a tree, or plant, for the propagation or multiplication of its kind; in which ſenſe the word takes in all kinds of ſeeds with their furniture. But botaniſts uſually underſtand by it that part of a plant wherein the ſeeds are contained.

FRUIT alſo implies an aſſemblage of ſeeds in a head; as in a ranunculus, *&c.* and all kinds of ſeeds, or grains, whether incloſed in a cover, capſule, or pod; and whether bony, fleſhy, ſkinny, membranous, or the like. See AGRICULTURE, Part I.

FRUMENTACEOUS, a term applied by botaniſts to all ſuch plants as have a conformity with wheat, in reſpect of their fruits, leaves, ears, or the like.

FRUMENTARII, a kind of ſoldiers, or archers, under the weſtern empire.

The firſt time we read of theſe officers is in the time of the emperor Adrian, who made uſe of them to inform himſelf of whatever paſſed. They did not make any particular corps diſtinct from the reſt of the forces, but there was a certain number of them in each legion. It is ſuppoſed, that they were at firſt a number of young perſons diſpoſed by Auguſtus throughout the provinces, particularly on all the grand roads, to acquaint the emperor, with all expedition, of every thing that happened.

Afterwards they were incorporated into the troops themſelves, where they ſtill retained their ancient name. As their principal office was the giving intelligence, they were often joined with the curioſi, with whom they agreed in this part of their office.

Their name of frumentarii is derived from their being alſo a ſort of purveyors to the armies, cities, *&c.* col-

collecting all the corn from the several provinces to furnish the common-wealth.

FRUMENTATION, in Roman antiquity, a largess of corn bestowed on the people. This practice of giving corn to the people was very ancient among the Romans; and frequently used to sooth the turbulent humour of the populace. At first the number of those to whom this largess was given, was indeterminate, till Augustus fixed it at two hundred thousand.

FRUSH, or FROG, among farriers, a sort of tender horn which arises in the middle of a horse's sole; and, at some distance from the toe, divides into two branches, running towards the heel in the form of a fork.

FRY, in zoology, signifies the spawn, or rather young, of fish.

FUCUS, in botany, a genus of submarine plants, belonging to the cryptogamia class.

The fucus consists of a tough matter, formed into a kind of leaves, which are flat and variously divaricated; and which have some appearance of fructification, in punctated tubercles, covering oblong vesicles, supposed by Linnæus to be male flowers; and smooth roundish vesicles, hollow and interwoven with filaments, which appear to him to be female flowers. There are thirty-four species of fucus, or sea wrack, many of them to be found on our coasts.

FUEL, whatever is proper to burn or make a fire; as, wood, turfs, peats, bituminous earths, coals, *&c.*

FUGALIA, in Roman antiquity, a feast supposed by some to be the same with the refugium, held on the 24th of February, in memory of the expulsion of the kings, and the abolishing of the monarchial government. Others again distinguish the fugalia from the regifuge. And others think, that the Fugalia was the same with the poplifugia, or the feast of Fugia, the goddess of joy, occasioned by the rout of an enemy, which was the reason the people abandoned themselves to riot and debauchery.

FUGITIVE, a person obliged to fly his country, or remove from a place where he had some abode, or establishment, on account of his crimes, debts, or other occasions.

FUGUE, in music, is when different parts of a musical composition follow each other; each repeating what the first had performed.

FULCRUM, in mechanics, the prop or support by which a lever is sustained. See MECHANICS.

FULD, a town and abbey of Germany, the abbot of which is a prince of the empire: E. long. 9° 35′, N. lat. 50° 34′.

FULICA, the COOT, in ornithology, a genus of birds, of the order of grallæ. It has a convex bill, with the upper mandible fornicated over the lower at the edge; the lower mandible is gibbous behind the tip. The forehead is bald, and the feet have four toes a little lobated. There are four species.

1. The Fulica with a bald forehead, a black body, and lobated toes. It is the coot of Ray, and an inhabitant of Europe, and feeds upon seeds and herbs, and runs as well as swims upon the water. 2. The fulica with a bald forehead, and toes without webs. It is the water-hen, or moor-hen of Ray, and is found in Europe. 3. The fulica with a bald forehead, a violet-coloured body, and toes without webs, is the purple water hen of Edwards, and it inhabits Asia and America. 4. The fulica with a carunculated forehead, a variegated body, spinous shoulders, and toes without webs; but the nail on the hinder toe is exceeding long. It is the spur-winged water-hen of Edwards, and is an inhabitant of South America. The nail on the hind toe is strait, and longer than a man's finger. The pollex rests upon one joint, and the wings are green.

FULIGINOUS, whatever proceeds from a thick, sooty smoke, such as litharge and lamp black.

FULIGNO, a city of Italy, in the pope's territories, ten miles north of Spoletto.

FULIGO, in natural history, a species of pumice-stone. See PUMICE.

FULLER, a workman employed in the woollen manufactories, to mill or scour cloths, serges, and other stuffs, in order to render them more thick, compact, and durable. See CLOTH.

FULLER'S EARTH, in natural history, a soft, greyish, brown, dense, and heavy marle: when dry, it is of a greyish ash-coloured brown, in all degrees from very pale to almost black, and it has generally something of a greenish cast: it is very hard and firm, of a compact texture, of a rough and somewhat dusty surface that adheres slightly to the tongue: it is very soft to the touch, not staining the hands, nor breaking easily between the fingers: it has a little harshness between the teeth, and melts freely in the mouth: thrown into water, it makes no ebullition, or hissing, but swells gradually in bulk, and falls into a fine soft powder. It makes no effervescence with aqua fortis.

It is of great use in scouring cloths, stuffs, *&c.* imbibing all the grease and oil used in preparing, dressing, *&c.* of the wool, for which reason it is made a contraband commodity, and is not to be exported under the penalty of 1 s. for every pound weight. See FULLING.

FULLER'S WEED, in botany. See DIPSACUS.

FULLERY, a place where cloths, *&c.* are fulled. See the next article.

FULLING, the art or act of scouring and pressing cloths, stuffs, stockings, *&c.* to cleanse, thicken, and render them more firm and strong, which is done by means of a water mill.

Fuller's earth is used with some proportion of soap; but soap alone would do much better, was it not dearer than fuller's earth.

Fulling of stockings, caps, *&c.* is performed either with the hands or feet, or a kind of wooden machine, either armed with wooden teeth, or those of horses or bullocks. The ingredients generally used on this occasion are fuller's earth, urine, white soap and green soap. But water softened with chalk is far preferable.

FULMINATING, something that thunders, or resembles thunder.

FULMINATION, in chemistry, is used in a synonymous sense with detonation.

Fulmination,

Fulmination in the depuration of the more perfect metals, is, when, upon infufing them with lead, a brighter colour fucceeds a kind of fulphureous cloud, before appearing in the metals, during the fufion.

Fulmination, in the Romifh canon law, a fentence of a bifhop, official, or other ecclefiaftic appointed by the pope, by which it is decreed, that fome bull fent from the pope fhall be executed.

FUMARIA, in botany, a genus of the diadelphia hexandria clafs. The calix confifts of two leaves; and the corolla is ringent. There are 11 fpecies, three of them natives of Britain, *viz.* the officinalis, or fumitory; the capreolata, or ramping fumitory; and the claviculata, or climbing fumitory.

The whole plant of the officinalis is ufed in medicine, being accounted good in the fcurvy, jaundice, and diforders of the mefentery and fpleen.

FUMIGATION, in chemiftry, a kind of calcination, when metals, or other hard bodies, are corroded, or foftened, by receiving certain fumes for that purpofe.

Fumigation, in medicine, the application of fumes to particular parts of the body; as thofe of factitious cinnabar, to venereal ulcers.

FUMITORY, in botany. See Fumaria.

FUNCHAL, the capital of the Madeira iflands, fubject to Portugal: W. long. 16°, N. lat. 32° 33′.

FUNCTION, the act of fulfilling the duties of any employment.

Function, being alfo applied to the actions of the body, is by phyficians divided into vital, animal, and natural The vital functions are thofe neceffary to life, and without which the individual cannot fubfift; as the motion of the heart, lungs, *&c.* The natural functions are fuch as it cannot fubfift any confiderable time without them, as the digeftion of the aliment, and its converfion into blood. Under animal functions are included the fenfes of touching, tafting, *&c.* memory, judgment, and voluntary motion, without any, or all of which an animal may live, but not very comfortably.

The animal functions perform the motion of the body by the action of the mufcles, and this action confifts chiefly in the fhortening the flefhy fibres, which is called contraction, the principal agents of which are the arteries and nerves diftributed in the flefhy fibres.

In fhort, all parts of the body have their own functions, or actions peculiar to themfelves. Life confifts in the exercife of thefe functions, and health in the free and ready exercife of them.

FUND, in commerce, fignifies the ftocks of the great trading and monied companies. See Stocks.

FUNDAMENT, in anatomy. See Anus.

FUNDI-BAY, that fituated between New England and New Scotland, in which there is faid to be an excellent fifhery.

FUNEN, the fecond ifland for magnitude belonging to the king of Denmark, fituated at the entrance of the Baltic fea, and feparated from Jutland by the ftrait called the leffer Belt, and from the ifland of Zeland by the ftrait called the great Belt. Its chief town is Odenfee.

FUNERAL rites, ceremonies accompanying the interment or burial of any perfon.

Thefe rites differed among the ancients according to the different genius and religion of each country. The Egyptians, among the reft of their funeral rites, embalmed their dead.

Among the ancient Greeks it was ufual fometimes, before the interment, to put a piece of money into the mouth of the deceafed, which was thought to be Charon's fare for wafting the departed foul over the infernal river. This ceremony was not ufed in thofe countries which were fuppofed to be fituated in the neighbourhood of the infernal regions, and to lead thither by a ready and direct road. The corpfe was likewife furnifhed with a cake, compofed of flour, honey, *&c.* which was defigned to appeafe the fury of Cerberus, the door-keeper of hell, and to procure the ghoft a fafe and quiet entrance.

During the time the corpfe continued in the houfe, there ftood before the door a veffel of water, the defign of which was, that thofe concerned about the body might purify themfelves by wafhing; it being the opinion of the Greeks, as well as of the Jews, that pollution was contracted by touching a dead body.

The ceremonies by which they expreffed their forrow for the death of their friends, were various; but it feems to have been a conftant rule to recede as much as poffible in habit and behaviour from their ordinary cuftoms. For this reafon they abftained from banquets and entertainments; they diverted themfelves of all ornaments; they tore, cut off, or fhaved their hair, which they caft into the funeral pile, to be confumed with the body of their deceafed friend. Sometimes they threw themfelves on the ground, and rolled in the duft, or covered their head with afhes; they beat their breafts, and even tore their flefh with their nails, upon the lofs of a perfon they much lamented. When perfons of rank, fuch as public magiftrates, or great generals, died, the whole city put on a face of mourning: all public meetings were intermitted; the fchools, baths, fhops, temples, and all places of concourfe were fhut up.

Interring or laying the dead in the ground, feems to have been the moft ancient practice among the Greeks; though burning came afterwards to be generally ufed among them. It was cuftomary to throw into the funeral pile thofe garments the deceafed ufually wore. The pile was lighted by one of the dead perfon's neareft relations or friends, who made prayers and vows to the winds to affift the flames, that the body might quickly be reduced to afhes; and during the time the pile was burning, the dead perfon's friends ftood by it, pouring libations of wine, and calling upon the deceafed.

When Numa reformed the religion of Rome, he ordered that the pontiffs fhould have the care of the funeral ceremonies; which, in moft refpects, were like thofe of the Greeks already defcribed.

The funeral rites among the Hebrews, were folemn and magnificent: when any perfon was dead, his relations and friends rent their cloaths; which cuftom is but faintly imitated by the modern Jews, who only cut off a

bit of their garment, in token of affliction. It was uſual to bend the dead perſon's thumb into the hand, and faſten it in that poſture with a ſtring; becauſe the thumb then having the figure of the name of God, they thought the devil would not dare to approach it. When they came to the burying place, they made a ſpeech to the dead in the following terms: "Bleſſed "be God, who has formed thee, fed thee, maintain-"ed thee, and taken away thy life. O dead! he knows "your numbers, and ſhall one day reſtore your life, *&c.*" Then they ſpoke the elogium, or funeral oration, of the deceaſed; after which they ſaid a prayer, called the righteouſneſs of judgment; then turning the face of the deceaſed towards heaven, they called out, "Go "in peace.

The ancient Chriſtians teſtified their abhorrence of the Pagan cuſtom of burning the dead; and always depoſited the body entire in the ground: and it was uſual to beſtow the honour of embalming upon the martyrs at leaſt, if not upon others. They prepared the body for burial, by waſhing it with water, and dreſſing it in a funeral attire. The exportation, or carrying forth of the body, was performed by near relations, or perſons of ſuch dignity as the circumſtances of the deceaſed required. Pſalmody, or ſinging of Pſalms, was the great ceremony uſed in all funeral proceſſions among the ancient Chriſtians.

In the Romiſh church, when a perſon is dead, they waſh the body, and put a crucifix in its hand. At its feet ſtands a veſſel full of holy water, and a ſprinkler, that they who come in may ſprinkle both themſelves and the deceaſed. In the mean time ſome prieſt ſtands by the corpſe, and prays for the deceaſed till it is laid in the earth. In the funeral proceſſion, the exorciſt walks firſt, carrying the holy water; next the croſs-bearer, afterwards the reſt of the clergy, and laſt of all the officiating prieſt. They all ſing the *miſerere*, and ſome other pſalms; and at the end of each pſalm a *requiem*. We learn from Alet's ritual, that the faces of deceaſed laymen muſt be turned towards the altar, when they are placed in the church; and thoſe of the clergy, towards the people. The corpſe is placed in the church ſurrounded with lighted tapers: after the office for the dead, maſs is ſaid; then the officiting prieſt ſprinkles the corpſe thrice with holy water, and as often throws incenſe on it. The body being laid in the grave, the friends and relations of the deceaſed ſprinkle the grave with holy water.

The funeral ceremonies of the Greek church, are much the ſame with thoſe of the Latin. It needs only be obſerved, that after the funeral ſervice, they kiſs the crucifix, and ſalute the mouth and forehead of the deceaſed: after which each of the company eats a bit of bread, and drinks a glaſs of wine in the church, wiſhing the ſoul a good repoſe, and the afflicted family all conſolation.

FUNERAL GAMES, a part of the ceremony of the ancient funerals.

It was cuſtomary for perſons of quality, among the ancient Greeks and Romans, to inſtitute games with all ſorts of exerciſes, to render the death of their friends more remarkable. This practice was generally received, and is frequently mentioned by ancient writers. Patroclus's funeral games, take up the greateſt part of one of Homer's iliads; and Agamemnon's ghoſt is introduced by the ſame poet telling the ghoſt of Achilles, that he had been a ſpectator at a great number of ſuch ſolemnities.

The celebration of theſe games among the Greeks, moſtly conſiſted of horſe-races; the prizes were of different ſorts and value, according to the quality and magnificence of the perſon that celebrated them. The garlands, given to victors on this occaſion, were uſually of parſly, which was thought to have ſome particular relation to the dead.

Thoſe games, among the Romans, conſiſted chiefly of proceſſions; and ſometimes of mortal combats of gladiators around the funeral pile. They, as well as the Greeks, had alſo a cuſtom, though very ancient, of cutting the throats of a number of captives before the pile, as victims to appeaſe the manes of the deceaſed. Cæſar relates, that the Gauls had this cuſtom.

The funeral games were aboliſhed by the emperor Claudius.

FUNERAL ORATION, a diſcourſe pronounced in praiſe of a perſon deceaſed, at the ceremony of his funeral.

FUNGIBLES, in Scots law, are ſuch things as are eſtimated by number, weight, or meaſure; as, coin, butter, ale, *&c.*

FUNGITÆ, in natural hiſtory, a kind of foſſile coral, of a conic figure, though ſometimes flatted and ſtriated longitudinally.

FUNGUS, in ſurgery, denotes any ſpongy excreſcence. See SURGERY.

FUNGUS, in botany, See BOTANY, p. 636.

FURCA, in antiquity, a piece of timber reſembling a fork, uſed by the Romans as an inſtrument of puniſhment.

The puniſhment of the furca was of three kinds: the firſt only ignominious, when a maſter, for ſmall offences, forced his ſervant to carry a furca on his ſhoulders about the city. The ſecond was penal, when the party was led about the circus, or other place, with the furca about his neck, and whipped all the way. The third was capital, when the malefactor, having his head faſtened to the furca, was whipped to death.

FURCHE', in heraldry, a croſs forked at the ends.

FURIES, in Pagan antiquity, certain goddeſſes whoſe office it was to puniſh the guilty after death. Theſe were three in number; Alecto, Megæra, and Tiſiphone, who were deſcribed with ſnakes inſtead of hair, and eyes like lightening, carrying iron-chains and whips in one hand, and in the other flaming torches; the latter to diſcover, and the former to puniſh the guilty; and they were ſuppoſed to be conſtantly hovering over ſuch perſons as had been guilty of any enormous crime.

Mythologiſts ſuppoſe, that Tiſiphone puniſhed the crimes which ſprang from hatred or anger; Megæra, thoſe from envy; and Alecto, thoſe from an inſatiable purſuit after riches and pleaſure. They were worſhipped at Caſina in Arcadia, and at Carmia in Peloponneſus.

fus. They had a temple at Athens, near the Areopagus, and their priests were chosen from amongst the judges of that court. At Telphusia, a city in Arcadia, a black ewe was sacrificed to them.

FURLING, in the sea language, signifies the wrapping up and binding any sail close to the yard; which is done by hauling upon the clew-lines, bunt-lines, *&c.* which wraps the sail close together, and being bound fast to the yard, the sail is furled.

FURLONG, a long measure, equal to one eighth of a mile, or forty poles.

It is also used, in some law-books, for the eighth part of an acre.

FURLOUGH, in the military language, a licence granted by an officer to a soldier, to be absent for some time from his duty.

FURNACE, an utensil, or vessel, proper to contain fire; or to raise and maintain a vehement fire in, whether of coal or wood. See Chemistry, p. 110.

FURNES, a town of Flanders, ten miles east of Dunkirk: E. long. 2° 25′, and N. lat. 51° 10′.

FUROR uterinus, a disorder peculiar to women. See Medicine.

FURR, in commerce, signifies the skin of several wild beasts, dressed in alum with the hair on, and used as a part of dress by princes, magistrates, and others. The kinds most in use are, those of the ermine, sable, castor, hare, coney, *&c.*

FURSTENBURGH, a town and castle of Germany, the capital of a county of the same name, thirty miles north-west of Constance: E. long. 8° 30′, and N. lat. 47° 50′.

FURSTENFIELD, a town of Austria and dutchy of Stiria, thirty-six miles east of Gratz: E. long. 16° 46′, N. lat. 47° 26′.

FURTHCOMING, in law, the name of an action competent to any person who has used arrestment in the hands of his debtor's creditor, for having the subject arrested declared his property. See Scots Law, title 25.

FURUNCLE, or Boil, in surgery, a small resisting tumour, with inflammation, redness, and great pain, arising in the adipose membrane, under the skin.

FURZE, in botany. See Ulex.

FUSANUS, in botany. See Euonymus.

FUSAROLE, in architecture, a moulding or ornament placed immediately under the echinus, in the Doric, Ionic, and Composite capitals.

FUSEE, in clock-work, is that conical part drawn by the spring, and about which the chain or string is wound; for the use of which, see Watch.

Fusee, or Firelock. See Musquet.

FUSIBILITY, in natural philosophy, that quality of bodies which renders them fusible.

FUSIL, in heraldry, a bearing of a rhomboidal figure, longer than the lozenge, and having its upper and lower angles more acute and sharp than the other two in the middle. It is called in Latin *fusus*, a spindle, from its shape. See Plate LXXX. fig. 10.

FUSILIERS, or Fusileers, in the military art, are foot-soldiers, armed with fusees, or firelocks.

FUSION, the melting of metals, minerals, *&c.* by means of fire. See Chemistry.

FUSTIAN, in commerce, a kind of cotton stuff, which seems as it were whaled on one side.

Right fustians should be altogether made of cotton-yarn, both woof and warp; but a great many are made, of which the warp is flax, or even hemp.

There are fustians made of several kinds, wide, narrow, fine, coarse; with shag or nap, and without it.

FUSTICK, or Fustock, a yellow wood, that grows in all the Caribbee islands, used in dying yellow. It pays no duty on importation.

FUTTOCKS, in a ship, the timbers raised over the keel, or the encompassing timbers that make her breadth.

FUTURE, in general, denotes whatever regards futurity, or the time to come.

G

GABARA, or Gabbara, in antiquity, the dead bodies which the Egyptians embalmed, and kept in their houses, especially those of such of their friends as died with the reputation of great piety and holiness, or as martyrs. See Embalming, and Mummy.

GABEL, according to the French duties or customs, a tax upon salt, which makes the second article in the king's revenue, and amounts to about one fourth part of the whole revenue of the kingdom.

GABIN, a town of great Poland, forty-six miles north-west of Warsaw: E. long. 20°, N. lat. 52° 35′.

GABIONS, in fortification, baskets made of ozier-twigs, of a cylindrical form, six feet high, and four wide; which being filled with earth, serve as a shelter from the enemies fire.

GABLOCKS, the artificial spurs of game-cocks.

GAD, among miners, a small punch of iron, with a long wooden handle, used to break up the ore.

One of the miners holds this in his hand, directing the point to a proper place, while the other drives it into the vein, by striking it with a sledge-hammer.

Gad-fly. See Oestrus.

GADUS, in ichthyology, a genus of fishes belonging to the order of jugulares. The head is smooth; there

are

are feven cylindrical rays in the branchioftege membrane; the body is oblong, with deciduous fcales; the whole fins are covered with the common fkin of the fifh; the rays of the back-fins are blunt, and thofe of the breaft are fharp. There are feventeen fpecies, principally diftinguifhed by their cirri, and the number of back-fins.

GAGE, in the fea-language. When one fhip is to windward of another, fhe is faid to have the weather-gage of her. They likewife call the number of feet that a veffel finks in the water, the fhip's gage: this they find by driving a nail into a pike near the end, and putting it down befide the rudder till the nail catch hold under it; then as many feet as the pike is under water, is the fhip's gage.

GAGE, among letter-founders, a piece of box, or other hard wood, varioufly notched; the ufe of which is to adjuft the dimenfions, flopes, *&c.* of the different forts of letters. See FOUNDERY.

Sliding-GAGE, a tool ufed by mathematical inftrument-makers, for meafuring and fetting off diftances.

Sea GAGE, an inftrument invented by Dr Hales and Dr Defaguliers, for finding the depth of the fea, the defcription whereof is this. AB (Plate LXXXVI. fig. 1. N° 1.) is the gage bottle, in which is cemented the gage-tube *Ff* in the brafs cap at G. The upper end of tube F is hermetically fealed, and the open lower end *f* is immerfed in mercury, marked C, on which fwims a fmall thicknefs or furface of treacle. On the top of the bottle is fcrewed a tube of brafs HG, pierced with feveral holes, to admit the water into the bottle AB. The body K is a weight hanging by its fhank L, in a focket N, with a notch on one fide at *m*, in which is fixed the catch *l* of the fpring S, and paffing through the hole L, in the fhank of the weight K, prevents its falling out when once hung on. On the top, in the upper part of the brafs tube at H, is fixed a large empty ball, or full-blown bladder I, which muft not be fo large, but that the weight K may be able to fink the whole under water.

The inftrument, thus conftructed, is ufed in the following manner: The weight K being hung on, the gage is let fall into deep water, and finks to the bottom; the focket N is fomewhat longer than the fhank L, and therefore, after the weight K comes to the bottom, the gage will continue to defcend, till the lower part of the focket ftrikes againft the weight; this gives liberty to the catch to fly out of the hole L, and let go the weight K; when this is done, the ball or bladder I, inftantly buoys up the gage to the top of the water. While the gage is under water, the water having free accefs to the treacle and mercury in the bottle, will by its preffure force it up into the tube F*f*, and the height to which it has been forced by the greateft preffure, *viz.* that at the bottom, will be fhewn by the mark in the tube which the treacle leaves behind it, and which is the only ufe of the treacle. This fhews into what fpace the whole air in the tube F*f* is compreffed; and confequently the height or depth of the water, which by its weight produced that compreffion, which is the thing required.

If the gage-tube F*f* be of glafs, a fcale might be drawn on it with the point of a diamond, fhewing, by infpection, what height the water ftands above the bottom. But the length of 10 inches is not fufficient for fathoming depths at fea, fince that, when all the air in fuch a length of tube is compreffed into half an inch, the depth of water is no more than 634 feet, which is not half a quarter of a mile.

If, to remedy this, we make ufe of a tube fifty inches long, which for ftrength may be a mufket-barrel, and fuppofe the air compreffed into an hundredth part of half an inch; then by faying, as 1 : 99 :: 400 : 39600 inches, or 3300 feet; even this is but little more than half a mile, or 2640 feet. But fince it is reafonable to fuppofe the cavities of the fea bear fome proportion to the mountainous parts of the land, fome of which are more than three miles above the earth's furface; therefore, to explore fuch great depths, the Doctor contrived a new form for his fea gage, or rather for the gage tube in it, as follows: BCDF (*ibid.* N° 2.) is a hollow metalline globe communicating on the top with a long tube AB, whofe capacity is a ninth part of that globe. On the lower part at D, it has alfo a fhort tube DE, to ftand in the mercury and treacle. The air contained in the compound gage-tube is compreffed by the water as before; but the degree of compreffion, or height to which the treacle has been forced, cannot there be feen through the tube; therefore, to anfwer that end, a flender rod of metal or wood, with a knob on the top of the tube AB, will receive the mark of the treacle, and fhew it, when taken out.

If the tube AB be 50 inches long, and of fuch a bore that every inch in length fhould be a cubic inch of air, and the contents of the globe and tube together 500 cubic inches; then, when the air is compreffed within an hundredth part of the whole, it is evident the treacle will not approach nearer than 5 inches of the top of the tube, which will agree to the depth of 3300 feet of water as above. Twice this depth will comprefs the air into half that fpace nearly, *viz.* $2\frac{1}{2}$ inches, which correfpond to 6600 which is a mile and a quarter. Again, half that fpace, or $1\frac{1}{4}$ inch, will fhew double the former depth, *viz.* 13200 feet, or $2\frac{1}{2}$ miles, which is probably very nearly the greateft depth of the fea.

GAIETA, a ftrong fortified town of the kingdom of Naples in Italy, thirty-five miles north-weft of the city of Naples: E. long. 14° 30′, and N. lat. 41° 20′.

GAINSBOROUGH, a market-town of Lincolnfhire, fourteen milles north-weft of Lincoln; which gives the title of earl to the noble family of Noel.

GAIOPHRAGMIA, in natural hiftory, a genus of feptariæ, divided by feptæ or partitions of earthy matter, of which there are feveral fpecies. See SEPTARIÆ.

GALACTITES, in natural hiftory, the name by which the ancients called a fmooth, afh-coloured, indurated kind of clay, faid to have been ufed with fuccefs for defluxions and ulcers of the eyes, and as an aftringent.

GALANGALS, in the materia medica, the name of a root

root kept in the ſhops, but now moſtly out of uſe in practice.

GALANTHUS, the SNOW-DROP, in botany, a genus of the hexandria monogynia claſs. It has three concave petals, a ſimple ſtigma, and a nectarium compoſed of three ſmall petals. There is but one ſpecies, a native of Germany.

GALATA, a great ſuburb belonging to Conſtantinople, oppoſite to the ſeraglio, on the other ſide of the harbour. It is here the Greeks, Armenians, Franks, Chriſtians, and Jews inhabit, and are allowed the exerciſe of their reſpective worſhips.

GALATIA, the ancient name of Amaſia, a province of Leſſer Aſia.

GALAX, in botany, a genus of the pentandria monogynia claſs. The calix conſiſts of ten leaves; and the capſule has one cell and two elaſtic valves. There is but one ſpecies, a native of Virginia.

GALAXY, in aſtronomy. See ASTRONOMY, p. 487.

GALBANUM, in pharmacy, a gum iſſuing from the ſtem of an umbelliferous plant, growing in Perſia and many parts of Africa.

It is ſometimes met with in the ſhops in looſe granules, called drops or tears; and ſometimes in large maſſes, formed of a number of theſe blended together; but in theſe maſſes ſome accidental foulneſs is often mixed with the gum. The ſingle drops uſually approach to a roundiſh, oblong, pear-like form. Galbanum is ſoft like wax, and, when freſh drawn, white; but it afterwards becomes yellowiſh or reddiſh: it is of a ſtrong ſmell, of an acrid and bitteriſh taſte; it is inflammable in the manner of a reſin, and ſoluble in water like a gum.

It attenuates and diſſolves tough phlegm, and is therefore of ſervice in aſthmas and inveterate coughs.

GALEGA, in botany, a genus of the diadelphia decandria claſs. The calix conſiſts of equal ſubulated teeth; and the pod has oblique ſtriæ, with a ſeed between each. There are eight ſpecies, none of them natives of Britain.

GALENISTS, in church-hiſtory, a branch of anabaptiſts, who are ſaid to have adopted ſeveral Arian opinions concerning the divinity of our Saviour.

GALEOBDOLON, in botany. See LEONURUS.

GALERITA, in ichthyology, a ſpecies of blennius. See BLENNIUS.

GALICIA, the moſt north-weſt province of Spain, bounded by the ocean on the north-weſt, by the provinces of Aſturias and Leon on the eaſt, and by Portugal on the ſouth.

GALICIA, or GUADALAJARA, a province of Mexico, bounded by new Mexico on the north, by the gulph of Mexico on the eaſt, by Mexico Proper on the ſouth, and by the Pacific Ocean and gulph of California on the weſt.

GALILE, or GALILEE, once a province of Judea, now of Turky in Aſia, was bounded by mount Lebanon on the north, by the river Jordan and the ſea of Galilee on the eaſt, by the river Chiſon on the ſouth, and by the Mediterranean on the weſt. It was the ſcene of many of our Saviour's miracles.

GALILEANS, a ſect of the Jews. Their founder was one Judas, a native of Galilee, from which place they derived their name. Their chief, eſteeming it an indignity for the Jews to pay tribute to ſtrangers, raiſed up his countrymen againſt the edict of the emperor Auguſtus, which had ordered a taxation or inrollment of all the ſubjects of the Roman empire.

They pretended that God alone ſhould be owned as Maſter and Lord; and in other reſpects were of the opinion of the Phariſees; but, as they judged it unlawful to pray for infidel princes, they ſeparated themſelves from the reſt of the Jews, and performed their ſacrifices apart.

GALL, in the animal œconomy. See BILE.

GALL-BLADDER. See ANATOMY, p. 269.

GALL, in natural hiſtory, denotes any protuberance or tumour produced by the puncture of inſects on plants and trees of different kinds.

Theſe galls are of various forms and ſizes, and no leſs different with regard to their internal ſtructure. Some have only one cavity, and others a number of ſmall cells communicating with each other. Some of them are as hard as the wood of the tree they grow on, whilſt others are ſoft and ſpongy; the firſt being termed gall-nuts, and the latter berry-galls, or apple-galls.

The general hiſtory of galls is this: an inſect of the fly kind is inſtructed by nature to take care for the ſafety of her young, by lodging her eggs in a woody ſubſtance, where they will be defended from all injuries: ſhe for this purpoſe wounds the leaves or tender branches of a tree; and the lacerated veſſels, diſcharging their contents, ſoon form tumours about the holes thus made. The hole in each of theſe tumours, through which the fly has made its way, may for the moſt part be found; and when it is not, the maggot inhabitant or its remains are ſure to be found within, on breaking the gall. However, it is to be obſerved, that in thoſe galls which contain ſeveral cells, there may be inſects found in ſome of them, though there be a hole by which the inhabitant of another cell has eſcaped.

Oak galls put, in a very ſmall quantity, into a ſolution of vitriol in water, though but a very weak one, give it a purple or violet colour; which, as it grows ſtronger, becomes black; and on this property depends the art of making our writing ink, as alſo a great deal of thoſe of dying and dreſſing leather, and other manufactures.

In medicine, galls are found to be very aſtringent, and good, under proper management, in diarrhœas, dyſentries, and hæmorrhages of all kinds; they have alſo a very eminent virtue as a febrifuge.

GALLERY, in architecture, a covered place in a houſe, much longer than broad, and uſually in the wings of a building; its uſe being chiefly to walk in.

GALLERY, in fortification, a covered walk acroſs the ditch of a town, made of ſtrong beams, covered over head with planks, and loaded with earth: ſometimes it is covered with raw hides to defend it from the artificial fires of the beſieged.

GALLERY *of a mine*, is a narrow paſſage, or branch of

a mine carried on under ground to a work designed to be blown up.

GALLERY, in a ship, that beautiful frame, which is made in the form of a balcony, at the stern of a ship without board; into which there is a passage out of the admiral's or captain's cabbin, and is for the ornament of the ship.

GALLEY, in naval affairs, a low-built vessel, using both sails and oars, and commonly carrying only a main-mast and fore mast, which may be struck or lowered at pleasure. Such vessels are much used in the Mediterranean, especially by the king of France. See SHIP.

GALLI, in antiquity, the priests of the goddess Cybele, who were eunuchs, and took their name from Gallus, a river in Phrygia.

When a youth was to be initiated into this order, the custom was to throw off his cloaths, to run crying aloud into the midst of the troop, and then drawing a sword to castrate himself; after this, he ran about the streets, carrying in his hands the marks of his mutilation, which he was to throw into a house, and in that house to put on a woman's dress.

GALLICIAN, any thing belonging to France: thus the term Gallician church denotes the church of France, or the assembly of the clergy of that kingdom.

GALLICISM, a mode of speech peculiar to the French language, and contrary to the rules of grammar in other languages.

GALLINÆ, in ornithology, an order of birds. See NATURAL HISTORY.

GALLINACIOUS, an appellation given to the birds of the order of the gallinæ.

GALLINULA, in ornithology. See SCOLOPAX.

GALLION, or GALLEON, in naval affairs, a sort of ships employed in the commerce of the West Indies. The Spaniards send annually two fleets; the one for Mexico, which they call the flota, and the other for Peru, which they call the gallions. Se FLOTA.

GALLIOT, a small galley designed only for chace, carrying only one mast, and two or three pattereroes; it can both sail and row, and has sixteen or twenty oars. All the seamen on board are soldiers, and each has a musket by him on quitting his oar.

GALLIPAGO-ISLANDS, are situated in the Pacific Ocean on both sides the equator, between 85° and 90°, W. long. and about four hundred miles west of Peru.

GALLIPOLI, a port town of European Turky, situated at the entrance of the Propontis, or Sea of Marmora, about 100 miles south-west of Constantinople: E. long. 28°, and N. lat. 40° 45′.

GALLIPOLI is also a port town of the kingdom of Naples, situated on the gulph of Otranto, about twenty-three miles west of that city: E. long. 19°, and N. lat. 40° 25′.

GALLIUM, LADIES BEDSTRAW, in botany, a genus of the tetrandria monogynia class. The corolla consists of one plane petal; and the seeds are two, and round. There are 23 species, 11 of them natives of Britain, *viz.* the verum, or yellow ladies-bedstraw; the mollugo, or wild madder; the montanum, or mountain ladies-bedstraw; the uliginosum, or marsh goose-grass; the erectum, or small mountain bastard madder; the pusillum, or least ladies-bedstraw; the palustre, or white ladies-bedstraw; the spurium, or goose-grass with smoother seeds; the aparine, cleavers, or goose-grass; the parisiense, or least goose-grass; and the boreale, or crosswood madder.

GALLO, an island on the Pacific Ocean near the coast of Peru, about 200 miles west of Popayan: W. long. 80°, and N. lat. 2° 15′.

GALLO is also a town of Italy, ten miles south of Ancona.

GALLO, or PUNTO GALLO, a sea-port of Ceylon, subject to the Dutch: E. long. 78°, and N lat. 6°.

GALLON, a measure of capacity both for dry and liquid things, containing four quarts; but these quarts, and consequently the gallon itself, are different, according to the quality of the thing measured: for instance, the wine gallon contains 231 cubic inches, and holds eight pounds averdupois, of pure water: the beer and ale gallon contains 282 solid inches, and holds ten pounds three ounces and a quarter averdupois, of water: and the gallon for corn, meal, *&c.* $272\frac{1}{4}$ cubic inches, and holds nine pounds thirteen ounces of pure water.

GALLOPAVO, in zoology. See MELEAGRIS.

GALLOWAY, a county of Scotland, which gives the title of earl to a branch of the noble family of Stuart.

It is divided into two districts; the western, called Upper Galloway, being the same with Wigtonshire; and the eastern, or stewartry of Kirkudbright, called Lower Galloway.

GALLOWAY is also the capital of a county of the same name, in the province of Connaught, in Ireland: W. long. 9° 12′, and N. lat. 53° 12′.

It has a good port, and is advantageously situated for foreign trade.

GALLUS, in ornithology. See PHASIANUS.

GALLY, in printing, a frame into which the compositor empties the lines out of his composing stick, and in which he ties up the page when it is compleated.

The gally is formed of an oblong square board, with a ledge on three sides, and a grove to admit a false bottom, called a gally-slice.

GAMBIA, a great river of Africa, which, running from east to west falls into the Atlantic ocean, 14° N. lat. and 15° W. lon.

GAMBOGE, is a concreted vegetable juice, the produce of two trees, both called by the Indians caracapulli, and is partly of a gummy, and partly of a resinous nature. It is brought to us either in form of orbicular masses, or of cylindrical rolls of various sizes; and is of a dense, compact, and firm texture, and of a beautiful yellow. It is chiefly brought to us from Cambaja, in the East Indies, called also Cambodja, and Cambogia; and from thence it has obtained its names of cambadium, cambogium, and gambogium.

It is a very rough and strong purge; it operates both by vomit and stool, and both ways with much violence, almost in the instant in which it is swallowed; but yet without griping. It requires caution and judgment in administring it; but those who know how to give it properly,

properly, find it an excellent remedy in dropsies, cachexies, jaundice, asthmas, catarrhs, and in the worst cutaneous eruptions.

GAME, in general, signifies any diversion, or sport, that is performed with regularity, and restrained to certain rules. See GAMING.

GAMES, in antiquity, were public diversions, exhibited on solemn occasions. Such, among the Greeks, were the Olympic, Pythian, Isthmian, Nemean, &c. games; and, among the Romans, the Apollinarian, Circensian, Capitoline, &c. games. See OLYMPIC, PYTHIAN, &c.

GAME, in law, signifies birds or prey, taken or killed by fowling, or hunting. There are several statutes for punishing offences committed by persons not qualified by law to take or destroy the game.

GAME-COCK, a fighting cock, or one kept for sport; a barbarous practice, which is a disgrace to any civilized nation.

GAMELIA, in Grecian antiquity, a nuptial feast, or rather sacrifice, held in the ancient Greek families on the day before a marriage; thus called, from a custom they had of shaving themselves on this occasion, and presenting their hair to some deity to whom they had particular obligations.

GAMELION, in the ancient chronology, was the eighth month of the Athenian year, containing twenty-nine days, and answering to the latter part of our January and beginning of February. It was thus called, as being, in the opinion of the Athenians, the most proper season of the year for marriage.

GAMING, the art of playing or practising any game, particularly those of hazard, as cards, dice, tables, &c.

Mr de Moivre, in a treatise de Mensura Sortis, has computed the variety of chances in several cases that occur in gaming, the laws of which may be understood by what follows.

Suppose p the number of cases in which an event may happen, and q the number of cases wherein it may not happen, both sides have the degree of probability, which is to each other as p to q.

If two gamesters, A and B, engage on this footing, that, if the cases p happen, A shall win; but if q happen, B shall win, and the stake be a; the chance of A will be $\frac{pa}{p+q}$, and that of B $\frac{qa}{p+q}$; consequently, if they sell the expectancies, they should have that for them respectively.

If A and B play with a single die, on this condition, that, if A throw two or more aces at eight throws, he shall win; otherwise B shall win; what is the ratio of their chances? Since there is but one case wherein an ace may turn up, and five wherein it may not, let $a=1$ and $b=5$. And, again, since there are eight throws of the die, let $n=8$; and you will have $\overline{a+b)}^{n}-b^{n}-nab^{n}-1$, to $b^{n}+nab^{n}-1$: that is, the chance of A will be to that of B, as 663991 to 10156525, or nearly as 2 to 3.

A and B are engaged at single quoits; and, after playing some time, A wants 4 of being up, and B 6; but B is so much the better gamester, that his chance against A upon a single throw would be as 3 to 2; what is the ratio of their chances? Since A wants 4, and B 6, the game will be ended at nine throws; therefore, raise $a+b$ to the ninth power, and it will be $a^9+9a^8b+36a^7bb+84a^6b^3+126a^5b^4+126a^4b^5$, to $84a^3b^6+36aab^7+6ab^8+b^9$: call a 3, and b 2, and you will have the ratio of chances in numbers, *viz.* 1759077 to 194048.

A and B play at single quoits, and A is the best gamester, so that he can give B 2 in 3, what is the ratio of their chances at a single throw? Suppose the chances as z to 1, and raise $z+1$ to its cube, which will be z^3+3z^2+3z+1. Now since A could give B 2 out of 3, A might undertake to win three throws running; and, consequently, the chances in this case will be as z^3 to $3z^2+3z+1$. Hence $z^3=3z^2+3z+1$; or, $2z^3=z^3+3z^2+3z+1$. And, therefore, $z\sqrt[3]{2}=z+1$; and, consequently, $z=\frac{1}{\sqrt[3]{2}-1}$. The chances, therefore, are $\frac{1}{\sqrt[3]{2}-1}$, and 1, respectively.

Again, suppose I have two wagers depending, in the first of which I have 3 to 2 the best of the lay, and in the second 7 to 4, what is the probability I win both wagers?

1. The probability of winning the first is $\frac{3}{5}$, that is the number of chances I have to win, divided by the number of all the chances: the probability of winning the second is $\frac{7}{11}$: therefore, multiplying these two fractions together, the product will be $\frac{21}{55}$, which is the probability of winning both wagers. Now, this fraction being subtracted from 1, the remainder is $\frac{34}{55}$, which is the probability I do not win both wagers: therefore the odds against me are 34 to 21.

2. If I would know what the probability is of winning the first, and losing the second, I argue thus: the probability of winning the first is $\frac{3}{5}$, the probability of losing the second is $\frac{4}{11}$: therefore multiplying $\frac{3}{5}$ by $\frac{4}{11}$, the product $\frac{12}{55}$ will be the probability of my winning the first, and losing the second; which being subtracted from 1, there will remain $\frac{43}{55}$, which is the probability I do not win the first, and at the same time lose the second.

3. If I would know what the probability is of winning the second, and at the same time losing the first, I say thus: the probability of winning the second is $\frac{7}{11}$; the probability of losing the first is $\frac{2}{5}$: therefore, multiplying these two fractions together, the product $\frac{14}{55}$ is the probability I win the second, and also lose the first.

4. If I would know what the probability is of losing both wagers, I say, the probability of losing the first is $\frac{2}{5}$, and the probability of losing the second $\frac{4}{11}$: therefore, the probability of losing them both is $\frac{8}{55}$; which being subtracted from 1, there remains $\frac{47}{55}$: therefore, the odds of losing both wagers is 47 to 8.

This way of reasoning is applicable to the happening or failing of any events that may fall under consideration.

deration. Thus if I would know what the probability is of missing an ace four tim s together with a die, this I consider as the failing of four different events. Now the probability of missing the first is $\frac{5}{6}$, the second is also $\frac{5}{6}$, the third $\frac{5}{6}$, and the fourth $\frac{5}{6}$; therefore the probability of missing it four times together is $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{625}{1296}$; which being subtracted from 1, there will remain $\frac{671}{1296}$ for the probability of throwing it once or oftener in four times: therefore the odds of throwing an ace in four times, is 671 to 625.

But if the flinging of an ace was undertaken in three times, the probability of missing it three times would be $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{125}{216}$; which being subtracted from 1, there will remain $\frac{91}{216}$ for the probability of throwing it once or oftener in three times: therefore the odds against throwing it in three times are 125 to 91. Again, suppose we would know the probability of throwing an ace once in four times, and no more: since the probability of throwing it the first time is $\frac{1}{6}$, and of missing it the other three times is $\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}$, it follows that the probability of throwing it the first time, and missing it the other three successive times, is $\frac{1}{6}\times\frac{5}{6}\times\frac{5}{6}\times\frac{5}{6}=\frac{125}{1296}$; but because it is possible to hit it every throw as well as the first, it follows, that the probability of throwing it once in four throws, and missing the other three, is $\frac{4\times125}{1296}=\frac{500}{1296}$; which being subtracted from 1, there will remain $\frac{796}{1296}$ for the probability of throwing it once, and no more, in four times. Therefore, if one undertake to throw an ace once, and no more, in four times, he has 500 to 796 the worst of the lay, or 5 to 8 very near.

Suppose two events are such, that one of them has twice as many chances to come up as the other, what is the probability that the event, which has the greater number of chances to come up, does not happen twice before the other happens once, which is the case of flinging 7 with two dice before 4 once? Since the number of chances are as 2 to 1, the probability of the first happening before the second is $\frac{2}{3}$, but the probability of its happening twice before it is but $\frac{2}{3}\times\frac{2}{3}$ or $\frac{4}{9}$: therefore it is 5 to 4 seven does not come up twice before four once.

But, if it were demanded, what must be the proportion of the facilities of the coming up of two events, to make that which has the most chances come up twice, before the other comes up once? The answer is 12 to 5 very nearly: whence it follows, that the probability of throwing the first before the second is $\frac{12}{17}$, and the probability of throwing it twice is $\frac{12}{17}\times\frac{12}{17}$, or $\frac{144}{289}$; therefore, the probability of not doing it is $\frac{145}{289}$: therefore the odds against it are as 145 to 144, which comes very near an equality.

Suppose there is a heap of thirteen cards of one colour, and another heap of thirteen cards of another colour, what is the probability that, taking one card at a venture out of each heap, I shall take out the two aces?

The probability of taking the ace out of the first heap is $\frac{1}{13}$, the probability of taking the ace out of the second heap is $\frac{1}{13}$; therefore the probability of taking out both aces is $\frac{1}{13}\times\frac{1}{13}=\frac{1}{169}$, which being subtracted from 1, there will remain $\frac{168}{169}$: therefore the odds against me are 168 to 1.

In cases where the events depend on one another, the manner of arguing is somewhat altered. Thus, suppose that out of one single heap of thirteen cards of one colour I should undertake to take out first the ace; and, secondly, the two: though the probability of taking out the ace be $\frac{1}{13}$, and the probability of taking out the two be likewise $\frac{1}{13}$; yet, the ace being supposed as taken out already, there will remain only twelve cards in the heap, which will make the probability of taking out the two to be $\frac{1}{12}$; therefore the probability of taking out the ace, and then the two, will be $\frac{1}{13}\times\frac{1}{12}$.

In this last question the two events have a dependence on each other, which consists in this, that one of the events being supposed as having happened, the probability of the other's happening is thereby altered. But the case is not so in the two heaps of cards.

If the events in question be n in number, and be such as have the same number a of chances by which they may happen, and likewise the same number b of chances by which they may fail, raise $a+b$ to the power n. And if A and B play together, on condition that if either one or more of the events in question happen, A shall win, and B lose, the probability of A's winning will be $\frac{\overline{a+b}|^n-b^n}{\overline{a+b}|^n}$; and that of B's winning will be $\frac{b^n}{\overline{a+b}|^n}$; for when $a+b$ is actually raised to the power n, the only term in which a does not occur is the last b^n: therefore all the terms but the last are favourable to A.

Thus if $n=3$, raising $a+b$ to the cube $a^3+3a^2b+3ab^2+b^3$, all the terms but b^3 will be favourable to A; and therefore the probability of A's winning will be $\frac{a^3+3a^2b+3ab^2}{\overline{a+b}|^3}$, or $\frac{\overline{a+b}|^3-b^3}{\overline{a+b}|^3}$; and the probability of B's winning will be $\frac{b^3}{\overline{a+b}|^3}$. But if A and B play on condition, that if either two or more of the events in question happen, A shall win; but in case one only happen, or none, B shall win; the probability of A's winning will be $\frac{\overline{a+b}|^n-nab^{n-1}-b^n}{\overline{n+b}|^n}$; for the only two terms in which aa does not occur, are the two last, *viz.* nab^{n-1} and b^n.

GAMMUT, in music, a scale whereon we learn to found the musical notes, *ut*, *re*, *mi*, *fa*, *sol*, *la*, in their several orders and dispositions. See MUSIC.

GANG-WAY is the several passages or ways from one part of the ship to the other; and whatever is laid in any of those passages, is said to lie in the gang-way.

GANGEA, the capital of a territory in the province of Chirvan, in Persia: E. long. 46°, N. lat. 41°.

GANGES,

GANGES, a large river of the hither India, rises in the mountains which separate India from Tartary; and, running from the north west to the south east near 1500 miles through the Mogul's dominions, discharges itself by several channels into the bay of Bengal.

GANGI, or COULER, a town of Golconda, in the hither India: E. long. 79°, and N. lat. 16°.

GANGLIO, or GANGLION, in surgery, a hard tubercle, generally moveable, in the external or internal part of the carpus, upon the tendons or ligaments in that part, usually without any pain to the patient.

GANGRENE, a very great and dangerous degree of inflammation, wherein the parts affected begin to corrupt, and put on a state of putrefaction. See MEDICINE and SURGERY.

GANTLET, or GAUNTLET, a large kind of glove, made of iron, and the figures covered with small plates. It was formerly worn by cavaliers, when armed at all points.

GAOL, a prison, or place of legal confinement.

GAOL DELIVERY, is where a commission or patent is granted by the king in the nature of a letter, to certain persons, who are thereby appointed his justices, or to two or three of them, authorising them to deliver his gaol, at such a place, of the prisoners contained therein; and for that end it commands them to meet at such a place, at the time they themselves shall appoint, when the sheriff of the county is commanded to bring all the prisoners in the gaol before them, *&c.*

GAP, a city and bishop's see of Dauphine, in France, eighteen miles west of Embrun: E. long. 5° 46′, N. lat. 44° 32′.

GARBE, in heraldry, a sheaf of any kind of grain, bore in several coats of arms, and said to represent summer, as a bunch of grapes does autumn.

GARCINIA, in botany, a genus of the icosandria monogynia class. The flower consists of four roundish patent petals; and the fruit is a large unilocular coriaceous berry, containing eight hairy and fleshy seeds, convex on one side, and angular on the other. There are two species, none of them natives of Britain.

GARDA, a town of the Veronese, in Italy, subject to Venice: E. long. 11°, N. lat. 45° 25′.

GARDANT, or GUARDANT, in heraldry, denotes any beast full faced, and looking right forward. See Plate LXXXVII. fig. 6. which represents a lion gardant.

GARDELEBEN, a town of Bradenburg, in Germany: E. long. 11° 45′, N. lat. 52° 40′.

GARDENING.

GARDENING, a branch of agriculture, containing the cultivation of gardens.

The simplest idea of a garden, is that of a spot embellished with a number of natural objects, trees, walks, polished parterres, flowers, streams, *&c.* One more complex comprehends statues and buildings, that nature and art may be mutually ornamental. A third approaching nearer perfection, is of objects assembled together, in order to produce, not only an emotion of beauty, essential to every garden, but also some other particular emotion, grandeur for example, or gaiety. The most perfect idea of a garden is an improvement upon the third, requiring the several parts to be arranged in such a manner, as to inspire all the different emotions that can be raised by gardening. In this idea of a garden, the arrangement is an important circumstance; for some emotions figure best in conjunction, and others ought always to appear in succession and never in conjunction. When the most opposite emotions, such as gloominess and gaiety, stillness and activity, follow each other in succession, the pleasure on the whole will be the greatest; but such emotions ought not to be united, because they produce an unpleasant mixture. For that reason, a ruin, affording a sort of melancholy pleasure, ought not to be seen from a flower-parterre, which is gay and cheerful: but to pass from an exhilarating object to a ruin, has a fine effect; for each of the emotions is the more sensibly felt by being contrasted with the other. Similar emotions, on the other hand, such as gaiety and sweetness, stillness and gloominess, motion and grandeur, ought to be raised together; for their effects upon the mind are greatly heightened by their conjunction.

Kent's method of embellishing a field, is admirable; which is, to paint a field with beautiful objects, natural and artificial, disposed like colours upon a canvas. It requires indeed more genius to paint in the gardening way: in forming a lanscape upon a canvas, no more is required but to adjust the figures to each other: an artist who lays out ground in Kent's manner, has an addditional task; he ought to adjust his figures to the several varieties of the field.

One garden must be distinguished from a plurality; and yet it is not obvious wherein the unity of a garden consists. A notion of unity is indeed suggested from viewing a garden surrounding a palace, with views from each window, and walks leading to every corner: but there may be a garden without a house; in which case, what makes it one garden, is the unity of design, every single spot appearing part of a whole. The gardens of Versailles, properly expressed in the plural number, being no fewer than sixteen, are indeed all of them connected with the palace, but have scarce any mutual connection: they appear not like parts of one whole, but rather like small gardens in contiguity. Were these gardens at some distance from each other, they would have a better effect: their junction breeds confusion of ideas, and upon the whole gives less pleasure than would be felt in a slower succession.

Regularity is required in that part of a garden which joins the dwelling-houſe; for being conſidered as a more immediate acceſſory, it ought to partake the regularity of the principal object: but in proportion to the diſtance from the houſe conſidered as the centre, regularity ought leſs and leſs to be ſtudied; for, in an extenſive plan, it hath a fine effect to lead the mind inſenſibly from regularity to a bold variety. Such arrangement tends to make an impreſſion of grandeur: and grandeur ought to be ſtudied as much as poſſible, even in a more confined plan, by avoiding a multiplicity of ſmall parts. A ſmall garden, on the other hand, which admits not grandeur, ought to be ſtrictly regular.

Milton, deſcribing the garden of Eden, prefers juſtly the grand taſte to that of regularity:

Flow'rs worthy of paradiſe, which not nice art
In beds and curious knots; but Nature boon
Pour'd forth profuſe on hill, and dale, and plain;
Both where the morning-ſun firſt warmly ſmote
The open field, and where the unpierc'd ſhade
Imbrown'd the noontide bow'rs. *Paradiſe Loſt, b.* 4.

An hill, by being covered with trees, appears both more powerful and more lofty; provided no other beauties be hid that might be ſeen if the hill were naked. To diſtribute trees in a plain requires more art: near the dwelling-houſe they ought to be ſo thin, as not to break the unity of the field; and even at the greateſt diſtance of diſtinct viſion, they ought never to be ſo crowded as to hide any beautiful object.

In the manner of planting a wood or thicket, much art may be diſplayed. A common centre of walks, termed *a ſtar*, from whence are ſeen a number of remarkable objects, appears too artificial, and conſequently too ſtiff and formal, to be agreeable: the crowding withal ſo many objects together, leſſens the pleaſure that would be felt in a ſlower ſucceſſion. Abandoning therefore the ſtar, let us try to ſubſtitute ſome form more natural, that will lay open all the remarkable objects in the neighbourhood. This may be done by various openings in the wood contrived to catch ſurrounding objects, which in walking bring ſucceſſively under the eye theſe objects as by accident; ſometimes a ſingle object, ſometimes a plurality in a line, and ſometimes a rapid ſucceſſion of them. In this form, the mind at intervals is rouſed and cheered by agreeable objects; and the ſcene is greatly heightened by the ſurpriſe it occaſions when we ſtumble, as it were, upon objects of which we had no expectation.

An object terminating in a narrow opening in a wood, appears at a double diſtance. This ſuggeſts another rule for diſtributing trees in ſome quarter near the dwelling-houſe; which is, to place a number of thickets one behind another, with an opening in each directing the eye to the moſt diſtant through all the intermediate thickets; which, by making theſe thickets appear more diſtant from each other than they are in reality, will enlarge in appearance the ſize of the whole field. To give this plan its utmoſt effect, the thickets ought to be at a conſiderable diſtance from each other: and, in order that each may be ſeen diſtinctly, the opening neareſt the eye ought to be wider than the ſecond, the ſecond wider than the third, and ſo one to the end.

By a judicious diſtribution of trees, various beauties may be produced, far exceeding what have been mentioned; which will appear as follows. A landſcape ſo rich as to ingroſs the whole attention, and ſo limited as ſweetly to be comprehended under a ſingle view, has a much finer effect than the moſt extenſive landſcape that requires a wandering of the eye through ſucceſſive ſcenes. This conſideration ſuggeſts a capital rule in laying out a field; which is, never at any one ſtation to admit a larger proſpect than can eaſily be taken in at once. A field ſo happily ſituated as to command a great extent of proſpect, is a delightful ſubject for applying this rule: let the proſpect be ſplit into proper parts by means of trees; ſtudying at the ſame time to introduce all the variety poſſible. A plan of this kind executed with taſte will produce charming effects: the beautiful proſpects are multiplied: each of them is much more agreeable than the entire proſpect was originally: and, to crown the whole, the ſcenery is greatly diverſified,

As gardening is not an inventive art, but an imitation of nature, or rather nature itſelf ornamented, it follows neceſſarily, that every thing unnatural ought to be rejected with diſdain. Statues of wild beaſts vomiting water, a common ornament in gardens, prevails in thoſe of Verſailles. Is this ornament in a good taſte? A jet d'eau, being partly artificial, may, without diſguſt, be tortured into a thouſand ſhapes: but a repreſentation of what really exiſts in nature, admits not any unnatural circumſtance. Theſe ſtatues therefore of Verſailles muſt be condemned; and yet ſo inſenſible has the artiſt been to juſt imitation, as to have diſplayed his vicious taſte without the leaſt colour or diſguiſe: a lifeleſs ſtatue of an animal pouring out water, may be endured without much diſguſt; but here the lions and wolves are put in violent action, each has ſeized its prey, a deer or a lamb, in act to devour; and yet, inſtead of extended claws and open mouth, the whole, as by a hocus-pocus trick, is converted into a different ſcene; the lion, forgetting his prey, pours out water plentifully; and the deer, forgetting its danger, performs the ſame operation.

In gardening, every lively exhibition of what is beautiful in nature has a fine effect; on the other hand, diſtant and faint imitations are diſpleaſing to every one of taſte. The cutting evergreens in the ſhape of animals, is a very ancient practice; as appears from the epiſtles of Pliny, who ſeems to be a great admirer of this puerile conceit. The propenſity to imitation gave birth to this practice; and has ſupported it wonderfully long, conſidering how faint and inſipid the imitation is. But the vulgar, great and ſmall, devoid of taſte, are entertained with the oddneſs and ſingularity of a reſemblance, however diſtant, between a tree and an animal. An attempt in the gardens of Verſailles, to imitate a grove of trees by a group of jets d'eau, appears, for the ſame reaſon, not leſs ridiculous.

In laying out a garden, every thing trivial or whimſical ought to be avoided. Is a labyrinth then to be juſtified? It is a mere conceit, like that of compoſing verſes in the ſhape of an ax or an egg: the walks and hedges may be agreeable; but in the form of a labyrinth, they ſerve to no end but to puzzle: a riddle is a conceit not ſo mean; becauſe

becauſe the ſolution is a proof of ſagacity, which affords no aid in tracing a labyrinth.

The gardens of Verſailles, executed with infinite expence by the beſt artiſts that could be found, are a laſting monument of a taſte the moſt depraved: the faults above mentioned, inſtead of being avoided, are choſen as beauties, and multiplied without end. Nature, it would ſeem, was deemed too vulgar to be imitated in the works of a magnificent monarch; and for that reaſon preference was given to things unnatural, which probably were miſtaken for ſupernatural.

A ſtraight road is the moſt agreeable, becauſe it ſhortens the journey. But in an embelliſhed field, a ſtraight walk has an air of ſtiffneſs and confinement: and at any rate is leſs agreeable than a winding or waving walk; for in ſurveying the beauties of an ornamented field, we love to roam from place to place at freedom. Winding walks have another advantage: at every ſtep they open new views. In ſhort, the walks in a field intended to pleaſe the eye, ought not to have any appearance of a road. This rule excludes not long ſtraight openings terminating upon diſtant objects; which openings, beſide variety, never fail to raiſe an emotion of grandeur, by extending in appearance the ſize of the field: an opening without a terminating object, ſoon cloſes upon the eye; but an object, at whatever diſtance, continues the opening, and deludes the ſpectator into a conviction, that the trees which confine the view are continued till they join the object: and the object alſo, as obſerved above, ſeems to be at a greater diſtance than it is in reality. Straight walks alſo in receſſes do extremely well: they vary the ſcenery, and are favourable to meditation.

An avenue ought not to be directed in a ſtraight line upon a dwelling houſe: better far an oblique approach in a waving line, with ſingle trees and other ſcattered objects interpoſed. In a direct approach, the firſt appearance continues the ſame to the end: we ſee a houſe at a diſtance, and we ſee it all along in the ſame ſpot without any variety. In an oblique approach, the interpoſed objects put the houſe ſeemingly in motion: it moves with the paſſenger, and appears to direct its courſe ſo as hoſpitably to intercept him. An oblique approach contributes alſo to variety: the houſe, being ſeen ſucceſſively in different directions, takes on at every ſtep a new figure.

A garden on a flat ought to be highly and variouſly ornamented, in order to occupy the mind, and prevent its regretting the inſipidity of an uniform plan. Artificial mounts in this view are common: but no perſon has thought of an artificial walk elevated high above the plain. Such a walk is airy, and tends to elevate the mind: it extends and varies the proſpect: and it makes the plain, ſeen from a height, appear more agreeable.

Whether ſhould a ruin be in the Gothic or Grecian form? In the former; becauſe it exhibits the triumph of time over ſtrength, a melancholy but not unpleaſant thought: a Grecian ruin ſuggeſts rather the triumph of barbarity over taſte, a gloomy and diſcouraging thought.

Fountains are ſeldom in a good taſte. Statues of animals vomiting water, which prevail every where, ſtand condemned. A ſtatue of a whale ſpouting water upward from its head, is in one ſenſe natural, as whales of a certain ſpecies have that power; but it is ſufficient to make this deſign be rejected, that its ſingularity would make it appear unnatural: there is another reaſon againſt it, that the figure of a whale is in itſelf not agreeable. In the many fountains in and about Rome, ſtatues of fiſhes are frequently employed to ſupport a large baſon of water. This unnatural conceit is not accountable, unleſs from the connection between water and the fiſh that ſwim in it; which, by the way, ſhows the influence of even the ſlighter relations.

Hitherto a garden has been treated as a work intended ſolely for pleaſure; or, in other words, for giving impreſſions of intrinſic beauty. What comes next in order is the beauty of a garden deſtined for uſe, termed *relative beauty*; ſee BEAUTY: and this branch ſhall be diſpatched in a few words. In gardening, luckily, relative beauty need never ſtand in oppoſition to intrinſic beauty: all the ground that can be requiſite for uſe, makes but a ſmall proportion of an ornamented field; and may be put in any corner without obſtructing the diſpoſition of the capital parts. At the ſame time, a kitchen-garden, or an orchard, is ſuſceptible of intrinſic beauty; and may be ſo artfully diſpoſed among the other parts, as by variety and contraſt to contribute to the beauty of the whole.

Gardening being in China brought to greater perfection than in any other known country, we ſhall take a ſlight view of Chineſe gardens, which will be found entirely obſequious to the principles that govern any one of the fine arts. In general, it is an indiſpenſible law there, never to deviate from nature; but in order to produce that degree of variety which is pleaſing, every method is uſed that is conſiſtent with nature. Nature is ſtrictly imitated in the banks of their artificial lakes and rivers; which ſometimes are bare and gravelly, ſometimes covered with wood quite to the brink of the water. To flat ſpots adorned with flowers and ſhrubs are oppoſed others ſteep and rocky. We ſee meadows covered with cattle; rice grounds that run into lakes; groves into which enter navigable creeks and rivulets: theſe generally conduct to ſome intereſting object, a magnificent building, terraces cut in a mountain, a caſcade, a grotto, an artificial rock, or ſuch like. Their artificial rivers are generally ſerpentine; ſometimes narrow, noiſy, and rapid; ſometimes deep, broad, and ſlow: and to make the ſcene ſtill more active, mills and other moving machines are often erected. In the lakes are interſperſed iſlands; ſome barren, ſurrounded with rocks and ſhoals; others inriched with every thing that art and nature can furniſh. Even in their caſcades they avoid regularity, as forcing nature out of its courſe: the waters are ſeen burſting from the caverns and windings of the artificial rocks, here an impetuous cataract, there many leſſer falls: and the ſtream often impeded by trees and ſtones, that ſeem brought down by the violence of the current. Straight lines are ſometimes indulged, in order to take the advantage of ſome intereſting object at a diſtance, by directing openings upon it.

Senſible of the influence of contraſt, the Chineſe artiſts deal in ſudden tranſitions, and in oppoſing to each other, forms, colours, and ſhades. The eye is conducted from

from limited to extenfive views, and from lakes and rivers to plains, hills, and woods: to dark and gloomy colours, are oppofed the more brilliant: the different maffes of light and fhade are difpofed in fuch a manner, as to render the compofition diftinct in its parts, and ftriking on the whole. In plantations, the trees are artfully mixed according to their fhape and colour; thofe of fpreading branches with the pyramidal, and the light green with the deep green. They even introduce decayed trees, fome erect, and fome half out of the ground. In order to heighten contraft, much bolder ftrokes are rifked: they fometimes introduce rough rocks, dark caverns, trees ill formed and feemingly rent by tempefts or blafted by lightning, a building in ruins or half confumed by fire. But to relieve the mind from the harfhnefs of fuch objects, they are always fucceeded by the fweeteft and moft beautiful fcenes.

The Chinefe ftudy to give play to the imagination. They hide the termination of their lakes: the view of a cafcade is frequently interrupted by trees, through which are feen obfcurely the waters as they fall. The imagination once roufed, is difpofed to magnify every object.

Nothing is more ftudied in Chinefe gardens than to raife wonder or furprize. In fcenes calculated for that end, every thing appears like fairy-land; a torrent, for example, conveyed under ground, puzzling a ftranger by its uncommon found to guefs what it may be; and, to multiply fuch uncommon founds, the rocks and buildings are contrived with cavities and interftices. Sometimes one is led infenfibly into a dark cavern, terminating unexpectedly in a landfcape inriched with all that nature affords the moft delicious. At other times, beautiful walks infenfibly conduct us to a rough uncultivated field, where bufhes, briers, and ftones interrupt the paffage: when we look about for an outlet, fome rich profpect unexpectedly opens to view. Another artifice is, to obfcure fome capital part by trees or other interpofed objects: our curiofity is raifed to know what lies beyond; and after a few fteps, we are greatly furprized with fome fcene totally different from what was expected.

Thefe curfory obfervations upon gardening, fhall be clofed with fome reflections. Rough uncultivated ground, difmal to the eye, infpires peevifhnefs and difcontent: may not this be one caufe of the harfh manners of favages? A field richly ornamented, containing beautiful objects of various kinds, difplays, in full luftre, the goodnefs of the Deity, and the ample provifion he has made for our happinefs; which muft fill every fpectator with gratitude to his Maker, and with benevolence to his fellow-creatures. Other fine arts may be perverted to excite irregular, and even vicious, emotions: but gardening, which infpires the pureft and moft refined pleafures, cannot but promote every good affection The gaiety and harmony of mind it produceth, inclining the fpectator to communicate his fatisfaction to others, and to make them happy as he himfelf is, tend naturally to eftablifh in him a habit of humanity and benevolence.

Having thus unfolded the general principles of gardening, that have an influence upon tafte or manners; we fhall now fubjoin the practical part, in the form of a calendar.

JANUARY.

Flower-Garden.

This is the proper time for planting roots of the ranunculus; the foil fhould be rich and fandy, and they fhould be planted at leaft three inches deep. By laying a quantity of earth made of old thatch or ftraw, about feven inches beneath the furface of the ground, and then filling it up with rich mould, a prodigious number of thefe flowers may be produced. A fine earth may likewife be made of tanner's bark, or the bottom of a wood pile, well mixed with about a third of natural foil, which will prove peculiarly ferviceable.

As the wind and froft are very prejudicial to carnations and auriculas, they fhould this month be kept covered.

Anemonies fhould be planted in beds of fine earth; no dung muft be ufed in planting them. The roots of thefe flowers may be increafed by breaking the knots, about the fize of a fmall button, afunder, and letting them lie two or three days in the fun, before you plant them. It fhould be remembered, that the roots of the anemony are to be taken up about the end of June or the beginning of July; after being dried in the fun, they fhould be preferved in a dry cool place, or kept in fand for a month, and then put in papers till the feafon for planting them. When thefe roots are firft tranfplanted, a thin layer of willow-earth, or rotten fally-wood, being put under them, forwards their growth.

Fruit-Garden.

The prunning of pears, vines, and plumbs, is the chief employment of this month. In pruning the pear, thofe buds which appear fuller than the reft fhould be carefully preferved; all branches that proceed from the knob, whereon the ftalk of a pear grew, are to be taken away, but the knob muft remain; and the extremity of the laft year's pruning is to be taken off.

As the large branches of a pear-tree are ufelefs in bearing, care fhould be taken to extend the branches fideways, and none but fmall branches fuffered to grow in the middle, and not even thofe to grow directly perpendicular, as, by that means, they would foon become what is called *great wood*.

A pear-tree that is vigorous and luxuriant fhould not be pruned till after it has begun to fhoot. A languifhing pear-tree may be reftored to its former ftate by pruning and removal into better ground. Another very good method of treating pear-trees not in a bearing ftate, is to bark the luxuriant branches all round about a quarter of an inch wide, more or lefs, according to their ftrength. Apple-trees will likewife bear this operation, which fhould be done in April. Trees that are too vigorous may be made to bear by cutting off the fap roots, or taking them up, and re-fetting them, for they are often planted

planted too deep. Plumbs and cherries may be pruned in the ſame manner as pears.

The winter-pruning of the vine (which requires a firſt, ſecond, third, and ſometimes a fourth pruning) ſhould be done either in October, November, December, or this month. The vigour of the vine is to be regarded; the ſmall weak ſhoots that never bear any fruit muſt be cleared away, and the other branches are to be ſo proportioned as not to occaſion any confuſion; ſuch as are thickeſt and beſt placed ſhould be preſerved, and the ſtrong ſhort branches left nine inches or more, according to the ſize of the vine. When they have ſhot twelve or fifteen inches long, which will be in the ſummer, you muſt begin to nail them up; and when they have ſhot two or three feet, ſtop or cut off the ends of the ſhoots; thoſe on the ſide ſhould not be broke off till the fruit is ſet: and a fruit bearing branch ſhould be cut within three or four eyes of the fruit.

All ſuckers ſhould be cut off as ſoon as they have ſhot ſeven or eight inches. The vine ſhould be kept thinner of wood than any other tree, though it puts forth the largeſt ſhoots. All the old wood ſhould be cut out, and its place ſupplied with vigorous young ſhoots.

All dead or cankered branches ſhould this month be cut from the ſtandard fruit-trees, as alſo ſuch as croſs each other; but in doing this you muſt be careful to make the wounded part as ſmooth as poſſible, and ſloping, that the wet may not enter and be detained there, to the great prejudice of the trees.

Kitchen-Garden.

The management of hot-beds claims almoſt the ſole attention of the kitchen-gardener this month. The place moſt expoſed to the ſun is beſt for making a hot-bed: when you have marked out the dimenſions of the bed, drive ſtakes into the ground on every ſide, a yard above the ground, and a foot aſunder; wind theſe round with bands made of hay or ſtraw, and then fill them up with wet litter and new horſe-dung, treading it down very hard as you fill; in doing which you muſt be careful to leave room for the earth and the ſhooting of your plants.

When you have thus laid the bed, fix your wooden frames fitted to the ſame, for the reception of the mould at top, and for the ſupport of glaſs frames, which are to be fixed ſloping.

The hot bed ſhould then be finiſhed by putting in the earth; an old hot bed, well rotted, affords excellent ſtuff for this purpoſe; but if that cannot be procured, ſome very rich mould well ſifted will do.

Over the whole you muſt fix matts ſupported by ſhort ſticks, which muſt remain about a week; by which time the bed will abate of its extreme heat, and be of a proper temperature for uſe.

The bed ſhould be warm, not hot; and when the heat leſſens too much, by applying new dung to the ſides, you may renew it.

When plants are come up in a hot bed, they ſhould have air and the ſun by degrees; and when ſtrong enough, ſhould be removed to a ſecond hot-bed, of leſs heat than the former, or into very rich earth, where they ſhould be frequently watered gently, and kept from the meridian ſun till well ſettled; and when the weather is cold, by covering the glaſſes a little before ſun-ſet with litter and matts, they may eaſily be defended from it.

Gardeners in general make their ſeed beds for cucumbers and melons in this month, for raiſing them before their natural ſeaſon; but the better method is, to make hot-beds the latter end of October or beginning of November: about four feet ſquare, and two feet high, is the proper ſize, wherein, after the heat is moderated, cucumbers and melons may be ſown.

About a week after their coming up, plant them four inches apart in the ſame bed, after having well ſtirred up the earth. As the days in October are uſually warm, the plants may be allowed to have air; but in January they muſt be kept covered up cloſe. In this firſt raiſing of plants, a gardener may, with due care, make them as hardy as he pleaſes.

It is uſual with ſome people to keep their melon ſeeds in milk four and twenty hours before they make uſe of them; others uſe them without that preparation: they ſhould be ſet two or three in a hole, in the hot-bed, about an inch deep, and covered cloſe up, to keep them warm. About the end of April is the time for planting melons, which ſhould firſt be done in ſmall baſkets made of old willow-twigs, three inches deep, and eight or nine inches over.

Two or three plants ſhould be planted in one baſket, and when they will bear it, moved on another hot bed, covered with a ſandy loam five or ſix inches thick, ſifted fine, wherein they are to grow all the ſummer.

Cucumbers are propagated after the ſame manner as melons; but as a bad ſeaſon may prevent their being ſucceſsfully raiſed, it is highly neceſſary to put ſome ſeeds into the bed at three or four different times this month, that if ſome ſhould fail, the others may ſupply their loſs. In order to raiſe aſparagus for hot-beds, make choice of a piece of ground that has been well dug and mellowed, then ſtrike out lines ſeven or eight inches from each other, and plant the aſparagus roots in them at ſix or ſeven inches apart when they are a twelvemonth old: let them be kept free from weeds, and remain in the nurſery two years, in which time they will be fit for the hot-bed. The hot-bed for the reception of theſe roots ſhould be made pretty ſtrong, and covered with earth ſix inches thick, encompaſſed round with bands of ſtraw. The aſparagus-roots ſhould be planted as cloſe as they can be placed together without trimming; which being done, cover the buds of the plants two inches thick with earth; in which ſtate let them remain five or ſix days before the frames and glaſſes are put over them; and then lay on over the whole three inches thick of freſh earth.

As ſoon as the buds appear, give them what air the ſeaſon will permit, which will make them green, and of a good taſte. The bed will laſt good about a month, producing daily freſh buds, if the weather be not too ſevere: when it begins to cool, warm horſe-litter laid upon the glaſſes every night will contribute as much to facilitate the ſhoot of the buds as if new dung were applied to the roots.

It ſhould be obſerved, that the time for this work is not only in this month, but from November till April; (making freſh buds every month to follow one another for a conſtant ſupply) and in April comes the natural crop.

A very moderate hot-bed made after the manner firſt directed, will ſerve to propagate early ſtrawberries.

You may make a bed in two or three hours, with the uſe of hot lime and powdered dung, the dung being in the middle, and the lime underneath and at top; over which you ſhould lay a quantity of fine rich mould.

To raiſe radiſhes in the hot-bed with ſucceſs, you ſhould have ſufficient thickneſs of rich light mould, that they may have proper depth to root in before they reach the dung.

Radiſhes may be ſowed all the year, but in hot-beds in the winter.

Muſtard, lettuce, creſſes, and other ſallading, are generally raiſed from the ſeeds ſown in drills or lines, in ſuch an expoſure as is required by the ſeaſon of the year; in the winter-ſeaſon, on moderate hot beds; in the ſpring, under glaſſes and frames; and in the ſummer, on natural beds of earth.

Creſſes ſown in the natural ground in Auguſt, reſiſt the froſts of the winter, and help greatly to inrich the hot-bed ſallads with the high taſte they maintain by being expoſed to the open air.

Small herbs ſhould be drawn up by the roots from the hot beds; and, in ſowing a ſecond crop, ſeeds of another kind ſhould be ſown, and not the ſame kind in the ſame place.

The hotſpur, charlton maſter, and other peas, muſt be ſown in drills three feet aſunder, that you may have room to go between them; and the lines ſhould run from north to ſouth.

When they have ſhot about ſix inches high, earth them about four inches on both ſides of the lines, raiſing a little bank on the eaſt ſide of them, to defend them from the blaſting winds.

In February you may ſow a ſecond crop, and in March a third.

You muſt, in the beginning of the winter, ſow twice the quantity of peaſe you need to do, if you ſtay till February or March; becauſe the cold weather and the mice will deſtroy great part of them.

FEBRUARY.

Flower-Garden.

For the better management of the auricula, which is to be ſown this month, prepare a box of oak or deal, four feet long, two feet wide, and ſix inches deep, with holes in the bottom, ſix inches diſtance from each other; in which, after laying two inches thick of cinders or ſea-coals; and ſpreading over them ſome earth taken out of hollow willow-trees, till you have filled the box, ſow the ſeeds on the top, without any covering of earth, preſſing them into the mould with a flat board, in order to ſettle them below the edges of the box that the light ſeeds may not float over the brim in watering.

From the time of ſowing to the beginning of April, this box muſt be placed where it will receive the ſun; but after that time, it muſt be removed into a ſhady place; and the ſeeds muſt be continually refreſhed with gentle waterings.

If the ſeedlings do not come up the firſt year, they will the ſecond; and in July or Auguſt, after they appear above ground, will be ſtrong enough to tranſplant; when you muſt ſet them in beds of light earth well ſifted, at about four inches diſtance from each other, and place them where they may receive only the morning ſun.

The April afterwards they will begin to ſhew themſelves, when they ſhould be tranſplanted into pots filled with ſoil made of one load of melon-earth, or dung well rotted, half a load of ſea-ſand, and half a load of ſandy loam; or a load of melon earth, and the like of ſandy loam; or one load of rotten wood, or the bottom of a wood-pile, the ſame quantity of loam, and half a load of melon earth, prepared as above.

Theſe flowers muſt be carefully ſheltered from the rains, which greatly impair their colours.

Provided the weather is mild, you may, toward the end of this month, plant out your choice carnations into the pots where they are to remain to flower; in doing which, you ſhould not take too much of the earth from their roots; and when they are planted, it will be proper to place the pots in a warm ſituation (but not too near walls, or pales, which will draw them up weak); and arch them over with hoops, that in bad weather they may be covered with mats; for unleſs they acquire ſtrength in the ſpring before the heat comes on, they will not produce large flowers.

The polyanthus ſeed muſt be ſown upon a place prepared with earth taken out of decayed willows, often watered and kept ſhaded from the ſun all April and May, till the young plants are come up.

The ſeedlings will be fit to tranſplant the July or Auguſt following into beds: the ſoil of which ſhould be ſomewhat binding, and their expoſure only to the morning ſun.

You may have an annual ſupply of larkſpurs without the trouble of ſowing, by ſuffering the ſeeds of the flowers to drop, which will come up the enſuing ſpring: they are ſown in ſpots, and flouriſh in variety of ground.

The ſingle ſort of Sweet William is raiſed by ſeeds ſown in February or March; the double ſorts, propagated from ſlips taken near the root about March or April, and planted in a loamy ſoil: they may alſo be laid down in the earth like carnation layers.

Holyhocks are raiſed by ſeeds ſown in this month, removed in Auguſt or September to their proper places of vegetation, in rich earth.

The moſt agreeable diſpoſition of this flower is, under ſome coarſe wall, which they will handſomely fill, or in any other place guarded from the winds.

Pinks, and candy-tufts, are generally uſed in edgings in gardens, and inſides of borders, where they are planted in ſpots, and have a very agreeable effect.

The ſeed is ſown in lines in this month or March; or they may be propagated from ſlips planted very early in the ſpring, or in Auguſt.

Roſe-

Rofe-trees, of which there are various forts, fucceed beft in a ftrong holding ground, tolerably moift; they may either be raifed from layers or fuckers, laid down and taken from the old roots in February or March, and tranfplanted immediately before the roots grow dry: fhould there be a neceffity for keeping them out of the ground for fome time, lay their roots in water five or fix hours before they are planted.

The rofe-tree does well in borders, or in the quarters of wildernefs works, among other flowering fhrubs; and fome or other of them will be in flower for ten months in the year.

The laburnum tree is commonly planted among the other flowering fhrubs of the wildernefs, and will grow in the moft open expofure, as well as under the fhade of large trees: it may eafily be raifed from feeds fown in this month, and tranfplanted two years after it comes up.

The althæa may be raifed from layers or feeds; there are feveral different colours of this flower, and they may be budded fo as to have all the colours on one plant.

The pomegranate profpers moft in a light foil; and being propagated by laying down the young fhoots in this month or March, may be tranfplanted either in the fpring or autumn feafon, when they may be put in pots, or againft a fouth wall, where the fruit will ripen.

The pomegranate may alfo be raifed from feed.

The fyringa may be raifed from feeds; but it is hardly thought worth the trouble, as it is very apt to put forth fuckers; thefe, however, may with eafe be taken off and tranfplanted at this time of the year, and in September.

It is a fhady pofition which makes this fhrub fhoot, and the fun makes it flower; but it will grow almoft any where.

The lilach is a plant which grows to a pretty large tree, bearing bunches of purple bloffoms, likes plumes of feathers, in May; and is raifed by laying down the young branches in this month or March, or by taking off the fuckers, and planting them in a light foil, about the fame time, or in September.

Thefe trees are highly ornamental in the quarters of wildernefs works, and fmall walks of them are very pleafant.

The Spanifh broom is planted in wildernefs works, and may be raifed from feeds fown in light earth; alfo by laying down the tender branches, and cutting them at the joints, after the manner of the carnation; but the latter method is not fo certain as the other, though it is far more troublefome.

The laurus tinus is greatly admired for producing its flower in the winter; and may be raifed from the berries, managed as the holly; or from layers, which is the moft expeditious way.

This plant is greatly hurt by froft, and fucceeds beft in moift fhady places; it will flourifh in loamy foil, without the help of any rich manure, which forwards its growth too much.

The laurus tinus, is often trained up as a headed plant, though it is beft planted againft a wall, or in wilderneffes; and it is obfervable, that this plant, like all other exotics, is naturally inclined to bloffom about the fpring in its own country, which is our autumn; for which reafon, it fhould be pruned in our fpring feafon after it has done blowing.

The phillyrea, may in general be propagated from the berries, or raifed from layers, which will prefently take root.

This plant, which fucceeds beft in a natural light foil, grows very faft; and being well fupported with rails or ftakes, a number of them makes a very thick and handfome hedge.

The yew-tree delights in a light barren foil, and is more plentifully produced on the coldeft mountains than in the richeft foils.

The berries of the yew may be laid in fand, as thofe of the holly, before they are fown; and there is no difficulty in propagating this plant, or removing it, if the roots are pruned from time to time, by digging about it while it ftands in the nurfery.

The holly will grow to a very large tree; but being a rooted plant, does not fucceed well when tranfplanted, unlefs the roots have been often pruned in the nurfery.

The berries of this plant, when ripe, are to be gathered; and after they have been laid to fweat fome time, are to be put in fand or earth, till the autumn following, when, and likewife in this month, they may be fown in nurfery beds.

They will lie in the ground for a long time before they begin to fpring, and it will be four or five years before the young ftocks will be fit to graft or inoculate upon.

The grafting muft be done in March, and the inoculating in July; but for ftandard trees or hedges, they muft be planted at their proper diftances while very young, that they may be accuftomed to the foil.

The bay-tree, which is managed as the holly, is raifed by berries fown in this month, on a bed of earth frefh dug, and covered with fome frefh natural earth, well fifted, about two inches thick.

In about fix weeks, the feeds thus fown will come up, fhould the weather prove moift; they fhould he covered with ftraw, or fern, for the three firft winters, after which time they muft be tranfplanted.

When thefe plants are difcoloured by froft, cut off the top-branch in the fpring, and they will fhoot afrefh.

The bay-tree may alfo be raifed from layers laid down in the month of October, for cuttings, fet in pots of fine earth, two or three inches deep; and from fuckers taken up with as much root as may be, and planted in the fhade, in a gravelly foil, being well watered to fettle the earth about their roots.

The laurel is propagated in the fame manner as the bay-tree, loves fhade, refifts the weather, and will thrive in almoft every foil.

Towards the end of this month, if the feafon proves favourable, ftir the furface of the ground of your flower-beds, and clear them from weeds, mofs, and whatever filth may appear thereon, which will not only make your garden look neat, but be of peculiar fervice to the flowers.

Fruit-Garden.

The bufinefs of this month is chiefly pruning and grafting

ing; and is more particularly the feafon for pruning fruit-trees.

When a tree has produced two well difpofed branches with fome weak ones intermixed, they fhould be fhortened equally to the length of five or fix inches; and if the pofition of the two branches be irregular, there muft be only one left to begin the formation of your tree.

A tree will fometimes fhoot five, fix, or feven branches, the firft year; when this happens, three or four only of the beft branches are to be preferved.

A multitude of branches in the firft year, is not always a fign of vigour; for they fometimes prove weak, occafioned by the infirmity of the roots: in pruning, generally a vigorous tree cannot have too many branches, if they are well difpofed, nor a weak one too few.

The fap of all trees muft be kept within due bounds, and a greater liberty is to be allowed to ftrong trees than to weak ones; for which reafon ftrong and vigorous branches are left of a greater length than feeble ones: and it is beft to prune weak fickly trees early, that the fap may not be too much wafted.

In the pruning of wall-fruit-trees, all the branches fhooting directly forward are to be cut off clofe to the branch they fpring from; and the utmoft care muft be taken to prevent their being too much crouded with wood, it being often neceffary to take off even bearing branches, to preferve your trees in beauty and health; for it is impoffible too great a number of branches fhould be fupplied with juices as they ought; and if they are not, either the bloffoms will drop off, or the fruit never ripen.

You fhould ever be careful to preferve a convenient fpace between one branch and another in all prunings; alfo that one branch does not crofs another: a flender bearing branch may, notwithftanding, fometimes be permitted to fteal behind the main body of the tree, and be no offence to the eye.

That a tree may be the better difpofed to bear fruit, the branches fhould be carried horizontally as much as poffible; for the more perpendicular the branches of a tree are led, the more they are inclined to run into great wood and barrennefs.

Small weak branches, fhooting from the like, fhould be cut away, as fhould all fhoots put forth in autumn.

When an old tree fhoots ftronger branches towards the bottom than the top, and the top is fickly, it muft be cut off, and a new figure formed from the lower branches; but if the top be in good health, you muft cut off the lower ones, unlefs it be a few that are well placed.

Where old trees are in a weak condition, to preferve them, they are to be difburthened totally, leaving a few branches only fhortened to five or fix inches.

Having thus laid down the principal rules for pruning in general, we now come to the management of the peach and other fruit trees in particular.

When peach trees are vigorous, it is beft to defer the firft pruning till they are ready to bloffom, when you may be at a certainty in preferving thofe branches which are moft promifing of fruit, and then to fhorten them as they require.

You may foon difcover the fruit-bearing branches by their fwelling buds, and you fhould reduce them to the length of five or fix inches; the laft year's fhoots may be left ten or twelve inches long.

In the fpace of about three years, all the wood muft at feveral prunings be taken away, but in the mean time the wall is to be furnifhed with other wood.

When you have reduced your tree to beauty and order, you have little to do but thinning your fruit till Midfummer, when the fhoots are to be fhortened and faftened to the wall, giving the fruit the advantage of the fun as much as poffible.

If the peach-tree makes over-hafte in its bearing, it is a fign of infirmity, and muft be accordingly managed, by pruning the branches fhort, and plucking off all or moft of the bloffoms or fruit; which it is much lefs difficult to do than when a peach is over vigorous; for then nature is apt to make a confufion, which requires the greateft fkill to know what branches are fit to be chofen, and what rejected.

The peach tree requires a fecond, and fometimes a third pruning; the laft of which is to be performed about the middle of May, or in June or July.

The apricot and nectarine may be pruned in the fame manner as the peach; but it fhould be obferved, that the apricot is more apt to run to wood than any other of thefe kind of wall-fruit trees.

The ufual ways of grafting are, in the cleft—in the bark—by approach, and whip-grafting.

Grafting in the cleft, or flip-grafting, is performed on the cherry, pear, and plumb ftocks, in the manner following.

When you have chofen a ftock, in a fmooth place cut off the head of it, floping: then, with your knife make the top horizontally even; which being done, make a flit of near two inches deep down the middle of the ftock; in which fix a cyon, floped on each fide from a bud; and clofing the bark of both exactly, tie them round with bafs.

When you have thus finifhed your grafting, put a quantity of clay and horfe-dung, tempered together, round the ftock and lower part of the cyon; in doing which, be careful not to difturb the latter.

Grafting in the bark is generally performed only on apples, by cutting the head of the ftock as already directed; but inftead of flitting it, flit only the bark a little above an inch on the fouth-weft fide, or as long as the floped part of the cyon; then, loofening the top of the bark with your knife, put in your cyon (being prepared with a flat flope about an inch long, ending in a point, and begun from the back-fide of an eye) and clofing it as above, cover it alfo in the fame manner with clay.

When either an apple, pear, plumb, or cherry tree, wants a branch to make the tree uniform, a graft may be put into the fide without cutting the head of it.

Grafting by approach, or inarching, is performed when a ftock grows fo near another tree, the fruit of which you would propagate, that it may be joined with a branch of that tree, by cutting the fides of the branch and ftock about three inches long, and fitting them, that the paffages of the fap may meet; in which pofture let them be bound and clayed.

When they are well cemented, cut off the head of the ftock

ftock about four inches above the birding; and in March following, having cut off the ftubb that was left of the ftock, and the cyon underneath, clofe the grafted place, that it may fubfift by the ftock only.

This manner of grafting agrees beft with vines, pomegranates, oranges, and fuch like fhrubs.

When the ftock and cyon are of the fame bignefs, the operation of whip-grafting is performed, by floping the ftock and cyon about an inch, fo as to make them fit, and then tying them together, and claying the place.

Kitchen Garden.

Hot-beds for radifhes and fpring carrots fhould now be made, according to the directions given for a common hot-bed in the preceding month; which, by proper management, will do for all forts of feeds that are annual.

To make a mufhrum bed, dig a trench five or fix inches deep, and lay in it either the dung of horfes, mules, or affes, in ridges, which dung muft be the laft covering before the earth is laid on.

The bed, when it is complete, muft be three or four feet high; and after covering the dung about two or three inches deep with fuch earth as is taken from under a turf, put fome mufhroom-earth all over the bed on the laft covering of dung.

Should the weather be fevere, you may defend the bed with ftraw or dry litter, eight or ten inches thick, or cover it with matts faftened on hoops.

The bed muft be kept properly watered, twice or thrice a-week, and the mufhrooms will come up in two months time at fartheft; fometimes in a month, when they muft be immediately cut.

By putting fome mufhroom earth on your cucumber-beds, you will greatly forward their growth.

In the natural ground potatoes love a fandy foil; and the fmaller roots, or knots of them, are commonly faved to raife a crop from, being fet about four or five inches deep in the ground, and five or fix inches apart; and when their haulms begin to decay, which is generally about Michaelmas, you may take them out of the ground with forks as you have occafion to ufe them.

The Jerufalem artichoke fucceeds beft in a ftiff foil, and affords a root as large as an ordinary turnip, being in tafte fomewhat like a potatoe, but rather more watery.

The feveral forts of cabbages, as the red cabbage, the Dutch cabbage, the Savoy cabbage, the Ruffia cabbage, the Batterfea cabbage, and the two forts of the fugar-loaf cabbage, fhould be planted at proper diftances, according to their feveral ftatures.

The Savoy cabbages are for winter ufe, and towards the fpring put forth fprouts preferable to the cabbages themfelves.

Almoft any ground will ferve for cabbages; but if the weather be dry, it muft be well watered before planting.

The hardeft cabbages may be taken up before the great frofts come on; and after they have hung up by the roots about a fortnight, lay them in a cellar, where they will keep a long time; or plant them deep in the ground clofe to one another, and cover them with haulm or ftraw, till you have occafion to ufe them.

Carrots are moft profperous in a light ground, in which their roots will grow to a great bignefs.

Spring-carrots are fown in July or Auguft; thofe intended for a winter-crop, in February or March, in dry weather.

When your carrots are come up, and have been above ground about a month, they muft be houghed, leaving the fpace of about five inches between the plants; and after the firft houghing they fhould be kept as clean as poffible till they are full grown, when they may be taken up for prefent ufe, and kept in fand during the winter.

Parfnips thrive beft in a rich foil, and, excepting that they fhould not ftand fo thick, are to be managed in the fame manner as carrots.

The fkirret requires a light, moift, yet a rich foil; and is propagated either by fowing feeds, or by tranfplanting the offsets from the roots,

As foon as the leaves begin to put forth, they fhould be taken out of the ground, and parted into as many flips as can be conveniently taken off with the roots, fo as only the frefh fpringing fibres remain on them; drills about four or five inches deep muft then be prepared to plant them five or fix inches apart, and they muft be kept well watered till their roots are fully grown.

The ufual time for fowing turnips is in July or Auguft, but fome people fow them in this month, by way of providing them for the fummer. They thrive beft in a fandy, loamy foil, but will grow in any ground: when the plants have two or three leaves, they fhould be houghed at the diftance prefcribed for parfnips and carrots.

Onions are fown in this month, and in March, in rich garden foil; and toward the latter end of April, being come up, they are houghed, when about three inches fhould be left between the plants till they begin to grow fit for fallads, and then they may be drawn, or thinned where they grow too clofe together.

In fowing onions you muft not be fparing of feeds, as it often happens many of them, being bad, have no effect.

When the leaves begin to change their colour, they fhould be pulled up, (in dry weather;) and after being well dried without doors, they muft be fpread on fome floor, to dry more thoroughly for winter ufe.

Such onions as fpire in the houfe, may this month be planted in lines fix inches apart, and two inches diftance for feeds for another year.

The leek is fown in a well-wrought ground, and is to be kept free from weeds, and houghed like the onion; the plants are tranfplanted in July, in rich light foil, in lines about five inches apart.

Strawberries profper moft in ground inclining to clay; and the beft way of managing them, is to provide a quantity of horfe-dung and coal-afhes well mixed together, and lay it upon the land to be dug or trenched in this month; then make borders three feet wide, on which the flips are to be planted from eight to eighteen inches apart, according to the forts: the chila ftrawberries being largeft, fhould be fet two feet afunder.

Afterwards you may ſet beans for a ſummer crop, and plant roſes, ſweet brier, currants or gooſeberries, at every five or ſix feet diſtance, as the plants will not begin to bear fruit to any purpoſe till the following year, and it will be the third year after planting before there will be a full crop; in the mean time the roſes, gooſeberries, *&c.* turn to a good account, beſides being ſerviceable to the plants by ſhading them.

The ſtrawberries ſhould be kept clear of weeds, and, if their blowing ſeaſon be dry, well watered: early in the ſpring you muſt cleanſe them, and fling looſe earth among them to ſtrengthen their roots.

Of ſtrawberries there are five ſorts, the chila ſtrawberry, the hautboy, the ſcarlet, the red, and the white wood-ſtrawberry.

There are two kinds of raſpberries, the red and white; the latter is the greater rarity, and thrives in ſuch ground as agrees beſt with ſtrawberries, being propagated by ſlips taken from the roots the latter end of this month or in March.

Raſpberries ſhould be planted in ſingle rows, about a foot or eighteen inches aſunder, and three feet between every row, leaving the heads two feet high when planted.

The Muſcovy cluſtered raſpberry, planted againſt a wall between the trees where there is a vacancy, will ripen very ſoon; and their chief culture is to keep them clean from weeds in the ſpring; to prune the tops of the ſtrongeſt ſhoots of the laſt year, leaving them about three feet high; and to cut away all dead and weak branches.

The gooſeberry is propagated either by ſeeds, ſuckers, or cuttings; the firſt may be ſown as ſoon as ripe, and will come up the ſpring following; the ſuckers are taken from the roots of old trees when their leaves are fallen, and tranſplanted in nurſeries, in open weather; and the cuttings will take root, being planted in the months of September or October.

This tree requires a ſtrong holding ſoil, and may be tranſplanted with more ſafety in October than at this time of the year.

Currants are to be raiſed in the ſame manner as the gooſeberry, and thrive beſt in the ſame kind of ſoil.

Liquorice ſhould be planted at this ſeaſon of the year; and the ground made choice of for planting it ſhould be trenched three feet deep, and the liquorice ſet at a foot diſtance every way.

MARCH.

Flower-Garden.

The roſe campion is propagated either from ſeeds ſown this month, or from ſlips taken from the roots: the double-bloſſom kind is raiſed from ſlips only, as it does not produce any ſeeds; the laſt-mentioned thrives beſt in a loamy ſoil, and open expoſure.

In this month alſo off-ſets of the white hellebore are planted in a rich light ſoil.

Seeds are now ſown of the fox-glove, which ſucceed beſt in the ſhade and a loamy ſoil; this flower does not blow till two months from the time of ſowing.

The poppy, which is an annual, is ſown in ſpots; as is the Venus looking-glaſs: the latter is proper alſo for edgings.

The valerian is raiſed from ſeeds, and ſome kinds of it are increaſed by parting the roots.

The primroſe tree will grow in any ſoil, and the ſeed of it is ſown in the natural ground towards the end of this month: it is very proper for the middle of borders in large gardens; and the ſeedling plants, which will not bloſſom till the ſecond year, are to be ſown in the nurſery, and the young plants removed to proper places in the Auguſt after they come up.

Slips of the gentianella are planted in a ſandy ſoil in this month or Auguſt.

Cardinal flowers are raiſed by ſeeds ſown in hot-beds, in fine ſifted earth; and the ſeeds being ſmall, are to be lightly covered with mould: theſe flowers, which are commonly cultivated in pots, may be increaſed by parting their roots in April, and planting them in places well expoſed to the ſun.

You ſhould now ſow the ſeeds of the ſtock-gilliflowers, and tranſplant them in the Auguſt following, in a light natural dry ſoil.

The double kinds of this flower may be increaſed by ſlips or cuttings planted in May, June, or July.

Sow the ſeeds of the acanthus, in a ſandy ſoil, and in the ſhade.

A loamy ſoil is requiſite for raiſing the double rocket flower, which is propagated from ſlips taken from about the root.

The ſcarlet lynchis is propagated either from ſeeds, or ſlips taken from the root; it is alſo cultivated in pots, and requires a loamy ſoil, and open expoſure.

The ſeveral ſorts of double wall-flowers may be raiſed from ſlips planted in ſhady places, either in March, April, May, or June; but the bloody wall-flower may be more eaſily raiſed from ſeeds ſown in this month: and a ſandy ſoil is requiſite to make them thrive.

The monk's hood, a flower of a poiſonous quality, is propagated by parting the roots, which ſhould be done in this month, and will thrive beſt in a loamy ſoil, in the moſt ſhady place in your garden.

The ſun-flower, which will grow in any ſoil, is raiſed from ſeeds ſown in large borders; and alſo by parting the roots, either in this month or in Auguſt.

The aſters, or ſtarworts, will thrive in any ſoil, and are fit companions for the talleſt flowers in your garden: they are propagated from ſlips taken from the root; and the beſt method is to plant them in pots, otherwiſe they will grow ſo numerous as to become a nuſance rather than an ornament.

Seeds or layers of the paſſion-tree may be ſown this month; and every cutting of it, being planted in fine earth, will take root about May or June.

This tree is a prodigious quick grower, and very hardy; loves moiſt and cool places; and, if conſtantly watered, and dunged about the roots, it will bear fruit reſembling lemons.

The arbutus, thrives in a light, gravelly ſoil, and may be raiſed either from ſeeds or layers; and the fruit (which muſt be gathered about Chriſtmas, and laid to dry for

a

a month) is to be ſown in pots of light earth, and covered about a quarter of an inch with fine mould in this month; and the gentle heat of a hot bed will greatly aſſiſt the germination of the ſeeds, which are to be frequently ſprinkled with pond-water as they come up.

The layers of the arbutus are made of the moſt tender ſhoots about September; but will not be ſtrong enough to tranſplant the ſpring following, though they will take root in a year's time.

The apocynum, or dog's-bane, is propagated from ſeeds ſown this month in hot-beds, or from cuttings; a light natural ſoil agrees beſt with them; they ſhould be watered but ſeldom, and then gently; and they ſhould be ſet in the hot-houſe ſooner or later, as they are more or leſs tender.

Set the ſtone of the fruit of the palm-tree this month in light earth, and give them the aſſiſtance of the hot-bed; it is a green-houſe plant, but might be made to ſtand abroad, after ſheltering for three or four years.

The green privet, which is a plant of a quick growth, and makes an admirable hedge, is propagated by ſowing the berries in light earth, about an inch deep, watering them frequently till they come up; a hot gravelly ſoil is the moſt proper for this tree; and they are to be tranſplanted from the ſeed-bed the ſecond year after ſowing.

The mezeron, ſhould now be ſown in a loamy ſoil, and care ſhould be taken to preſerve it from the birds.

The berries of the juniper-tree may be ſown this month in rich ground without watering, or in any light manure, and in about two months they will come up; and they are to remain in the ſeed-bed two years, during which time they muſt be kept free from weeds, and then they may be tranſplanted.

You may now take off the ſuckers of the *ſpiræa frutex*, and plant them in a light ſoil.

Sow the ſeeds of the ſeveral kinds of firs ornamental in wilderneſs-works, which will flouriſh in any ſoil; in order to keep their bodies ſmooth and free from knots, you muſt break off their collateral buds while they are young and tender.

Upon the hot-bed, ſow ſuch exotic ſeeds as are leſs tender, and arrive ſooner at perfection than thoſe ſown the laſt month; among which are the China or Indian pink, the *naſturtium Indicum*, *convolvulus*, and balſamines; and none of theſe muſt be planted in the natural ground till the middle of May: if you have no hot-bed, you may defer growing the marvel of Peru and the *naſturtium* till the next month, when they will come up in the natural ground.

Plant tube-roſes in pots of freſh earth, giving them a gentle warmth, but no water till they ſprout out of the ground.

The ſeeds of the *campanula pyramidalis* ſhould now be ſown, and ſlips taken off from the roots; freſh air ſhould be given to the pots of this flower, and they ſhould be ſet in ſome pit where the ſun may come at them, by which means they will grow tall.

Mend and repair your ſhelves and places of ſhelter for auriculas, which ſhould now be guarded on all ſides but the eaſt from the ſun, and defended from rain; put canvas coverings or matts over your tulips, to prevent their being blighted; and tranſplant your carnation layers for blowing, if they were not planted out in autumn.

The ſeeds of the humble and ſenſitive plants may now be ſown upon the hot-beds; and the *noli me tangere* in the natural ground.

You may tranſplant your evergreens; graft the Spaniſh white jeſſamin upon the common Engliſh ſort; and ſlip or ſet box for edgings, or in figured works.

Such exotic plants as have ſuffered in the green-houſe, ſhould be removed to the hot-houſe; where, to prevent the ſteam of the bed from being of bad conſequence, the dung ſhould be covered with a due thickneſs of earth.

Fruit-Garden.

You may make layers of the vine either in this or the next month, and they will be fit to tranſplant at Michaelmas; this tree is alſo propagated by laying down the young branches as ſoon as the fruit is gathered, or by making plantations of cuttings at that time.

If the weather proves open in February, that is the beſt time for planting vines; and the ſoil in which they beſt ſucceed is rocky or gravelly.

A chalky hill, lying very open to the ſun, will produce better grapes than any of the rich ſoils prepared with horſe-dung; but a tolerable good compoſt, to mix with the earth about the roots, may be made with the rubbiſh of old buildings.

In planting a vine, let the places where your vines are to ſtand be open and prepared before any of the plants are taken out of the nurſery, when great care ſhould be taken in their removal; they are to be planted ſix or ſeven feet every way, and the beſt grapes for a vineyard are the marlmorſe, chiante, claret grape, and Burgundy black morellon.

Theſe vines are to be pruned the September before tranſplanted, according to their ſtrength, leaving not more than four buds on the ſtrongeſt; and to cleanſe them from weeds is all the care they will require the firſt ſummer.

Shorten the ſummer-ſhoots about the end of September, and the ſtrongeſt of them will begin to ſhew a little fruit the ſummer following.

In May or June of this ſecond year, the ſmall ſhoots and ſuperfluous branches are to be carefully broke off, and two or three ſhoots only preſerved on each vine, which ſhould be ſupported by ſtakes or poles, till the September following, (for the nearer the grapes grow to the ground, provided they do not touch it, the ſweeter they will be) and then they may be ſhortened.

The vineyard, thus planted and managed, will, in five or ſix years time, ptoduce a good crop of grapes.

The fig is raiſed either from layers, ſeeds, or ſuckers; the layers are ordered like thoſe of the vine; the ſeeds are ſown in rubbiſh, or ſuch like ſoil; and the ſuckers are ſeparated from the old roots the beginning of this month, and tranſplanted without cutting off their tops.

The fig-tree thrives in the ſame ſort of ſoil as the vine, and may be planted either againſt walls or in ſtandards.

The pruning of this tree is very different from that of

of other fruit-trees; for as the practice is to take away the ſmall branches in pruning other trees, ſo here it is to be avoided, becauſe the fig puts forth its fruit chiefly at the extremities of the laſt year's ſhoots; but you may cut off ſome of the weak ſmaller ſhoots which do not promiſe to bear, ſo as you do it cloſe to the great wood.

The branches muſt not be ſuffered to grow too high, as they are prevented by that means from being full; the new thick branches muſt be ſhortened yearly to about a foot, and the bud at the end of the branches broken off in the ſpring time, which will cauſe the figs to ſhoot out more early, and inſtead of a ſingle branch there will be two.

The pruning ſeaſon of the fig is towards the end of this month; and it is beſt in the ſummer to let this tree have ſome liberty from the wall, and not ſuffer it to continue cloſe tacked to it like other fruit-trees; but in the winter ſome of the ſtraggling branches ſhould be cut off, and the beſt and biggeſt branches tacked to the wall in November, that they may be more effectually ſettled, and ſheltered from the froſt in the winter by the defence of a matt, or otherwiſe, eſpecially when the ſeaſon is very cold.

The ſuckers which this tree puts forth in great abundance, muſt be kept down, and whatever you cut away, muſt be as cloſe to the great wood or roots as you can; and a whole tree may, after an unkind winter, be cut down for the recovery of its former ſtate of health.

The following is the method of making the horizontal ſhelters for fruit trees: Lay rows of tiles in the ſtructure of the wall, at certain diſtances one above another, the tiles jetting forward, and hanging over the plane of the wall about an inch and a half; this is neither a difficult nor a chargeable work, if the wall be of brick, to place between every two rows of bricks theſe horizontal ſhelters of tiles: and if the wall be of ſtone, and the joints be any thing regular, it is not leſs eaſy.

In order to avoid the inconvenience of branches riding over the edges of the tiles, in each row, at convenient diſtances, muſt be left void places or gaps, for the wood branches to paſs through; which gaps are to be left wider at the bottom than at the top of the wall; and the rows of the tiles are not to be laid exactly horizontal, but rather a litt'e ſloping, the beter to ſhoot off the water from the fruit.

Bloſſoms and tender fruit are more eſpecially preſerved by theſe horizontal ſhelters, than by matts, or coverings, of any kind whatſoever; and by their aſſiſtance a good quantity of the choiceſt fruit may be depended on in the moſt difficult and unſeaſonable year.

KITCHEN GARDEN.

DIRECTIONS have, in the month of January, been given how to ſow peaſe in drills, or lines, and to earth them when they come out of the ground; when beans may be planted three feet aſunder between the rows, and the large peâs four feet, being ſet about five inches apart in a ſtiff ſoil, without any manure, kept clean and watered about the time of their bloſſom.

Thyme is raiſed either by ſeeds ſown in this month or April, or from ſlips planted at the ſame time.

Sage is alſo propagated from ſeeds or ſlips, but moſt commonly from the latter, taken from the roots at the end of this month, or the beginning of the next, and planted, in light earth, a foot apart.

Of marjoram there are two ſorts; one of which is called winter ſweet marjoram, and propagated by planting the ſlips about March or April in moiſt ground; and the other ſort is ſown annually on hot-beds.

Camomile and penny-royal are propagated from ſlips planted in this or the next month, in ſtiff ſoil and in a ſhady part of the garden.

Fennel is raiſed from ſeeds ſown in this month in the natural ground; as is parſley, dill, &c.

Mint and balm will grow any where, and are propated by parting their roots in any time of the ſpring as well as by ſowing.

Mint is more generally propagated than balm, and when it is about a foot high you may cut it in branches, and dry it in the ſhade for winter uſe.

Rue is a plant which is multiplied by ſlips ſet in a light ſoil, and ſhould have a place in the ſhade.

Tanſy is a plant, which ſhould always be kept dry in winter, and is increaſed by parting the roots in the ſpring.

Sellery is a hot herb, and raiſed from ſeed ſown in this month, or April, in ſome well expoſed place in the garden; it muſt be planted out about ſix weeks after it is come up in beds, allowing ſix inches diſtance between the plants, and they may remain to the middle of June, at which time ſome of the firſt ſowing will be fit to plant in trenches for blanching, in a light rich ſoil.

Your trenches muſt be eight or ten inches wide, and of the ſame depth; in which the plants are to be put as ſoon as made, after having pruned off their tops and roots; place them at five inches diſtance; as they increaſe in growth, earth them up within four or five inches of their tops. Endive may be ſown in this month, but April is the more proper time; a light ſoil agrees beſt with it, and when it has been come up about ſix weeks, plant it in beds as directed for ſellery, and about the middle of July plant it in rows about ſix inches apart.

When it is well grown, tie up ſome of it to whiten; which work ſhould be continued every ten or twelve days.

Purſlane is ſown in this month, and glaſſes are uſed to help it forward; and in April it is ſown in warm places.

Sorrel is ſown in rows or drills, like other ſallading.

Of ſpinach, in March, April and May, you are to ſow ſeveral parcels of ground at different times, about a fortnight from each other, as a conſtant ſupply for the table, till there is plenty of other greens.

There are two ſorts of ſpinach, the prickly ſort, and the round ſpinach, both of which thrive in a light rich ſoil; and ſuch as is intended for winter uſe muſt be ſown in Auguſt.

Chives are raiſed by off-ſets from the roots, planted at ſix inches diſtance, cutting off their branches at the time of planting; they ſucceed beſt in a light, rich ground; and the oftener they are cut, the ſmaller and finer they are.

Tarragon

Tarragon is raiſed from ſlips and ſeeds; the ſlips are taken from the root, and planted in this month in as warm an expoſure as poſſible.

Artichoke ſeeds are ſown about the beginning of this month, and planted out in April; and the middle of this month is the moſt proper time to ſlip the roots for new plantations; for they are raiſed by ſuckers as well as ſeeds.

When you have ſevered the ſlips, three heads are to be left growing upon every old root; and theſe ſlips are to be planted two feet apart, in lines four feet diſtance from each other, and well watered after planting.

Artichokes thrive beſt in a ſtrong rich ground, expoſed to the ſun, with dung well mellowed in it: when they bloſſom the firſt year, the roots are endangered; you may therefore break off the bloſſoms, and about the middle of July break off the ſtems of the old roots that have done blowing, by which means you will furniſh yourſelves with freſh ſhoots.

The ſeeds of the cabbage and lettuce of all kinds may now be ſown in the open ground among the crops; a light rich ground and a warm expoſure agrees beſt with them; and that there may not be wanting a ſupply of them, they are to be ſown every month from March to Auguſt, when the winter crops are to be put in, which ſhould be planted out three weeks after they come up, at about five inches diſtance.

Such as produce large cabbages early in the ſpring may be permitted to ſtand for ſeed, and are to be ſtaked up and defended from the wind; the ſeeds will be fit to gather as ſoon as they begin to ſhew their down, and then the plants are to be pulled up and ſet to dry in a green-houſe.

The cauliflower ſeed is ſown in ſome well-expoſed corner of the garden, where the young plants may be ſheltered; and about the middle of April, when they are in their firſt leaf, they are to be planted in a nurſery about five or ſix inches aſunder, and there continue till the latter end of May, or June, when they are to be tranſplanted abroad for your crop, which ſhould be done in moiſt or rainy weather; or if it be a dry ſeaſon, holes are to be made in the ground, about three feet apart, and to be well watered before you plant the cauliflowers, which will make the plants ſhoot, being alſo frequently watered afterwards.

In the autumn following they will bear large flowers; but ſome of them will not flower till after Michaelmas, and ſuch plants may be taken up with the earth round their roots, and ſet together in the green-houſe, or ſome ſuch place, where they will enlarge themſelves, and be fit for uſe in the winter.

To raiſe ſummer cauliflowers, you muſt ſow the ſeed the beginning of Auguſt, upon ſome decayed hot-bed; and as ſoon as they have put out their leaf, tranſplant them about three inches diſtance, upon ſome other bed: in the middle of September draw out every other plant, and ſet them ſix inches apart under a ſouth wall, to ſtand there till ſpring, when they are to be planted out for flowering; or you may ſet them in the places where they are to bloſſom, covering them with glaſs-bells in the winter.

If the weather is open, the firſt week in this month you may ſow aſparagus; and the ſeedlings will be fit for planting out the February or March following.

The following is the method uſed by the beſt gardeners to produce a natural crop.

After meaſuring out the ground, allowing four feet for the breadth of each bed, and two feet for the alleys between the beds; open a trench at one end, and lay into the bottom of it horſe-dung about ſix or eight inches thick; then go on and trench the ſame quantity of ground lying next to the firſt trench, throwing the earth of the ſecond trench upon the dung at the bottom of the firſt, and thus continue working till the whole is done.

Having finiſhed your beds, plant aſparagus, taken freſh out of the nurſery, in lines at eight or ten inches diſtance, ſpreading their roots, and covering their buds with earth about four inches thick; each bed takes up four rows; and when they are all planted, ſow the whole with onions, and rake it level, for the alleys will not be of any uſe till after Michaelmas, when the onions will be off, and the ſhoots of the aſparagus plants made that ſummer are to be cut down, the alleys dug up, part of the ſoil thrown upon the beds, to raiſe the earth about five or ſix inches above the buds of the plants, and the alleys ſupplied with dung, or ſome rich ſoil.

In March following the earth muſt be raked down; and the alleys are to be turned up every winter, and now and then enriched with dung.

When Michaelmas is paſt, you may cut down the haulm, and give them their winter-dreſſing; and you ſhould not be later than the middle of March in raking and laying down the beds.

It is a general rule, not to cut any of the aſparagus till the fourth year after planting; but where the plants are ſtrong, a few may be taken here and there in very ſmall quantities the third year.

The aſparagus appears above ground the beginning of April, and may be cut till the beginning of June, when they have ſtood five years; but if they are younger, you muſt not cut them after the middle of May.

No buds that appear above ground ſhould be ſuffered to grow in the cutting ſeaſon, unleſs they proceed from freſh plants, to make good deficiencies; and thoſe muſt be ſuffered to run up every year, till they have gathered ſtrength: it is beſt to cut them downwards a little ſloping with a knife made blunt at the point.

APRIL.

Flower-Garden.

In this month, and the beginning of May, the ſeeds of the carnation are to be ſown in a compoſt made of ſandy loam, and well-conſumed melon-earth, two loads of the former to one load of the latter; ſift them well together, and let them lie in a heap for a time to mellow; then ſift it a ſecond time either to ſow the carnation-ſeeds in, or to plant your layers or roots of them upon.

Having filled your pots with this earth, and ſmoothed them on the top, ſprinkle on your ſeeds; and covering them with the ſame compoſt, preſs it gently with a board, and let them ſtand expoſed to the weather.

 The

The feed will come up in about three weeks; and in the July following the young plants will be big enough to tranfplant into beds, where they muft be fet about ten inches diftant from one another, and fhaded from the fun with mats for about three weeks.

You may find many varieties from the feedling plants in the fecond year; and whatever rarities appear, they muft be laid down as foon as poffible, by cutting half through a joint, and fplitting the internode upwards, half way to the other joint above it; then the wounded part muft be buried in the earth, and faftened down till it takes root, which, provided the earth is light, will be in about two months.

The moft proper feafon for laying down the layers of the feedlings is in July; and when planted they muft be carefully guarded, both from the intenfe heat in fummer, and the chilling frofts in winter.

The flower ftems will begin to put forth about April, when each flower muft be fupported by its ftem being tyed to a ftick about four feet long; and as foon as the flower-buds appear, leave only one or two of the largeft upon each flower ftem, to bloffom; and about ten days before the flowers open, the round poded kinds will begin to crack their hufks on one fide, when you fhould fplit or open the hufk on the oppofite fide to the natural fraction with a fine needle; and three or four days before the complete opening of the flower, you muft cut off the points on the top of the flower-pod, and fupply the vacancies on each fide of the hufk with two fmall pieces of vellum, which may be eafily flipped between the flower-leaves and the infide of the hufk, by which means the flower will make an equal difplay of its parts, and the form of it, confequently, be entirely regular.

When the bloffom begins to fhew its colour, you fhould fix a piece of flat board upon the fticks, to fhelter it from the fun's extreme heat.

The feeds of the carnation muft be gathered towards the end of September, in dry weather, and be expofed for a month or two, through a glafs, without opening the hufks till the time of fowing the feeds comes round again.

The feeds of the columbine are fown in the nurfery this month, from whence you may remove the choice plants to the garden, and next year they will yield flowers; the roots of this flower will hold good for three or four years, when you muft have a fupply of frefh ones.

The feed of the fcarlet bean is annually fown in good ground, well expofed to the fun; and fticks fhould be fixed in the ground, round which they will twine, and make a very agreeable fhew.

The amaranthus is an annual, fown on a hot-bed; and the feeds being fown in this or the preceding month, in the hotteft part of your garden, are to be raifed under glaffes.

The African marygold is alfo an annual, raifed on a hot-bed.

Fruit-Garden.

You fhould now carefully weed your beds of ftrawberries, and take off their runners; and if the feafon is dry, it will be proper to water them, for they produce but little fruit when this is neglected.

Lay the branches of the peach-tree horizontally, and keep them free from great wood, and perpendicular fhoots in the middle, that the fap may be carried in fuch due proportion as is neceffary; and it fhould be ever obferved, that too much vigour is as pernicious as too little, with refpect to the tree bearing a fufficient quantity of fruit.

When a pear or apple-tree is ungovernable, and will not bear frnit, ftrip off the bark of the ftrongeft branches half an inch, or an inch, according to the bignefs of the tree, and take it entirely away to the wood.

Thefe branches will continue to bear fruit for feveral years; and when they die, there are always in a pear-tree a fufficient number of others to fucceed them, efpecially in the middle of the tree; which, if ungovernable, ought to undergo the fame kind of difcipline.

This work, which fhould be practifed only on low dwarfs, or wall-trees, is beft done in March or April.

Cherry-trees, not in a thriving condition, fhould now be flit perpendicularly down with the point of a knife, juft entering the bark of the ftem of the tree, to prevent being hide-bound; after which operation they will thrive and profper wonderfully, when, for want of it, they will continue almoft barren for ten or fifteen years.

At this time you fhould look carefully to your young fruit-trees which were planted in the fpring, obferving to water them in dry weather; and if you obferve the leaves beginning to curl up, you fhould water them gently all over their branches; which may alfo be practifed to great advantage on old trees; but it muft not be done in the heat of the day, left the fun fhould fcorch their leaves, nor too late in the evening, efpecially if the nights are cold.

Where you obferve the fruit-trees to be greatly infefted with infects, you fhould wafh the branches with water, in which a great quantity of tobacco-ftalks have been fteeped; which, if carefully done, will infallibly deftroy the infects, and not do any any injury to the trees; or if the leaves which are curled are taken off, and fome tobacco-duft thrown on the branches, it will deftroy the infects, and may, in a day or two, be wafhed off again.

Towards the end of this month, you muft look over your efpaliers and walls of fruit-trees, training in the regular kindly fhoots in their proper fituation, and difplacing all fore-right and luxuriant ones.

In the middle of this month uncover thofe fig trees which were fcreened from the froft in the winter; but do it with caution, as the young fruit, which now begins to appear, may be greatly hurt by being expofed to the air too fuddenly.

Kitchen-Garden.

The middle of this month is the proper time to plant out melons, which are to be raifed under paper: in making thefe ridges, if the ground is dry, the dung fhould be but a half a foot higher than the furface of the ground, and the earth fhould be laid at leaft a foot and a half thick upon the dung, that the plants may have depth enough to root; they will require no watering, after they are

well

well rooted, and hereby a choicer ſort of melons may be generally obtained; which, in the common method, frequently miſcarry, or produce but little fruit.

The alleys between theſe beds ſhould be afterwards raiſed with dung and earth to the level of the beds, that the roots may have room to extend on each ſide, for the roots of theſe plants ſpread as far in the ground as their branches extend on the ſurface.

Of kidney-beans we have two ſorts; the one, which is called the Batterſea-bean, bears early, and near the root, without running high; and the other, grows near ſix feet high.

We ſow theſe beans, the firſt week in this month, about four inches apart, in drills from north to ſouth, in a light freſh ſoil, covering them with earth, raiſed in a ridge, to keep the wet from them: the lines of the Batterſea-beans ſhould be too feet apart; and the other ſort are be ſown in rows like rounceval-peas, having alleys between them two feet and a half wide; the former kind need not be ſtaked, but the others will not bear well unleſs they are ſtaked.

From the firſt ſowing in this month, you may, once every three weeks till the middle of July, continue to ſow freſh ground with kidney-beans to ſucceed one another; obſerving, that when the ground is very dry, as in June and July, and the weather hot, you muſt water the drills as ſoon as you have opened them, before you put in the ſeed, which will contribute to their vegetation; but after they are ſown, you muſt avoid watering them.

Toward the end of this month, you may ſow the nonpareils, and the Spaniſh morotto-peas, about two or three inches apart in lines, leaving a ſpace of three or four feet for alleys, till the whole is ſown; and when they grown up ſix inches high, earth them up, and ſet one row of ſticks or boughs about ſix feet high, on each ſide, for them to run up, and you will have a plentiful crop.

The charlton, or maſter-hotſpur, ſhould be ſown in December, for the firſt crop, in drills about two or three feet aſunder, the lines running from north to ſouth: a ſecond crop of the ſame kind of peas ſhould be ſown in February; and in March we may put in a third crop of the ſame ſort.

Some ground may be prepared about the beginning of April for the dwarf-peas, which ſeldom riſe higher than half a foot, and are to be ſet four or five inches apart, in lines about eighteen inches diſtant from one another; and in order to have a conſtant ſupply of young peas, there is a ſort of dwarf peas which may be ſown in May or June, in edgings upon a gentle hot-bed, the firſt week in September, and will produce peas in the winter.

Spaniſh chardons may now be ſown in the natural ground; you are to make holes for the ſeeds about five or ſix feet diſtance, and put four or five ſeeds in each hole; and when they are come up, leave growing only one ſtrong plant in a hole for blanching.

Lavender and roſemary are raiſed from ſlips planted in this month, which take root almoſt immediately if they are ſhoots of the laſt year, but if they are older they will not grow: theſe plants ſhould be ſet in a light ſandy-ſoil, in the warmeſt and drieſt part of the garden.

MAY.

FLOWER-GARDEN.

THE ficoides, which is propagated by the cuttings, being planted abroad in a natural bed of earth in this month, will be fit to put in pots in Auguſt, where it may remain in open air till the latter end of September; ſome kinds of this plant being annual, muſt be raiſed from ſeeds every year; and one ſort of it will ſtand the winter, if we raiſe young plants of it about July or Auguſt, that do not bloſſom in three or four months.

The ſhrub-kinds, which have their ſtalks woody, will bear moderate waterings; but the others, which are more ſucculent, muſt have very little water. Theſe plants muſt be expoſed to the ſun, which will open their bloſſoms, unleſs it be two kinds, which only flower in the night. The cuttings of theſe plants ſhould not be planted before the wounded parts have been dried a day or two in the ſun.

The torch-thiſtle is a ſucculent plant, raiſed from cuttings planted between May and the end of July, upon a little hill in the middle of the pot, for they can hardly endure water: and before they are put into the hot bed, they muſt ſtand abroad about twenty days to take root; their waterings muſt be ſeldom, and gentle: and the beſt compoſt for this plant is, the rubbiſh of old walls, mixed with about one third of ſandy ſoil. The ſidums, eſpecially the tree-kind, are eaſily propagated from branches ſet in the earth in a light ſandy ſoil, either in this or any of the ſummer-months, giving them a little water, and as much air and ſhade as poſſible in the ſummer; and in the winter no water at all.

There are ſeveral ſorts of the geranium, which are raiſed by planting the cuttings, this month, in natural ground, where they will become proper for tranſplanting the Auguſt following; and from ſeeds ſown in March on hot-beds. Thoſe planted in the natural ground require a medium ſoil without dung, muſt be frequently watered, and houſed with the orange-trees.

The amomum Plinii is raiſed from cuttings planted this month in the natural ground: during the ſummer it muſt ſtand in ſome place defended from the ſun, and be conſtantly ſupplied with water.

Cuttings of the Arabian j ſſamin may this month be planted in a ſandy ſoil, and is more injured by wet than cold. At the time the cuttings are taken from this plant, it ſhould pruned to within ſix inches of the laſt year's ſhoot, and have freſh earth put to the roots; by which means it will ſhoot near a foot in the enſuing ſummer.

Layers of the myrtle-tree ſhould be made this month: the youngeſt ſhoots muſt be bent into the earth, after it is well ſtirred; and being often refreſhed with water, will take root, and be fit to take off from the mother-plants in the ſpring following. In July, the cuttings of this tree are planted, ſtripping off the leaves, two inches from each cutting, and ſetting them that depth, about an inch apart, in pots of fine light earth, watering them frequently till they have taken root, which will be about the latter end of Auguſt; and this young plantation is to remain till the

the ſecond of March before they are to be tranſplanted into pots. About the middle of April you may prune, and put earth about the roots of ſuch old myrtle-trees as are in a bad ſtate, and cut the branches off their heads within three or four inches of the ſtem.

The melianthus is a plant propagated with eaſe from ſlips taken about the roots any time between this month and Auguſt, planted in a ſandy ſoil, and frequently watered.

The pyracantha is raiſed from cuttings, planted in May or June, in pots of fine earth, and watered frequently, keeping them from the ſun till the following winter, when a warm expoſure will be ſerviceable to them. This tree may alſo be raiſed from layers and ſeeds, and thrives beſt in a dry gravelly ſoil, unmixed with dung or any other rich manure.

The oleander plant has many varieties; the moſt common of which is the ſcarlet oleander, which being of a hardy nature, may be kept abroad all the winter under a ſouth wall; but the ſweet-ſcented oleander is more tender, and ſhould be houſed with the orange-tree. Theſe ſhrubs are raiſed by layers in this month or the next, in a medium ſoil, and with moderate watering, and will take root to tranſplant the Auguſt following.

Orange and lemon trees may this month be removed and tranſplanted without danger, as well as brought out of the conſervatory: upon bringing out your exotics, and other plants, bruſh and cleanſe them from the duſt they have contracted in the houſe, give them freſh earth on the ſurface of their pots, and water them well, when they are placed in the order they are to ſtand. When you tranſplant or remove orange-trees, you are to do it carefully, without injuring their bodies; let the caſes for your trees be filled with a compoſition of two parts in ſandy loam, one part rotten dung, and one part white ſand; and when your orange-trees are ſo removed, give them frequent waterings, but without wetting either the ſtem or the leaves; ſet them in the ſhade for a fortnight, and let them have the ſun by degrees; as, when it is too hot upon them, it turns their leaves yellow.

Fruit-Garden.

In the beginning of this month, look carefully over your wall and eſpalier trees, and take off all fore-right ſhoots, and ſuch as are luxuriant and ill-placed; and train ſuch kindly branches as you would preſerve regularly to the wall or eſpalier, which will prevent your trees from growing into confuſion.

Fruit-trees may be tranſplanted in the ſummer months, from May to Auguſt, even when the trees are in bloſſom: the method of tranſplanting them is, by preparing holes for them before you begin to take them up; and the earth taken out of the holes you are to make very fine, and mix with water in large tubs to the conſiſtence of thin batter, with which each hole is to be filled for the tree to be planted in, before the earthy parts have time to ſettle or fall to the bottom. A tree, thus planted in batter, has its roots immediately cloſed, and guarded from the air; and as the ſeaſon now diſpoſes every part of the tree for growth and ſhooting, it loſes very little of its vigour if you are careful of its roots, obſerving to wound but few of them at the taking the tree out of the ground, and not let them dry in the paſſage from one place to another. Though this pap is of uſe in ſummer-plantations, yet in the uſual winter-plantations it is pernicious, as it will then chill and rot the root of your trees.

As the cutting and wounding ſome roots of a tree, and among them of the capital ones, cannot be avoided, a mixture of gum has been contrived to plaiſter over the wounded parts of the great roots, and prevent the air and wet penetrating too much into the veſſels of the roots; and if the root be very large, you may at the ſame time mark its correſponding limb or branch in the head, to be cut off about a fortnight afterwards in the ſame proportion, and then to be plaiſtered in the ſame manner as the root was done before.

In the removal of trees, care muſt be taken that it be ſudden; for if the roots are permitted to grow the leaſt dry, we may preſently diſcern a failure in the top-branches, which will require time to redreſs; for which reaſon, it has been thought impoſſible to remove a large tree to any conſiderable diſtance.

There is one convenience in this laſt way of planting, which is not in the common way; and that is, that the tree may be taken up without any earth about the roots, which makes the tranſportation more eaſy; and by this method, and the aſſiſtance of prepared gums, peach trees, nectarines, pear-trees, plumb-trees, and cherry-trees, with fruit upon them, either green or ripe, may be removed, though the trees are ſix or ſeven years old; and trees of all ſorts may be thus tranſplanted in the ſummer.

Kitchen-Garden.

You may now give your melons air in the middle of the day, and look to your melon-ridges, weeding them, and carefully pruning off the water branches, which are known by their flatneſs and extraordinary breadth; it is alſo neceſſary to pinch off the tops of the runners that have fruit upon them, having three or four joints above the fruit, and taking care that the fruit be well ſheltered with leaves from the power of the ſun, otherwiſe their growth will be ſpoiled; but when the growth is perfected, you cannot expoſe them too much to the ſun for ripening. If the ſeaſon be dry, rather float the alleys between the melon-ridges, than pour water upon the plant, or near the ſtems.

About the beginning of this month, ſow cucumbers in the natural ground, both for ſallad and pickling: in ſowing thoſe for ſallads, put about twelve ſeeds in each hole; but leave only four or five when they come up; let the earth be freſh, and well worked with a ſpade, rather light than ſtiff; and a plantation of this kind will produce twice as much fruit as one of the ſame quantity of ground forced with dung.

To raiſe cucumbers for pickling, ſow them in a drill, as you do peaſe or French beans; and put a row of buſhy ſticks on each ſide of them: the rows muſt be four or five feet aſunder; and if ſowed in the ſouth border, where

where there is a vacancy, and nailed againſt the wall, they will grow ſtraiter and finer flavoured than thoſe on the ground.

Replant imperial and Sileſia lettuce: ſow ſome of the white and brown Dutch cos-lettuce, to be planted out for cabbaging in June: ſow radiſhes and endive very thin, to be branched without tranſplanting; and you may alſo ſow purſlane and cabbage-feed; tranſplant cauliflower-plants; make your firſt drills for ſellery, if your plants are large enough. Plant out cabbages and beet-chard; and you may yet ſow thyme, ſweet marjoram, and gilly-flowers.

You ſhould now be very careful to deſtroy weeds before they ſhed their ſeeds; deſtroy alſo the neſts of caterpillars and other inſects which annoy your trees; prune off all crumpeled leaves, for they harbour the worſt of vermin; and if the weather be dry, water new-planted trees, aſparagus, *&c.*

JUNE.

FLOWER-GARDEN.

THE leaves of the ſaffron crocus appear as ſoon as the flower is paſt, and remain all winter, which in the ſpring ſhould be tied together in knots to help the increaſe of the roots; and theſe will be fit to remove or tranſplant about Midſummer. This plant delights in chalky ground, but it will proſper alſo in a ſandy ſoil; and the piſtillum contains the ſaffron uſed in medicine. The roots of the ſeveral kinds of crocus may be taken out of the ground in this month, and replanted with other bulbs; they love a light ſoil, and may be increaſed by off-ſets.

The cyclamen is propagated from ſeeds ſown as ſoon as ripe, in a light ſoil, and tranſplanted in Midſummer when their leaves are decayed; and it is a general rule, that all bulbs may be ſafely tranſplanted, when their flowers and leaves are decayed.

The colchicum thrives beſt in a ſandy ſoil, and will only bear tranſplanting about Midſummer, when the roots are entirely at reſt. There are many ſorts of aloes, the moſt common whereof are brought from America; but Africa produces the greateſt variety, where they grow upon rocky ground; therefore the earth proper for them is to be made with one half ſandy ſoil, and the other rubbiſh of old walls, mixed and ſifted together; you ſhould plant them ſhallow in the pots, raiſing the earth about them, ſo that the plant may, as it were, ſtand on a hill; and when you water them, do it without touching any part of the plant, otherwiſe they will be in danger of rotting; the off-ſets of the aloe may be planted in the latter end of this month, and the beginning of July, when they ſhould be ſuffered to ſtand abroad for about nine days; and they may be helped with a hot-bed as ſoon as they begin to take root; if the weather be fair while the aloes are abroad, their earth being dry, will require watering once a-week; and from the time of their being houſed till the middle of October, gentle refreſhments may be given them while the ſun is upon them in the morning; but from October to March, they muſt be kept very dry. In May they ſhould be tranſplanted, without diſturbing the roots; the ſeeds of many kinds of aloes ripen in Britain, and may be ſown in April upon hot-beds. The fritillaria is propagated by planting their branches in a natural bed of earth any time between June and Auguſt, and they will ſoon be fit to plant into pots; they ſucceed beſt in the ſame ſort of earth as the aloe.

The Indian fig is raiſed by planting its leaves ſingly about two inches deep, in pots of earth compoſed of lime, rubbiſh, and ſandy ſoil, after their wounds are dried, and letting them ſtand abroad till they take root, and then they may have the help of the hot-bed; you muſt give theſe plants a good deal of the ſun, and the leaves ſhould be planted during the ſummer-months.

FRUIT-GARDEN.

THE inoculation of fruit-trees now demands the attention of the gardener, and the following is the moſt approved method of performing the operation. About Midſummer take off a vigorous ſhoot from any tree you would propagate; and after having made choice of a ſtock of about three or four years growth, in a ſmooth part of it make a downright ſlit in the bark, a little above an inch in length, and another croſswiſe at the top of that, to give way to the opening of the bark; then gently looſen the bark from the wood on both ſides, beginning at the top; which being done, cut off your bud with a penknife, entering pretty deep into the wood, as much above as below the bud, to the length of the ſlit in the ſtock: after the bud is thus prepared, take out the woody part of it (carefully preſerving the eye of the bud) then put it in between the bark and the wood of the ſtock at the croſs ſlit, putting it downward by the ſtalk, where the leaf grew, till it exactly cloſes; then bind it about with coarſe woolen yarn, the better to make all parts regularly cloſe, and the bud incorporate with the ſtock: in three weeks time the bud will be incorporated with the ſtock, when you muſt looſen the yarn, that it may not gall the place too much: the quicker this operation is performed, the better; and you muſt put two buds into one ſtock, in inoculating nectarines aud peaches. If the buds inoculated this month do not hit, you may make another attempt in the ſame year, and on the ſame ſtock. The proper time for inoculating is from the beginning of this month to the latter end of Auguſt; and care muſt be taken that the branch and ſhoot made choice of for inoculation, do not lie by, but that they be uſed as ſoon as cut.

You may upon one tree, bud peaches, nectarines, apricots, plumbs, and almonds.

KITCHEN-GARDEN.

KIDNEY-BEANS, radiſhes, lettuces for cabbaging, and endive, may now be ſown; as may alſo the large ſort of peas, about five or ſix inches apart, allowing three or four feet diſtance between the lines, and they will in September afford a good crop.

Replant cabbage-lettuces; tranſplant leeks in light rich ground, and at ſix inches diſtance from each other; and if the weather be dry, you may gather herbs for drying againſt

gainſt the winter, ſuch as lavender, roſemary, ſage, mint, ſweet marjoram, thyme, *&c.*

Take eſpecial care to preſerve your plants from the ſcorching ſun; ſtir up ſtiff ground; continue to deſtroy weeds; and give your plants gentle waterings about their extreme fibres, which ſhould be done at the cloſe of day.

JULY.

Flower-Garden.

There is little to be done in the flower-garden this month: the berries of the coffee-tree which are now ripe, may be ſown, firſt cleaning their ſeeds from the pulp, in pots of fine earth, about an inch deep; and if you give them the help of a hot-bed, in leſs than ſix weeks time they will ſprout.

The fruit of the ananas being ripe in this month, if you cut off the crown of the leaves which grows on the top of it, and plant it in a light ſandy earth, it will, with the aſſiſtance of a hot-bed, preſently take root.

Anemony feeds, now ſown, muſt be ſprinkled with water frequently and gently.

Fruit-Garden.

The management of the vine ſhould this month be chiefly attended to: it is to be obſerved, that from a vigorous ſhoot of a vine already once pruned, there will puſh again ſeveral Midſummer ſhoots weaker than the former, from the firſt, ſecond, and third bud towards the extremity; which ſhoots are to be taken off, only remembering that it is proper to ſpare the laſt of ſuch ſhoots ſo far as to leave one bud upon it, from whence, in Autumn, nature may a third time exert herſelf; for if thoſe ſhoots were all entirely removed, the vine would puſh at thoſe bearing buds which lie at the bottom of the ſhoots; in conſequence of which, there would be either a want of fruit at thoſe places next year, or a neceſſity of pruning the branch ſhorter than was intended, or is in the winter convenient.

There is no danger in expoſing the grapes this month to the ſun; for though the vines appear thin of wood and leaves, the Autumn ſhoots will recover that fault.

Put nets over your grapes to preſerve them from the birds; and you ſhould alſo guard againſt waſps and other inſects, which now deſtroy the peaches, apricots, and other fruit; by placing phials of honey and ale near the trees, you may ſoon entrap a great number of them.

Kitchen-Garden.

You may know ſow kidney-beans, and ſome peas, to bear in September and October; ſow cucumbers upon a bed made with dry horſe-litter, and covered with light earth ten inches thick; they muſt be covered at night in September with a common frame and glaſs, to keep them from froſt and rain, and by this method you may have ſome cucumbers till Chriſtmas.

Make a bed for muſhrooms as directed in February; and be ſure to cover it very thin with earth.

About the middle of this month ſow royal Sileſia, and brown Dutch, white goſs, and other ſorts of lettuces, chervil, carrots, and turnips.

Plant cabbages, and ſavoys; tranſplant endive for blanching againſt winter; earth up ſellery in drills, and plant out a new crop to ſucceed the former; take up ſhallots, garlick; and water plentifully all herbs that are ſeeding.

AUGUST.

Flower-Garden.

The tulip-tree being a plant of the wood, ſhould be among ſuch trees as are deſigned for groves, where it will riſe to a great height: the ſeeds of this tree come from Virginia, and are to be ſown in pots this month, and ſheltered the winter, and they will come up all in the ſpring following.

At two years growth the young plants may be tranſplanted into ſingle pots, and muſt have ſhelter in the winter for the firſt nine years at leaſt, till they have gathered ſtrength enough to reſiſt the ſeverity of the froſts, when they may be planted in the natural ground, rather a ſandy ſoil than any other.

The iris flower has many varieties, ſome with bulbous and ſome with tuberous-roots: the roots of the bulbous iris may be taken up as ſoon as the leaves begin to wither, and planted in Auguſt; and they may be increaſed by off-ſets taken from their roots when their ſtalks are decayed: the beſt of the tuberous kind is the the chalcedonian iris, commonly called the toad-flag, which requires a warm and rich ſoil, and muſt be carefully ordered, or it will not thrive well.

The narciſſus, or daffodil, is a flower of a hardy nature, and thrives greatly in any ground; theſe flowers are propagated from off-ſets from their roots, planted in this month, and may be raiſed by ſeeds ſown in September, which will produce great varieties: the ſeedling plants are to remain without removal two or three years, when they are to be taken up in June, and replanted in good ground at a proper diſtance.

The jonquil is of the ſame kind with the daffodil, and flowers much about the ſame time; the roots, which are bulbous, are to be taken out of the ground, and replanted like other bulbs.

The bulbous violet, or ſnow-drop, is reckoned amongſt the daffodils, and is one of the earlieſt flowers in the ſpring.

You may now plants off-ſets of the hyacinth, in beds of ſandy ſoil; the tuberous hyacinth is a plant of an aſpiring head, and very tender nature; the roots of it muſt be taken up in April, and replanted in pots of prepared earth; and, like other ſhrubs, it requires the aſſiſtance of a hot-bed: you may take up the bulbs of this plant in September, and preſerve them in dry ſand.

This is the proper time for parting the roots of the lily, which ſucceeds beſt in an open ſandy ſoil: the ſtriped

ped white lily is ſo great a rarity as to deſerve a place in the niceſt garden, and the orange-lily is a proper companion for it; the lily of the valley is eaſily raiſed from plants, and thrives beſt in ſhady ground.

The crown-imperial may be raiſed from ſeeds, but is commonly propagated from off ſets that ſpring yearly from old roots, which are to be taken up in June when the ſtalks are dry, and replanted in Auguſt.

The work to be done this month, in the fruit and kitchen-garden, is the ſame as directed in the preceding month.

S E P T E M B E R.

Flower-Garden.

The tulip is propagated in the following manner: the ſtems of this flower being left remaining upon the root, will perfect their ſeeds about July, which will be fit to gather when the ſeed-veſſels begin to burſt; and then they are to be cut cloſe to the ground in a dry day, and laid in ſome dry place till September, when they are to be ſown, in a ſoil compoſed of natural black earth and ſand; and after their ſecond appearance above ground, they may be taken from the pots they were ſown in, and put in a bed of natural ſandy ſoil, well ſifted, where the thickneſs of half an inch of the ſame earth ſhould be ſpread over them; and thus they are to continue, without any other culture than every year adding half an inch for their covering, till they begin to blow, which will be in five or ſix years time: in this manner tulip-ſeeds are every year to be ſown for new varieties.

In planting tulips, all the forward blowers ſhould be planted in a bed together; and of the late flowering tulips the talleſt ſorts ſhould be placed in the middle line of the bed, with two rows of the ſhorter on each ſide.

Tulips planted in this month need no ſhelter till March, when, the flower-buds appearing, they ſhould be defended from blights with mats, or other covering; which covering will alſo ſerve to ſhelter them, when blown from the too powerful heat of the ſun, and pernicious damps.

There are two claſſes of tulips; the prœcoce tulips or early blowers, and the ſerotine or later blowers; and theſe are diſtinguiſhed by their double and ſingle flowers: they have alſo different denominations, from their colour and ſtature, as bagats, which are the talleſt flowers, commonly purple and white marbled; agates, which grow ſhorter, and are veined with two colours; and beazarts, which have four colours, tending to yellow and red, of ſeveral ſorts.

You may now take up the roots of the peony, part and plant them; they will proſper in any ſoil.

The ſeed of the mullein may now be ſown, in a ſandy ſoil, and a ſhady part of the garden; it is a beautiful plant, and bloſſoms four feet high.

Violets are increaſed by tranſplanting their runners either in this month or in February, which will of themſelves take root at every joint; they thrive beſt in a binding ſoil, ſhady ſituation, and ſhould be planted in the moſt rural parts of the garden.

You may now increaſe daiſies by parting their roots; and they make very pretty edgings for flower beds.

Layers of the honeyſuckle may now be put down; they thrive beſt in the ſhade, and are moſt eaſily trained up in pots.

There are ſeven ſorts of the jeſſamine: the common white, the yellow, and the Perſian jeſſamine, are propagated from layers or cuttings, and will grow in any ſoil; the layers are made in this month, and the cuttings may at the ſame time be planted, which ſhould always be a foot long, and two joints be under ground. The jeſſamine ſhould be planted againſt walls or trees, or mixed in hedges. There are jeſſamines of a more tender nature, which require to be ſheltered in the conſervatory in the winter, as the Spaniſh jeſſamine, the Portugal jeſſamine, the Indian jeſſamine, and the Arabian jeſſamine: theſe are propagated by grafting on the common white jeſſamine in March, or by inarching in May, or cuttings planted at the ſame time: the inarched plants are to be cut off the middle of Auguſt following, and in February you are to cut off the branches within four or five inches of the ſtem; and, after they have freſh earth put to their roots, they may be ſet near the glaſſes or windows of the green-houſe: they ſucceed beſt in a medium ſoil between ſand and clay, without dung, and ſhould not be watered too frequently.

The virgin's bower is raiſed from layers in this month, and from cuttings alſo: it is of a twining nature, muſt be ſupported with ſtakes: it may either be planted againſt a wall, or ſet in the wilderneſs; and it thrives beſt in a light ſoil.

The Virginia dog-wood bloſſoms early in the ſpring; and the flowers are ſucceeded by red berries, which hang a long time upon the tree: the ſeeds are ſown in pots of light earth in autumn, and they are to ſtand the winter in the green-houſe, giving them the aſſiſtance of the hot-bed the following ſpring.

The Virginia myrtle, which bears berries, from which is drawn the green wax whereof candles are made, is propagated by ſowing the berries in pots of black ſandy earth, which ſhould be kept continually moiſt.

The ſaſſafras-tree is a plant of Virginia, which loſes its leaves in winter, and in the ſpring puts forth its yellow flowers in cluſters, which are ſucceeded by blue berries, like thoſe of the laurus tinus; theſe berries are ſown in autumn, in a ſandy ſoil.

You may now make layers or ſlips of the box-tree; and the ſeeds may be ſown as ſoon as ripe, or laid in ſand during the winter, to be ſown in the ſpring following; this plant thrives beſt in a chalky ſoil.

The dwarf or Dutch box, is of great uſe for edging of flower-beds, or making ſcroll-works; it will remain good, without renewing, a long time; and ſo great is the increaſe of it, that being earthed up every year, in four or five years after the planting, it may be taken up, parted, or ſlipped, and be made to plant four times the ground it ſtood upon.

Fruit Garden.

You may now gather the different ſorts of fruit as they ripen; for thoſe which are in eating this month, ſeldom continue long good.

Tranſplant

Tranſplant ſtrawberries, gooſeberries, raſpberries, and currants, towards the end of this month, if the weather proves moiſt, otherwiſe it will be better to defer it till the beginning of the next month; and this is the beſt ſeaſon to plant cuttings of gooſeberries and currants, which will take root, and make better plants than thoſe which are propagated by ſuckers.

Your fruit trees againſt the wall of your forcing-frame, muſt now be pruned and trained cloſe to the wall or eſpalier, that their buds may be preparing before the ſeaſon for applying the heat; and you ſhould alſo prepare for the ground where the fruit-trees are deſigned to be planted the next month, that it may lie to mellow and ſweeten.

Kitchen-Garden.

Sow Spaniſh radiſhes for the winter, and ſpinach to be cut in February; make plantations of the Dutch brown lettuce to ſtand the winter; ſow ſorrel, chervil, and ſmall herbs for ſallads, in ſome well-expoſed place, obſerving to provide ſuch mixtures for this ſeaſon as are hotter to the taſte, than in the former months.

You may now replant endive, and all ſorts of fibrous-rooted herbs; continue to earth up ſellery; raiſe the banks of earth about chardones for blanching; tranſplant aſparagus-roots; make plantations of cabbages and coleworts; tranſplant young cauliflower plants in places where they are to flower; tranſplant ſtrawberries; make beds for muſhrooms; cover muſhrooms ſown in July every night; earth up your winter-plants; prepare compoſts; and, if the weather be dry, water your plants and herbs in the morning, and give your turnips the firſt houghing.

Such cucumbers as are now ripe, muſt be cut open, and the ſeed or pulp taken out of them, which ſhould lie three or four days together before they are waſhed, and ten days in the ſun before it is laid up; and it ſhould ever be obſerved, that if ſeeds are not thoroughly dry before they are laid up, they will rot, and be good for nothing.

OCTOBER.

Flower-Garden.

You ſhould now plant anemonies, and ranunculuſes; and as ſoon as they appear, defend them from winds and froſts, with ſaw-duſt, dry ſtraw, or matts; and make an end of putting tulips into the ground: and likewiſe put hyacinths, tulips, narciſſuſes, *&c.* in glaſſes made for that purpoſe, to blow early in the houſe.

Continue to tranſplant and lay roſes, and ſuch like flowering ſhrubs; and to plant the cuttings of jeſſamines and honeyſuckles in ſhady borders. Sow the berries of yew, holly, and other evergreens, prepared in earth or ſand; and prune theſe kinds of plants if the ſeaſon be mild.

This is a proper time to remove your ananas or pine-apples out of the bark-beds into the ſtove; and always keep a tub of water in the ſtove to water them when it is wanted, which ſhould ſtand twenty-four hours before it is uſed.

Set your pots of carnations, which are now blowing, into your green-houſe near the door; and the beginning of this month you are to houſe your myrtles, amomum Plinii, melianthus, and ſuch tender greens as remain yet abroad. Tie up thoſe plants that grow diſorderly, and place the aloes, torch-thiſtles, euphorbiums, *&c.* neareſt the ſun; and the other plants, which are more hardy, towards the back of the houſe.

When you water your houſed greens, let it be in the morning, when the ſun ſhines upon them; but you are to give no more waterings to your tender ſucculent plants after the middle of the month.

The windows of the green-houſe are to be kept open day and night till about the fifteenth of this month: after that, in the day time only.

Fruit-Garden.

You may now plant peaches, apricots, and other fruit-trees; and as nothing is more prejudicial to them than dung, this ſhould be done in untried earth.

Should this month be a wet one, you muſt raiſe the borders, and the trees planted high; for it is certain death to peaches and apricots, to ſtand where the water ſtagnates in the winter.

Vines ſhould now be planted againſt walls ſeven or eight feet aſunder, in a ſoil compoſed of ſea coal aſhes, drift ſand, or the rubbiſh of old buildings, with an equal quantity of natural earth mixed with rotten dung.

About the middle of this month ſow cyder-preſſings in beds of freſh earth, to raiſe ſtocks for grafting, or even making of orchards without grafting; and from a nurſery of this kind we may have as many different ſorts of apples as we raiſe plants, although the ſeeds come all from the ſame tree.

You may now have plantations of apples, grafted upon paradiſe ſtocks, in pots; they will bear when the trees are very ſmall, and very greatly ſet off an entertainment, being placed growing upon a table among diſhes of fruit.

Tranſplant trees of all ſorts, and lay up acorns and maſt in ſand; lay bare the roots of old unthriving forward blowing trees; ſtir up new-planted ground; and lay in a good ſtock of untried earth to be ready upon all occaſions, for fruit-trees, ever-greens, and flowers.

Kitchen-Garden.

This is the proper ſeaſon to lay up roots for winter-ſtore, ſuch as carrots and parſnips; take the roots of turnips out of the ground, and lay them up in ſand; make plantations of currants and gooſeberries, from the ſuckers or cuttings.

The firſt week of this month ſow cucumbers on the natural ground, to be afterwards tranſplanted into pots, for the convenience of ſheltering from cold nights, till a hot-bed is prepared for them. This is better than to begin after the uſual method in December or January.

Make plantations of lettuce, for winter-uſe: tranſplant

cabbages

cabbages and cauliflower plants. Take up thofe cauliflower plants which begin to flower, tie their leaves together, and bury their roots and ftalks in fand, in a cellar, or fome cool place. Cut artichokes with long ftalks, and preferve them in the houfe by fetting their ftalks in fand. Earth up and drefs fuch artichokes as have done blowing: and continue to earth up fcllery for blanching.

Sow kidney-beans in bafkets under a fouth wall, to be afterwards forwarded by hot-beds, for early beans; and hot-fpur peas, and Spanifh beans, in fome well expofed border, under a wall or a hedge. Sow alfo radifhes in fome warm place, to draw early in the fpring; and creffes, lettuce, muftard, fpinach, *&c.* upon a decayed hot-bed: Put likewife fome roots of mint upon a gentle hot-bed for winter fallads.

NOVEMBER.

Flower-Garden.

You may now cut down the ftalks of fuch tall blowing flowers as have done bloffoming within three inches of the root. Tie up all trees and fhrubs to ftakes, otherwife by their being loofe, and at liberty, the winds will deftroy them. Lay up heaps of earth for your feveral forts of flowers, and make the proper mixtures for exotics; obferving, that where the ground is too ftiff, it may be brought to a ftate of loam, by adding to it a fufficient quantity of drift or fea-fand.

Peonies, and fome fibrous roots, may now be planted. If the weather be open, you may yet tranfplant rofes, jeffamines, honeyfuckles, fyringa, and lilac. Unnail your paffion-trees from the wall, and lay them upon the ground, that in cafe of fevere frofts they may be covered with ftraw.

Plant hyacinths, jonquils, narciffus's, and polyanthus's, in pots, and plunge them into hot-beds, to bloffom about Chriftmas: lay down your auricula pots upon their fides, the plants towards the fun, to drain them from moifture, and preferve them from frofts; and fhelter young feedling bulbs from the froft, but give them daily airings.

Fruit-Garden.

The bufinefs of this month being principally planting, it may be neceffary to give the reader directions for bringing fruits to perfection in the winter, fo as to have, by a particular management in planting, ripe fruit throughout the year.

Apricots, cherries, early peaches, nectarines, currants, goofeberries, are to be planted in the following manner, againft a paling of five feet high: the ftakes to fupport this paling muft be fet about four feet diftance from one another; to which you are to nail whole deal-boards of twelve feet long, well-jointed to one another, and ploughed on the edges, fo as to fet in laths, that thereby the fteam of the dung, which is to lie at the back, may not get among the plants; becaufe wherever fuch fteam comes, it will caufe mildews.

The deals are to be an inch in thicknefs; for if they are not quite fo thick, the trees will be apt to be fcorched upon the firft application of the hot dung; and if they are thicker, the artificial heat applied to their backs, upon the time it begins to decline, will not be powerful enough to warm thoroughly, and then the dung muft be oftener refrefhed.

When the paling is up, you are to mark out a border on the fouth fide of it, about four feet wide; and on the outfide of the border, faften to the ground, in a ftraight line, fome fcantlings of wood about four inches thick, to reft glafs lights upon, which are to flope back to the paling, to fhelter the fruit as occafion requires: between thefe glafs-lights, there muft be bars cut of whole deal, about four inches wide, for the glaffes to reft upon; and the bars muft always remain fixed, as in a frame for a hot-bed.

There muft be a door, fhaped to the profile of the frame, at each end, to be opened, either the one or the other, as the wind happens to blow, ever obferving that the door be opened on that fide only which is moft free from the wind.

You may plant fruit-trees in a frame of this fort the fame fummer it is made, and the trees will take very good root before winter, and be fo well ftored with fap againft the following fpring, that they will fhew no fign of their removal, but bear extremely. Befides, by this fummer planting, the trees feldom or never throw away their ftrength in autumn-fhoots, or make any attempts towards it, till September and October, when the frofts prevent their defign.

The trees planted muft have time allowed for the juices to digeft, before you begin to force them: therefore the hot dung is not to be applied to the back of the paling before November.

About the middle of this month, or towards the end, is the time to bring ripe cherries in February: and at the fame time likewife the heat may be ufed for apricots, fo as to make the mafculine apricots as large as duke cherries by February, and ripen them the beginning of April. The Anne peach will ripen about the end of April, as will alfo feveral forts of forward plumbs.

The early nectarine thus forced will ripen with the mafculine apricot: we may have green goofeberries fit for tarts in January and February; and ripe goofeberries and currants in March and April; but cherries do not bear this alteration in nature fo well.

The grapes that do beft for this fort of work, are, the royal mufcadine, marlmorfe, black fweet water, and black morillon: the beft forts of the forward peaches, nectarines, cherries, and plumbs, and the Dutch rafpberry, fhould be ever fixed on for forcing in the above manner. A row or two of ftrawberries may alfo be planted in this frame, which would ripen at the end of February, or beginning of March; and amongft the fruit you may mix here and there a monthly rofe-tree; and have a border planted with early tulips, hyacinths, jonquils, narciffus's, and other flowers, which by the forcing heats would make a kind of fummer all the winter.

The trees planted in thefe frames muft be clofe to the paling, contrary to the methods of planting againft walls;

for the roots will run under the pales, and draw nouriſhment equally from the earth about them ; but with walls it is otherwiſe.

The trees need not be planted at a greater diſtance than four or five feet; and thoſe that have ſtood ſeven or eight years againſt walls, may be removed to theſe forcing-frames without any danger: as to pruning theſe trees, the ſame method is to be followed as recommended for other trees in February; but the ſeaſon for doing it is not the ſame; for in the forcing frames our ſpring begins in November; but in the other caſe it does not begin till the end of January, or beginning of February.

The trees are to be pruned and nailed to pales about a week before the forcing heat is applied, and all the glaſſes put up as ſoon as they are pruned.

The hot-dung intended to be laid at the back of the pales, ſhould be toſſed up in an heap ſome days before it is uſed, that it may yield an heap every where alike: when it is fit to be applied to the pales, lay it four feet wide at the baſe; and let it ſlope to two feet at the top, the height in all being at firſt within four inches of the top of the pales, and in about ſix weeks time it will ſink to four feet, when you are to apply freſh dung. The bloſſoming of the tree is very much helped by covering them with the glaſs lights in froſty weather: but they ſhould not be denied the rain, if the weather be tolerably mild, till the buds begin to ſtir; after that, the glaſſes to remain over them conſtantly, till the ſun begins to have ſome power.

When the ſun ſhines warm, and the wind is not too ſharp, give the air at the front of your frame; and if this does not happen during a fortnight's ſpace, then give air at the end, and put up mats or canvas to correct the winds, and cauſe the air to circulate in the frames.

About three changes of dung will be ſufficient to bring your cherries to ripeneſs in February, allowing each parcel to remain a month at the back of the pales: but if April proves cold, the forcing heat is to be continued till May, for plumbs, peaches, nectarines, and apricots.

Kitchen-Garden.

Hot beds for aſparagus ſhould now be made; alſo gentle hot-beds for the cucumbers and kidney-beans ſown in October: continue to ſow radiſhes, lettuce, creſſes, ſpinach, *&c.* on a hot-bed; and if your nurſery is without roots, provide them from ſome old plantations.

Sow peaſe, and beans of the hotſpur and Spaniſh kinds, in open ground; and if the weather be fair, earth up thoſe ſown in September. Earth up ſellery, and tie up endive plants for blanching: and this is the beſt time to cut down aſparagus haulm, when it is turned yellow; it muſt be cut within two or three inches of the ground, and the earth of the alleys flung up upon the beds; or if the aſparagus be worn, you are to give it a covering of rich dung, not quite rotten: and cover well your artichokes with long dung, to defend them from froſts, otherwiſe they will be deſtroyed in a ſevere winter. Houſe, and cover with ſand, carrots, parſnips, *&c.* and houſe cabbages.

You muſt now trench your ground, and lay it up in ridges to mellow; and in a froſty ſeaſon wheel on dung and other manures upon ſuch places as want to be enriched.

Plants are to be guarded againſt froſts, and ſheltered againſt cold rains; and trees muſt be ſtaked, to defend them againſt violent winds, common in this month.

DECEMBER.

Flower-Garden.

You ſhould now cover the beds of choice anemonies, hyacinths, and ranunculus's; pick off dead and rotten leaves from all exotic plants; lay mulch about the roots of new-planted trees and ſhrubs; cover the pots of ſeedling flowers; turn over the earth prepared for the flower garden, that the froſt may make it mellow; and mix up ſome new heaps, that there may be a ſufficient quantity ready for uſe eight or ten months before it is wanted.

You muſt not be too haſty in warming your green-houſe with artificial heats, but let in as much ſun as poſſible, which being a natural heat, is the moſt agreeable to your tender plants. The chief buſineſs is to keep out froſts; to effect which, the doors and windows of your green-houſe muſt be well matted, and guarded from the piercing air.

But as no plant can live without air, therefore to recruit it in the houſe, and feed the plants therewith without pinching them, it is adviſeable, that at the end of your green-houſe there ſhould be an antichamber, through which you are to paſs to the houſe; which chamber will have freſh air from abroad every time you go into it; and upon opening the door of it into the green-houſe, the air will there mix with the other that has been pent up, and impregnate it with new parts, by which means, it will contribute to the vegetation of plants, without coming upon them too ſuddenly.

Fruit-Garden.

Continue to prune vines; prune and nail wall-fruit trees, alſo ſuch ſtandards as are hardy; examine orchard trees, and take away ſuch branches as make confuſion; covering every conſiderable wound with a mixture of bees wax, roſin, and tar, in equal quantities, and of tallow about half the quantity of any of the others; which are to be melted together in an earthen veſſel well glazed; and, with a painting bruſh dipped into it, the wound is to be covered: deſtroy ſnails in every part of your garden; and you may, if the weather proves mild, remove or plant moſt ſorts of hardy trees that in the winter ſhed their leaves.

Kitchen-Garden.

If the ſeaſon proves mild, you may earth up thoſe artichokes which were in the former months neglected; in doing which, if the ground is not very good, bury ſome rotten dung in it, which will greatly promote the growth of your artichokes in the ſpring following.

Towards the middle of the month, make a hot-bed for aſparagus,

aſparagus, in like manner as that made in November. Sow upon hot-beds, lettuce, radiſh, creſſes, muſtard, and other herbs which are hot, to cut for ſmall ſallads.

In open weather you may ſow early peas and beans of the ſame kinds, and in the ſame manner, as directed in November and the preceding months; and as vermin now very much deſtroy your roots and ſeeds, you are to ſet traps to catch them.

You ſhould, when the weather is not too ſevere, uncover the cauliflower plants every day, that they may enjoy the benefit of the air, otherwiſe they will be very weakly; and in dry weather take up ſellery, and endive to blanch.

Great care muſt now be taken of the muſhroom-beds; they ſhould be covered with freſh dry ſtraw, ſo thick as to keep out the wet; for as, where proper care is taken, there will be a conſtant ſupply of them for the table in the moſt rigorous ſeaſon, ſo, when they are neglected, the produce will be ſmall in proportion.

GARGARISM, in medicine, is ſometimes taken, in a large ſenſe, for every collution of the mouth; but, ſtrictly ſpeaking, it ſignifies a liquid medicine, appropriated to affections of the mouth, gums, fauces, larynx, and ſometimes of the head, received into the mouth, and there uſed by way of collution, without deglutition.

GARLAND, a ſort of chaplet made of flowers, feathers, and ſometimes precious ſtones, worn on the head, in manner of a crown.

GARLAND alſo denotes ornaments of flowers, fruits, and leaves, intermixed; anciently much uſed at the gates of temples, where feaſts and ſolemn rejoicings were held; or at any other place where marks of public joy or gaiety were required, as at triumphal arches, tournaments, *&c.*

GARNET, in natural hiſtory, a very beautiful gem, of a red colour, with an admixture of bluiſh.

When pure and free from blemiſhes, it is little inferior, in appearance, to the oriental ruby, though only of a middle degree of hardneſs between the ſapphire and common cryſtal. It is found of various ſizes, from that of a pin's head to an inch in diameter.

Among our lapidaries and jewellers, genuine garnets are known by different names according to their different degrees of colour. 1. The garnet, ſimply ſo called, is the fineſt and moſt valuable kind, being of a very deep blood red, with a faint admixture of blue. 2. The rock-ruby, a name very improperly given to the garnet, when it is of a very ſtrong but not deep red, and has a fairer caſt of the blue: this is a very beautiful gem. 3. The ſorane or ſerain garnet, that of a yet brighter red, approaching to the colour of native cinnabar, with a faint blue tinge. 4. The almandine, a garnet only a little paler than that called the rock-ruby.

Garnets are very properly diſtinguiſhed into the oriental and occidental kinds, as being found in Europe as well as the Eaſt Indies. The oriental ones are principally brought from Calicut, Cananor, and Cambay; and the European ones are common in Italy, Hungary, and Bohemia.

Some authors have ſuppoſed the deeper-coloured garnet to be the ſame with the carbuncle of the ancients; from which it really differs; ſince, on receiving the ſun's beams, it never gives ſo true a fire-colour as the carbuncle.

GARONNE, a large river of France, which taking its riſe in the Pyrenean mountains, runs north-weſt by the city of Tholouſe, divides the provinces of Guienne and Gaſcony, and, viſiting the city of Bordeaux, falls into the bay of Biſcay, about ſixty miles below that city. It has alſo a communication with the Mediterranean, by means of the royal canal of Lewis XIV. The tide flows up this river twenty miles above Bourdeaux.

GARTER, a ligature for tying up the ſtocking; but particularly uſed for the badge of a noble order of knights, hence denominated the

Order of the GARTER, a military order of knighthood, the moſt noble and ancient of any lay-order in the world, inſtituted by Edward III. This order conſiſts of twenty-ſix knights-companions, generally princes and peers, whereof the king of England is the ſovereign or chief. They are a college or corporation, having a great and little ſeal.

Their officers are a prelate, chancellor, regiſter, king at arms, and uſher of the black rod. They have alſo a dean with twelve canons, and petty canons, vergers, and twenty-ſix penſioners or poor knights. The prelate is the head. This office is veſted in the biſhop of Wincheſter, and has ever been ſo. Next to the prelate is the chancellor; which office is veſted in the biſhop of Saliſbury, who keeps the ſeals, *&c.* The next is the regiſter, who by his oath is to enter upon the regiſtry, the ſcrutinies, elections, penalties, and other acts of the order, with all fidelity. The fourth officer is garter, and king at arms, being two diſtinct offices united in one perſon. Garter carries the rod and ſceptre at the feaſt of St George, the protector of this order, when the ſovereign is preſent. He notifies the elections of new knights, attends the ſolemnity of their inſtallations, carries the garter to the foreign princes, *&c.* He is the principal officer within the college of arms, and chief of the heralds. See KING *at arms.*

All theſe officers, except the prelate, have fees and penſions. The college of the order is ſeated in the caſtle of Windſor, with the chapel of St George, and the charter-houſe, erected by the founder for that purpoſe. The habit and enſign of the order are, a garter, mantle, cape, george, and collar. The four firſt were aſſigned the knights-companions by the founder; and the george and collar by Henry VIII. The garter (Plate LXXXVI. fig. 2. N° 1.) challenges pre-eminence.

nence over all the other parts of the drefs, by reafon that from it the noble order is denominated; that it is the firft part of the habit prefented to foreign princes, and abfent knights, who, and all other knights-elect, are therewith firft adorned; and it is of fo great honour and grandeur, that by the bare inveftiture with this noble enfign, the knights are efteemed companions of the greateft military order in the world. It is worn on the left leg between the knee and calf, and is enamelled with this motto, HONI SOIT QVI MAL Y PENSE; i. e. *Shame to him that thinks evil hereof:* The meaning of which is, that king Edward having laid claim to the kingdom of France, retorted fhame and defiance upon him that fhould dare to think amifs of the juft enterprize he had undertaken, for recovering his lawful right to that crown; and that the bravery of thofe knights whom he had elected into this order, was fuch as would enable him to maintain the quarrel againft thofe that thought ill of it.

The mantle (*ibid.* N° 2.) is the chief of thefe veftments made ufe of upon all folemn occafions The colour of the mantle is by the ftatutes appointed to be blue. The length of the train of the mantle only diftinguifhes the fovereign from the knights-companions. To the collar of the mantle is fixed a pair of long ftrings, anciently wove with blue filk only, but now twifted round, and made of Venice gold and filk, of the colour of the robe, with knobs, or buttons, and taffels at the end. The left fhoulder of the mantle has, from the inftitution, been adorned with a large garter, with the device, HONI SOIT, *&c.* within this is the crofs of the order, which was ordained to be worn at all times by king Charles I. At length the ftar was introduced, being a fort of crofs irradiated with beams of filver. (*ibid.* N° 3.)

The collar (*ibid.* N° 4) is appointed to be compofed of pieces of gold in fafhion of garters, the ground enamelled blue, and the motto gold.

The manner of electing a knight companion into this moft noble order, and the ceremonies of inveftiture are as follow. When the fovereign defigns to elect a companion of the garter, the chancellor belonging to this order draws up the letters, which, paffing both under the fovereign's fign-manual and fignet of the order, are fent to the perfon by garter principal king at arms; and are in this manner, or to the fame effect: "We, with the companions of our moft noble "order of the garter, affembled in chapter, holden this "prefent day at our caftle at Windfor, confidering the "virtuous fidelity you have fhewn, and the honour-"able exploits you have done in our fervice, by vin-"dicating and maintaining our right, *&c.* have e-"lected and chofen you one of the companions of our "order. Therefore, we require you to make your "fpeedy repair unto us, to receive the enfigns thereof, "and be ready for your inftallation upon the — day "of this prefent month, *&c.*"

The garter, which is of blue velvet bordered with fine gold-wire, having commonly the letters of the motto of the fame, is, at the time of election, buckled upon the left leg, by two of the fenior companions, who receive it from the fovereign, to whom it was prefented upon a velvet cufhion, by garter king at arms, with the ufual reverence, whilft the chancellor reads the following admonition, enjoined by the ftatutes: "To the honour of God omnipotent, and in "memorial of the bleffed martyr St George, tie about "thy leg, for thy renown, this noble garter; wear "it as the fymbol of the moft illuftrious order, ne-"ver to be forgotten or laid afide; that thereby "thou mayeft be admonifhed to be courageous; and, "having undertaken a juft war, in which thou fhalt "be engaged, thou mayeft ftand firm, valiantly fight, "and fucceffively conquer."

The princely garter being then buckled on, and the words of its fignification pronounced, the knight elect is brought before the fovereign, who puts about his neck, kneeling, a fky-coloured ribbon, (*ibid.* N° 5.) whereunto is appendant, wrought in gold within the garter, the image of St George on horfeback, with his fword drawn, encountering with the dragon. In the mean time, the chancellor reads the following admonition: "Wear this ribbon about thy neck, adorned "with the image of the bleffed martyr and foldier of "Chrift, St George, by whofe imitation provoked, "thou mayft fo overpafs both profperous and adverfe "adventures, that having ftoutly vanquifhed thy ene-"mies, both of body and foul, thou mayft not only "receive the praife of this tranfient combat, but be "crowned with the palm of eternal victory."

Then the knight elected kiffes the fovereign's hand, thanks his majefty for the great honour done him, rifes up, and falutes all the companions feverally, who return their congratulations. N° 2. (*ibid.*) exhibits a view of a knight of the garter in the habit of this order.

Since the inftitution of this order, there have been eight emperors, and twenty-eight kings, befides numerous fovereign princes, enrolled as companions thereof. Its origin is fomewhat differently related: the common account is, that it was erected in honour of a garter of the countefs of Salifbury, which fhe dropped dancing with king Edward, and which that prince picked up: but our beft antiquaries think it was inftituted on account of the victory over the French at Creffy, where the king ordered his garter to be difplayed as a fignal of the battle.

GASCOIN, or GASCOIGN, denotes the hinder thigh of a horfe, which begins at the ftifle, and reaches to the ply or bending of the ham.

GASCONY, the moft fouth-weft province of France, bounded by Guienne, on the north; by Languedoc, on the eaft; by the Pyrenees, which feparate it from Spain, on the fouth; and by the Bay of Bifcay, on the weft.

CASSENHOVEN, or GUTZENHOVEN, a town of the Auftrian Netherlands, fifteen miles eaft of Louvain: E. long. 50°, and N. lat. 5° 55′.

GASTEROSTEUS, in ichthyology, a genus of fifhes belonging to the order of thoracici. There are three

rays

rays in the membrane of the gills; the body is carinated; and there are some distinct prickles before the back-fin. There are eleven species, distinguished by the number of prickles on the back.

GASTRIC, in general, something belonging to the stomach.

GASTROCNEMIUS, in anatomy. See ANATOMY, p. 209.

GASTROCNEMIUS is also the name of one of the extensor-muscles of the foot.

GASTROMANCY, a method of divination by water, practised by the ancient Greeks.

GASTRORAPHY, in surgery, the operation of sewing up wounds of the abdomen See SURGERY.

GATE, in architecture. See ARCHITECTURE, p. 356.

GATTON, a borough-town of Surry, sixteen miles south of London, which sends two members to parliament.

GAVEREN, or WAVEREN, a town of the Austrian Netherlands, situated on the east bank of the river Scheld: E. long. 3° 35′, N. lat. 51°.

GAUGE-POINT of a solid measure, the diameter of a circle whose area is equal to the solid content of the same measure.

GAUGER, a king's officer, who is appointed to examine all tuns, pipes, hogsheads, and barrels of wine, beer, ale, oil, honey, *&c.* and give them a mark of allowance, before they are sold in any place within the extent of his office.

GAUGING. See GEOMETRY.

GAUNT-BELLIED, in the menage, is said of a horse whose belly shrinks up towards his flanks.

GAWSE, or GAWZE, in commerce, a very slight, thin, open kind of stuff, made of silk, and sometimes of thread; there are also figured gawzes, and some with gold or silver flowers on a silk ground.

GAZELLA, in zoology. See CAPRA.

GAZETTE, a news-paper, or printed account of the transactions of all the countries in the known world, in a loose sheet, or half-sheet. This name is with us confined to that paper of news published by authority.

The word is derived from *gazetta*, a Venetian coin, which was the usual price of the first news-papers printed there, and which was afterwards given to the paper itself.

GELATINOUS, in pharmacy and medicine, any thing approaching to the glutinous consistence of a gelatina or jelly. See JELLY.

GELDERLAND, comprehending Zutphen, is a province of the United Netherlands, bounded by the Zuider-sea and Overyssel on the north, by Westphalia on the east, by Brabant on the south, and by the province of Utrecht on the west.

GELDING, the operation of castrating any animal.

GELDERS, a city of Gelderland, situated twenty-three miles south of Nimeguen: E. long. 6° 8′, and N. lat. 51° 35′.

GELENHAUSEN, an imperial city of Germany, governed by its own magistrates; it is situated nine miles north of Hanau: E. long. 8° 50′, and N. lat. 50° 15′.

GEM, in natural history, a common name for all precious stones; of which their are two classes, the pellucid and semi-pellucid.

The bodies composing the class of pellucid gems are bright, elegant, and beautiful fossils, naturally and essentially compound, ever found in small detached masses, extremely hard, pellucid, and of great lustre; composed of a very firm and pure matter, without any admixture of earthy substance, giving fire without steel, not fermenting with acid menstruums, and very difficultly calcinable in the fire.

The bodies composing the class of semi-pellucid gems are, stones naturally and essentially compound, not inflammable nor soluble in water, found in detached masses, and composed of crystalline matter, debased by earth: however, they are but slightly debased, and are of great beauty and brightness, of a moderate degree of transparency, and are usually found in small masses.

GEMARA, in Jewish antiquity, a collection of decisions and determinations on the law, written after the Misna was completed.

It was called *gemara*, or *perfection*, because it was considered as so perfect an explication of the law, that after it no further additions could be made, or any thing more desired. It is otherwise called the talmud. See TALMUD.

GEMBLOURS, a town of the Austrian Netherlands, in the province of Brabant, situated on the river Orne, ten miles north-west of Namur: E. long. 4° 30′, and N. lat. 50° 30′.

GEMELLUS, in anatomy. See ANATOMY, p. 205.

GEMINI, the TWINS, in astronomy, one of the twelve signs of the zodiac, the third in order, beginning with aries. See ASTRONOMY.

GEMMA, in natural history. See GEM.

GEMUND, a town of Germany, in the circle of Westphalia, and dukedom of Juliers, situated on the river Roer: E. long. 6° 15′, and N. lat. 50° 34′.

GEMUND, a town of Germany, in the circle of Swabia, and county of Rechsberg, situated on the river Rems: E. long. 9° 40′, and N. lat. 48° 45′.

GEMUND, a town of Germany, in the circle of Franconia, situated on the river Maine: E. long. 9° 45′, and N. lat. 50° 8′.

GENDARMES, or GENS D'ARMES, in the French armies, a denomination given to a select body of horse, on account of their succeeding the ancient gendarmes, who were thus called from their being completely clothed in armour.

The king's body-guards, the light horse of the royal house, and the musqueteers, are at present reputed to belong to the gendarmerie.

The grand gendarmes are a troop composed of about 250 gentlemen, who guard the king's person. The king himself is their captain, and one of the prime peers their captain-lieutenant, who has under him two lieutenants, three ensigns, three guidons, and other officers. There are, besides these, gendarmes of the queen, the dauphin, *&c.*

GENDER, among grammarians, a division of nouns, or names, to distinguish the two sexes.

This was the original intention of gender; but, afterwards, other words which had no proper relation, either to the one sex or the other, had genders assigned them, rather out of caprice than reason; which is at length established by custom. Hence genders vary according to the languages, or even according to the words introduced from one language into another. Thus *arbor*, in Latin, is feminine; but *arbre*, in French, is masculine: and *dens*, in Latin, is masculine; but *dent*, in French, is feminine.

GENEALOGY, an enumeration of a series of ancestors; or a summary account of the relations and alliances of a person or family, both in the direct and collateral line.

GENEP, a town in the dutchy of Cleeve, in Germany, situated on the Nierse and Maese, ten miles west of Cleeve: E. long. 5° 30′, and N. lat. 51° 40′.

GENERAL, an appellation given to whatever belongs to a whole genus. See GENUS.

GENERAL CHARGE, in law. See CHARGE *to enter heir*.

GENERAL TERMS, among logicians, those which are made the signs of general ideas.

GENERAL *of an army*, in the art of war, he who commands in chief.

The office of a general is, to regulate the march and encampment of the army; in the day of battle to chuse out the most advantageous ground; to make the disposition of the army; to post the artillery; and where there is occasion, to send his orders by his aids de camp. At a siege, he is to cause the place to be invested; to order the approaches and attacks; to visit the works; and to send out detachments to secure his convoys.

GENERATING LINE, or FIGURE, in geometry, is that which by its motion produces any other plane or solid figure.

GENERATION, in physiology, the act of procreating and producing a being similar to the parent.

According to Aristotle, the male animals contain the principle, and the female the matter of generation: for though both were furnished indeed with a seminal liquor, yet the semen of the males alone was prolific. The moderns, on the other hand, as well those who contend for the system of generation from eggs, as they who adopt that of the animalcules in the male-seed, pretend that females have no such seminal liquor at all, and that what was commonly taken for it was some other animal fluid.

Harvey is of opinion, that all females are furnished with eggs, and that the embryos, or young animals, are formed in the same manner as a chick in the egg of any bird. Generation, according to this celebrated physician, is effected wholly by means of the uterus, or womb; which conceives the fœtus by a kind of contagion communicated to it by the male-seed, much in the same way as the load-stone communicates magnetism to iron. This contagion, he thinks, acts not only on the uterus, but is communicated to the whole body of the female, which is altogether prolific; tho' the uterus, he acknowledges, is the only part that is capable of conceiving the fœtus, just as the brain is alone capable of forming ideas and notions. Agreeable to this doctrine of Harvey, Steno and other anatomists have pretended to discover certain eggs in the ovaries or testicles of women; which Mr Buffon denies to be the case, affirming, that there are no such eggs to be found in the ovaries or testicles of women.

We cannot enter into a detail of the reasonings for and against the system of generation from eggs; and shall therefore only observe, that its advocates pretend to have discovered eggs in all the females on which they made observations; that the largest of those found in women did not exceed the bigness of a pea; that they are extremely small in young girls under fourteen, but that age and commerce with men makes them grow larger; that there are more than twenty such eggs in each ovary or testicle; that they are fecundated in the ovary by the spirituous and volatile part of the male-seed; that they afterwards are detached and fall into the uterus through the Fallopian tubes; that here the fœtus is formed of the internal substance of the egg, and the placenta of the exterior part.

Leewenhoek is the author of another system of generation, from animalcules in the male seed. He tells us, he discovered many thousands of these in a drop less than a grain of sand. They are found in the semen of all males whatever, but not in that of females; and are so small, that 3,000,000,000 of them are not equal to a grain of sand, whose diameter is but the hundredth part of an inch. When any of these animalcules gets into an egg, fit to receive it, and this falls into the womb through the Fallopian tubes, the humours which distil through the vessels of the womb, penetrating the coats of the egg, swell and dilate it, as the sap of the earth does seed thrown into it. The placenta begins to appear like a little cloud, upon one side of the external coat of the egg; and, at the same time, the spine of the embryo-animalcule is grown so big, as to become visible; and a little afterwards, the cerebrum and cerebellum appear like two bladders; and the eyes stand next goggling out of the head; then the beating of the heart, or punctum saliens, is plainly to be seen; and the extremities discover themselves last of all.

These animalcules are of different figures, some like tadpoles, and others like eels. In the semen of a man, and in that of a dog, there have been discovered two different kinds of them, the one supposed to be males and the other females. Some even pretend to have seen animalcules disengage themselves from the membranes that surround them; and that they then appeared perfectly like men, with legs, arms, *&c.* like those of the human body!

All the advocates for the system of generation from animalcules strongly oppose that from eggs. They contend, that these animalcules cannot be looked upon as the inhabitants of the semen, since they were of greater extent than the liquor itself; not to mention, that no such animals are found in any other liquors of the body; and since females have nothing similar to these animals, they think it manifest that the prolific

principle

principle resides in males. When they are asked, to what purpose serves such an immense profusion of human animalcules? they answer, that it is agreeable to the ordinary course of nature, both in the animal and vegetable part of the creation. They likewise strengthen their system, by alledging the many examples we have of similar transformations in the insect-class of animals, which, from caterpillars and small worms, become winged animals of the butterfly or fly kinds.

By this system, says Mr Buffon, the first woman cannot be said to have contained the whole race of mankind, as being all, according to it, the true posterity of the first man, and in their animalcule state contained only in him. On this principle, he proceeds to invalidate the system of generation from animalcules: for supposing the size of a man to be 1, then will that of one of the spermatic animalcules be $\frac{1}{1000000000}$; and as a man is to an animalcule of the first generation in the same ratio that this animalcule is to an animalcule of the second generation, it follows, that this last will be expressed by the fraction $\frac{1}{1000000000000000000}$. In this manner he computes the size of the animalcules of several generations, all supposed to be living animals, notwithstanding that their minuteness exceeds the power of imagination to conceive; and then tells us, that the system of generation from eggs is liable to the same objections, whereof the detail may be seen in his Hist. Natur. tom. II. p. 157, *& seq.*

As to Buffon's own system, he thinks that every part, both of animals and vegetables, contains an infinite number of organic molecules; that these molecules assume successively different forms, and are put into different motions, according to the circumstances they are in; but that they are much more numerous in the seminal liquors of both sexes, and the seeds of plants, than in other parts; that these organic molcules make the matter of nutrition; that this matter is always active, and tends to organization, forming itself into different shapes, according to the moulds it meets with. When the quantity of this organic matter is but small, as in man, and most large animals, generation only takes place at the age of maturity, and even then the number of animals produced is but small. The case is just the reverse in animals which abound with this matter, as in fishes, and most birds.

With respect to the generation of mankind, the same author thinks it a certain fact, that the male-seed is received into the womb of the woman; and that, for this purpose, it is highly probable the internal orifice opens during the act of coition. The female-seed also makes its way into the womb, where, being mixed with that of the male, they both together contribute to the formation of the fœtus; which is either male or female, according as the seed of the man or woman abounds most with organic molecules; and the infant resembles either father or mother, according to the different combinations of these molecules. Both these seminal liquors he thinks equally active in the formation of the fætus, and that they fix and counterbalance each other; the molecules of each parent being thereby determined to form similar parts to those of the individual that furnished them, as the head, trunk, arms, legs, *&c.* He thinks the molecules proceeding from the genital parts fix themselves first; and that the other molecules arrange themselves successively round these, in the same order which they before occupied in the parent. When a great quantity of the seminal liquors of both sexes is received into the womb, there are formed different spheres of attraction, in different parts of these liquors; the consequence of which is, that several fœtuses are formed at the same time.

Nearly a kin to Mr Buffon's system is that of Mr Maupertuis, which he has explained in his Venus Physique. He observes, that all the variety observable among mankind, may have been accidental at first; but being once established in the constitution of the parents, they become natural to their posterity. To illustrate this, he gives an instance of a sexdigitary family at Berlin, who had six fingers, or six toes, and frequently both; and that this peculiarity was transmitted equally by the father and mother, but was lost by alliances with those who had but the usual number of fingers or toes.

He farther observes, that most animals, excepting mankind, have stated seasons for procreation; and that the females go with young some a longer, others a shorter time. Mares go from eleven to twelve months; cows and hinds go nine months, as do also women; foxes and wolves, five months; and bitches go only seven weeks; cats nine weeks; and rabbits but thirty-one days. Most birds are hatched in twenty-one days; the canary birds, and some others, are hatched in thirteen or fourteen days. It appears, therefore, that there is an endless variety in the time and manner of the generation of animals.

Whoever reads this short sketch of the different theories of generation that have hitherto been invented, will probably require no other arguments to convince him, that physicians and philosophers are still as ignorant of the nature of this mysterious operation as they were in the days of Noah.

Parts of GENERATION. See ANATOMY, p. 270.

GENERATION *of Plants*. See BOTANY, p. 643.

GENESIS, among mathematicians, signifies the formation or production of some figure or quantity.

GENESIS, among divines, a canonical book of the Old Testament, and the first of the pentateuch or five books of Moses. The Hebrews call it Bereschith, or, In the beginning, these being the first words in the book. The Greeks gave it the name of Genesis, from its beginning with the history of the creation of the world. See BIBLE.

GENET, GENNET, or JENNET, in the menage, denotes a small-sized well-proportioned Spanish horse.

To ride *a la genette*, is to ride after the Spanish fashion: so short, that the spurs bear upon the horse's flank.

GENEVA, a city near the confines of France and Switzerland, on the river Rhone, about sixty miles north-west of Lyons: E. long. 6°, N. lat. 46° 20′.

Geneva is a fortified town, about two miles in circumference, situated at the west end of a lake sixty miles long, and twelve broad, called the lake of Geneva.

neva. It is a republic, governed by a council of 200, and a fenate of twenty five members; and is faid to contain 30,000 inhabitants.

GENEVA, or GIN, among diftillers, an ordinary malt fpirit, diftilled a fecond time, with the addition of fome juniper-berries.

Originally, the berries were added to the malt in the grinding; fo that the fpirit thus obtained was flavoured with the berries from firft, and exceeded all that could be made by any other method. At prefent, they leave out the berries entirely, and give their fpirits a flavour by diftilling them with a proper quantity of oil of turpentine; which, though it nearly refembles the flavour of juniper-berries, has none of their valuable virtues.

GENIAL, an epithet given by the Pagans to certain gods who were fuppofed to prefide over generation.

The genial gods, fays Feftus, were earth, air, fire, and water. The twelve figns, together with the fun and moon, were fometimes alfo ranked in the number.

GENICULI, among botanifts, the knots or joints in the ftalks of plants; whence they are denominated geniculate plants.

GENIOGLOSSI, in anatomy. See ANATOMY, p. 304.

GENIOHYOIDÆUS, in anatomy. See ANATOMY, p. 304.

GENIS, a town of Savoy, fituated on the river Guier, twelve miles weft of Chambery.

GENISTA, GREEN-WEED, or DYER'S WEED, a genus of the diadelphia decandria clafs. The calix is bilabiated; the vexillum is oblong, and reflected. There are 14 fpecies, two of which are natives of Britain, *viz.* the tinctoria, or dyer's weed; and the anglica, or needle-furze.

GENITAL, an appellation given to whatever belongs to the parts of generation. See GENERATION.

GENITES, among the Hebrews, thofe defcended from Abraham, without any mixture of foreign blood.

The Greeks diftinguifhed by the name of genites fuch of the Jews as were iffued from parents, who, during the Babylonifh captivity, had not allied with any gentile family.

GENITIVE, in grammar, the fecond cafe of the declenfion of nouns. The relation of one thing confidered as belonging in fome manner to another, has occafioned a peculiar termination of nouns, called the genitive cafe: But in the vulgar tongues, they make ufe of a fign to exprefs the relation of this cafe. In Englifh they prefix the particle *of*, in French *de* or *du*, *&c.* Though in ftrictnefs there are no cafes in either of thefe languages; inafmuch as they do not exprefs the different relations of things by different terminations, but by additional prepofitions, which is otherwife in the Latin.

GENIUS, a good or evil fpirit, or dæmon, whom the ancients fuppofed fet over each perfon, to direct his birth, accompany him in life, and be his guard. See DÆMON.

The rank and office of the genii were inferior to thofe of the lares; for the latter were the tutelar gods of a family, whereas the genii had the care or government only of fingle perfons, or places.

GENIUS, in matters of literature, *&c.* a natural talent or difpofition to do one thing more than another; or the aptitude a man has received from nature to perform well and eafily that which others can do but indifferently and with a great deal of pains.

To know the bent of nature is the moft important concern. Men come into the world with a genius determined not only to a certain art, but to certain parts of that art, in which only they are cabable of fuccefs. If they quit their fphere, they fall even below mediocrity in their profeffion. Art and induftry add much to natural endowments, but cannot fupply them where they are wanting. Every thing depends on genius. A painter often pleafes without obferving rules, whilft another difpleafes though he obferves them, becaufe he has not the happinefs of being born with a genius for painting.

GENOA, a city and archbifhop's fee of Italy, and capital of a republic of the fame name, is built on a ftrand near the fea, and rifes gradually to the top of a hill; the houfes, which are lofty and well built, rifing like the feats of a theatre, afford a fine profpect at fea. The harbour is large and deep, and the principal ftreet, from one end to the other, refembles a double row of palaces: E. long. 9° 30′, and N. lat. 44° 30.

GENTIANA, in botany, a genus of the pentandria digynia clafs. The corolla confifts of one petal; the capfule has two valves, and one cell. There are twenty-eight fpecies, five of which are natives of Britain, *viz.* the pneumoanthe, or calathian violet; the amarella, or autumnal gentian; the centaurium, or leffer centaury; the campeftris, or vernal dwarf gentian; and the filiformis, or marfh century.

The root of this plant is large, remarkably tough, and of a firm texture. It is brought to us from Germany, where it is in many places cultivated as liquorice is amongft us; and it is to be chofen frefh, tough, of a middle fize, free from the fmall fibres, and well dried; tho' if it be fcorched, it is to be rejected This root is one of the beft ftomachics.

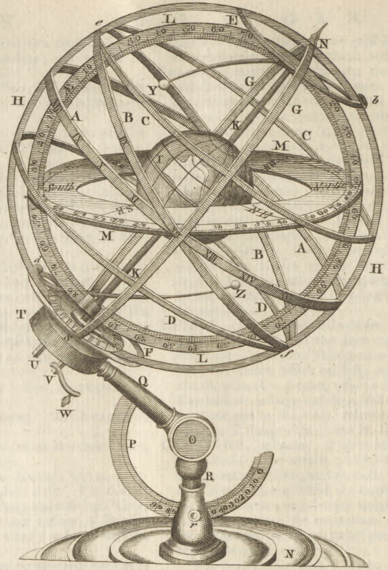
GENTILE, in matters of religion, a pagan, or worfhipper of falfe gods.

GENTILE, in the Roman law and hiftory, a name which fometimes expreffes what the Romans otherwife called barbarians, whether they were allies of Rome or not: but this word was ufed in a more particular fenfe for all ftrangers and foreigners not fubject to the Roman empire.

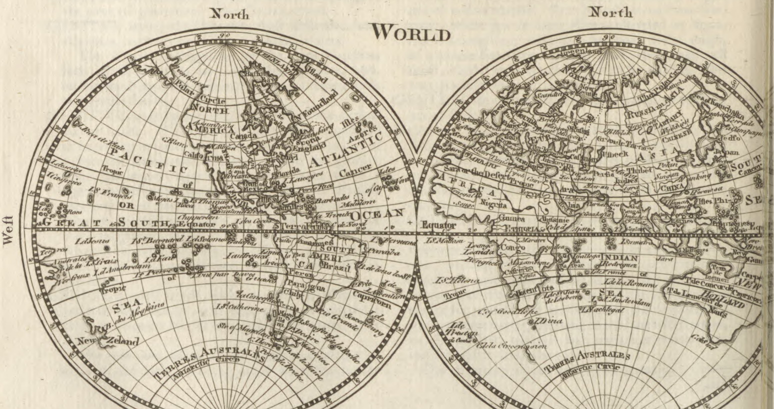
GENTLEMAN-USHER *of the black rod.* See ROD.

GENTLEMEN *of the chapel*, officers whofe duty and attendance is in the royal chapel, being in number thirty-two, whereof twelve are priefts; the other twenty, commonly called clerks of the chapel, affift in the performance of divine fervice. One of the firft twelve is chofen for confeffor of the houfhold, whofe office it is to read prayers every morning to the houfhold fervants, to vifit the fick, examine and prepare communicants, and adminifter the facrament.

One of twenty clerks, well verfed in mufic, is chofen firft



ARMILLARY SPHERE



WORLD

A Bell

firſt organiſt, who is maſter of the children, to inſtruct them in muſic, and whatever elſe is neceſſary for the ſervice of the chapel; a ſecond is likewiſe an organiſt; a thirſt, a lutaniſt; and a fourth, a violiſt.

There are likewiſe three vergers, ſo called from the ſilver-rods they carry in their hands; being a ſerjeant, a yeoman, and groom of the veſtry; the firſt attends the dean and ſub-dean, and finds ſurplices and other neceſſaries for the chapel; the ſecond has the whole care of the chapel, keeps the pews, and ſeats the nobility and gentry; the groom has his attendance within the chapel-door, and looks after it.

GENUS, among metaphyſicians and logicians, denotes a number of beings, which agree in certain general properties common to them all; ſo that a genus is nothing elſe but an abſtract idea, expreſſed by ſome general name or term.

It is plain, therefore, that by a genus we do not barely ſignify one particular thing, nor yet a plurality of things; but a ſort or kind of things, all agreeing in certain general properties.

Thus animal is ſaid to be a genus in reſpect of man and brute, in regard man and brute agree in the common nature and character of animal: ſo a right-lined figure of four ſides, is a genus in reſpect of a parallelogram, and a trapezium; and ſo likewiſe is ſubſtance, in reſpect of ſubſtance extended which is body, and thinking ſubſtance which is mind.

GENUS is alſo uſed for a character or manner applicable to every thing of a certain nature or condition: in which ſenſe it ſerves to make capital diviſions in divers ſciences, as rhetoric, anatomy, and natural hiſtory.

GENUS, in rhetoric. Authors diſtinguiſh the art of rhetoric, as alſo orations or diſcourſes produced thereby, into three genera or kinds, demonſtrative, deliberative, and judiciary.

To the demonſtrative kind belong panegyrics, genethliacons, epithalamiums, funeral harangues, *&c.*

To the deliberative kind belong perſuaſions, diſſuaſions, commendations, *&c.* To the judiciary kind belong defences and accuſations.

GENUS, in natural hiſtory, a ſub-diviſion of any claſs or order of natural beings, whether of the animal, vegetable, or mineral kingdoms, all agreeing in certain common characters. See NATURAL HISTORY.

GEOCENTRIC, in aſtronomy, is applied to a planet or its orbit, to denote it concentric with the earth, or as having the earth for its centre, or the ſame centre with the earth.

GEOGRAPHICAL MILE, the ſame with the ſea-mile; being one minute, or the ſixtieth part of a degree of a great circle on the earth's ſurface.

GEOGRAPHY.

GEOGRAPHY, the doctrine or knowledge of the terreſtrial globe; or the ſcience that teaches and explains the properties of the earth, and the parts thereof which depend upon quantity.

THE DESCRIPTION AND USE OF THE GLOBES AND ARMILLARY SPHERE.

IF a map of the world be accurately delineated on a ſpherical ball, the ſurface thereof will repreſent the ſurface of the earth: for the higheſt hills are ſo inconſiderable with reſpect to the bulk of the earth, that they take off no more from its roundneſs than grains of ſand do from the roundneſs of a common globe; for the diameter of the earth is 8000 miles, in round numbers, and no known hill upon it is three miles in perpendicular height.

For the proof of the earth's being ſpherical, ſee ASTRONOMY, p. 440.

With regard to what we call *up* and *down*, ſee ASTRONOMY, p. 445.

To an obſerver placed any where in the indefinite ſpace, where there is nothing to limit his view, all remote objects appear equally diſtant from him; and ſeem to be placed in a vaſt concave ſphere, of which his eye is the centre. The moon is much nearer to us than the ſun; ſome of the planets are ſometimes nearer, and ſometimes farther from us, than the ſun; others of them never come ſo near us as the ſun always is; the remoteſt planet in our ſyſtem, is beyond compariſon nearer to us than any of the fixed ſtars are. And yet all theſe celeſtial objects appear equally diſtant from us. Therefore, if we imagine a large hollow ſphere of glaſs to have as many bright ſtuds fixed to its inſide, as there are ſtars viſible in the heaven, and theſe ſtuds to be of different magnitudes, and placed at the ſame angular diſtances from each other as the ſtars are; the ſphere will be a true repreſentation of the ſtarry heaven, to an eye ſuppoſed to be in its centre, and viewing it all around. And if a ſmall globe, with a map of the earth upon it, be placed on an axis in the centre of this ſtarry ſphere, and the ſphere be made to turn round on this axis, it will repreſent the apparent motion of the heavens round the earth.

If a great circle be ſo drawn upon this ſphere, as to divide it into two equal parts or hemiſpheres, and the plane of the circle be perpendicular to the axis of the ſphere, this circle will repreſent the *equinoctial*, which divides the heaven into two equal parts, called the *northern* and the *ſouthern hemiſpheres*; and every point of that circle will be equally diſtant from the *poles*, or ends of the axis in the ſphere. That pole which is in the middle of the northern

northern hemiſphere, will be called the *north pole of the ſphere*; and that which is in the middle of the ſouthern hemiſphere, the *ſouth pole*.

If another great circle be drawn upon the ſphere, in ſuch a manner as to cut the equinoctial at an angle of $23\frac{1}{2}$ degrees in two oppoſite points, it will repreſent the *ecliptic*, or circle of the ſun's apparent annual motion: one half of which is on the north ſide of the equinoctial, and the other half on the ſouth.

If a large ſtud be made to move eaſtward in this ecliptic, in ſuch a manner as to go quite round it, in the time that the ſphere is turned round weſtward 366 times upon its axis; this ſtud will repreſent the *ſun*, changing his place every day a 365th part of the ecliptic; and going round weſtward, the ſame way as the ſtars do; but with a motion ſo much ſlower than the motion of the ſtars, that they will make 366 revolutions about the axis of the ſphere, in the time that the ſun makes only 365. During one half of theſe revolutions, the ſun will be on the north ſide of the equinoctial; during the other half, on the ſouth; and at the end of each half, in the equinoctial.

If we ſuppoſe the terreſtrial globe in this machine to be about one inch in diameter, and the diameter of the ſtarry ſphere to be about five or ſix feet, a ſmall inſect on the globe would ſee only a very little portion of its ſurface; but it would ſee one half of the ſtarry ſphere; the convexity of the globe hiding the other half from its view. If the ſphere be turned weſtward round the globe, and the inſect could judge of the appearances which ariſe from that motion, it would ſee ſome ſtars riſing to its view in the eaſtern ſide of the ſphere, whilſt others were ſetting on the weſtern: but as all the ſtars are fixed to the ſphere, the ſame ſtars would always riſe in the ſame points of view on the eaſt ſide, and ſet in the ſame points of view on the weſt ſide. With the ſun it would be otherwiſe, becauſe the ſun is not fixed to any point of the ſphere, but moves ſlowly along an oblique circle in it. And if the inſect ſhould look towards the ſouth, and call that point of the globe, where the equinoctial in the ſphere ſeems to cut it on the left ſide, the *eaſt point*; and where it cuts the globe on the right ſide, the *weſt point*; the little animal would ſee the ſun riſe north of the eaſt, and ſet north of the weſt, for $182\frac{1}{2}$ revolutions; after which, for as many more, the ſun would riſe ſouth of the eaſt, and ſet ſouth of the weſt. And in the whole 365 revolutions, the ſun would riſe only twice in the eaſt point, and ſet twice in the weſt. All theſe appearances would be the ſame, if the ſtarry ſphere ſtood ſtill (the ſun only moving in the ecliptic) and the earthly globe were turned round the axis of the ſphere eaſtward. For, as the inſect would be carried round with the globe, he would be quite inſenſible of its motion; and the ſun and ſtars would appear to move weſtward.

We may imagine as many circles deſcribed upon the earth as we pleaſe; and we may imagine the plane of any circle deſcribed upon the earth to be continued, until it marks a circle in the concave ſphere of the heavens.

The *horizon* is either *ſenſible* or *rational*. The *ſenſible* horizon is that circle which a man ſtanding upon a large plane obſerves to terminate his view all around, where the heaven and earth ſeem to meet. The plane of our ſenſible horizon continued to the heaven, divides it into two hemiſpheres; one viſible to us, the other hid by the convexity of the earth.

The plane of the *rational horizon*, is ſuppoſed parallel to the plane of the ſenſible; to paſs through the centre of the earth, and to be continued to the heavens. And although the plane of the ſenſible horizon touches the earth in the place of the obſerver, yet *this* plane, and that of the rational horizon, will ſeem to coincide in the heaven, becauſe the whole earth is but a point compared to the ſphere of the heaven.

The earth being a ſpherical body, the horizon, or limit of our view, muſt change as we change our place.

The *poles of the earth*, are thoſe two points on its ſurface in which its axis terminates. The one is called the *north pole*, and the other the *ſouth pole*.

The *poles of the heaven*, are thoſe two points in which the earth's axis produced terminates in the heaven; ſo that the *north pole* of the heaven is directly over the north pole of the earth; and the *ſouth pole* of the heaven is directly over the ſouth pole of the earth.

The *equator* is a great circle upon the earth, every part of which is equally diſtant from either of the poles. It divides the earth into two equal parts, called the *northern* and *ſouthern hemiſpheres*. If we ſuppoſe the plane of this circle to be extended to the heaven, it will mark the *equinoctial* therein, and will divide the heaven into two equal parts, called the *northern* and *ſouthern* hemiſpheres of the heaven.

The *meridian* of any place is a great circle paſſing through that place and the poles of the earth We may imagine as many ſuch meridians as we pleaſe, becauſe any place that is ever ſo little to the eaſt or weſt of any other place, has a different meridian from that place; for no one circle can paſs through any two ſuch places and the poles of the earth.

The *meridian* of any place is divided by the poles into two ſemicircles: that which paſſes through the place is called the *geographical*, or *upper meridian*; and that which paſſes through the oppoſite place, is called the *lower meridian*.

When the rotation of the earth brings the plane of the geographical meridian to the ſun. it is *noon* or *mid-day* to that place; and when the lower meridian comes to the ſun, it is *mid-night*.

All places lying under the ſame geographical meridian, have their noon at the ſame time, and conſequently all the other hours. All thoſe places are ſaid to have the ſame *longitude*, becauſe no one of them lies either eaſtward or weſtward from any of the reſt.

If we imagine 24 ſemicircles, one of which is the geographical meridian of a given place, to meet at the poles, and to divide the equator into 24 equal parts; each of theſe meridians will come round to the ſun in 24 hours, by the earth's equable motion round its axis in that time. And, as the equator contains 360 degrees, there will be 15 degrees contained between any two of theſe meridians which are neareſt to one another: for 24 times 15 is 360. And as the earth's motion is eaſtward, the ſun's apparent motion will be weſtward, at the rate of 15 degrees each hour. Therefore,

They whoſe geographical meridian is 15 degrees eaſtward

ward from us, have noon, and every other hour, an hour fooner than we have. They whofe meridian is fiftcen degrees weftward from us, have noon, and every other hour, an hour later than we have: and fo on in proportion, reckoning one hour for every fifteen degrees.

For the ecliptic circle, figns, and degrees, fee ASTRONOMY, p. 435.

The *tropics* are leffer circles in the heaven, parallel to the equinoctial; one on each fide of it, touching the ecliptic in the points of its greateft declination; fo that each tropic is $23\frac{1}{2}$ degrees from the equinoctial, one on the north fide of it, and the other on the fouth. The northern tropic touches the ecliptic at the beginning of Cancer, the fouthern at the beginning of Capricorn; for which reafon the former is called the *tropic of Cancer*, and the latter the *tropic of Capricorn*.

The *polar circles* in the heaven, are each $23\frac{1}{2}$ degrees from the poles, all around. That which goes round the north pole, is called the *arctic circle*. The fouth polar circle, is called the *antarctic circle*, from its being oppofite to the arctic.

The ecliptic, tropics, and polar circles, are drawn upon the terreftrial globe, as well as upon the celeftial. But the ecliptic, being a great fixed circle in the heavens, cannot properly be faid to belong to the terreftrial globe; and is laid down upon it only for the conveniency of folving fome problems. So that, if this circle on the terreftrial globe was properly divided into the months and days of the year, it would not only fuit the globe better, but would alfo make the problems thereon much eafier.

For the earth's motion round its axis every 24 hours; its motion in the ecliptic round the fun every year; and the viciffitude of feafons; fee ASTRONOMY, p. 452.

Defcription of the Terreftrial Globe. [See Plate XLIV. fig. 2.]

The equator, ecliptic, and tropics, polar circles, and meridians, are laid down upon the globe in the manner already defcribed. The ecliptic is divided into 12 figns, and each fign into 30 degrees. Each tropic is $23\frac{1}{2}$ degrees from the equator, and each polar circle $23\frac{1}{2}$ degrees from its refpective pole. Circles are drawn parallel to the equator, at every ten degrees diftance from it on each fide to the poles: thefe circles are called *parallels of latitude*. On large globes there are circles drawn perpendicularly through every tenth degree of the equator, interfecting each other at the poles: but on globes of or under a foot diameter, they are only drawn through every fifteenth degree of the equator; thefe circles are generally called *meridians*, fometimes *circles of longitude*, and at other times *hour-circles*.

The globe is hung in a brafs-ring, called the *brazen meridian*; and turns upon a wire in eace pole funk half its thicknefs into one fide of the meridian ring; by which means, *that* fide of the ring divides the globe into two equal parts, called the *eaftern* and *weftern hemifpheres*; as the equator divides it into two equal parts, called the *northern* and *fouthern hemifpheres*. The ring is divided into 360 equal parts or degrees, on the fide wherein the axis of the globe turns. One half of thefe degrees are numbered, and reckoned, from the equator to the poles, where they end at 90: their ufe is to fhew the latitudes of places. The degrees on the other half of the meridian ring are numbered from the poles to the equator, where they end at 90: their ufe is to fhew how to elevate either the north or fouth pole above the horizon, according to the latitude of any given place, as it is north or fouth of the equator.

The brazen meridian is let into two notches made in a broad flat ring, called the *wooden horizon*; the upper furface of which divides the globe into two equal parts, called the *upper* and *lower hemifpheres*. One notch is in the north point of the horizon, and the other in the fouth. On this horizon are feveral concentric circles, which contain the months and days of the year, the figns and degrees anfwering to the fun's place for each month and day, and the 32 points of the compafs.—The graduated fide of the brafs meridian lies towards the eaft fide of the horizon, and fhould be generally kept towards the perfon who works problems by the globes.

There is a fmall *horary circle*, fo fixed to the north part of the brazen meridian, that the wire in the north pole of the globe is in the centre of that circle; and on the wire is an *index*, which goes over all the 24 hours of the circle, as the globe is turned round its axis. Sometimes there are two horary circles, one between each pole of the globe and the brazen meridian.

There is a thin flip of brafs, called the *quadrant of altitude*, which is divided into 90 equal parts or degrees, anfwering exactly to fo many degrees of the equator. It is occafionally fixed to the uppermoft point of the brazen meridian by a nut and fcrew. The divifions end at the nut, and the quadrant is turned round upon it.

The Defcription and Ufe of the Armillary Sphere. [See Plate LXXXVII. Fig. 1.]

THE exterior parts of this machine are, a compages of brafs rings, which reprefent the principal circles of the heaven, *viz.* 1. The equinoctial *AA*, which is divided into 360 degrees (beginning at its interfection with the ecliptic in Aries) for fhewing the fun's right afcenfion in degrees; and alfo into 24 hours, for fhewing his right afcenfion in time. 2. The ecliptic *BB*, which is divided into 12 figns, and each fign into 30 degrees, and alfo into the months and days of the year; in fuch a manner, that the degree or point of the ecliptic in which the fun is, on any given day, ftands over that day in the circle of months. 3. The tropic of Cancer *CC*, touching the ecliptic at the beginning of Cancer in *e*, and the tropic of Capricorn *DD*, touching the ecliptic at the beginning of Capricorn in *f*; each $23\frac{1}{2}$ degrees from the equinoctial circle. 4. The arctic circle *E*, and the antarctic circle *F*, each $23\frac{1}{2}$ degrees from its refpective pole at *N* and *S*. 5. The equinoctial colure *GG*, paffing through the north and fouth poles of the heaven at *N* and *S*, and through the equinoctial points Aries and Libra, in the ecliptic. 6. The folftitial colure *HH*, paffing through the poles of the heaven,

heaven, and through the folftitial points Cancer and Capricorn, in the ecliptic. Each quarter of the former of thefe colures is divided into 90 degrees, from the equinoctial to the poles of the world, for fhewing the declination of the fun, moon, and ftars; and each quarter of the latter, from the ecliptic at *e* and *f*, to its poles *b* and *d*, for fhewing the latitude of the ftars.

In the north pole of the ecliptic is a nut *b*, to which is fixed one end of a quadrantal wire, and to the other end a fmall fun *Y*, which is carried round the ecliptic *B B*, by turning the nut: and in the fouth pole of the ecliptic is a pin *d*, on which is another quadrantal wire, with a fmall moon Z upon it, which may be moved round by hand: but there is a particular contrivance for caufing the moon to move in an orbit which croffes the ecliptic at an angle of $5\frac{1}{3}$ degrees, in two oppofite points called the *moon's nodes*; and alfo for fhifting thefe points backward in the ecliptic, as the *moon's nodes* fhift in the heaven.

Within thefe circular rings is a fmall terreftrial globe *J*, fixt on an axis *K K*, which extends from the north and fouth poles of the globe at *n* and *s*, to thofe of the celeftial fphere at *N* and *S*. On this axis is fixt the flat celeftial meridian *L L*, which may be fet directly over the meridian of any place on the globe, and then turned round with the globe, fo as to keep over the fame meridian upon it. This flat meridian is graduated the fame way as the brafs meridian of a common globe, and its ufe is much the fame. To this globe is fitted the moveable horizon *M M*, fo as to turn upon two ftrong wires proceeding from its eaft and weft points to the globe, and entering the globe at the oppofite points of its equator, which is a moveable brafs ring let into the globe in a groove all around its equator. The globe may be turned by hand within this ring, fo as to place any given meridian upon it, directly under the celeftial meridian *L L*. The horizon is divided into 360 degrees all around its outermoft edge, within which are the points of the compafs, for fhewing the amplitude of the fun and moon, both in degrees and points. The celeftial meridian *L L* paffes through two notches in the north and fouth points of the horizon, as in a common globe: but here, if the globe be turned round, the horizon and meridian turn with it. At the fouth pole of the fphere is a circle of 24 hours, fixt to the rings, and on the axis is an index which goes round that circle, if the globe be turned round its axis.

The whole fabric is fupported on a pedeftal *N*, and may be elevated or depreffed upon the joint *O*, to any number of degrees from 0 to 90, by means of the arc *P*, which is fixed in the ftrong brafs arm *Q*, and flides in the upright piece *R*, in which is a fcrew at *r*, to fix it at any proper elevation.

In the box *T* are two wheels (as in Dr Long's fphere) and two pinions, whofe axes come out at *V* and *U*; either of which may be turned by the fmall winch *W*. When the winch is put upon the axis *V*, and turn backward, the terreftrial globe, with its horizon and celeftial meridian, keep at reft; and the whole fphere of circles turns round from eaft, by fouth, to weft, carrying the fun *Y*, and moon *Z*, round the fame way, and caufing them to rife above and fet below the horizon. But when the winch is put upon the axis *U*, and turned forward, the fphere with the fun and moon keep at reft; and the earth, with its horizon and meridian, turn round from weft, by fouth, to eaft; and bring the fame points of the horizon to the fun and moon, to which thefe bodies came when the earth kept at reft, and they were carried round it; fhewing that they rife and fet in the fame points of the horizon, and at the fame times in the hour circle, whether the motion be in the earth or in the heaven. If the earthly globe be turned, the hour-index goes round its hour-circle; but if the fphere be turned, the hour-circle goes round below the index.

And fo, by this conftruction, the machine is equally fitted to fhew either the real motion of the earth, or the apparent motion of the heaven.

To rectify the fphere for ufe, firft flacken the fcrew *r* in the upright ftem *R*, and taking hold of the arm *Q*, move it up or down until the given degree of latitude for any place be at the fide of the ftem *R*; and then the axis of the fphere will be properly elevated, fo as to ftand parallel to the axis of the world, if the machine be fet north and fouth by a fmall compafs: this done, count the latitude from the north pole, upon the celeftial meridian *L L*, down towards the north notch of the horizon, and fet the horizon to that latitude; then, turn the nut *b* until the fun *Y* comes to the given day of the year in the ecliptic, and the fun will be at its proper place for that day: find the place of the moon's afcending node, and alfo the place of the moon, by an Ephemeris, and fet them right accordingly: laftly, turn the winch *W*, until either the fun comes to the meridian *L L*, or until the meridian comes to the fun (according as you want the fphere or earth to move) and fet the hour-index to the XII, marked noon, and the whole machine will be rectified.———Then turn the winch, and obferve when the fun or moon rife and fet in the horizon, and the hour-index will fhew the times thereof for the given day.

As thofe who underftand the ufe of the globes will be at no lofs to work many other problems by this fphere, it is needlefs to enlarge any farther upon it.

Directions for ufing Globes.

In ufing globes, keep the eaft fide of the horizon towards you (unlefs your problem require the turning of it), which fide you may know by the word Eaft upon the horizon; for then you have the graduated fide of the meridian towards you, the quadrant of altitude before you, and the globe divided exactly into two equal parts, by the graduated fide of the meridian.

In working fome problems, it will be neceffary to turn the whole globe and horizon about, that you may look on the weft fide thereof; which turning will be apt to jog the ball fo, as to fhift away that degree of the globe which was before fet to the horizon or meridian: to avoid which inconvenience, you may thruft in the feather-end of a quill between the ball of the globe and the brazen meridian; which, without hurting the ball, will keep it

it from turning in the meridian, whilst you turn the west side of the horizon towards you.

PROB. I. *To find the latitude and longitude of any given place upon the globe.*—Turn the globe on its axis, until the given place comes exactly under that graduated side of the brasen meridian, on which the degrees are numbered from the equator; and observe what degree of the meridian the place then lies under; which is its latitude, north or south, as the place is north or south of the equator.

The globe remaining in this position, the degree of the equator, which is under the brasen meridian, is the longitude of the place which is east or west, as the place lies on the east or west side of the first meridian of the globe. —All the Atlantic Ocean, and America, is on the west side of the meridian of London; and the greatest part of Europe, and of Africa, together with all Asia, is on the east side of the meridian of London, which is reckoned the *first meridian* of the globe by the British geographers and astronomers.

PROB. II. *The longitude and latitude of a place being given, to find that place on the globe.*—Look for the given longitude in the equator (counting it eastward or westward from the first meridian, as it is mentioned to be east or west;) and bring the point of longitude in the equator to the brasen meridian, on that side which is above the south point of the horizon: then count from the equator, on the brasen meridian, to the degree of the given latitude, towards the north or south pole, according as the latitude is north or south; and under that degree of latitude on the meridian, you will have the place required.

PROB. III. *To find the difference of longitude, or difference of latitude, between any two given places.*—Bring each of these places to the brasen meridian, and see what its latitude is: the lesser latitude subtracted from the greater, if both places are on the same side of the equator, or both latitudes added together, if they are on different sides of it, is the difference of latitude required. And the number of degrees contained between these places, reckoned on the equator, when they are brought separately under the brasen meridian, is their difference of longitude; if it be less than 180: but if more, let it be subtracted from 360, and the remainder is the difference of longitude required. Or,

Having brought one of the places to the brasen meridian, and set the hour-index to XII, turn the globe until the other place comes to the brasen meridian, and the number of hours and parts of an hour, past over by the index, will give the longitude in time; which may be easily reduced to degrees, by allowing 15 degrees for every hour, and one degree for every four minutes.

N B. When we speak of bringing any place to the brasen meridian, it is the graduated side of the meridian that is meant.

PROB. IV. *Any place being given, to find all those places that have the same longitude or latitude with it.* —Bring the given place to the brasen meridian, then all those places which lie under that side of the meridian, from pole to pole, have the same longitude with the given place. Turn the globe round its axis, and all those places which pass under the same degree of the meridian that the given place does, have the same latitude with that place.

Since all latitudes are reckoned from the equator, and all longitudes are reckoned from the first meridian, it is evident, that the point of the equator which is cut by the first meridian, has neither latitude nor longitude.—The greatest latitude is 90 degrees, because no place is more than 90 degrees from the equator. And the greatest longitude is 180 degrees, because no place is more than 180 degrees from the first meridian.

PROB. V. *To find the* antœci, periœci, *and* antipodes, *of any given place.*—Bring the given place to the brasen meridian; and having found its latitude, keep the globe in that situation, and count the same number of degrees of latitude from the equator towards the contrary pole; and where the reckoning ends, you have the *antœci* of the given place upon the globe. Those who live at the equator have no *antœci*.

The globe remaining in the same position, set the hour-index to the upper XII on the horary circle, and turn the globe until the index comes to the lower XII; then, the place which lies under the meridian, in the same latitude with the given place, is the *periœci* required. Those who live at the poles have no *periœci*.

As the globe now stands (with the index at the lower XII) the *antipodes* of the given place will be under the same point of the brasen meridian where its *antœci* stood before. Every place upon the globe has its *antipodes*.

PROB. VI. *To find the distance between any two places on the globe.*—Lay the graduated edge of the quadrant of altitude over both the places, and count the number of degrees intercepted between them on the quadrant; then multiply these degrees by 60, and the product will give the distance in geographical miles: but to find the distance in miles, multiply the degrees by 69½, and the product will be the number of miles required. Or, take the distance betwixt any two places with a pair of compasses, and apply that extent to the equator; the number of degrees, intercepted between the points of the compasses, is the distance in degrees of a great circle; which may be reduced either to geographical miles, or to English miles, as above.

PROB. VII. *A place on the globe being given, and its distance from any other place, to find all the other places upon the globe which are at the same distance from the given place.*—Bring the given place to the brasen meridian, and screw the quadrant of altitude to the meridian, directly over that place; then keeping the globe in that position, turn the quadrant quite round upon it, and the degree of the quadrant that touches the second place will pass over all the other places which are equally distant with it from the given place.

This is the same as if one foot of a pair of compasses was set in the given place, and the other foot extended to the second place, whose distance is known; for if the compasses be then turned round the first place as a centre, the moving foot will go over all those places which are at the same distance with the second from it.

PROB. VIII. *The hour of the day at any place being given, to find all those places where it is noon at that time.*

time.—Bring the given place to the brasen meridian, and set the index to the given hour; this done, turn the globe until the index points to the upper XII, and then all the places that lie under the brasen meridian have noon at that time.

N. B. The upper XII always stands for noon; and when the bringing of any place to the brasen meridian is mentioned, the side of that meridian on which the degrees are reckoned from the equator is meant, unless the contrary side be mentioned.

PROB. IX. *The hour of the day at any place being given, to find what o'clock it then is at any other place.*—Bring the given place to the brasen meridian, and set the index to the given hour; then turn the globe, until the place where the hour is required comes to the meridian, and the index will point out the hour at that place.

PROB. X. *To find the sun's place in the ecliptic, and his declination, for any given day of the year.*—Look on the horizon for the given day, and right against it you have the degree of the sign in which the sun is (or his place) on that day at noon. Find the same degree of that sign in the ecliptic line upon the globe, and having brought it to the brasen meridian, observe what degree of the meridian stands over it; for that is the sun's declination, reckoned from the equator.

PROB. XI. *The day of the month being given, to find all those places of the earth over which the sun will pass vertically on that day.*—Find the sun's place in the ecliptic for the given day, and having brought it to the brasen meridian, observe what point of the meridian is over it; then, turning the globe round its axis, all those places which pass under that point of the meridian, are the places required; for as their latitude is equal, in degrees and parts of a degree, to the sun's declination, the sun must be directly over head to each of them at its respective noon.

PROB. XII. *A place being given in the torrid zone, to find those two days of the year on which the sun shall be vertical to that place.*—Bring the given place to the brasen meridian, and mark the degree of latitude that is exactly over it on the meridian; then turn the globe round its axis, and observe the two degrees of the ecliptic which pass exactly under that degree of latitude: lastly, find on the wooden horizon, the two days of the year in which the sun is in those degrees of the ecliptic, and they are the days required: for on them, and none else, the sun's declination is equal to the latitude of the given place; and consequently, he will then be vertical to it at noon.

PROB. XIII. *To find all those places of the north frigid zone, where the sun begins to shine constantly without setting, on any given day, from the 21st of March to the 23d of September.*—On these two days, the sun is in the equinoctial, and enlightens the globe exactly from pole to pole: therefore, as the earth turns round its axis, which terminates in the poles, every place upon it will go equally through the light and the dark, and so make equal day and night to all places of the earth. But as the sun declines from the equator, towards either pole, he will shine just as many degrees round that pole, as are equal to his declination from the equator; so that no place within that distance of the pole will then go through any part of the dark, and consequently the sun will not set to it. Now, as the sun's declination is northward, from the 21st of March to the 23d of September, he must constantly shine round the north pole all that time; and on the day that he is in the northern tropic, he shines upon the whole north frigid zone; so that no place within the north polar circle goes through any part of the dark on that day. Therefore,

Having brought the sun's place for the given day to the brasen meridian, and found his declination (by Prob. IX.) count as many degrees on the meridian, from the north pole, as are equal to the sun's declination from the equator, and mark that degree from the pole where the reckoning ends: then, turning the globe round its axis, observe what places in the north frigid zone pass directly under that mark; for they are the places required.

The like may be done for the south frigid zone, from the 23d of September to the 21st of March, during which time the sun shines constantly on the south pole.

PROB. XIV. *To find the place over which the sun is vertical at any hour of a given day.*—Having found the sun's declination for the given day (by Prob. IX.) mark it with a chalk on the brasen meridian: then bring the place where you are (suppose Edinburgh) to the brasen meridian, and set the index to the given hour; which done, turn the globe on its axis, until the index points to XII at noon; and the place on the globe, which is then directly under the point of the sun's declination marked upon the meridian, has the sun that moment in the zenith, or directly over head.

PROB. XV. *The day and hour of a lunar eclipse being given; to find all those places of the earth to which it will be visible.*—The moon is never eclipsed but when she is full, and so directly opposite to the sun, that the earth's shadow falls upon her. Therefore, whatever place of the earth the sun is vertical to at that time, the moon must be vertical to the antipodes of that place: so that the sun will be then visible to one half of the earth, and the moon to the other.

Find the place to which the sun is vertical at the given hour (by Prob. XIV.) elevate the pole to the latitude of that place, and bring the place to the upper part of the brasen meridian, as in the former problem: then, as the sun will be visible to all those parts of the globe which are above the horizon, the moon will be visible to all those parts which are below it, at the time of her greatest obscuration.

PROB. XVI. *To rectify the globe for the latitude, the zenith, and the sun's place.*—Find the latitude of the place (by Prob. I.) and if the place be in the northern hemisphere, raise the north pole above the north point of the horizon, as many degrees (counted from the pole upon the brasen meridian) as are equal to the latitude of the place. If the place be in the southern hemisphere, raise the south pole above the south point of the horizon, as many degrees as are equal to the latitude. Then, turn the globe till the place comes under its latitude on the brasen meridian, and fasten the quadrant of altitude so, that the chamfered edge of its nut (which is even with the graduated edge) may be joined to the zenith, or

or point of latitude. This done, bring the ſun's place in the ecliptic for the given day (found by Prob X.) to the graduated ſide of the braſen meridian, and ſet the hour-index to XII at noon, which is the uppermoſt XII on the hour-circle; and the globe will be rectified.

PROB. XVII. *The latitude of any place, not exceeding* $66\frac{1}{2}$ *degrees, and the day of the month, being given; to find the time of ſun riſing and ſetting, and conſequently the length of the day and night.*—Having rectified the globe for the latitude, and for the ſun's place on the given day (as directed in the preceding problem) bring the ſun's place in the ecliptic to the eaſtern ſide of the horizon, and the hour-index will ſhew the time of ſun riſing; then turn the globe on its axis, until the ſun's place comes to the weſtern ſide of the horizon, and the index will ſhew the time of ſun-ſetting.

The hour of ſun-ſetting doubled, gives the length of the day; and the hour of ſun-riſing doubled, gives the length of the night.

PROB. XVIII. *The latitude of any place, and the day of the month being given; to find when the morning twilight begins, and the evening twilight ends, at that place.*—This problem is often limited: for, when the ſun does not go 18 degrees below the horizon, the twilight continues the whole night; and for ſeveral nights together in ſummer, between 49 and $66\frac{1}{2}$ degrees of latitude; and the nearer to $66\frac{1}{2}$, the greater is the number of theſe nights. But when it does begin and end, the following method will ſhew the time for any given day.

Rectify the globe, and bring the ſun's place in the ecliptic to the eaſtern ſide of the horizon; then mark that point of the ecliptic with a chalk which is in the weſtern ſide of the horizon, it being the point oppoſite to the ſun's place: this done, lay the quadrant of altitude over the ſaid point, and turn the globe eaſtward, keeping the quadrant at the chalk mark, until it be juſt 18 degrees high on the quadrant; and the index will point out the time when the morning twilight begins: for the ſun's place will then be 18 degrees below the eaſtern ſide of the horizon. To find the time when the evening twilight ends, bring the ſun's place to the weſtern ſide of the horizon, and the point oppoſite to it, which was marked with the chalk, will be riſing in the eaſt: then, bring the quadrant over that point, and keeping it thereon, turn the globe weſtward, until the ſaid point be 18 degrees above the horizon on the quadrant, and the index will ſhew the time when the evening twilight ends; the ſun's place being then 18 degrees below the weſtern ſide of the horizon.

PROB. XIX. *To find on what day of the year the ſun begins to ſhine conſtantly without ſetting, on any given place in the north frigid zone; and how long he continues to do ſo.*—Rectify the globe to the latitude of the place, and turn it about until ſome point of the ecliptic, between aries and cancer, coincides with the north point of the horizon where the braſen meridian cuts it: then find, on the wooden horizon, what day of the year the ſun is in that point of the ecliptic; for that is the day on which the ſun begins to ſhine conſtantly on the given place, without ſetting. This done, turn the globe untill ſome point of the ecliptic, between cancer and libra, coincides with the north point of the horizon, where the braſen meridian cuts it; and find, on the wooden horizon, on what day the ſun is in that point of the ecliptic; which is the day that the ſun leaves off conſtantly ſhining on the ſaid place, and riſes and ſets to it as to other places on the globe. The number of natural days, or compleat revolutions of the ſun about the earth, between the two days above found, is the time that the ſun keeps conſtantly above the horizon without ſetting: for all that portion of the ecliptic, which lies between the two points which interſect the horizon in the very north, never ſets below it: and there is juſt as much of the oppoſite part of the ecliptic that never riſes; therefore, the ſun will keep as long conſtantly below the horizon in winter, as above it in ſummer.

PROB. XX. *To find in what latitude the ſun ſhines conſtantly without ſetting, for any length of time leſs than* $182\frac{1}{2}$ *of our days and nights.*—Find a point in the ecliptic half as many degrees from the beginning of cancer (either toward aries or libra) as there are natural days in the time given; and bring that point to the north ſide of the braſen meridian, on which the degrees are numbered from the pole towards the equator: then, keep the globe from turning on its axis, and ſlide the meridian up or down, until the foreſaid point of the ecliptic comes to the north point of the horizon, and then the elevation of the pole will be equal to the latitude required.

PROB. XXI. *The latitude of a place, not exceeding* $66\frac{1}{2}$ *degrees, and the day of the month being given; to find the ſun's amplitude, or point of the compaſs on which he riſes or ſets.*—Rectify the globe, and bring the ſun's place to the eaſtern ſide of the horizon; then obſerve what point of the compaſs on the horizon ſtands right againſt the ſun's place, for that is his amplitude at riſing. This done, turn the globe weſtward, until the ſun's place comes to the weſtern ſide of the horizon, and it will cut the point of his amplitude at ſetting. Or, you may count the riſing amplitude in degrees, from the eaſt point of the horizon, to that point where the ſun's place cuts it; and the ſetting amplitude, from the weſt point of the horizon, to the ſun's place at ſetting.

PROB. XXII. *The latitude, the ſun's place, and his altitude, being given; to find the hour of the day, and the ſun's azimuth, or number of degrees that he is diſtant from the meridian.*—Rectify the globe, and bring the ſun's place to the given height upon the quadrant of altitude; on the eaſtern ſide of the horizon, if the time be in the forenoon; or the weſtern ſide, if it be in the afternoon: then the index will ſhew the hour; and the number of degrees in the horizon, intercepted between the quadrant of altitude and the ſouth point, will be the ſun's true azimuth at that time.

PROB. XXIII. *The latitude, hour of the day, and the ſun's place, being given; to find the ſun's altitude and azimuth.*—Rectify the globe, and turn it until the index points to the given hour; then lay the quadrant of altitude over the ſun's place in the ecliptic, and the degree of the quadrant cut by the ſun's place is his altitude at that time above the horizon; and the degree of the horizon cut by the quadrant is the ſun's azimuth, reckoned from the ſouth.

PROB. XXIV. *The latitude, the ſun's altitude, and his*

his azimuth being given; *to find his place in the ecliptic, the day of the month, and hour of the day, though they had all been lost.*—Rectify the globe for the latitude and zenith, and set the quadrant of altitude to the given azimuth in the horizon; keeping it there, turn the globe on its axis until the ecliptic cuts the quadrant in the given altitude: that point of the ecliptic which cuts the quadrant there, will be the sun's place; and the day of the month answering thereto, will be found over the like place of the sun on the wooden horizon. Keep the quadrant of altitude in that position; and, having brought the sun's place to the brasen meridian, and the hour-index to XII at noon, turn back the globe, until the sun's place cuts the quadrant of altitude again, and the index will shew the hour.

Any two points of the ecliptic, which are equidistant from the beginning of Cancer or of Capricorn, will have the same altitude and azimuth at the same hour, though the months be different; and therefore it requires some care in this problem, not to mistake both the month and the day of the month; to avoid which, observe, that from the 20th of March to the 21st of June, that part of the ecliptic which is between the beginning of Aries and beginning of Cancer is to be used: from the 21st of June to the 23d of September, between the beginning of Cancer and beginning of Libra: from the 23d of September to the 21st of December, between the beginning of Libra and the beginning of Capricorn; and from the 21st of December to the 20th of March, between the beginning of Capricorn and beginning of Aries. And as one can never be at a loss to know in what quarter of the year he takes the sun's altitude and azimuth, the above caution with regard to the quarters of the ecliptic will keep him right as to the month and day thereof.

PROB. XXV. *To find the length of the longest day at any given place.*—If the place be on the north side of the equator (find its latitude by Prob. I.) and elevate the north pole to that latitude; then, bring the beginning of Cancer to the brazen meridian, and set the hour-index to XII at noon. But if the given place be on the south side of the equator, elevate the south pole to its latitude, and bring the beginning of Capricorn to the brass meridian, and the hour-index to XII. This done, turn the globe westward, until the beginning of Cancer or Capricorn (as the latitude is north or south) comes to the horizon; and the index will then point out the time of sun-setting, for it will have gone over all the afternoon hours, between mid-day and sun set; which length of time being doubled, will give the whole length of the day from sun-rising to sun-setting. For, in all latitudes, the sun rises as long before mid day, as he sets after it.

PROB. XXVI. *To find in what latitude the longest day is, of any given length, less than 24 hours.*—If the latitude be north, bring the beginning of Cancer to the brasen meridan, and elevate the north pole to about $66\frac{1}{2}$ degrees; but if the latitude be south, bring the beginning of Capricorn to the meridian, and elevate the south pole to about $66\frac{1}{2}$ degrees; because the longest day in north latitude is, when the sun is in the first point of Cancer; and in south latitude, when he is in the first point of Capricorn. Then set the hour-index to XII at noon, and turn the globe westward, until the index points at half the number of hours given; which done, keep the globe from turning on its axis, and slide the meridian down in the notches, until the aforesaid point of the ecliptic (*viz.* Cancer or Capricorn) comes to the horizon; then, the elevation of the pole will be equal to the latitude required.

PROB. XXVII. *The latitude of any place, not exceeding $66\frac{1}{2}$ degrees, being given; to find in what climate the place is.*—Find the length of the longest day at the given place, by Prob. XXV. and whatever be the number of hours whereby it exceedeth twelve, double that number, and the sum will give the climate in which the place is.

PROB. XXVIII. *The latitude, and the day of the month, being given; to find the hour of the day when the sun shines.*—Set the wooden horizon truly level, and the brasen meridian due north and south by a mariner's compass: then, having rectified the globe, stick a small sewing-needle into the sun's place in the ecliptic, perpendicular to that part of the surface of the globe: this done, turn the globe on its axis, until the needle comes to the brasen meridian, and set the hour-index to XII at noon; then, turn the globe on its axis, until the needle points exactly towards the sun (which it will do when it casts no shadow on the globe), and the index will shew the hour of the day.

The Use of the Celestial Globe.

HAVING done for the present with the terrestrial globe, we shall proceed to the use of the celestial; first premising, that as the equator, ecliptic, tropics, polar-circles, horizon, and brasen meridian, are exactly alike on both globes, all the former problems concerning the sun are solved the same way by both globes. The method also of rectifying the celestial globe is the same as rectifying the terrestrial.

N. B. The sun's place for any day of the year stands directly over that day on the horizon of the celestial globe, as it does on that of the terrestrial.

The *latitude* and *longitude* of the stars, or of all other celestial phenomena, are reckoned in a very different manner from the latitude and longitude of places on the earth: for all terrestrial latitudes are reckoned from the equator; and longitudes from the meridian of some remarkable place, as of London by the British, and of Paris by the French. But the astronomers of all nations agree in reckoning the latitudes of the moon, stars, planets, and comets, from the ecliptic; and their longitudes from the equinoctial colure, in that semi circle of it which cuts the ecliptic at the beginning of Aries; and thence eastward, quite round, to the same semi-circle again. Consequently those stars which lie between the equinoctial and the northern half of the ecliptic, have north declination and south latitude; those which lie between the equinoctial and the southern half of the ecliptic, have south declination and north latitude; and all those which lie between the tropics and poles, have their declinations and latitudes of the same denomination.

There are six great circles on the celestial globe, which cut

cut the ecliptic perpendicularly, and meet in two opposite points in the polar circles; which points are each ninety degrees from the ecliptic, and are called its poles. These polar points divide those circles into 12 semicircles; which cut the ecliptic at the beginnings of the 12 signs. They resemble so many meridians on the terrestrial globe; and as all places which lie under any particular meridian-semicircle on that globe, have the same longitude, so all those points of the heaven, through which any of the above semicircles are drawn, have the same longitude.—And as the greatest latitudes on the earth are at the north and south poles of the earth, so the greatest latitudes in the heaven are at the north and south poles of the ecliptic.

For the division of the stars into constellations, &c. see ASTRONOMY, p. 486.

PROB. I. *To find the right ascension and declination of the sun, or any fixed star.*—Bring the sun's place in the ecliptic to the brasen meridian; then that degree in the equinoctial which is cut by the meridian, is the sun's *right ascension;* and that degree of the meridian which is over the sun's place, is his *declination*. Bring any fixed star to the meridian, and its right ascension will be cut by the meridian in the equinoctial; and the degree of the meridian that stands over it, is its declination.

So that the right ascension and declination, on the celestial globe, are found in the same manner as longitude and latitude on the terrestrial.

PROB. II. *To find the latiude and longitude of any star.*—If the given star be on the north side of the ecliptic, place the 90th degree of the quadrant of altitude on the north pole of the ecliptic, where the twelve semicircles meet, which divide the ecliptic into the 12 signs: but if the star be on the south side of the ecliptic, place the 90th degree of the quadrant on the south pole of the ecliptic: keeping the 90th degree of the quadrant on the proper pole, turn the quadrant about, until its graduated edge cuts the star: then, the number of degrees in the quadrant, between the ecliptic and the star, is its latitude; and the degree of the ecliptic, cut by the quadrant, is the star's longitude, reckoned according to the sign in which the quadrant then is.

PROB. III. *To represent the face of the starry firmament, as seen from any given place of the earth, at any hour of the night.*—Rectify the celestial globe for the given latitude, the zenith, and sun's place, in every respect, as taught by the XVIth problem, for the terrestrial; and turn it about, until the index points to the given hour: then, the upper hemisphere of the globe will represent the visible half of the heaven for that time: all the stars upon the globe being then in such situations, as exactly correspond to those in the heaven. And if the globe be placed duly north and south, by means of a small sea-compass, every star in the globe will point toward the like star in the heaven: by which means, the constellations and remarkable stars may be easily known. All those stars which are in the eastern side of the horizon, are then rising in the eastern side of the heaven; all in the western, are setting in the western side; and all those under the upper part of the brasen meridian, between the south point of the horizon and the north pole, are at their greatest altitude, if the latitude of the place be north: but if the latitude be south, those stars which lie under the upper part of the meridian, between the north point of the horizon and the south pole, are at their greatest altitude.

PROB. IV. *The latitude of the place, and day of the month, being given; to find the time when any known star will rise, or be upon the meridian, or set.*—Having rectified the globe, turn it about until the given star comes to the eastern side of the horizon, and the index will shew the time of the star's rising; then turn the globe westward, and when the star comes to the brasen meridian, the index will shew the time of the star's coming to the meridian of your place; lastly, turn on, until the star comes to the western side of the horizon, and the index will shew the time of the star's setting.

N. B. In northern latitudes, those stars which are less distant from the north pole, than the quantity of its elevation above the north point of the horizon, never set; and those which are less distant from the south pole, than the number of degrees by which it is depressed below the horizon, never rise: and *vice versa* in southern latitudes.

PROB. V. *To find at what time of the year a given star will be upon the meridian, at a given hour of the night.*—Bring the given star to the upper semicircle of the brass meridian, and set the index to the given hour; then turn the globe, until the index points to XII at noon, and the upper semicircle of the meridian will then cut the sun's place, answering to the day of the year sought; which day may be easily found against the like place of the sun among the signs on the wooden horizon.

PROB. VI. *The latitude, day of the month, and azimuth of any known star, being given; to find the hour of the night.*—Having rectified the globe for the latitude, zenith, and sun's place, lay the quadrant of altitude to the given degree of azimuth in the horizon: then turn the globe on its axis, until the star comes to the graduated edge of the quadrant; and when it does, the index will point out the hour of the night.

PROB. VII. *The latitude of the place, the day of the month, and altitude of any known star, being given; to find the hour of the night.*—Rectify the globe as in the former problem, guess at the hour of the night, and turn the globe until the index points at the supposed hour; then lay the graduated edge of the quadrant of altitude over the known star, and if the degree of the star's height in the quadrant upon the globe, answers exactly to the degree of the star's observed altitude in the heaven, you have guessed exactly: but if the star on the globe is higher or lower than it was observed to be in the heaven, turn the globe backwards or forwards, keeping the edge of the quadrant upon the star, until its centre comes to the observed altitude in the quadrant; and then, the index will shew the true time of the night.

PROB. VIII. *An easy method for finding the hour of the night by any two known stars, without knowing either their altitude or azimuth; and then, of finding both their altitude and azimuth, and thereby the true meridian.*—Tie one end of a thread to a common musket-bullet; and, having rectified the globe as above, hold the other end of the thread in your hand, and carry it

ſlowly round betwixt your eye and the ſtarry heaven, until you find it cuts any two known ſtars at once. Then gueſſing at the hour of the night, turn the globe until the index points to that time in the hour circle; which done, lay the graduated edge of the quadrant over any one of theſe two ſtars on the globe, which the thread cut in the heaven. If the ſaid edge of the quadrant cuts the other ſtar alſo, you have gueſſed the time exactly; but if it does not, turn the globe ſlowly backwards or forwards, until the quadrant (kept upon either ſtar) cuts them both through their centres: and then, the index will point out the exact time of the night; the degree of the horizon, cut by the quadrant, will be the true azimuth of both theſe ſtars from the ſouth; and the ſtars themſelves will cut their true altitude in the quadrant. At which moment, if a common azimuth-compaſs be ſo ſet upon a floor or level pavement, that theſe ſtars in the heaven may have the ſame bearing upon it (allowing for the variation of the needle) as the quadrant of altitude has in the wooden horizon of the globe, a thread extended over the north and ſouth points of that compaſs will be directly in the plane of the meridian: and if a line be drawn upon the floor or pavement, along the courſe of the thread, and an upright wire be placed in the ſouthmoſt end of the line, the ſhadow of the wire will fall upon that line, when the ſun is on the meridian, and ſhines upon the pavement.

PROB. IX. *To find the place of the moon, or of any planet; and thereby to ſhew the time of its riſing, ſouthing, and ſetting.*—Seek in Parker's or Weaver's ephemeris the geocentric place of the moon or planet in the ecliptic, for the given day of the month; and, according to its longitude and latitude, as ſhewn by the ephemeris, mark the ſame with a chalk upon the globe. Then, having rectified the globe, turn it round its axis weſtward; and as the ſaid mark comes to the eaſtern ſide of the horizon, to the braſen meridian, and to the weſtern ſide of the horizon, the index will ſhew at what time the planet riſes, comes to the meridian, and ſets, in the ſame manner as it would do for a fixed ſtar.

For an explanation of the harveſt-moons by a globe, ſee ASTRONOMY, p. 463.

For the deſcription and uſe of a planetary globe, ſee ASTRONOMY, p. 498.

For the equation of time, ſee ASTRONOMY, p. 458.

HAVING thus explained the uſe of the globes, and general principles of geography, we muſt refer to the maps for the ſituation of each particular country, with regard to longitude, latitude, *&c.* The uſe of maps is obvious from their conſtruction. The degrees of the meridian, and parallels, ſhew the longitudes and latitudes of places; and the ſcale of miles annexed, their diſtances. The ſituation of places, with regard to each other, as well as the cardinal points, appears by inſpection; the top of the map being always the *north*, the bottom the *ſouth*, the right-hand the *eaſt*, and the left the *weſt*, unleſs the compaſs uſually annexed ſhew the contrary.

The brevity, which we are neceſſarily obliged to obſerve, prevents us from taking any notice of many particulars, which are to be found in large treatiſes on this ſubject. A general account of countries, cities, rivers, mountains, *&c.* is given under their reſpective names, as they occur in the order of the alphabet. We ſhall therefore conclude this article with the following table, which will ſerve to give an idea of the general diviſion of the habitable earth; and at the ſame time ſerve to explain the maps in Plates 87. 88. 89. 90. 91. and 92.

The Diviſion of the Habitable Earth, the ſquare Miles of each Diviſion and Subdiviſion, Capital Cities, with the Diſtance and Bearing of each from London; alſo the Time of each Country compared with that of England.

THE terraqueous globe is divided into	I. EUROPE	2,749,349	Square miles, 60 miles in length to a degree.
	II. ASIA	10,257,487	
	III. AFRICA	8,506,208	
	IV. AMERICA	9,153,762	
	Habitable earth	30,666,806	
	Seas, and unknown parts	117,843,821	
	Superficies of the whole globe	148,510,627	

Diviſion and ſubdiviſion.	Square miles.	Capital cities.	Diſtance and bearing from London.	Diff. of time from London.
I. EUROPE.				*H.M.
1. *Spain*	150,243	*Madrid*	690 S	0 16 W
2. *Portugal*	27,851	*Liſbon*	840 S W	0 38 W
3. *France*	138,837	*Paris*	203 E	0 9 E

4. *Italy*

* A degree of longitude being 4 minutes in time, therefore by having the longitude we have the time. A watch that is ſet to time at London would be 16 minutes too faſt at Madrid, as it lies to the weſt of the meridian at London: and Vienna being 16 degrees and 20 minutes to the eaſt of the meridian of London, conſequently a watch ſet at London would be 1 hour and 5 minutes too ſlow at Vienna.

GEOMETRY.

GEOMETRY originally signified no more than the art of measuring the earth, or any distances or dimensions within it: but at present, it denotes the science of magnitude in general; comprehending the doctrine and relations of whatever is susceptible of augmentation or diminution, considered in that light.

Hence to geometry may be referred the consideration not only of lines, surfaces, and solids; but also of time, velocity, number, weight, *&c.*

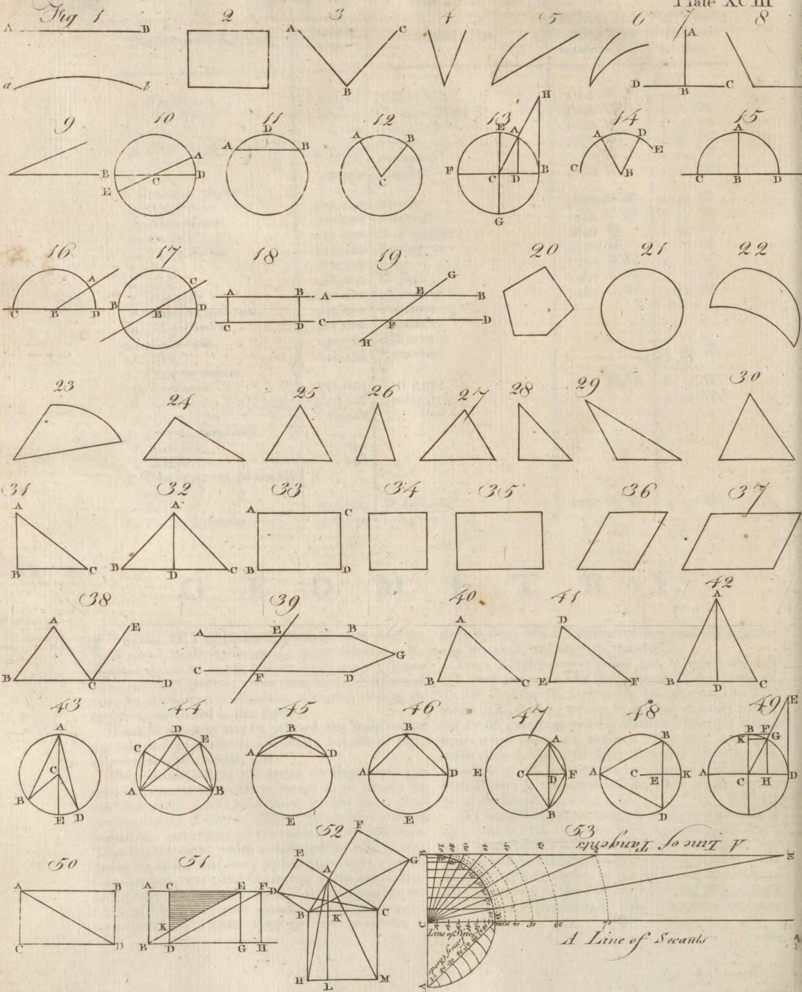
This science had its rise among the Egyptians, who were in a manner compelled to invent it, to remedy the confusion which generally happened in their lands, from the inundations of the river Nile, which carried away all boundaries, and effaced all the limits of their possessions. Thus this invention, which at first consisted only in measuring the lands, that every person might have what belonged to him, was called Geometry, or the art of measuring land; and it is probable that the draughts and schemes, which they were annually compelled to make, helped them to discover many excellent properties of these figures; which speculations continued to be gradually improved, and are so to this day.

From Egypt geometry passed into Greece; where it continued to receive new improvements in the hands of Thales, Pythagoras, Archimedes, Euclid, *&c.* The Elements of Geometry, written by this last in fifteen books, are a most convincing proof to what perfection this science was carried among the ancients. However, it must be acknowledged, that it fell short of modern geometry; the bounds of which, what by the invention of fluxions, and the discovery of the almost infinite orders of curves, are greatly enlarged.

We may distinguish the progress of geometry into three ages; the first of which was in its meridian glory at the time when Euclid's Elements appeared; the second, beginning with Archimedes, reaches to the time of Des Cartes, who, by applying algebra to the elements of geometry, gave a new turn to this science, which has been carried to its utmost perfection by Sir Isaac Newton and Mr Leibnitz.

In

Plate XCIII



A.B. Sc.

In treating this useful subject, we shall divide it into two parts; the first containing the general principles; and the second, the application of these principles to the mensuration of surfaces, solids, *&c.*

PART I.

GENERAL PRINCIPLES OF GEOMETRY.

Art. 1. A point is that which is not made up of parts, or which is of itself indivisible.

2. A line is a length without breadth, as B——

3 The extremities of a line are points; as the extremities of the line AB, are the points A and B, fig. 1. Plate XCIII.

4. If the line AB be the nearest distance between its extremes A and B, then it is called a *strait line*, as A B; but if it be not the nearest distance, then it is called a *curve line*, as AB; fig. 1.

5. A surface is that which is considered as having only length and breadth, but no thickness, as B, fig. 2.

6. The terms or boundaries of a surface are lines.

7. A plain surface is that which lies equally between its extremes.

8. The inclination between two lines meeting one another (provided they do not make one continued line,) or the opening between them, is called an *angle*; thus the inclination of the line AB to the line CB (fig. 3) meeting one another at B, or the opening between the two lines AB and CB, is called an angle.

9. When the lines forming the angle are right lines, then it is called a *right-lined angle*, as A, fig. 4. if one of them be right and the other curved, it is called a *mixed angle*, as B, fig 5. if both if them be curved, it is called a *curve-lined angle*, as C, fig. 6.

10. If a right line AB fall upon another DC, (fig. 7.) so as to incline neither to one side nor to the other; but make the angles ABD, ABC, on each side equal to one another; then the line AB is said to be *perpendicular* to the line DC, and the two angles are called *right-angles*.

11. An obtuse angle is that which is greater than a right one, as A, fig. 8; and an acute angle, that which is less than a right one, as B, fig. 9.

12. If a right line DC be fastened at one of its ends C, and the other end D be carried quite round, then the space comprehended is called a *circle*; the curve line described by the point D, is called the *periphery* or *circumference* of the circle; the fixed point C is called the *centre* of it. Fig. 10.

13. The describing line CD is called the *radius*, *viz.* any line drawn from the centre to the circumference; whence all radii of the same or equal circles are equal.

14. Any line drawn through the centre, and terminated both ways by the circumference, is called a *diameter*, as BD is a diameter of the circle BADE. And the diameter divides the circle and circumference into two equal parts, and is double the radius.

15. The circumference of every circle is supposed to be divided into 360 equal parts, called *degrees*; and each degree is divided into 60 equal parts, called *minutes*; and each minute into 60 equal parts called, *seconds*; and these into *thirds*, *fourths*, &c these parts being greater or less according as the radius is.

16. Any part of the circumference is called an *arch*, or *arc*; and is called an arc of as many degrees as it contains parts of the 360, into which the circumference was divided: Thus if AD be the $\frac{1}{8}$ of the circumference, then the arc AD is an arc of 45 degrees.

17. A line drawn from one end of an arc to the other, is called a *chord*, and is the measure of the arc; thus the right line AB is the chord of the arc ADB, fig. 11.

18. Any part of a circle cut off by a chord, is called a *segment*; thus the space comprehended between the chord AB and circumference ADB (which is cut off by the chord AB) is called a segment. Whence it is plain,

1st, That all chords divide the circle into two segments.

2dly, The less the chord is, the more unequal are the segments, and *e contra*.

3dly, When the chord is greatest, *viz.* when it is a diameter, then the segments are equal, *viz.* each a semicircle.

19. Any part of a circle (less than a semicircle) contained between two radii and an arc, is called a *sector*; thus the space contained between the two radii, AC, BC, and the arc AB, is called the sector; fig. 12.

20. The right sine of any arc, is a line drawn perpendicular from one end of the arc, to a diameter drawn through the other end of the same arc; thus (fig. 13.) AD is the right sine of the arc AB, it being a line drawn from A, the one end of the arc AB, perpendicular to CB, a diameter passing through B, the other end of the arc AB.

Now the sines standing on the same diameter, still increase till they come to the centre, and then becoming the radius, it is plain that the radius EC is the greatest possible sine, and for that reason it is called the *whole sine*.

Since the whole-sine EC must be perpendicular to the a diameter FB (by def. 20.) therefore producing the diameter EG, the two diameters FB, EG, must cross one another at right angles, and so the circumference of the circle must be divided by them into four parts EB, BG, GF, and FE, and these four parts are equal to one another (by def. 10.) and so EB a quadrant, or fourth part of the circumference; therefore the radius EC is always the sine of the quadrant, or fourth part of the circle EB.

Sines are said to be of so many degrees, as the arc contains parts of the 360, into which the circumference is supposed to be divided; so the radius being the sine of a quadrant, or fourth part of the circumference, which contains 90 degrees (the fourth part of 360), therefore the radius must be the sine of 90 degrees.

21. The part of the radius comprehended between the extremity of the right ſine and the lower end of the arc, *viz.* DB, is called the verſed ſine of the arc AB.

22. If to any point in the circumference, *viz.* B, there be drawn a diameter FCB, and from the point B, perpendicular to that diameter, there be drawn the line BH; that line is called a *tangent* to the circle in the point B; which tangent can touch the circle only in one point B, elſe if it touched it in more, it would go within it, and ſo not be a tangent but a chord, (by art. 17.)

23. The tangent of any arc AB, is a right line drawn perpendicular to a diameter through the one end of the arc B, and terminated by a line CAH, drawn from the centre through the other end A; thus BH is the tangent of the arch AB.

24. And the line which terminates the tangent, *viz.* CH, is called the ſecant of the arc AB.

25. What an arc wants of a quadrant is called the *complement* of that arc; thus AE, being what the arc AB wants of the quadrant EB, is called the complement of the arc AB.

26. And what an arc wants of a ſemicircle is called the *ſupplement* of that arc; thus ſince AF is what the arc AB wants of the ſemicircle BAF, it is the ſupplement of the arc AB.

27. The ſine, tangent, *&c.* of the complement of any arc, is called the *co-ſine*, *co-tangent*, *&c.* of that arc; thus the ſine, tangent, *&c.* of the arc AE is called the co-ſine, co-tangent, *&c.* of the arc AB.

28. The ſine of the ſupplement of an arc is the ſame with the ſine of the arc itſelf; for, drawing them according to the definitions, there reſults the ſelf-ſame line.

29. A right-lined angle is meaſured by an arc of a circle deſcribed upon the angular point as a centre, comprehended between the two legs that form the angle; thus (fig. 14.) the angle ABD is meaſured by the arc AD of the circle CADE that is deſcribed upon the point B as a centre; and the angle is ſaid to be of as many degrees as the arc is; ſo if the arc AD be 45 degrees, then the angle ABD is ſaid to be an angle of 45 degrees.

Hence the angles are greater or leſs, according as the arc deſcribed about the angular point and terminated by the two legs contain a greater or a leſs number of degrees.

30. When one line falls perpendicularly on another, as AB on CD, fig. 15. then the angles are right (by the 10th def.); and deſcribing a circle on the centre B, ſince the angles ABC ABD are equal, their meaſures muſt be ſo too, *i. e.* the arcs AC AD muſt be equal; but the whole CAD is a ſemicircle, ſince CD, a line paſſing through the centre B, is a diameter; therefore each of the parts AC AD is a quadrant, *i. e.* 90 degrees; ſo the meaſure of a right angle is always 90 degrees.

31. If one line AB fall any way upon another, CD, then the ſum of the two angles ABC ABD is always equal to the ſum of two right angles; fig. 16. For on the point B, deſcribing the circle CAD, it is plain, that CAD is a ſemicircle (by the 14th); but CAD is equal to CA and AD the meaſure of the two angles; therefore the ſum of the two angles is equal to a ſemicircle, that is, to two right angles, (by the laſt).

Cor. 1. From whence it is plain, that all the angles which can be made from a point in any line, towards one ſide of the line, are equal to two right angles.

2. And that all the angles which can be made about a point, are equal to four right ones.

32. If one line AC croſs another BD in the point E, then the oppoſite angles are equal, *viz.* BEA to CED, and BEC equal to AED; fig. 17. For upon the point E, as a centre, deſcribing the circle ABCD, it is plain ABC is a ſemicircle, as alſo BCD (by the 14th); therefore the arc ABC is equal to the arc BCE; and from both taking the common arc BC, there will remain AB equal to CD, *i. e.* the Angle BEA equal to the angle CED (by art. 29.). After the ſame manner we may prove, that the angle BEC is equal to the angle AED.

33. Lines which are equally diſtant from one another, are called *parallel lines*; as AB, CD, fig. 18.

34. If a line GH croſs two parallels AB, CD, (fig. 19.) then the external oppoſite angles are equal, *viz.* GEB equal to CFH and AEG equal to HFD. For ſince AB and CD are parallel to one another, they may be conſidered as one broad line, and GH croſſing it; then the vertical or oppoſite angles GEB CFG are equal (by art. 32.), as alſo AEG and HFD by the ſame.

35. If a line GH croſs two parallels AB CD, then the alternate angles, *viz.* AEF and EFD, or CFE and FEB, are equal; that is, the angle AEF is equal to the angle EFD, and the angle CFE is equal to the angle FEB, for GEB is equal to AEF (by art. 32.), and CFH is equal to EFD (by the ſame); but GEB is equal to CFH (by the laſt); therefore AEF, is equal to EFD. The ſame way we may prove FEB equal to EFC.

36. If a line GH croſs two parallel lines AB, CD, then the external angle GEB is equal to the internal oppoſite one EFD, or GEA equal to CFE. For the angle AEF is equal to the angle EFD (by the laſt); but AEF is equal to GEB (by art. 32.), therefore GEB is equal to EFD. The ſame way we may prove AEG equal to CFE.

37. If a line GH croſs two parallel lines AB CD, then the ſum of the two internal angles, *viz.* BEF and DFE, or AEF and CFE, are equal to two right angles; for ſince the angle GEB is equal to the angle EFD (by art. 36.), to both add the angle FEB, then GEB and BEF are equal to BEF and DFE; but GEB and BEF are equal to two right angles (by art. 31.) therefore BEF and DFE are alſo equal to two right angles. The ſame way we may prove that AEF and CFE are equal to two right angles.

39. A figure is any part of ſpace bounded by lines or a line. If the bounding lines be ſtrait, it is called a *rectilineal figure*, as A, fig. 20. if they be curved, it is called a *curvineal figure*, as B or C, fig. 21. and fig. 22. if they be partly curve lines and partly ſtrait, it is called a *mixt figure*, as D, fig. 23.

35. The moſt ſimple rectilinear figure is that which is bounded by three right lines, and is called a *triangle*, as A, fig. 24.

40. Triangles are divided into different kinds, both with reſpect to their ſides and angles: with reſpect to their ſides they are commonly divided into three kinds, *viz.*

41. A

41. A triangle having all its three ſides equal to one another, is called an *equilateral triangle*, as A, fig. 25.

42. A triangle having two of its ſides equal to one another, and the third ſide not equal to either of them, is called an *Iſoſceles triangle*, as B, fig. 26.

43. A triangle having none of its ſides equal to one another, is called a *ſcalene triangle*, as C, fig. 27.

44. Triangles, with reſpect to their angles, are divided into three different kinds, *viz.*

45. A triangle having one of its angles right, is called a *right-angled triangle*, as A, fig. 28.

46. A triangle having one of its angles obtuſe, or greater than a right angle, is called an *obtuſe-angled triangle*, as B, fig. 29.

47 Laſtly, a triangle having all its angles acute, is called an *acute-angled triangle*, as C, fig. 30.

48. In all right-angled triangles, the ſides comprehending the right angle are called the legs, and the ſide oppoſite to the right angle is called the *hypothenuſe*. Thus in the right-angled triangle ABC, fig. 31. (the right angle being at B) the two ſides AB and BC, which comprehend the right angle ABC, are the legs of the triangle; and the ſide AC, which is oppoſite to the right angle ABC, is the hypothenuſe of the right-angled triangle ABC.

49. Both obtuſe and acute angled triangles are in general called *oblique-angled triangles*; in all which any ſide is called the *baſe*, and the other two the *ſides*.

50. The perpendicular height of any triangle is a line drawn from the vertex to the baſe perpendicularly; thus if the triangle ABC (fig. 32.) be propoſed, and BC be made its baſe, then A will be the vertex, *viz.* the angle oppoſite to the baſe; and if from A you draw the line AD perpendicular to BC, then the line AD is the height of the triangle ABC ſtanding on BC as its baſe.

Hence all triangles ſtanding between the ſame parallels have the ſame height, ſince all the perpendiculars are equal by the nature of parallels.

51. A figure bounded by four ſides is called a *quadrilateral* or *quadrangular figure*, as ABDC, fig. 33.

52. Quadrilateral figures whoſe oppoſite ſides are parallel, are called *parallelograms*. Thus in the quadrilateral figure ABDC, if the ſide AC be parallel to the ſide BD which is oppoſite to it, and AB be parallel to CD, then the figure ABDC is called a parallelogram.

53. A parallelogram having all its ſides equal and angles right, is called a *ſquare*, as A, fig. 34.

54. That which hath only the oppoſite ſides equal and its angles right, is called a *rectangle*, as B, fig. 35.

55. That which hath equal ſides but oblique angles, is called a *rhombus*, as C, fig. 36. and is juſt an inclined ſquare.

56. That which hath only the oppoſite ſides equal and the angles oblique, is called a *rhomboides*, as D, fig. 37. and may be conceived as an inclined rectangle.

57. When none of the ſides are parallel to another, then the quadrilateral figure is called a *trapezium*.

58. Every other right lined figure, that has more ſides than four, is in general called a *polygon*. And figures are called by particular names according to the number of their ſides, *viz.* one of five ſides is called a *pentagon*, of ſix a *hexagon*, of ſeven a *heptagon*, and ſo on. When the ſides forming the polygon are equal to one another, the figure is called a regular figure or polygon.

59. *In any triangle* ABC (fig. 38.) *one of its legs, as* BC, *being produced towards* D, *the external angle* ACD *is equal to both the internal oppoſite ones taken together*, viz. *to* ABC *and* BAC. In order to prove this, through C draw CE parallel to AB; then ſince CE is parallel to AB, and the lines AC and BD croſſeth them, the angle ECD is equal to ABC (by art. 36.) and the angle ACE equal to CAB (by art. 35.); therefore the angles ECD and ECA are equal to the angles ABC and CAB; but the angles ECD and ECA are together equal to the angle ACD; therefore the angle ACD is equal to both the angles ABC and CAB taken together.

Cor. Hence it may be proved, that if two lines AB and CD (fig. 39.) be croſſed by a third line EF, and the alternate angles AEF and EFD be equal, the lines AB and CD will be parallel; for if they are not parallel, they muſt meet one another on one ſide of the line EF (ſuppoſe at G) and ſo form the triangle EFG, one of whoſe ſides GE being produced to A, the exterior angle AEF muſt (by this article) be equal to the ſum of the two angles EFG and EGF; but, by ſuppoſition, it is equal to the angle EFG alone; therefore the angle AEF muſt be equal to the ſum of the two angles EFG and EGF, and at the ſame time equal to the angle EFG alone, which is abſurd; ſo the lines AB and CD cannot meet, and therefore muſt be parallel.

60. *In any triangle* ABC, *all the three angles taken together are equal to two right angles.* To prove this, you muſt produce BC, one of its legs, to any diſtance, ſuppoſe to D; then by the laſt propoſition, the external angle, ACD, is equal to the ſum of the two internal oppoſite ones CAB and ABC; to both add the angle ACB, then the ſum of the angles ACD and ACB will be equal to the ſum of the angles CAB and CBA and ACB. But the ſum of the angles ACD and ACB, is equal to two right ones (by art. 32.), therefore the ſum of the three angles CAB and CBA and ACB, is equal to two right angles; that is, the ſum of the three angles of any triangle ACB is equal to two right angles.

Cor. 1. Hence in any triangle given, if one of its angles be known, the ſum of the other two is alſo known: for ſince (by the laſt) the ſum of all the three is equal to two right angles, or a ſemicircle, it is plain, that taking any one of them from a ſemicircle or 180 degrees, the remainder will be the ſum of the other two. Thus (in the former triangle ABC) if the angle ABC be 40 degrees, by taking 40 from 180 we have 140 degrees; which is the ſum of the two angles BAC, ACB: the converſe of this is alſo plain, *viz.* the ſum of any two angles of a triangle being given, the other angle is alſo known by taking that ſum from 180 degrees.

2. In any right-angled triangle, the two acute angles muſt juſt make up a right one between them; conſequently, any one of the oblique angles being given, we may find the other by ſubtracting the given one from 90 degrees, which is the ſum of both.

61. If in any two triangles, ABC (fig. 40.) DEF (fig. 41.) two legs of the one, *viz.* AB and AC, be equal to two

two legs in the other, *viz.* to DE and DF, each to each refpectively, *i. e.* AB to DE, and AC to DF; and if the angles included between the equal legs be equal, *viz.* the angle BAC equal to the angle EDF; then the remaining leg of the one fhall be equal to the remaining leg of the other, *viz.* BC to EF; and the angles oppofite to equal legs fhall be equal, *viz.* ABC equal to DEF (being oppofite to the equal legs AC and DF), alfo ACB equal to DFE (which are oppofite to the equal legs AB and DE). For if the triangle ABC be fuppofed to be lifted up and put upon the triangle DEF, and the point A on the point D; it is plain, fince BA and DE are of equal length, the point E will fall upon the point B; and fince the angles BAC EDF are equal, the line AC will fall upon the line DF; and they being of equal length, the point C will fall upon the point F; and fo the line BC will exactly agree with the line EF, and the triangle ABC will in all refpects be exactly equal to the triangle DEF; and the angle ABC will be equal to the angle DEF, alfo the angle ACB will be equal to the angle DFE.

Cor. 1. After the fame manner it may be proved, that if in any two triangles ABC, DEF, (fee the preceding figure) two angles ABC and ACB of the one, be equal to two angles DEF and EFE of the other, each to each refpectively, *viz.* the angle ABC to the angle DEF, and the angle ACB equal to the angle DFE, and the fides included between thefe angles be alfo equal, *viz.* BC equal to EF, then the remaining angles and the fides oppofite to the equal angles, will alfo be equal each to each refpectively; *viz.* the angle BAC equal to the angle BDF, the fide AB equal to DE, and AC equal to DF: for if the triangle ABC be fuppofed to be lifted up and laid upon the triangle DEF, the point B being put upon the point E, and the line BC upon the line EF, fince BC and EF are of equal lengths, the point C will fall upon the point F, and fince the angle ACB is equal to the angle DFE, the line CA will fall upon the line FD, and by the fame way of reafoning the line BA will fall upon the line ED; and therefore the point of interfection of the two lines BA and CA, *viz.* A, will fall upon the point of interfection of the two lines BD and FD, *viz.* D, and confequently BA will be equal to DE, and AC equal to DF, and the angle BAC equal to the angle EDF.

Cor. 2. It follows likewife from this article, that if any triangle ABC (fig. 42.) has two of its fides AB and AC equal to one another, the angles oppofite to thefe fides will alfo be equal, *viz.* the angles ABC equal to the angle ACB. For fuppofe the line AD, bifecting the angle BAC, or dividing it into two equal angles BAD and CAD, and meeting BC in D, then the line AD will divide the whole triangle BAC into two triangles ABD and DAC; in which BA and AD two fides of the one, are equal to CA and AD two fides of the other, each to each refpectively, and the included angles BAD and DAC are by fuppofition equal; therefore (by this article) the angle ABC muft be equal to the angle ACB.

62. *Any angle, as* BAD (fig. 43.) *at the circumference of a circle* BADE, *is but half the angle* BCD *at the centre ftanding on the fame arch* BED. To demonftrate this, draw through A and the centre C, the right line ACE, then the angle ECD is equal to both the angles DAC and ADG (by art. 59.); but fince AC and CD are equal (being two radii of the fame circle) the angles fubtended by them muft be equal alfo, (by *art.* 62. *cor.* 2.) *i. e.* the angle CAD equal to the angle CDA; therefore the fum of them is double any one of them, *i. e.* DAC and ADC is double of CAD, and therefore ECD is alfo double of DAC: the fame way it may be proved, that ECB is double of CAB; and therefore the angle BCD is double of the angle BAD, or BAD the half of BCD, which was to be proved.

Cor. 1. Hence an angle at the circumference is meafured by half the arc it fubtends; for the angle at the centre (ftanding on the fame arc) is meafured by the whole arc (by art. 29.); but fince the angle at the centre is double that at the circumference, it is plain the angle at the circumference muft be meafured by only half the arc it ftands upon.

Cor. 2. Hence all angles, ACB, ADB, AEB, *&c.* (fig. 44.) at the circumference of a circle, ftanding on the fame chord AB, are equal to one another; for by the laft corollary they are all meafured by the fame arc, *viz.* half the arc AB which each of them fubtends.

Cor. 3. Hence an angle in a fegment greater than a femicircle is lefs than a right angle: thus, if ADB be a fegment greater than a femicircle, (fee the laft figure) than the arc AB, on which it ftands, muft be lefs than a femicircle, and the half of it lefs than a quadrant or a right angle; but the angle ADB in the fegment is meafured by the half of AB, therefore it is lefs than a right angle.

Cor. 4. An angle in a femicircle is a right angle. For fince ABD (fig. 45.) is a femicircle, the arc AED muft alfo be a femicircle: but the angle ABD is meafured by half the arc AED, that is, by half a femicircle or quadrant; therefore the angle ABD is a right one.

Cor. 5. Hence an angle in a fegment lefs than a femicircle, as ABD, (fig. 46.) is greater than a right angle: for fince the arc ABD is lefs than a femicircle, the arc AED muft be greater than a femicircle, and fo it is half greater than a quadrant, *i. e.* than the meafure of a right angle; therefore the angle ABD, which is meafured by half the arc AED, is greater than a right angle.

63. *If from the centre* C *of the circle* ABE, (fig. 47.) *there be let fall the perpendicular* CD *on the chord* AB, *then that perpendicular will bifect the chord* AB *in the point* D. To demonftrate this, draw from the centre to the extremities of the chord the two lines CA, CB; then fince the lines CA and CB are equal, the angles CAB, CBA, which they fubtend muft be equal alfo, (by *art.* 62. *cor.* 2.) but the perpendicular CD divides the triangle ACB into two right-angled triangles ACD and CDB, in which the fum of the angles ACD and CAD in the one, is equal to the fum of the angles DCB and CBD in the other, each being equal to a right angle, (by *cor.* 2. of *art.* 61.) but CAD is equal to CBD, therefore ACD is equal to BCD. So in the two triangles ACD and BCD, the two legs AC and CD in the one, are equal to the two legs BC and CD in the other, each to each refpectively, and the included angles ACD and BCD are equal; therefore the remaining legs AD and BD are equal (by art. 61.) and confequently AB bifected in D.

64. If

64. If from the centre C of a circle ABE, there be drawn a perpendicular CD on the chord AB, and produced till it meet the circle in F, then the line CF bisects the arch AB in the point F; for (see the foregoing figure) joining the points A and F, F and B by the streight lines AF, FB, then in the triangles ADF, BDF, AD is equal to DB (by art. 63.) and DF common to both; therefore AD and DF, two legs of the triangle ADF, are equal to BD and DF, two legs of the triangle BDF, and the included angles ADF BDF are equal, being both right; therefore (by art. 61.) the remaining legs AF and FB are equal; but in the same circle equal lines are chords of equal arches, therefore the arches AF and FB are equal. So the whole arch AFB is bisected in the point F by the line CF.

Cor. 1. From art. 63. it follows, that any line bisecting a chord at right angles is a diameter; for since (by art. 63.) a line draw from the centre perpendicular to a chord, bisects that chord at right angles; therefore, conversly, a line bisecting a chord at right angles, must pass thro' the centre, and consequently be a diameter

Cor. 2. From the two last articles it follows, that the sine of any arc is the half of the chord of twice the arc; for (see the foregoing scheme) AD is the sine of the arc AF, by the definition of a sine, and AF is half the arc AFB, and AD half the chord AB (by art. 63.); therefore the *cor.* is plain.

65. In any triangle, the half of each side is the sine of the opposite angle; for if a circle be supposed to be drawn through the three angular points A, B, and D of the triangle ABD, fig. 48. then the angle DAB is measured by half the arch BKD (by *cor.* 1. of *art.* 62.) but the half of BD, *viz.* BE, is the sine of half the arch BKD, *viz.* the sine of BK (by *cor.* 2. of the last) which is the measure of the angle BAD; therefore the half of BD is the sine of the angle BAD; the same way it may be proved, that the half of AD is the sine of the angle ABD, and the half of AB is the sine of the angle ADB.

66. The sine, tangent, &c. of any arch is called also the sine, tangent, &c. of the angle whose measure the arc is: thus because the arc GD (fig. 49.) is the measure of the angle GCD; and since GH is the sine, DE the tangent, HD the versed sine, CE the secant, also GK the co-sine, BF the co-tangent, and CF the co-secant, &c. of the arch GD; then GH is called the sine, DE the tangent, &c. of the angle GCD, whose measure is the arch GD.

67. *If two equal and parallel lines*, AB *and* CD (fig. 50.) *be joined by two others*, AC *and* BD; *then these shall also be equal and parallel.* To demonstrate this, join the two opposite angles A and D with the line AD; then it is plain this line AD divides the quadrilateral, ACDB, into two triangles, *viz.* ABD, ACD, in which AB a leg of the one, is equal to DC a leg of the other, by supposition, and AD is common to both triangles; and since AB is parallel to CD, the angle BAD will be equal to the angle ADC, (by art. 36.) therefore in the two triangles BA and AD; and the angle BAD is equal to CD and DA; and the angle ADC, that is, two legs and the included angle in the one, is equal to two legs and the included angle in the other; therefore (by art. 61) BD is equal to AC, and since the angle DAC is equal to the angle ADB, therefore the lines BD AC are parallel (by *cor. art.* 59.)

Cor. 1. Hence it is plain, that the quadrilateral ABDC is a parallelogram, since the opposite sides are parallel.

Cor. 2. In any parallelogram the line joining the opposite angles (called the diagonal) as AD, divides the figure into two equal parts, since it has been proved that the triangles ABD ACD are equal to one another.

Cor. 3. It follows also, that a triangle ACD on the same base CD, and between the same parallels with a parallelogram ABDC, is the half of that parallelogram.

Cor. 4. Hence it is plain, that the opposite sides of a parallelogram are equal; for it has been proved, that ABDC being a parallelogram, AB will be equal to CD, and AC equal to BD.

68. All parallelograms on the same or equal bases, and between the same parallels, are equal to one another; that is, if BD and GH (fig. 51.) be equal, and the lines BH and AF be parallel, then the parallelograms ABDC, BDFE, and EFHG, are equal to one another. For AC is equal to EF, each being equal to BD, (by *cor.* 4. of 67.) To both add CE, then AE will be equal CF. So in the two triangles ABE CDF, AB a leg of the one, is equal to CD a leg in the other; and AE is equal to CF, and the angle BAE is equal to the angle DCF (by art. 36.); therefore the two triangles ABE CDF are equal (by art. 61.); and taking the triangle CKE from both, the figure ABKC will be equal to the figure KDFE; to both which add the little triangle KBD, then the parallelogram ABDC will be equal to the parallelogram BDFE. The same way it may be proved, that the parallelogram EFHG is equal to the parallelogram EFDB; so the three parallelograms ABDC, BDFE, and EFHG will be equal to one another.

Cor. Hence it is plain, that triangles on the same base, and between the same parallels, are equal; since they are the half of the parallelograms on the same base and between the same parallels. (by *cor.* 3. of last *art.*)

69. *In any right-angled triangle*, ABC, (fig. 52.) *the square of the hypothenuse* BC, *viz.* BCMH, *is equal to the sum of the squares made on the two sides* AB *and* AC, viz. *to* ABDE *and* ACGF. To demonstrate this, through the point A draw AKL perpendicular to the hypothenuse BC, join AH, AM, DC, and BG; then it is plain that DB is equal to BA (by art. 53.), also BH is equal to BC (by the same); so in the two triangles DBC ABH, the two legs DB and BC in the one are equal to the two legs AB and BH in the other; and the included angles DBC and ABH are also equal; (for DBA is equal to CBH, being both right; to each add ABC, then it is plain that DBC is equal to ABH) therefore the triangles DBC ABH are equal (by art. 61.) but the triangle DBC is half of the square ABDE (by *cor.* 3. of 67th) and the triangle ABH is half the parallelogram BKLH (by the same), therefore half the square ABDE is equal to half the parallelogram BKL. Consequently the square ABDE is equal to the parallelogram BKLH. The same way it may be proved, that the square ACGF is equal to the parallelogram KCML. So the sum of the squares ABDE and ACGF is equal the sum of the parallelograms BKLH and KCML, but the sum of these parallelograms is equal to the square BCMH, therefore the

 sum

fum of the fquares on AB and AC is equal to the fquare on BC.

Cor. 1. Hence in a right-angled triangle, the hypothenufe and one of the legs being given, we may eafily find the other, by taking the fquare of the given leg from the fquare of the hypothenufe, and the fquare root of the remainder will be the leg required.

Cor. 2. Hence, the legs in a right-angled triangle being given, we may find the hypothenufe, by taking the fum of the fquares of the given legs, and extracting the fquare root of that fum.

70. If upon the line AB (fig. 53.) there be drawn a femicircle ADB, whofe centre is C, and on the point C there be raifed a perpendicular to the line AB, *viz.* CD; then it is plain the arc DB is a quadrant, or contains 90 degrees; fuppofe the arc DB to be divided into 9 equal arcs, each of which will contain 10 degrees, then on the point B raifing BE perpendicular to the line AB, it will be a tangent to the circle in the point B, and if to every one of the divifions of the quadrant, *viz.* B 10, B 20, B 30, B 40, *&c.* you draw the fine, tangent, *&c.* (as in the fcheme) we fhall have the fine, tangent, *&c.* to every ten degrees in the quadrant: and the fame way we may have the fine, tangent, *&c.* to every fingle degree in the quadrant, by dividing it into 90 equal parts beginning from B, and drawing the fine, tangent, *&c.* to all the arcs beginning at the fame point B. By this method they draw the lines of fines, tangents, *&c.* of a certain circle on the fcale; for after drawing them on the circle, they take the length of them, and fet them off in the lines drawn for that purpofe. The fame way, by fuppofing the radius of any number of equal parts, (fuppofe 1000, or 10,000, *&c.*) it is plain the fine, tangent, *&c.* of every arc muft confift of fome number of thefe equal parts; and by computing them in parts of the radius, we have tables of fines, tangents, *&c.* to every arc in the quadrant, called natural fines, tangents, *&c.* and the logarithms of thefe give us tables of logarithmic fines, tangents, *&c.* See LOGARITHMS.

71. In any triangle, ABC, (Plate XCIV. fig. 1.) if one of its fides, as AC, be bifected in E, (and confequently AC double of AE) and thtough E be drawn ED, parallel to BC, and meeting AB in D, then BC will be double of ED, and AB double of AD, through D draw DF, parallel to AC, meeting BC in F: for fince, by conftruction, DF is parallel to AC, and DE parallel to BC; therefore, (by art. 36.) the angle BFD will be equal to the angle BCA, (and by the fame article) the angle BCA will be equal to the angle DEA, confequently the angle BFD will be equal to the angle DEA; alfo, (by art. 36.) the angle BDF will be equal to the angle DAE; and fince DF is parallel to EC, and DB parallel to FC, the quadrilateral DFCE will be a parallelogram; and therefore, (by art. 59. cor. 4.) DF will be equal to EC, which, by conftruction, is equal to AE; fo in the two triangles BDF DAE, the two angles BFD and BDF in the one, are equal to the two angles DBA and DAE in the other, each to each refpectively; and the included fide DF, is equal to the included fide AE; therefore, (by art. 61. cor. 1.) AD will be equal to DB, and confequently AB double of AD; alfo (by the fame) DE will be equal to BF; but DE is alfo (by art. 67. cor. 4.) equal to FC; therefore BF and EC together, or BC, will be double of DE.

After the fame manner it may be proved, that if in the triangle AKG, (fig. 2.) AE be taken equal to a third part of AK, and through E be drawn ED, parallel to KG, and meeting AG in D; then ED will be equal to a third part of GK, and AD equal to a third part of AG.

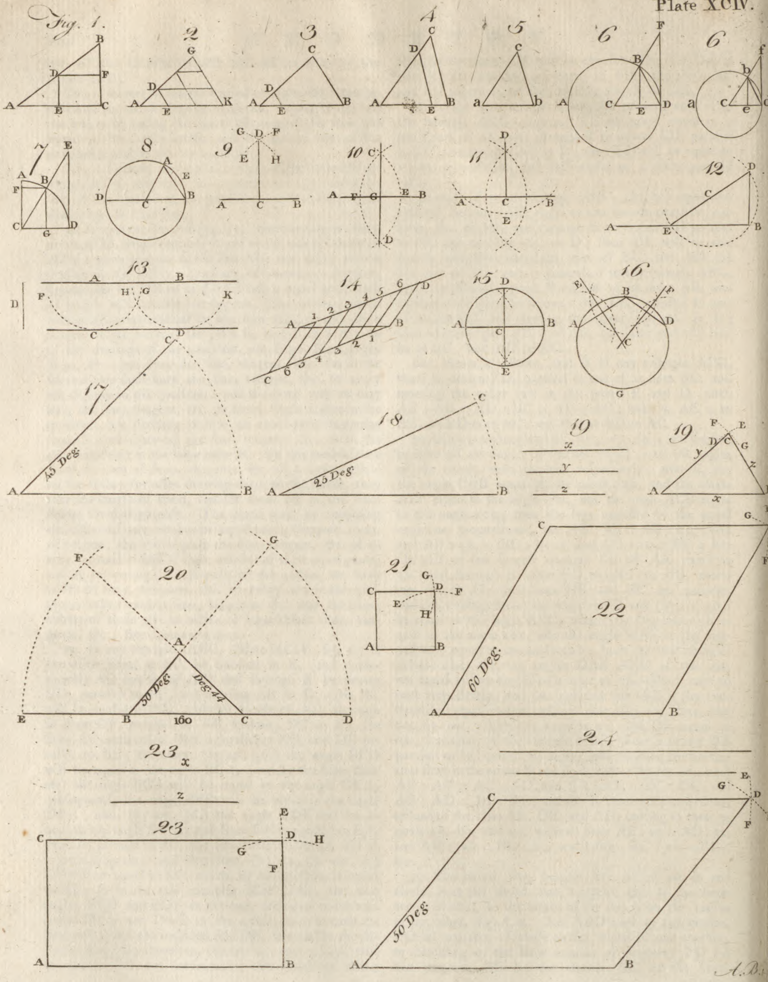
Likewife if in any triangle ABC, (fig. 3.) upon the fide AB, be taken AE, equal to one fourth, one fifth, one fixth, *&c.* of AB, and through E be drawn ED parallel to BC and meeting AC in D; then DE will be one fourth, one fifth, one fixth, *&c.* of BC, and AD the like part of AC; and, in general, if in any triangle ABC, there be affumed a point E on one of its fides AB, and through that point be drawn a line ED, parallel to one of it fides BC, and meeting the other fide AC in D; then whatever part AE is of AB, the fame part will ED be of BC, and AD of AC.

Cor. Hence it follows, that if in any triangle ABC, there be drawn ED, parallel to one of its fides BC, and meeting the other two in the points E and D, then AE : AB :: ED : BC :: AD : AC; that is, AE is to AB, as ED is to BC, and that as AD to AC.

72. If any two triangles ABC, fig 4. abc, fig. 5. are fimilar, or have all the angles of the one equal to all the angles of the other, each to each refpectively; that is, the the angle CAB equal to the angle cab, and the angle ABC equal to the angle abc, and the angle ACB equal to the angle acb; then the legs oppofite to the equal angles are proportioned, *viz.* AB : ab :: AC : ac :: and and AB : ab :: BC : bc :: and AC : ac :: BC : bc. On AB of the largeft triangle fet off AE equal to ab, and through E draw ED parallel to BC, meeting AC in D; then fince DE and BC are parallel, and AB croffing them, the angle AED will (by art. 36.) be equal to the angle ABC, which (by fuppofition) is equal to the angle abc, alfo the angle DAE is (by fuppofition) equal to the angle cab; fo in the two triangles AED, abc, the two angles DAE AED of the one, are equal to two angles cab abc of the other, each to each refpectively, and the included fide AE is (by conftruction) equal to the included fide ab; therefore, (by art. 61. cor. 1.) AD is equal to ac, and DE equal to cb; but fince, in the triangle ABC, there is drawn DE parallel to BC one of its fides, and meeting the two other fides in the points D and E, therefore (by cor. art. 71.) AB : AE :: AC : AD, and AB : AE :: BC : DE, and AC : AD :: BC : DE; and in the three laft proportions, inftead of the lines AE, DE, and AD, putting in their equals ab, bc, and ac, we fhall have AB : ab :: AC : ac, and AB : ab :: BC : bc, and laftly, AC : ac :: BC : bc.

73. The chord, fine, tangent, *&c.* of any arc in one circle, is to the chord, fine, tangent, *&c.* of the fame arc in another, as the radius of the one is to the radius of the other, fig. 6, 6. Let ABD abd be two circles, BD bd two arcs of thefe circles, equal to one another, or confifting of the fame number of degrees; FD fd the tangents, BD bd the chords, BE be the fines, *&c.*

Plate XCIV.



&c. of these two arcs BD bd, and CD cd the radii of the circles; then say, CD : cd :: FD : fd, and CD : cd :: BD : bd, and CD : cd :: BE : be, *&c.* For since the arcs BD bd are equal, the angles BCD bcd will be equal; and FD fd, being tangents to the points D and d, the angles CDF cdf will be equal, being each a right angle (art. 22.) so in the two triangles CDF cdf, the two angles FCD CDF of the one, being equal to the two angles fcd cdf of the other, each to each, the remaining angle CFD, will be equal to the remaining angle cfd, (by art. 60.); therefore the triangles CFD cfd are similar, and consequently (by art. 73) CD : cd :: FD : fd. In the same manner it may be demonstrated, that CD : cd :: BD : bd, and CD : cd :: BE : be, *&c.*

74. Let ABD (fig. 7) be a quadrant of a circle described by the radius CD BD any arc of it, and BA its complement, BG or CF the sine, CG or BF the cosine, DE the tangent, and CE the secant of that arc BD. Then since the triangles CDE CGB are similar or equiangular, it will be (by art. 72.) DE : EC :: GB : BC, *i. e.* the tangent of any arc, is to the secant of the same, as the sine of it is to the radius. Also since DE : EC :: GB : BC; therefore, by inverting that proportion, we have EC : DE :: BC : GB, *i e.* the secant is to the tangent, as the radius is to the sine of any arc.

Again, since the triangles CDE CGB are similar, therefore (by art. 72.) it will be CD : CE :: CG : CB, *i. e.* as the radius is to the secant of any arc, so is the cosine of that arc to the radius. And by inverting the proportion we have this, *viz.* As the secant of any arc is to the radius, so is the radius to the co-sine of that arc.

75. In all circles the chord of 60 is always equal in length to the radius. Thus in the circle AEBD, (fig. 8.) if the arc AEB be an arc of 60 degrees, then drawing the chord AB, I say AB shall be equal to the radius CB or AC; for in the triangle ACB, the angle ACB is 60 degrees, being measured by the arc AEB; therefore the sum of the other two angles is 120 degrees, (by *cor.* 1. of 60.); but since AC and CB are equal to the two angles CAB, CBA will also be equal; consequently each of them half their sum 120, *viz.* 60 degrees; therefore all the three angles are equal to one another, consequently all the legs, therefore AB is equal to CB.

Cor. Hence the radius from which the lines on any scale are formed, is the chord of 60 on the line of chords.

Geometrical Problems.

PROB. 1. From a point C (fig. 9.) in a given line AB to raise a perpendicular to that line.

Rule. From the point C take the equal distances CB, CA on each side of it. Then stretch the compasses to any distance greater than CB or CA, and with one foot of them in B, sweep the arc EF with the other; again, with the same opening, and one foot in A, sweep the arc GH with the other, and these two arcs will intersect one another in the point D; then join the given points C and D with the line CD, and that shall be the perpendicular required.

2. To divide a given right line AB (fig. 10.) into two equal parts; that is, to bisect it.

Rule. Take any distance with your compasses that you are sure is greater than half the given line; then setting one foot of them in B, with the other sweep the arc DFC; and with the same distance, and one foot in A, with the other sweep the arc CED; these two arcs will intersect one another in the points C D, which joined by the right line DC will bisect AB in G.

3. From a given point D, (fig. 11.) to let fall a perpendicular on a given line AB.

Rule. Set one foot of the compasses in the point D, and extend the other to any distance greater than the least distance between the given point and the line, and with that extent sweep the arc AEB, cutting the line in the two points A and B, then (by the last prob.) bisect the line AB in the point C, lastly join C and D, and that line CD is the perpendicular required.

4. (Fig. 12.) Upon the end B of a given right line BA, to raise a perpendicular.

Rule. Take any extent in your compasses, and with one foot in B fix the other in any point C without the given line; then with one point of the compasses in C, describe with the other the circle EBD, and thro' E and C draw the diameter ECD meeting the circle in D; join D and B, and the right line DB is that required; for EBD is a right angle (by *cor.* 4. of 63.).

5. (Fig. 13.) To draw one line parallel to another given line AB, that shall be distant from one another by any given distance D.

Rule. Extend your compasses to the given distance D; then setting one foot of them in any point of the given line (suppose A), with the other sweep the arc FCG; again, at the same extent, and one foot in any other point of the given line B, sweep the arc HDK, and draw the line CD touching them, and that will be parallel to the given line AB, and distant from it by the line D as was required.

6. (Fig. 14.) To divide a given line AB into any number of equal parts, suppose 7.

Rule. From the point A draw any line AD, making an angle with the line AB, then through the point B, draw a line BC parallel to AD; and from A, with any small opening of the compasses, set off a number of equal parts (on the line AD,) less by one than the proposed number (here 6); then from B set off the same number of the same parts (on the line BC); lastly, join 6 and 1, 2 and 5, 3 and 4, 4 and 3, 5 and 2, 6 and 1, and these lines will cut the given line as required.

7. (Fig. 15.) To quarter a given circle, or to divide it into four equal parts.

Rule. Thro' the centre C of the given circle, draw a diameter AB, then upon the point C raise a perpendicular DCE to the line AB; and these two diameters AB and DE shall quarter the circle.

8 (Fig. 16) Thro' three given points A, B, and D, to draw a circle. (*Note*, The three points must not lie in the same straight line.)

Rule. Join A and B, also B and D, with the streight lines AB BD; then (by prob. 2.) bisect AB with the line

line EC, also BD with the line FC, which two lines will cut one another in some point C; that is the centre of the circle required: then fixing one point of your compasses in D, and stretching the other to A, describe the circle ABDG, which will pass thro' the three points given. The reason of this is plain from cor. 1. of art. 64.

9. (Fig. 17.) From the point A of the given line AB, to draw another line (suppose AC) that shall make with AB an angle of any number of degrees, suppose 45.

Rule. Let the given line AB be produced, then take off your scale the length of the chord of 60 degrees, which is equal to the radius of the circle the scale was made for (by art. 75.); and setting one foot in A, with the other sweep of the arc BC; then with your compasses take from your scale the chord of 45 degrees, and set off that distance from B to C. Lastly, join A and C, and the line AC is that required. For the angle CAB, which is measured by the arc BC, is an angle of 45 degrees, as was required.

10. An angle BAC (fig. 18.) being given, to find how many degrees it contains.

Rule. With your compasses take the length of your chord of 60 from your scale. Then, setting one foot of them in A, with the other sweep the arc BC, which is the arc comprehended between the two legs AB, AC produced if needful. Lastly, take with your compasses the distance BC, and applying it to your line of chords on the scale, you will find how many degrees the arc BC contains, and consequently the degrees of the angle BAC which was required.

11. Three lines x, y, and z being given, (fig. 19. 19.) to form a triangle of them; but any two of these lines taken together must always be greater than the third.

Rule. Make any one of them, as x, the base; then with your compasses take another of them, as z, and setting one foot in one end of the line x, as B, with the other sweep the arc DE; and taking with your compasses the length of the other y, set one foot of them in A, the other end of the line x, and with the other sweep the arc FG, which will cut the other in C; lastly, join CA and CB, and the triangle CAB is that required.

12. To make a triangle, having one of its legs of any number of equal parts (suppose 160), and one of the angles at that leg 50 degrees, and the other 44 degrees.

Rule. Draw an indefinite line ED, (fig. 20.) then take off the line of equal parts with your compasses, 160 of them, and set them on the indefinite line, as BC; then (by prob. 9.) draw BA, making the angle ABC of 50 degrees, and (by the same) draw from C the line AC, making the angle ACB of 44 degrees; which two lines will meet one another in A, and the triangle ABC is that required. See TRIGONOMETRY.

13. Upon a given line AB (fig. 21.) to make a square.

Rule. Upon the extremity A of the given line AB, raise a perpendicular AC (by prob. 4.); then take AC equal to AB, and with that extent, setting one foot of the compasses in C, sweep with the other foot the arc GH; then with the same extent, and one foot in B, with the other sweep the arc EF, which will meet the former in some point D; lastly, join C and D, D and B, and the figure ABDC will be the square required.

14. On a given line AB (fig. 22.) to draw a rhomb that shall have one of its angles equal to any number of degrees, suppose 60 degrees.

Rule. From the point A of the given line AB, draw the line AC, making the angle CAB of 60 degrees, (by prob. 9.) then take AC equal to AB, and with that extent, fixing one foot of the compasses in B, with the other describe the arc GH; and at the same extent, fixing one foot of the compasses in C, with the other describe the arc EF cutting the former in D; lastly, join CD and DB, and the figure ACDB is that required.

15. Given two lines x and z, of these two to make a rectangle.

Rule Draw a line, as AB, (fig. 23. 23.) equal in length to one of the given lines x; and on the extremity A of that line, raise a perpendicular AC, on which take AC equal to the other line z; then take with your compasses the length of the line AB, and at that extent, fixing one foot of them in C, with the other sweep the arc EF; and also taking with your compasses the extent of the line AC, fix one foot of them in B, and with the other sweep the arc GH, which will meet the former in D; lastly, join CD and BD, and the figure ABDC will be that required.

16. Two lines x and z being given, of these to form a rhomboides that shall have one of its angles any number of degrees, suppose 50.

Rule. Draw a line AB (fig. 24. 24.) equal in length to one of the lines, as x; then draw the line AC, making with the former the angle BAC equal to the proposed, suppose 50 degrees, and on that line take AC equal to the given line z, then with your compasses take the length of AB, and fixing one foot in C, sweep the arc EF; also, taking the length of AC, and setting one foot in B, with the other sweep the arc GH, which will cut the former in D; then join CD and DB, so the figure ACDB will be that required.

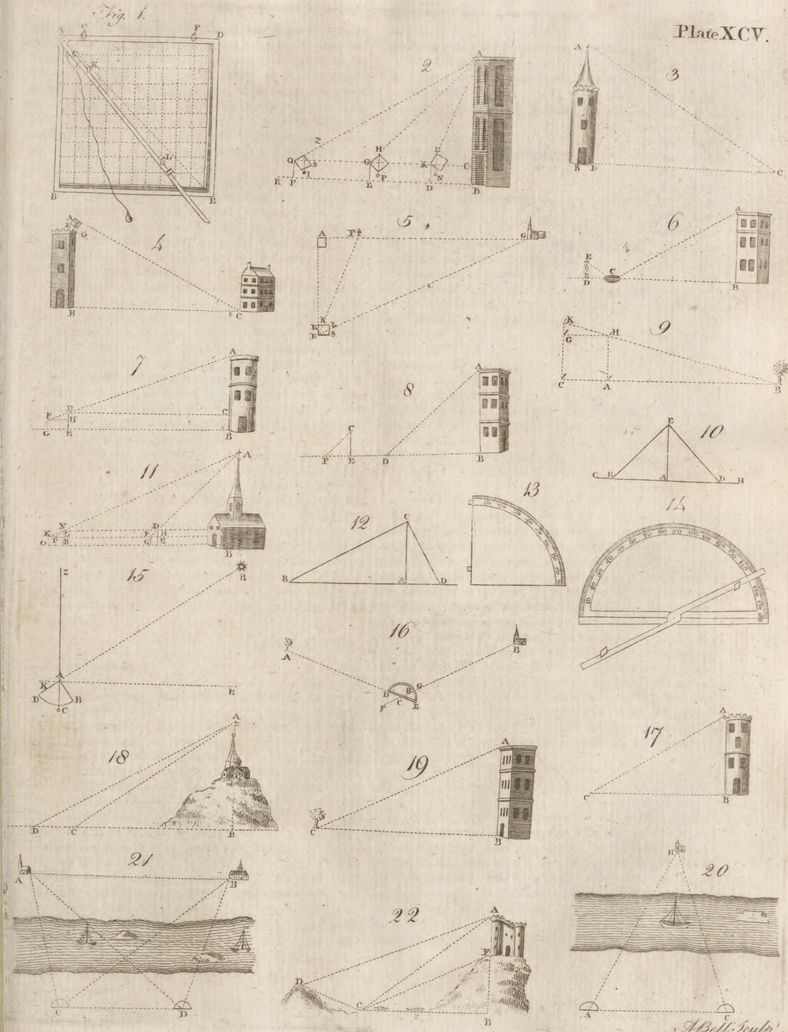
PART II.

THE APPLICATION OF THE FOREGOING PRINCIPLES TO THE MENSURATION OF SURFACES, SOLIDS, &c.

Of the Mensuration of Lines and Angles.

A Line, or length, to be measured, whether it be distance, height, or depth, is measured by a line less than it. With us the least measure of length is an inch: not that we measure no line less than it, but because we do not use the name of any measure below that of an inch; expressing lesser measures by the fractions of an inch: and in this treatise we use decimal fractions as the easiest. Twelve inches make a foot; three feet and an

Plate XCV.



A Bell Sculp.

inch make the Scots ell; six ells make a fall; forty falls make a furlong; eight furlongs make a mile: so that the Scots miles is 1184 paces, accounting every pace to be five feet. These things are according to the statutes of Scotland; notwithstanding which, the glaziers use a foot of only eight inches; and other artists for the most part use an English foot, on account of the several scales marked on the English foot-measure for their use. But the English foot is somewhat less than the Scots; so that 185 of these make 186 of those.

Lines, to the extremities and any intermediate point of which you have easy access are measured by applying to them the common measure a number of times. But lines, to which you cannot have such access, are measured by methods taken from geometry; the chief whereof we shall here endeavour to explain. The first is by the help of the geometrical square.

" As for the English measures, the yard is three feet, " or thirty-six inches. A pole is sixteen feet and a half, " or five yards and a half. The chain, commonly called " *Gunter's chain*, is four poles, or twenty-two yards, " that is, sixty six feet. An English statute-mile is four- " score chains, or 1760 yards, that is, 5280 feet.

" The chain (which is now much in use, because it is " very convenient for surveying) is divided into a hun- " dred links, each of which is $7\frac{92}{100}$ of an inch: whence " it is easy to reduce any number of those links to feet, " or any number of feet to links.

" A chain that may have the same advantages in sur- " veying in Scotland, as Gunter's chain has in England, " ought to be in length seventy-four feet, or twenty-four " Scots ells, if no regard is had to the difference of the " Scots and English foot above mentioned. But, if re- " gard is had to that difference, the Scots chain ought " to consist of $74\frac{2}{5}$ English feet, or 74 feet 4 inches and " $\frac{4}{5}$ of an inch. This chain being divided into an hun- " dred links, each of those links is 8 inches and $\frac{928}{1000}$ of " an inch. In the following table, the most noted mea- " sures are expressed in English inches and decimals of " an inch."

	English inch.	*Dec.*
The English foot, is	12	000
The Paris foot,	12	788
The Rhindland foot, measured by Mr Picart,	12	362
The Scots foot,	12	065
The Amsterdam foot, by Snellius and Picart,	11	172
The Dantzick foot, by Hevelius,	11	297
The Danish foot, by Mr Picart,	12	465
The Swedish foot, by the same,	11	692
The Brussels foot, by the same,	10	828
The Lyons foot, by Mr Auzout,	13	458
The Bononian foot, by Mr Cassini,	14	938
The Milan foot, by Mr Auzout,	15	631
The Roman palm used by merchants, according to the same,	9	791
The Roman palm used by architects,	8	779
The palm of Naples, according to Mr Auzout,	10	314
The English yard,	36	000
The English ell,	45	000
The Scots ell,	37	200
The Paris aune used by mercers, according to Mr Picart,	46	786
The Paris aune used by drapers, according to the same,	46	680
The Lyons aune, by Mr Auzout,	46	570
The Geneva aune,	44	760
The Amsterdam ell,	26	800
The Danish ell, by Mr Picart,	24	930
The Swedish ell,	23	380
The Norway ell,	24	510
The Brabant or Antwerp ell,	27	170
The Brussels ell,	27	260
The Bruges ell,	27	550
The brace of Bononia, according to Auzout,	25	200
The brace used by architects in Rome,	30	730
The brace used in Rome by merchants,	34	270
The Florence brace used by merchants, according to Picart,	22	910
The Florence geographical brace,	21	570
The vara of Seville,	33	127
The vara of Madrid,	39	166
The vara of Portugal,	44	031
The cavedo of Portugal,	27	354
The ancient Roman foot,	11	632
The Persian arish, according to Mr Græves,	38	364
The shorter pike of Constantinople, according to the same,	25	576
Another pike of Constantinople, according to Mess. Mallet and De la Porte,	27	920

PROPOSITION I.

PROB. *To describe the structure of the geometrical square.*—The geometrical square is made of any solid matter, as brass or wood, or of any four plain rulers joined together at right angles, (as in Plate XCV. fig. 1.) where A is the centre, from which hangs a thread with a small weight at the end, so as to be directed always to the centre. Each of the sides BE and DE is divided into an hundred equal parts, or (if the sides be long enough to admit of it) into a thousand parts; C and F are two sights, fixed on the side AD. There is moreover an index GH, which, when there is occasion, is joined to the centre A, in such manner as that it can move round, and remain in any given situation. On this index are two sights perpendicular to the right line going from the centre of the instrument: these are K and L. The side DE of the instrument is called the upright side; E the reclining side.

PROPOSITION II.

FIG. 2. *To measure an accessible height*, AB, *by the help of a geometrical square, its distance being known.*—Let BR be an horizontal plane, on which there stands perpendicularly any line AB: let BD, the given distance of the observator from the height, be 96 feet; let the height of the observator's eye be supposed 6 feet; and let the instrument, held by a steady hand, or rather leaning on a support, be directed towards the summit A, so that one eye (the other being shut) may see it clearly through the sights; the perpendicular or plumb-line meanwhile hanging free, and touching the surface of the in-

ſtrument: let now the perpendicular be ſuppoſed to cut off on the right ſide KN 80 equal parts. It is clear that LKN, ACK, are ſimilar triangles; for the angles LKN, ACK are right angles, and therefore equal; moreover LN and AC are parallel, as being both perpendicular to the horizon; conſequently, (by art. 60. cor. 1. part 1.) the angles KLN, KAC, are equal; wherefore, (by art. 60. cor. 2. of part 1.) the angles LNK, and AKC, are likewiſe equal: ſo that in the triangles NKL, KAC, (by art. 72. of part 1.) as NK : KL :: KC (*i. e.* BD) : CA; that is, as 80 to 100, ſo is 96 feet to CA. Therefore, by the rule of three, CA will be found to be 120 feet; and CB, which is 6 feet, being added, the whole height is 126 feet.

But if the diſtance of the obſervator from the height, as BE, be ſuch, that, when the inſtrument is directed as formerly toward the ſummit A, the perpendicular falls on the angle P, oppoſite to H, the centre of the inſtrument, and BE or CG be given of 120 feet; CA will alſo be 120 feet. For in the triangles HGP, ACG, equiangular, as in the preceding caſe, as PG : GH : : GC : CA. But PG is equal to GH; therefore GC is likewiſe equal to CA: that is, CA will be 120 feet, and the whole height 126 feet as before.

Let the diſtance BF be 300 feet, and the perpendicular or plumb-line cut off 40 equal parts from the reclining ſide: Now, in this caſe, the angles QAC, QZI, are equal, and the angles QZI, ZIS, are equal; therefore the angle ZIS is equal to the angle QAC. But the angles ZSI QCA are equal, being right angles; therefore, in the equiangular triangles ACQ, SZI, it will be, as ZS : SI : : CQ : CA; that is, as 100 to 40, ſo is 300 to CA. Wherefore, by the rule of three, CA will be found to be of 102 feet. And, by adding the height of the obſervator, the whole BA will be 126 feet. Note, that the height is greater than the diſtance, when the perpendicular cuts the right ſide, and leſs if it cut the reclined ſide; and that the height and diſtance are equal, if the perpendicular fall on the oppoſite angle.

SCHOLIUM.

If the height of a tower, to be meaſured as above, end in a point, (as in fig. 3.) the diſtance of the obſervator oppoſite to it, is not CD, but is to be accounted from the perpendicular to the point A; that is, to CD muſt be added the half of the thickneſs of the tower, *viz.* BD: which muſt likewiſe be underſtood in the following propoſitions, when the caſe is ſimilar.

PROPOSITION III.

Fig. 4. *From the height of a tower* AB *given, to find a diſtance on the horizontal plane* BC, *by the geometrical ſquare*.—Let the inſtrument be ſo placed, as that the mark C in the oppoſite plane may be ſeen through the ſights; and let it be obſerved how many parts are cut off by the perpendicular. Now, by what hath been already demonſtrated, the triangles AEF, ABC, are ſimilar; therefore, it will be as EF to AE, ſo AB (compoſed of the height of the tower BG, and of the height of the centre of the inſtrument A, above the tower BG) to the diſtance BC. Wherefore, if, by the rule of three, you ſay, as EF to AE, ſo is AB to BC, it will be the diſtance ſought.

PROPOSITION IV.

Fig. 5. *To meaſure any diſtance at land or ſea, by the geometrical ſquare.*—In this operation, the index is to be applied to the inſtrument, as was ſhown in the deſcription; and, by the help of a ſupport, the inſtrument is to be placed horizontally at the point A; then let it be turned till the remote point F, whoſe diſtance is to be meaſured, be ſeen through the fixed ſights; and bringing the index to be parallel with the other ſide of the inſtrument, obſerve by the ſights upon it any acceſſible mark B, at a ſenſible diſtance: then carrying the inſtrument to the point B, let the immoveable ſights be directed to the firſt ſtation A, and the ſights of the index to the point F. If the index cut the right ſide of the ſquare, as in K, in the two triangles BRK, and BAF, which are æquiangular, it will be as BR to RK, ſo BA (the diſtance of the ſtations to be meaſured with a chain) to AF; and the diſtance AF ſought will be found by the rule of three. But if the index cut the reclined ſide of the ſquare in any point L, where the diſtance of a more remote point is ſought; in the triangles BLS, BAG, the ſide LS ſhall be to SB, as BA to AG, the diſtance ſought; which accordingly will be found by the rule of three.

PROPOSITION V.

Fig. 6. *To meaſure an acceſſible height by means of a plain mirror.*—Let AB be the height to be meaſured; let the mirror be placed at C, in the horizontal plane BD, at a known diſtance BC; let the obſerver go back to D, till he ſee the image of the ſummit in the mirror, at a certain point of it, which he muſt diligently mark; and let DE be the height of the obſervator's eye. The triangles ABC and EDC are equiangular; for the angles at D and B are right angles; and ACB, ECD, are equal, being the angles of incidence and reflexion of the ray AC, as is demonſtrated in optics; wherefore the remaining angles at A and E are alſo equal: therefore it will be, as CD to DE, ſo CB to BA; that is, as the diſtance of the obſervator from the point of the mirror in the right line betwixt the obſervator and the height, is to the height of the obſervator's eye, ſo is the diſtance of the tower from that point of the mirror, to the height of the tower ſought; which therefore will be found by the rule of three.

Note 1. The obſervation will be more exact, if, at the point D, a ſtaff be placed in the ground perpendicularly, over the top of which the obſervator may ſee a point of the glaſs exactly in a line betwixt him and the tower.

Note 2. In place of a mirror may be uſed the ſurface of water contained in a veſſel, which naturally becomes parallel to the horizon.

PROPOSITION VI.

Fig. 7. *To meaſure an acceſſible height* AB *by means of two ſtaffs.*—Let there be placed perpendicularly in the ground a longer ſtaff DE, likewiſe a ſhorter one FG, ſo as the obſervator may ſee A, the top of the height to be meaſured, over the ends D F of the two ſtaffs; let FH and DC, parallel to the horizon, meet DE and AB in H and C; then the triangles FHD, DCA, ſhall be equiangular;

equiangular; for the angles at C and H are right ones; likewise the angle A is equal to the angle FDH; wherefore the remaining angles DFH, and ADC, are also equal: Wherefore, as FH, the distance of the staffs, to HD, the excess of the longer staff above the shorter; so is DC, the distance of the longer staff from the tower, to CA, the excess of the height of the tower above the longer staff. And thence CA will be found by the rule of three.

To which if the length DE be added, you will have the whole height of the tower BA.

SCHOLIUM.

FIG. 8. Many other methods may be occasionally contrived for measuring an accessible height. For example, from the given length of the shadow BD, to find out the height AB, thus: Let there be erected a staff CE perpendicularly, producing the shadow EF: The triangles ABD, CEF, are equiangular; for the angles at B and E are right; and the angles ADB and CFE are equal, each being equal to the angle of the sun's elevation above the horizon: Therefore, as EF, the shadow of the staff, to EC, the staff itself; so BD, the shadow of the tower, to BA, the height of the tower. Though the plane on which the shadow of the tower falls be not parallel to the horizon, if the staff be erected in the same plane, the rule will be the same.

PROPOSITION VII.

To measure an inaccessible height by means of two staffs.—Hitherto we have supposed the height to be accessible, or that we can come at the lower end of it; now if, because of some impediment, we cannot get to a tower, or if the point whose height is to be found out be the summit of a hill, so that the perpendicular be hid within the hill; if, for want of better instruments, such an inaccessible height is to be measured by means of two staffs, let the first observation be made with the staffs DE and FG, (as in prop. 6.); then the observator is to go off in a direct line from the height and first station, till he come to the second station; where (fig. 11.) he is to place the longer staff perpendicularly at RN, and the shorter staff at KO, so that the summit A may be seen along their tops; that is, so that the points KNA may be in the same right line. Through the point N, let there be drawn the right line NP parallel to FA: Wherefore in the triangles KNP, KAF, the angles KNP KAF are equal, also the angle AKF is common to both; consequently the remaining angle KPN is equal to the remaining angle KFA. And therefore, PN : FA :: KP : KF. But the triangles PNL, FAS are similar; therefore, PN : FA :: NL : SA. Therefore, (by the 11. 5. Eucl.) KP : KF :: N L : SA. Thence, alternately, it will be, as KP (the excess of the greater distance of the short staff from the long one above its lesser distance from it) to NL, the excess of the longer staff above the shorter; so KF, the distance of the two stations of the shorter staff to SA the excess of the height sought above the height of the shorter staff. Wherefore SA will be found by the rule of three. To which let the height of the shorter staff be added, and the sum will give the whole inaccessible height BA.

Note 1. In the same manner may an inaccessible height be found by a geometrical square, or by a plain speculum. But we shall leave the rules to be found out by the student, for his own exercise.

Note 2. That by the height of the staff we understand its height above the ground in which it is fixed.

Note 3. Hence depends the method of using other instruments invented by geometricians; for example, of the geometrical cross: And if all things be justly weighed, a like rule will serve for it as here. But we incline to touch only upon what is most material.

PROPOSITION VIII.

FIG. 9. *To measure the distance* AB, *to one of whose extremities we have access, by the help of four staffs.*—Let there be a staff fixed at the point A; then going back at some sensible distance in the same right line, let another be fixed in C, so as that both the points A and B be covered and hid by the staff C: likewise going off in a perpendicular from the right line CB, at the point A, (the method of doing which shall be shown in the following *scholium*), let there be placed another staff at H; and in the right line CKG (perpendicular to the same CB, at the point B), and at the point of it K, such that the points K, H, and B may be in the same right line, let there be fixed a fourth staff. Let there be drawn, or let there be supposed to be drawn, a right line GH parallel to CA. The triangles KGH, HAB, will be equiangular; for the angles HAB KGH are right angles. Also the angles ABH, KHG are equal; wherefore, as KG (the excess of CK above AH) to GH, or to CA, the distance betwixt the first and second staff; so is AH, the distance betwixt the first and third staff, to AB the the distance sought.

SCHOLIUM.

FIG. 10. To draw on a plane a right line AE perpendicular to CH, from a given point A; take the right lines AB, AD, on each side equal; and in the points B and D, let there be fixed stakes, to which let there be tied two equal ropes BE, DE, or one having a mark in the middle, and holding in your hand their extremities joined, (or the mark in the middle, if it be but one), draw out the ropes one the ground; and then, where the two ropes meet, or at the mark, when by it the rope is fully stretched, let there be placed a third stake at E; the right line AE will be perpendicular to CH in the point A (prob. 1. of part. i.). In a manner not unlike to this, may any problems that are resolved by the square and compasses, be done by ropes and a cord turned round as a radius.

PROPOSITION IX.

FIG. 12. *To measure the distance* AB, *one of whose extremities is accessible.*—From the point A, let the right line AC of a known length be made perpendicular to AB, (by the preceding *scholium*): likewise draw the right line CD perpendicular to CB, meeting the right line AB in D: then as DA : AC :: AC : AB. Wherefore, when DA and AC are given, AB will be found by the rule of three.

SCHOLIUM.

All the preceding operations depend on the equality of some angles of triangles, and on the similarity of the triangles arising from that equality. And on the same principles

ciples depend innumerable other operations which a geometrician will find out of himſelf, as is very obvious. However, ſome of theſe operations require ſuch exactneſs in the work, and without it are ſo liable to errors, that, *cæteris paribus*, the following operations, which are performed by a trigonometrical calculation, are to be preferred; yet could we not omit thoſe above, being moſt eaſy in practice, and moſt clear and evident to thoſe who have only the firſt elements of geometry. But if you are provided with inſtruments, the following operations are more to be relied upon. We do not inſiſt on the eaſieſt caſes to thoſe who are ſkilled in plain trigonometry, which is indeed neceſſary to any one who would apply himſelf to practice. See TRIGONOMETRY.

PROPOSITION X.

FIG. 13. *To deſcribe the conſtruction and uſe of the geometrical quadrant.*—The geometrical quadrant is the fourth part of a circle divided into ninety degrees, to which two ſights are adapted, with a perpendicular or plumb line hanging from the centre. The general uſe of it is for inveſtigating angles in a vertical plane, comprehended under right lines going from the centre of the inſtrument, one of which is horizontal, and the other is directed to ſome viſible point. This inſtrument is made of any ſolid matter as wood, copper, &c.

PROPOSITION XI.

FIG. 14. *To deſcribe and make uſe of the graphometer.*—The graphometer is a ſemicircle made of any hard matter, of wood, for example, or braſs, divided into 180 degrees; ſo fixed on a *fulcrum*, by means of a braſs ball and ſocket, that it eaſily turns about, and retains any ſituation; two ſights are fixed on its diameter. At the centre there is commonly a magnetical needle in a box. There is likewiſe a moveable ruler, which turns round the centre, and retains any ſituation given it. The uſe of it is to obſerve any angle, whoſe vertex is at the centre of the inſtrument in any plane, (though it is moſt commonly horizontal, or nearly ſo), and to find how many degrees it contains.

PROPOSITION XII.

FIG. 15. and 16. *To deſcribe the manner in which angles are meaſured by a quadrant or graphometer.*—Let there be an angle in a vertical plane, comprehended between a line parallel to the horizon HK, and the right line RA, coming from any remarkable point of a tower or hill, or from the ſun, moon, or a ſtar. Suppoſe that this angle RAH is to be meaſured by the quadrant: let the inſtrument be placed in the vertical plane, ſo as that the centre A may be in the angular point: and let the ſights be directed towards the object at R, (by the help of the ray coming from it, if it be the ſun or moon, or by the help of the viſual ray, if it is any thing elſe), the degrees and minutes in the arc BC cut off by the perpendicular, will meaſure the angle RAH required. For, from the make of the quadrant, BAD is a right angle; therefore BAR is likewiſe right, being equal to it. But, becauſe HK is horizontal, and AC perpendicular, HAC will be a right angle; and therefore equal alſo to BAR. From thoſe angles ſubtract the part HAB that is common to both; and there will remain the angle BAC equal to the angle RAH. But the arc BC is the meaſure of the angle BAC; conſequently, it is likewiſe the meaſure of the angle RAH.

Note, That the remaining arc on the quadrant DC is the meaſure of the angle RAZ, comprehended between the foreſaid right line RA and AZ which points to the zenith.

Let it now be required to meaſure the angle ACB (fig. 16) in any plane, comprehended between the right-lines AC and BC, drawn from two points A and B, to the place of ſtation C. Let the graphometer be placed at C, ſupported by its *fulcrum* (as was ſhown above); and let the immoveable ſights on the ſide of the inſtrument DE be directed towards the point A; and likewiſe (while the inſtrument remains immoveabe) let the ſights of the ruler FG (which is moveable about the centre C) be directed to the point B. It is evident, that the moveable ruler cuts off an arc DH, which is the meaſure of the angle ACB ſought. Moreover, by the ſame method, the inclination of CE, or of FG, may be obſerved with the meridian line, which is pointed out by the magnetic needle incloſed in the box, and is moveable about the centre of the inſtrument, and the meaſure of this inclination or angle found in degrees.

PROPOSITION XIII.

FIG. 17. *To meaſure an acceſſible height by the geometrical quadrant.*—By the 12th prop. of this part, let the angle C be found by means of the quadrant. Then in the triangle ABC, right-angled at B, (BC being ſuppoſed the horizontal diſtance of the obſervator from the tower), having the angle at C, and the ſide BC, the required height BA will be found by the 3d caſe of plain trigonometry. See TRIGONOMETRY.

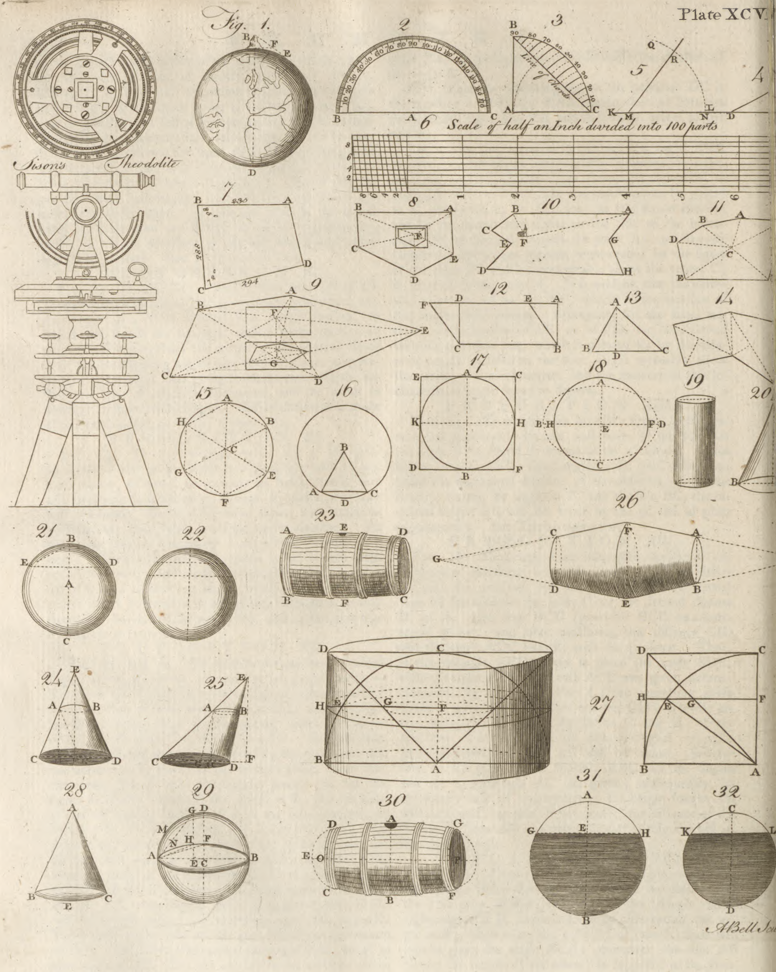
PROPOSITION XIV.

FIG. 18. *To meaſure an inacceſſible height by the geometrical quadrant.*—Let the angle ACB be obſerved with the quadrant (by the 12th prop. of this part;) then let the obſerver go from C to the ſecond ſtation D, in the right line BCD (provided BCD be a horizontal plane); and after meaſuring this diſtance CD, take the angle ADC likewiſe with the quadrant. Then, in the triangle ACD, there is given the angle ADC, with the angle ACD; becauſe ACB was given before: therefore (by art. 59. of Part I.) the remaining angle CAD is given likewiſe. But the ſide CD is likewiſe given, being the diſtance of the ſtation C and D; therefore (by the firſt caſe of oblique-angled triangles in trigonometry) the ſide AC will be found. Wherefore, in the right-angled triangle ABC, all the angles and the hypothenuſe AC are given; conſequently, by the fourth caſe of trigonometry, the height ſought AB will be found; as alſo (if you pleaſe) the diſtance of the ſtation C, from AB the perpendicular within the hill or inacceſſible height.

PROPOSITION XV.

FIG. 19. *From the top of a given height, to meaſure the diſtance* BC.—Let the angle BAC be obſerved by the 12th prop. of this; wherefore in the triangle ABC, right-angled at B, there is given by obſervation the angle at A; whence (by the 59th art. of Part I.) there will alſo be given the angle BCA: moreover the ſide AB (being the height of the tower) is ſuppoſed to be given. Wherefore,

Plate XCV.



A.Bell Sculp

Wherefore, by the 3d caſe of trigonometry, BC, the diſtance ſought, will be found.

PROPOSITION XVI.

FIG. 20. *To meaſure the diſtance of two places* A *and* B, *of which one is acceſſible, by the graphometer.*—Let there be erected at two points A and C, ſufficiently diſtant, two viſible ſigns; then (by the 12th prop. of this part) let the two angles BAC, BCA be taken by the graphometer. Let the diſtance of the ſtations A and C be meaſured with a chain. Then the third angle B being known, and the ſide AC being likewiſe known; therefore, by the firſt caſe of trigonometry, the diſtance required, AB, will be found.

PROPOSITION XVII.

FIG. 21. *To meaſure by the graphometer, the diſtance of two places, neither of which is acceſſible.*—Let two ſtations C and D be choſen, from each of which the places may be ſeen whoſe diſtance is ſought: let the angles ACD, ACB, BCD, and likewiſe the angles BDC, BDA, CDA, be meaſured by the graphometer; let the diſtance of the ſtations C and D be meaſured by a chain, or (if it be neceſſary) by the preceding practice. Now, in the triangle ACD, there are given two angles ACD and ADC; therefore, the third CAD is likewiſe given; moreover the ſide CD is given; therefore, by the firſt caſe of trigonometry, the ſide AD will be found. After the ſame manner, in the triangle BCD, from all the angles and one ſide CD given, the ſide BD is found. Wherefore, in the triangle ADB, from the given ſides DA and DB, and the angle ADB contained by them, the ſide AB (the diſtance ſought) is found by the 4th caſe of trigonometry of oblique-angled triangles.

PROPOSITION XVIII.

FIG. 22. *It is required by the graphometer and quadrant, to meaſure an acceſſible height* AB, *placed ſo on a ſteep, that one can neither go near it in an horizontal plane, nor recede from it, as we ſuppoſed in the ſolution of the* 14*th Prop.*—Let there be choſen any ſituation as C, and another D; where let ſome mark be erected: let the angles ACD and ADC be found by the graphometer; then the third angle DAC will be known. Let the ſide CD, the diſtance of the ſtations, be meaſured with a chain, and thence (by trigon.) the ſide AC will be found. Again, in the triangle ACB, right angled at B, having found by the quadrant the angle ACB, the other angle CAB is known likewiſe: but the ſide AC in the triangle ADC is already known; therefore the height required AB will be found by the 4th caſe of right-angled triangles. If the height of the tower is wanted, the angle BCF will be found by the quadrant; which being taken from the angle ACB already known, the angle ACF will remain: but the angle FAC was known before; therefore the remaining angle AFC will be known. But the ſide AC was alſo known before; therefore, in the triangle AFC, all the angles and one of the ſides AC being known, AF, the height of the tower above the hill, will be found by trigonometry.

SCHOLIUM.

It were eaſy to add many other methods of meaſuring heights and diſtances; but, if what is above be underſtood, it will be eaſy (eſpecially for one that is verſed in the elements) to contrive methods for this purpoſe, according to the occaſion: ſo that there is no need of adding any more of this ſort. We ſhall ſubjoin here a method by which the diameter of the earth may be found out.

PROPOSITION XIX.

PLATE CXVI. FIG. 1. *To find the diameter of the earth from one obſervation.*—Let there be choſen a high hill AB, near the ſea-ſhore, and let the obſervator on the top of it, with an exact quadrant divided into minutes and ſeconds by tranſverſe diviſions, and fitted with a teleſcope in place of the common ſights, meaſure the the angle ABE contained under the right line AB, which goes to the centre, and the right line BE drawn to the ſea, a tangent to the globe at E; let there be drawn from A perpendicular to BD, the line AF meeting BE in F. Now in the right-angled triangle BAF all the angles are given, alſo the ſide AB, the height of the hill; which is to be found by ſome of the foregoing methods, as exactly as poſſible; and (by trigonometry) the ſides BF and AF are found. But, by cor. 36th 3. Eucl. AF is equal to FE; therefore BE will be known. Moreover, by 36th 3. Eucl. the rectangle under BA and BD is equal to the ſquare of BE. And thence, by 17th 6. Eucl. as AB : BE :: BE : BD. Therefore, ſince AB and BE are already given, BD will be found by 11th, 6. Eucl. or by the rule of three; and ſubtracting BA, there will remain AD the diameter of the earth ſought.

SCHOLIUM.

Many other methods might be propoſed for meaſuring the diameter of the earth. The moſt exact is that propoſed by Mr Picart of the academy of ſciences at Paris.

"According to Mr Picart, a degree of the meridian "at the latitude of 49° 21′, was 57,060 French toiſes, "each of which contains ſix feet of the ſame meaſure; "from which it follows, that, if the earth be an exact "ſphere, the circumference of a great circle of it will "be 123,249,600 Paris feet, and the ſemidiameter of "the earth 19.615,800 feet: but the French mathematicians, who of late have examined Mr Picart's operations, aſſure us, That the degree in that latitude "is 57,183 toiſes. They meaſured a degree in Lapland, in the latitude of 66° 20′, and found it of "57,438 toiſes. By comparing theſe degrees, as well "as by the obſervations on pendulums, and the theory "of gravity, it appears that the earth is an oblate ſpheroid; and (ſuppoſing thoſe degrees to be accurately "meaſured) the axis or diameter that paſſes through the "poles will be to the diameter of the equator, as 177 to "178, or the earth will be 22 miles higher at the equator "than at the poles. A degree has likewiſe been meaſured at the equator, and found to be conſiderably leſs "than at the latitude of Paris; which confirms the oblate figure of the earth. But an account of this laſt "menſuration has not been publiſhed as yet. If the "earth was of an uniform denſity from the ſurface to "the centre, then, according to the theory of gravity, "the meridian would be an exact ellipſis, and the axis "would be to the diameter of the equator as 230 to "231; and the difference of the ſemidiameter of the "equator and ſemiaxis about 17 miles."

In what follows, a figure is often to be laid down on paper, like to another figure given; and becaufe this likenefs confifts in the equality of their angles, and in the fides having the fame proportion to each other (by the definitions of the 6th of Eucl.) we are now to fhew what methods practical geometricians ufe for making on paper an angle equal to a given angle, and how they conftitute the fides in the fame proportion. For this purpofe they make ufe of a protractor, (or, when it is wanting, a line of chords), and of a line of equal parts.

PROPOSITION XX.

FIG. 2. 3. 4. 5. and 6. *To defcribe the conftruction and ufe of the protractor, of the line of chords, and of the line of equal parts.*--The protractor is a fmall femicircle of brafs, or fuch folid matter. The femicircumference is divided into 180 degrees. The ufe of it is, to draw angles on any plane, as on paper, or to examine the extent of angles already laid down. For this laft purpofe, let the fmall point in the centre of the protractor be placed above the angular point, and let the fide AB coincide with one of the fides that contain the angle propofed; the number of degrees cut off by the other fide, computing on the protractor from B, will fhow the quantity of the angle that is to be meafured.

But if an angle is to be made of a given quantity on a given line, and at a given point of that line, let AB coincide with the given line, and let the centre A of the inftrument be applied to that point. Then let there be a mark made at the given number of degrees; and a right line drawn from that mark to the given point, will conftitute an angle with the given right line of the quantity required; as is manifeft.

This is the moft natural and eafy method, either for the extent of an angle on paper, or for defcribing on paper an angle of a given quantity.

But when there is fcarcity of inftruments, or becaufe a line of chords is more eafily carried about, (being defcribed on a ruler on which there are many other lines befides), practical geometricians frequently make ufe of it. It is made thus: let the quadrant of a circle be divided into 90 degrees; (as in fig. 4.) The line AB is the chord of 90 degrees; the chord of every arc of the quadrant is transferred to this line AB, which is always marked with the number of degrees in the correfponding arc.

Note, that the chord of 60 degrees is equal to the radius, by corol. 15. 4th Eucl. If now a given angle EDF is to be meafured by the line of chords from the centre D, with the diftance DG, (the chord of 60 degrees,) defcribe the arch GF; and let the points G and F be marked where this arch interfects the fides of the angle. Then if the diftance GF, applied on the line of chords from A to B, gives (for example) 25 degrees, this fhall be the meafure of the angle propofed.

When an obtufe angle is to be meafured with this line, let its complement to a femicircle be meafured, and thence it will be known. It were eafy to transfer to the diameter of a circle the chords of all arches to the extent of a femicircle; but fuch are rarely found marked upon rules.

But now, if an angle of a given quantity, fuppofe of 50 degrees, is to be made at a given point M of the right line KL (fig. 6.) From the centre M, and the diftance MN, equal to the chord of 60 degrees, defcribe the arc QN. Take off an arc NR, whofe chord is equal to that of 50 degrees on the line of chords; join the points M and R; and it is plain that MR fhall contain an angle of 50 degrees with the line KL propofed.

But fometimes we cannot produce the fides, till they be of the length of a chord of 60 degrees on our fcale; in which cafe it is fit to work by a circle of proportions (that is a fector), by which an arc may be made of a given number of degrees to any radius.

The quantities of angles are likewife determined by other lines ufually marked upon rules, as the lines of fines, tangents, and fecants; but, as thefe methods are not fo eafy or fo proper in this place, we omit them.

To delineate figures fimilar or like to others given, befides the equality of the angles, the fame proportion is to be preferved among the fides of the figure that is to be delineated, as is among the fides of the figures given. For which purpofe, on the rules ufed by artifts, there is a line divided into equal parts, more or lefs in number, and greater or leffer in quantity, according to the pleafure of the maker.

A foot is divided into inches; and an inch, by means of tranfverfe lines, into 100 equal parts: fo that with this fcale, any number of inches, below twelve, with any part of an inch, can be taken by the compaffes, providing fuch part be greater than the one hundredth part of an inch. And this exactnefs is very neceffary in delineating the plans of houfes, and in other cafes.

PROPOSITION XXI.

FIG. 7. *To lay down on paper, by the protractor or line of chords, and line of equal parts, a right-lined figure like to one given, providing the angles and fides of the figure given be known by obfervation or menfuration.* —For example, fuppofe that it is known that in a quadrangular figure, one fide is of 235 feet, that the angle contained by it and the fecond fide is of 84°, the fecond fide of 288 feet, the angle contained by it and the third fide of 72°, and that the third fide is 294 feet. Thefe things being given, a figure is to be drawn on paper like to this quadrangular figure. On your paper, at a proper point A, let a right line be drawn, upon which take 235 equal parts, as AB. The part reprefenting a foot is taken greater or leffer, according as you would have your figure greater or lefs. In the adjoining figure, the 100th part of an inch is taken for a foot. And accordingly an inch divided into 100 parts, and annexed to the figure, is called a fcale of 100 feet. Let there be made at the point B (by the preceding prop.) an angle ABC of 85°, and let BC be taken of 288 parts like to the former. Then let the angle BCD be made of 72°, and the fide CD of 294 equal parts. Then let the fide AD be drawn; and it will compleat the figure like to the figure given. The meafures of the angle A and D can be known by the protractor or line of chords, and the fide AD by the line of equal parts; which will exactly anfwer to the correfponding angles and to the fide of the primary figure.

After the very fame manner, from the fides and angles given, which bound any right-lined figure, a figure like to it may be drawn, and the reft of its fides and angles be known.

COROL-

COROLLARY.

Hence any trigonometrical problem in right-lined triangles, may be resolved by delineating the triangle from what is given concerning it, as in this proposition. The unknown sides are examined by a line of equal parts, and the angles by a protractor or line of chords.

PROPOSITION XXII.

The diameter of a circle being given, to find its circumference nearly.—The periphery of any polygon inscribed in the circle is less than the circumference, and the periphery of any polygon described about a circle is greater than the circumference. Whence Archimedes first discovered that the diameter was in proportion to the circumference, as 7 to 22 nearly; which serves for common use. But the moderns have computed the proportion of the diameter to the circumference to greater exactness. Supposing the diameter 100, the periphery will be more than 314, but less than 315. The diameter is more nearly to the circumference, as 113 to 355. But Ludolphus van Cuelen exceeded the labours of all; for by immense study he found, that, supposing the diameter 100,000,000,000,000,000,000,000,000,000,000,

the periphery will be less than

314,159,265,358,979,323,846,264,338,327,951,

but greater than

314,159,265,358,979,323,846,264,338,327,950;

whence it will be easy, any part of the circumference being given in degrees and minutes, to assign it in parts of the diameter.

Of Surveying and Measuring of LAND.

HITHERTO we have treated of the measuring of angles and sides, whence it is abundantly easy to lay down a field, a plane, or an entire country: for to this nothing is requisite but the protraction of triangles, and of other plain figures, after having measured their sides and angles. But as this is esteemed an important part of practical geometry, we shall subjoin here an account of it with all possible brevity; suggesting withal, that a surveyor will improve himself more by one day's practice, than by a great deal of reading.

PROPOSITION XXIII.

To explain what surveying is, and what instruments Surveyors use.—First, it is necessary that the surveyor view the field that is to be measured, and investigate its sides and angles, by means of an iron chain (having a particular mark at each foot of length, or at any number of feet, as may be most convenient for reducing lines or surfaces to the received measures), and the graphometer described above. Secondly, It is necessary to delineate the field *in plano*, or to form a map of it; that is, to lay down on paper a figure similar to the field; which is done by the protractor (or line of chords) and of the line of equal parts. Thirdly, It is necessary to find out the area of the field so surveyed and represented by a map. Of this last we are to treat below.

The sides and angles of small fields are surveyed by the help of a plain table; which is generally of an oblong rectangular figure, and supported by a *fulcrum*, so as to turn every way by means of a ball and socket. It has a moveable frame, which surrounds the board, and serves to keep a clean paper put on the board close and tight to it. The sides of the frame facing the paper are divided into equal parts every way. The board hath besides a box with a magnetic needle, and moreover a large index with two sights. On the edge of the frame of the board are marked degrees and minutes, so as to supply the room of a graphometer.

PROPOSITION XXIV.

FIG. 8. *To delineate a field by the help of a plain-table, from one station whence all its angles may be seen, and their distances measured by a chain.*—Let the field that is to be laid down be ABCDE. At any convenient place F, let the plain-table be erected; cover it with clean paper, in which let some point near the middle represent the station. Then applying at this place the index with the sights, direct it so as that through the sights some mark may be seen at one of the angles, suppose A; and from the point F, representing the station, draw a faint right line along the side of the index: then, by the help of the chain, let FA the distance of the station from the foresaid angle be measured. Then taking what part you think convenient for a foot or pace from the line of equal parts, set off on the faint line the parts corresponding to the line FA that was measured; and let there be a mark made representing the angle of the field A. Keeping the table immoveable, the same is to be done with the rest of the angles; then right lines joining those marks shall include a figure like to the field, as is evident from 5. 6. Eucl.

COROLLARY.

The same thing is done in like manner by the graphometer: for having observed in each of the triangles, AFB, BFC, CFD, *&c.* the angle at the station F, and having measured the lines from the station to the angles of the field, let similar triangles be protracted on paper (by the 21. prop. of this) having their common vertex in the point of station. All the lines, excepting those which represent the sides of the field, are to be drawn faint or obscure.

Note 1. When a surveyor wants to lay down a field, let him place distinctly in a register all the observations of the angles, and the measures of the sides, until, at time and place convenient, he draw out the figure on paper.

Note 2. The observations made by the help of the graphometer are to be examined: for all the angles about the point F ought to be equal to four right ones. (by cor. 2. art. 30. of part I.)

PROPOSITION XXV.

FIG. 9. *To lay down a field by means of two stations, from each of which all the angles can be seen, by measuring only the distance of the stations.*—Let the instrument be placed at the station F: and having chosen a point representing it upon the paper which is laid upon the plain table, let the index be applied at this point, so as to be moveable about it. Then let it be directed successively to the several angles of the field: and when any angle is seen through the sights, draw an obscure line along the side of the index. Let the index, with the sights, be directed after the same manner to the station G: on the obscure line drawn along its side, pointing to A,

A, set off from the scale of equal parts a line corresponding to the measured distance of the stations, and this will determine the point G. Then remove the instrument to the station G, and applying the index to the line representing the distance of the stations, place the instrument so that the first station may be seen through the sights. Then the instrument remaining immoveable, let the index be applied at the point representing the second station G, and be successively directed by means of its sights, to all the angles of the field, drawing (as before) obscure lines: and the intersection of the two obscure lines that were drawn to the same angle from the two stations will always represent that angle on the plan. Care must be taken that those lines be not mistaken for one another. Lines joining those intersections will form a figure on the paper like to the field.

SCHOLIUM.

It will not be difficult to do the same by the graphometer, if you keep a distinct account of your observations of the angles made by the line joining the stations, and the lines drawn from the stations to the respective angles of the field. And this is the most common manner of laying down whole countries. The tops of two mountains are taken for two stations, and their distance is either measured by some of the methods mentioned above, or is taken according to common repute. The sights are successively directed towards cities, churches, villages, forts, lakes, turnings of rivers, woods, &c.

Note, The distance of the stations ought to be great enough, with respect to the field that is to be measured; such ought to be chosen as are not in a line with any angle of the field. And care ought to be taken likewise that the angles, for example, FAG, FDG, &c. be neither very acute, nor very obtuse. Such angles are to be avoided as much as possible; and this admonition is found very useful in practice.

PROPOSITION XXVI.

Fig. 10. *To lay down any field, however irregular its figure may may be, by the help of the graphometer.*—Let ABCEDHG be such a field. Let its angles (in going round it) be observed with a graphometer (by the 12. of this) and noted down; let its sides be measured with a chain; and (by what was said on the 21. of this) let a figure like to the given field be protracted on paper. If any mountain is in the circumference, the horizontal line hid under it is to be taken for a side, which may be found by two or three observations according to some of the methods described above; and its place on the map is to be distinguished by a shade, that it may be known a mountain is there.

If not only the circumference of the field is to be laid down on the plan, but also its contents, as villages, gardens, churches, public roads, we must proceed in this manner.

Let there be (for example) a church F, to be laid down in the plan. Let the angles ABF BAF be observed and protracted on paper in their proper places, the intersection of the two sides BF and AF will give the place of the church on the paper: Or, more exactly, the lines BF AF being measured, let circles be described from the centres B and A, with parts from the scale corresponding to the distances BF and AF, and the place of the church will be at their intersection.

Note 1. While the angles observed by the graphometer are taken down, you must be careful to distinguish the external angles, as E and G, that they may be rightly protracted afterwards on paper.

Note 2. Our observations of the angles may be examined by computing if all the internal angles make twice as many right angles, four excepted, as there are sides of the figure: (for this is demonstrated by 32. 1. Eucl.) But in place of any external angle DEC, its complement to a circle is to be taken.

PROPOSITION XXVII.

Fig. 11. *To lay down a plain field without instruments.*—If a small field is to be measured, and a map of it to be made, and you are not provided with instruments; let it be supposed to be divided into triangles, by right-lines, as in the figure; and after measuring the three sides of any of the triangles, for example of ABC, let its sides be laid down from a convenient scale on paper, (by the 22. of this.) Again, let the other two sides BD CD of the triangle CBD be measured and protracted on the paper by the same scale as before. In the same manner proceed with the rest of the triangles of which the field is composed, and the map of the field will be perfected; for the three sides of a triangle determine the triangle; whence each triangle on the paper is similar to its correspondent triangle in the field, and is similarly situated; consequently the whole figure is like to the whole field.

SCHOLIUM.

If the field be small, and all its angles may be seen from one station, it may be very well laid down by the plain-table, (by the 24. of this). If the field be larger, and have the requisite conditions, and great exactness is not expected, it likewise may be plotted by means of the plain-table, or by the graphometer, (according to the 25. of this; but in fields that are irregular and mountainous, when an exact map is required, we are to make use of the graphometer, (as in the 26. of this,) but rarely of the plain-table.

Having protracted the bounding lines, the particular parts contained within them may be laid down by the proper operations for this purpose, (delivered in the 26th proposition; and the method described in the 27th proposition may be sometimes of service;) for we may trust more to the measuring of sides, than to the observing of angles. We are not to compute four-sided and many sided figures till they are resolved into triangles: for the sides do not determine those figures.

In the laying down of cities, or the like, we may make use of any of the methods described above that may be most convenient.

The map being finished, it is transferred on clean paper, by putting the first sketch above it, and marking the angles by the point of a small needle. These points being joined by right lines, and the whole illuminated by colours proper to each part, and the figure of the mariners compass being added to distinguish the north and south, with a scale on the margin, the map or plan will be finished and neat.

We

We have thus briefly and plainly treated of ſurveying, and ſhown by what inſtruments it is performed; having avoided thoſe methods which depend on the magnetic needle, not only becauſe its direction may vary in different places of a field (the contrary of this at leaſt doth not appear,) but becauſe the quantity of an angle obſerved by it cannot be exactly known; for an error of two or three degrees can ſcarcely be avoided in taking angles by it.

As for the remaining part of ſurveying, whereby the area of a field already laid down on paper is found in acres, roods, or any other ſuperficial meaſures; this we leave to the following ſection, which treats of the menſuration of ſurfaces.

"Beſides the inſtruments deſcribed above, a ſurveyor "ought to be provided with an off-ſet ſtaff equal in "length to ten links of the chain, and divided into ten "equal parts. He ought likewiſe to have ten arrows or "ſmall ſtraight ſticks near two feet long, ſhod with iron "ferrils. When the chain is firſt opened, it ought to be "examined by the off-ſet ſtaff. In meaſuring any line, "the leader of the chain is to have the ten arrows at firſt "ſetting out. When the chain is ſtretched in the line, "and the near end touches the place from which you mea"ſure, the leader ſticks one of the ten arrows in the "ground, at the far end of the chain. Then the leader "leaving the arrow, proceeds with the chain another "length; and the chain being ſtretched in the line, ſo "that the near end touches the firſt arrow, the leader "ſticks down another arrow at his end of the chain. The "line is preſerved ſtraight, if the arrows be always ſet "ſo as to be in a right line with the place you meaſure "from, and that to which you are going. In this man"ner they proceed till the leader have no more arrows. "At the eleventh chain, the arrows are to be carried to "him again, and he is to ſtick one of them into the "ground, at the end of the chain. And the ſame is to "be done at the 21. 31. 41. *&c.* chains, if there are "ſo many in a right line to be meaſured. In this man"ner you can hardly commit an error in numbering the "chains, unleſs of ten chains at once.

"The off-ſet ſtaff ſerves for meaſuring readily the di"ſtances of any things proper to be repreſented in your "plan, from the ſtation-line while you go along. Theſe "diſtances ought to be entered into your field-book, "with the correſponding diſtances from the laſt ſtation, "and proper remarks, that you may be enabled to plot "them juſtly, and be in no danger of miſtaking one for "another when you extend your plan. The field-book "may be conveniently divided into five columns. In "the middle column the angles at the ſeveral ſtations "taken by the theodolite are to be entered, with di"ſtances from the ſtations. The diſtances taken by the "off-ſet ſtaff, on either ſide of the ſtation-line, are to be "entered into columns on either ſide of the middle co"lumn, according to their poſition with reſpect to that "line. The names and characters of the objects, with "proper remarks, may be entered in columns on either "ſide of theſe laſt.

"Becauſe, in the place of the graphometer deſcribed "by our author, ſurveyors now make uſe of the theodo"lite, we ſhall ſubjoin a deſcription of Mr Siſſon's lateſt "improved theodolite from Mr Gardner's practical ſur"veying improved. See a figure of it in Plate XCVI.

"In this inſtrument, the three ſtaffs, by braſs ferrils "at top, ſcrew into bell-metal joints, that are moveable "between braſs pillars, fixed in a ſtrong braſs plate; in "which, round the centre, is fixed a ſocket with a ball move"able in it, and upon which the four ſcrews preſs, that ſet "the limb horizontal: Next above is another ſuch plate, "through which the ſaid ſcrews paſs, and on which, "round the centre, is fixed a fruſtum of a cone of bell"metal, whoſe axis (being connected with the centre of "the bell) is always perpendicular to the limb, by means "of a conical braſs ferril fitted to it, whereon is fixed "the compaſs-box; and on it the limb, which is a ſtrong "bell-metal ring, whereon are moveable three braſs in"dexes; in whoſe plate are fixed four braſs pillars, "that, joining at top, hold the centre pin of the bell"metal double ſextant, whoſe double index is fixed on "the centre of the ſame plate: Within the double ſex"tant is fixed the ſpirit-level, and over it the teleſcope.

"The compaſs box is graved with two diamonds for "north and ſouth, and with 20 degrees on both ſides "of each, that the needle may be ſet to the variation, "and its error alſo known.

"The limb has two *fleurs de luce* againſt the diamonds "in the box, inſtead of 180 each; and is curiouſly di"vided into whole degrees, and numbered to the left "hand at every ten to twice 180, having three indexes "diſtant 120, (with Nonius's diviſions on each for the "decimals of a degree), that are moved by a pinion fix"ed below one of them, without moving the limb; and "in another is a ſcrew and ſpring under, to fix it to any "part of the limb. It has alſo diviſions numbered, for "taking the quarter girt in inches of round timber at the "middle height, when ſtanding ten feet horizontally "diſtant from its centre; which at 20 muſt be doubled, "and at 30 tripled; to which a ſhorter index is uſed, "having Nonius's diviſions for the decimals of an inch; "but an abatement muſt be made for the bark, if not ta"ken off.

"The double ſextant is divided on one ſide from un"der its centre (when the ſpirit-tube and teleſcope are "level) to above 60 degrees each way, and numbered at "10, 20, *&c.* and the double index (through which it "is moveable) ſhews on the ſame ſide the degree and de"cimal of any altitude or depreſſion to that extent "by Nonius's diviſions: On the other ſide are diviſions "numbered, for taking the upright height of timber, *&c.* "in feet, when diſtant 10 feet; which at 20 muſt be "doubled, and at 30 tripled; and alſo the quantities for "reducing hypothenuſal lines to horizontal. It is "moveable by a pinion fixed in the double index.

"The teleſcope is a little ſhorter than the diameter "of the limb, that a fall may not hurt it; yet it will "magnify as much, and ſhew a diſtant object as perfect, "as moſt of triple its length. In its focus are very fine "croſs wires, whoſe interſection is in the plane of the "double ſextant; and this was a whole circle, and turn"ed in a lathe to a true plane, and is fixed at right angles "to the limb; ſo that, whenever the limb is ſet horizon"tal, (which is readily done by making the ſpirit-tube "level

" level over two ſcrews, and the like over the other two), " the double ſextant and teleſcope are moveable in a vertical plane; and then every angle taken on the limb " (though the teleſcope be never ſo much elevated or " depreſſed) will be an angle in the plane of the horizon. " And this is abſolutely neceſſary in plotting a horizontal " plane.

" If the lands to be plotted are hilly, and not in any " one plane, the lines meaſured cannot be truly laid down " on paper, without being reduced to one plance, which " muſt be the horizontal, becauſe angles are taken in that " plane.—

" In viewing your objects, if they have much altitude " or depreſſion, either write down the degree and decimal " ſhewn on the double ſextant, or the links ſhewn on the " back ſide; which laſt ſubtracted from every chain in " the ſtation-line, leaves the length in the horizontal " plane. But if the degree is taken, the following table " will ſhew the quantity.

A table of the links to be ſubtracted out of every chain in hypothenuſal lines of ſeveral degrees altitude, or depreſſion, for reducing them to horizontal.

Degrees.	*Links.*	*Degrees.*	*Links.*	*Degrees.*	*Links.*
4,05	$\frac{1}{4}$	14,07	3	23,074	8
5,73	$\frac{1}{2}$	16,26	4	24,495	9
7,02	$\frac{3}{4}$	18,195	5	25,84	10
8,11	1	19,95	6	27,13	11
11,48	2	21,565	7	28,36	12

" Let the firſt ſtation line really meaſure 1107 links, " and the angle of altitude or depreſſion be 19°, 95; " looking in the table you will find againſt 19°, 95, is 6 " links. Now 6 times 11 is 66; which ſubtracted from " 1107, leaves 1041, the true length to be laid down " in the plan.

" It is uſeful in ſurveying, to take the angles, which " the bounding lines form, with the magnetic needle, " in order to check the angles of the figure, and to plot " them conveniently afterwards."

Of the Surfaces of Bodies.

THE ſmalleſt ſuperficial meaſure with us is a ſquare inch; 144 of which make a ſquare foot. Wrights make uſe of theſe in the meaſuring of deals and planks; but the ſquare foot which the glaziers uſe in meaſuring of glaſs, conſiſts only of 64 ſquare inches. The other meaſures are, firſt, the ell ſquare; ſecondly, the fall, containing 36 ſquare ells; thirdly, the rood, containing 40 falls; fourthly, the acre, containing 4 roods. Slaters, maſons, and paviours, uſe the ell ſquare and the fall; ſurveyors of land uſe the ſquare ell, the fall, the rood, and the acre.

The ſuperficial meaſures of the Engliſh are, firſt, the ſquare foot; ſecondly, the ſquare yard, containing 9 ſquare feet, for their yard contains only 3 feet; thirdly, the pole, containing $30\frac{1}{4}$ ſquare yards; fourthly, the rood, containing 40 poles; fifthly, the acre, containing 4 roods. And hence it is eaſy to reduce our ſurperficial meaſures to the Engliſh, or theirs to ours.

" In order to find the content of a field, it is moſt con- " venient to meaſure the lines by the chains deſcribed a- " bove, p. 693. that of 22 yards for computing the Eng- " liſh acres, and that of 24 Scots ells for the acres of " Scotland. The chain is divided into 100 links, and the " ſquare of the chain is 10,000 ſquare links; ten ſquares " of the chain, or 100,000 ſquare links, give an acre. " Therefore, if the area be expreſſed by ſquare links, " divide by 100,000, or cut off five decimal places, and " the quotient ſhall give the area in acres and decimals " of an acre. Write the entire acres apart; but multi- " ply the decimals of an acre by 4, and the product ſhall " give the remainder of the area in roods and decimals " of a rood. Let the entire roods be noted apart after " the acres; then multiply the decimals of a rood by 40, " and the product ſhall give the remainder of the area in " falls or poles. Let the entire falls or poles be then " writ after the roods, and multiply the decimals of a " fall by 36, if the area is required in the meaſures of " Scotland; but multiply the decimals of a pole by $30\frac{1}{4}$, " if the area is required in the meaſures of England, and " the product ſhall give the remainder of the area in " ſquare ells in the former caſe, but in ſquare yards in " the latter. If, in the former caſe, you would reduce " the decimals of the ſquare ell to ſquare feet, multiply " them by 9.50694; but, in the latter caſe, the decimals " of the Engliſh ſquare yard are reduce to ſquare feet, " by multiplying them by 9.

" Suppoſe, for example, that the area appears to con- " tain 12.65842 ſquare links of the chain of 24 ells; " and that this area is to be expreſſed in acres, roods, " falls, &c. of the meaſures of Scotland. Divide the " ſquare links by 100,000, and the quotient 12.65842 " ſhows the area to contain 12 acres $\frac{65842}{100000}$ of an acre. " Multiply the decimal part by 4, and the product " 2.63368 gives the remainder in roods and decimals of " a rood. Thoſe dec mals of the rood being multipled " by 40, the product gives 25.3472 falls. Multiply the " decimals of the fall by 36, and the product gives " 12.4992 ſquare ells. The decimals of the ſquare ell " multiplied by 9.50994 give 4.7458 ſquare feet. " Therefore the area propoſed amounts to 12 acres, 2 " roods, 25 falls, 12 ſquare ells, and $4\frac{7458}{10000}$ ſquare " feet.

" But if the area contains the ſame number of ſquare " links of Gunter's chain, and is to be expreſſed by " Engliſh meaſures, the acres and roods are computed in " the ſame manner as in the former caſe. The poles are " computed as the falls. But the decimals of the pole, " *viz.* $\frac{3472}{10000}$, are to be multiplied by $30\frac{1}{4}$ (or 30.25), " and the product gives 10.5028 ſquare yards. The de- " cimals of the ſquare yard, multiplied by 9, give 4.5252 " ſquare feet; therefore, in this caſe, the area is in " Engliſh meaſure 12 acres, 2 roods, 25 poles, 10 ſquare " yards, and $4\frac{5252}{10000}$ ſquare feet.

" The Scots acre is to the Engliſh acre, by ſtatute, " as 100,000 to 78,694, if we have regard to the diffe- " rence betwixt the Scots and Engliſh foot above men- " tioned. But it is cuſtomary in ſome parts of England " to

"to have 18, 21 &c. feet to a pole, and 160 ſuch poles "to an acre; whereas, by the ſtatute, $16\frac{1}{2}$ feet make a "pole. In ſuch caſes the acre is greater in the dupli- "cate ratio of the number of feet to a pole.

"They who meaſure land in Scotland by an ell of 37 "Engliſh inches, make the acre leſs than the true Scots "acre by $593\frac{6}{10}$ ſquare Engliſh feet, or by about $\frac{1}{93}$ of "the acre.

"An huſband-land contains 6 acres of ſock and ſythe- "land, that is, of land that may be tilled with a plough, "and mown with a ſythe; 13 acres of arable land make "an oxgang or oxengate; four oxengate make a pound- "land of old extent (by a decree of the Exchequer, "March 11. 1585), and is called *librata terræ*. A "forty-ſhilling land of old extent contains eight oxgang, "or 104 acres.

"The arpent, about Paris, contains 32400 ſquare Pa- "ris feet, and is equal to $2\frac{2}{3}$ Scots roods, or $\frac{37}{100}$ Eng- "liſh roods.

"The *actus quadratus*, according to Varro, Collu- "mella, &c. was a ſquare of 120 Roman feet. The "*jugerum* was the double of this. It is to the Scots a- "cre as 10,000 to 20,456, and to the Engliſh acre as "10,000 to 16,097. It was divided (like the *as*) into "12 *unciæ*, and the *uncia* into 24 *ſcrupula*."—This, with the three preceding paragraphs, are taken from an ingenious manuſcript, written by Sir Robert Stewart profeſſor of natural philoſophy. The greateſt part of the table in p. 693. was taken from it likewiſe.

PROPOSITION XXVIII.

FIG. 12. *To find out the area of a rectangular parallelogram* ABCD.—Let the ſide AB, for example, be 5 feet long, and BC (which conſtitutes with BA a right angle at B) be 17 feet. Let 17 be multiplied by 5, and the product 85 will be the number of ſquare feet in the area of the figure ABCD. But if the parallelogram propoſed is not rectangular as BEFC, its baſe BC multiplied into its perpendicular height AB (not into its ſide BE) will give its area. This is evident from art. 68. of part 1.

PROPOSITION XXIX.

FIG. 13. *To find the area of a given triangle.*—Let the triangle BAC be given, whoſe baſe BC is ſuppoſed 9 feet long: let the perpendicular AD be drawn from the angle A oppoſite to the baſe, and let us ſuppoſe AD to be four feet. Let the half of the perpendicular be multiplied into the baſe, or the half of the baſe into the perpendicular, or take the half of the product of the whole baſe into the perpendicular, the product gives 18 ſquare feet for the area of the given triangle.

But if only the ſides are given, the perpendicular is found either by protracting the triangle, or by 12th and 13th 2. Eucl. or by trigonometry. But how the area of a triangle may may be found from the given ſides only, ſhall be ſhewn in the 31ſt prop.

PROPOSITION XXX.

FIG. 14. *To find the area of any rectilineal figure.*—If the figure be irregular, let it be reſolved into triangles; and drawing perpendiculars to the baſes in each of them, let the area of each triangle be found by the preceding prop. and the ſum of theſe areas will give the area of the figure.

SCHOLIUM 1.

In meaſuring boards, planks, and glaſs, their ſides are to be meaſured by a foot-rule divided into 100 equal parts; and after multiplying the ſides, the decimal fractions are eaſily reduced to leſſer denominations. The menſuration of theſe is eaſy, when they are rectangular parallelograms.

SCHOLIUM 3.

If a field is to be meaſured, let it firſt be plotted on paper, by ſome of the methods above deſcribed, and let the figure ſo laid down be divided into triangles, as was ſhown in the preceding propoſition.

The baſe of any triangle, or the perpendicular upon the baſe, or the diſtance of any two points of the field, is meaſured by applying it to the ſcale according to which the map is drawn.

SCHOLIUM 3.

But if the field given be not in a horizontal plane, but uneven and mountainous, the ſcale gives the horizontal line between any two points, but not their diſtance meaſured on the uneven ſurface of the field. And indeed it would appear, that the horizontal plane is to be accounted the area of an uneven and hilly country. For if ſuch ground is laid out for building on, or for planting with trees, or bearing corn, ſince theſe ſtand perpendicular to the horizon, it is plain, that a mountainous country cannot be conſidered as of greater extent for thoſe uſes than the horizontal plane; nay, perhaps, for nouriſhing of plants, the horizontal plane may be preferable.

If, however, the area of a figure, as it lies regularly on the ſurface of the earth, is to be meaſured, this may be eaſily done by reſolving it into triangles as it lies. The ſum of their areas will be the area ſought; which exceeds the area of the horizontal figure more or leſs, according as the field is more or leſs uneven.

PROPOSITION XXXI.

FIG. 13. *The ſides of a triangle being given, to find the area, without finding the perpendicular.*—Let all the ſides of the triangle be collected into one ſum; from the half of which let the ſides be ſeparately ſubtracted, that three differences may be found betwixt the foreſaid half ſum and each ſide; then let theſe three differences and the half ſum be multiplied into one another, and the ſquare root of the product will give the area of the triangle. For example, let the ſides be 10, 17, 21; the half of their ſum is 24; the three differences betwixt this half ſum and the three ſides, are 14, 7, and 3. The firſt being multiplied by the ſecond, and their product by the third, we have 294 for the product of the differences; which multiplied by the foreſaid half ſum 24, gives 7056; the ſquare root of which 84 is the area of the triangle. The demonſtration of this, for the ſake of brevity, we omit. It is to be found in ſeveral treatiſes, particularly in Clavius's Practical Geometry.

PROPOSITION XXXII.

FIG. 15. *The area of the ordinate figure* ABEFGH *is equal to the product of the half circumference of the polygon, multiplied into the perpendicular drawn from the centre of the circumſcribed circle to the ſide of the polygon.*—For the ordinate figure can be reſolved into as many equal triangles, as there are ſides of the figure;

figure; and since each triangle is equal to the product of half the base into the perpendicular, it is evident that the sum of all the triangles together, that is the polygon, is equal to the product of half the sum of the bases (that is the half of the circumference of the polygon) into the common perpendicular height of the triangles drawn from the centre C to one of the sides; for example, to AB.

PROPOSITION XXXIII.

FIG. 16. *The area of a circle is found by multiplying the half of the periphery into the radius, or the half of the radius into the periphery*—For a circle is not different from an ordinate or regular polygon of an infinite number of sides, and the common height of the triangles into which the polygon or circle may be supposed to be divided is the radius of the circle.

Were it worth while, it were easy to demonstrate accurately this proposition, by means of the inscribed and circumscribed figures, as is done in the 5th prop. of the treatise of Archimedes concerning the dimensions of the circle.

COROLLARY.

Hence also it appears, that the area of the sector ABCD is produced by multiplying the half of the arc into the radius, and likewise that the area of the segment of the circle ADC is found by subtracting from the area of the sector the area of the triangle ABC.

PROPOSITION XXXIV.

FIG. 17. *The circle is to the square of the diameter, as* 11 *to* 14 *nearly.*—For if the diameter AB be supposed to be 7, the circumference AHBK will be almost 22 (by the 22d prop. of this part), and the area of the square DC will be 49; and, by the preceding prop. the area of the circle will be $38\frac{1}{2}$: therefore the square DC will be to the inscribed circle as 49 to $38\frac{1}{2}$, or as 98 to 77, that is, as 14 to 11. *Q. E. D.*

If greater exactness is required, you may proceed to any degree of accuracy: for the square DC is to the inscribed circle, as 1 to $1-\frac{1}{3}+\frac{1}{5}-\frac{1}{7}+\frac{1}{9}-\frac{1}{11}+\frac{1}{13}$, *&c. in infinitum.*

"This series will be of no service for computing the "area of the circle accurately, without some further artifice, because it converges at too slow a rate. The "area of the circle will be found exactly enough for "most purposes, by multiplying the square of the diameter by 7854, and dividing by 10,000, or cutting "off four decimal places from the product; for the area "of the circle is to the circumscribed square nearly as "7854 to 10,000."

PROPOSITION XXXV.

FIG. 18. *To find the area of a given ellipse*—Let ABCD be an ellipse, whose greater diameter is BD, and the lesser AC, bisecting the greater perpendicularly in E. Let a mean proportional HF be found (by 13th 6. Eucl.) between AC and BD, and (by the 33d of this) find the area of the circle described on the diameter HF. This area is equal to the area of the ellipse ABCD. For because, as BD to AC, so the square of BD to the square of HF, (by 2. cor. 20th 6. Eucl.): but (by the 2d 12. Eucl.) as the square of BD to the square of HF, so is the circle of the diameter BD to the circle of the diameter HF: therefore as BD to AC, so is the circle of the diameter BD to the circle of the diameter HF. And (by the 5th prop. of Archimedes of spheroids) as the greater diameter BD to the lesser AC, so is the circle of the diameter BD to the ellipse ABCD. Consequently (by the 11th 5. Eucl.) the circle of the diameter BD will have the same proportion to the circle of the diameter HF, and to the ellipse ABCD. Therefore, (by 9th 5. Eucl.) the area of the circle of the diameter HF will be equal to the area of the ellipse ABCD. *Q. E. D.*

SCHOLIUM.

From this and the two preceding propositions, a method is derived of finding the area of an ellipse. There are two ways: 1st, Say, as one is to the lesser diameter, so is the greater diameter to a fourth number, (which is found by the rule of three.) Then again say, as 14 to 11, so is the 4th number found to the area sought. But the second way is shorter. Multiply the lesser diameter into the greater, and the product by 11; then divide the whole product by 14, and the quotient will be the area sought of the ellipse. For example, Let the greater diameter be 10, and the lesser 7; by multiplying 10 by 7, the product is 70; and multiplying that by 11, it is 770; and dividing 770 by 14, the quotient will be 55, which is the area of the ellipse sought.

"The area of the ellipse will be found more accurately, by multiplying the product of the two diameters "by .7854."

We shall add no more about other plain surfaces, whether rectilinear or curvilinear, which seldom occur in practice; but shall subjoin some propositions about measuring the surfaces of solids.

PROPOSITION XXXVI.

To measure the surface of any prism.—By the 14th definition of the 11th Eucl. a prism is contained by planes, of which two opposite sides (commonly called the bases) are plain rectilineal figures; which are either regular and ordinate, and measured by prop. 32. of this; or however irregular, and then they are measured by the 38th prop. The other sides are parallelograms, which are measured by prop. 28th; and the whole superficies of the prism consists of the sum of those taken altogether.

PROPOSITION XXXVII.

To measure the superficies of any pyramid.—Since its basis is a rectilinear figure, and the rest of the planes terminating in the top of the pyramid are triangles; these measured separately, and added together, give the surface of the pyramid required.

PROPOSITION XXXVIII.

To measure the superficies of any regular body.—These bodies are called regular, which are bounded by equilateral and equiangular figures. The superficies of the tetraedron consists of four equal and equiangular triangles; the superficies of the hexaedron, or cube, of six equal squares; an octedron, of eight equal equilateral triangles; a dodecaedron, of twelve equal and ordinate pentagons; and the superficies of an icosiædron of twenty equal and equilateral triangles. Therefore it will be easy to measure these surfaces from what has been already shown.

In the same manner we may measure the superficies of a solid contained by any planes.

PRO-

PROPOSITION XXXIX.

FIG. 19. *To measure the superficies of a cylinder.*—Because a cylinder differs very little from a prism, whose opposite planes (or bases) are ordinate figures of an infinite number of sides, it appears that the superficies of a cylinder, without the bases, is equal to an infinite number of parallelograms; the common altitude of all which is the same with the height of the cylinder, and the bases of them all differ very little from the periphery of the circle which is the base of the cylinder. Therefore this periphery multiplied into the common height, gives the superficies of the cylinder, excluding the bases; which are to be measured separately by the help of the 33d prop.

This proposition concerning the measure of the surface of the cylinder (excluding its basis) is evident from this, that when it is conceived to be spread out, it becomes a parallelogram, whose base is the periphery of the circle of the base of the cylinder stretched into a right line, and whose height is the same with the height of the cylinder.

PROPOSITION XL.

FIG. 20. *To measure the surface of a right cone.*—The surface of a right cone is very little different from the surface of a right pyramid, having an ordinate polygon for its base of an infinite number of sides; the surface of which (excluding the base) is equal to the sum of the triangles. The sum of the bases of these triangles is equal to the periphery of the circle of the base, and the common height of the triangles is the side of the cone AB; wherefore the sum of these triangles is equal to the product of the sum of the bases (*i. e.* the periphery of the base of the cone) multiplied into the half of the common height, or it is equal to the product of the periphery of the base.

If the area of the base is likewise wanted, it is to be found separately by the 33d prop. If the surface of a cone is supposed to be spread out on a plane, it will become a sector of a circle, whose radius is the side of the cone; and the arc terminating the sector is made from the periphery of the base. Whence, by corol. 33d prop. of this, its dimension may be found.

COROLLARY.

Hence it will be easy to measure the surface of a *frustum* of a cone cut by a plane parallel to the base.

PROPOSITION XLI.

FIG. 21. *To measure the surface of a given sphere.*—Let there be a sphere, whose centre is A, and let the area of its convex surface be required. Archimedes demonstrates (37. prop. 1. book of the sphere and cylinder) that its surface is equal to the area of four great circles of the sphere; that is, let the area of the great circle be multiplied by 4, and the product will give the area of the sphere; or, (by the 20th 6. and 2d 12 of Eucl.) the area of the sphere given is equal to the area of a circle whose radius is the right line BC, the diameter of the sphere. Therefore having measured (by 33d prop) the circle described with the radius BC, this will give the surface of the sphere.

PROPOSITION XLII.

FIG. 22. *To measure the surface of a segment of a sphere.*—Let there be a segment cut off by the plane ED. Archimedes demonstrates (49, and 50. 1 *De sphæra*) that the surface of this segment, excluding the circular base, is equal to the area of a circle whose radius is the right line BE drawn from the vertex B of the segment to the periphery of the circle DE. Therefore, (by the 33d prop.) it is easily measured.

COROLLARY 1.

Hence that part of the surface of a sphere that lieth between two parallel planes is easily measured, by subtracting the surface of the lesser segment from the surface of the greater segment.

COROLLARY 2.

Hence likewise it follows, that the surface of a cylinder, described about a sphere (excluding the basis) is equal to the surface of the sphere, and the parts of the one to the parts of the other, intercepted between planes parallel to the basis of the cylinder.

Of Solid Figures and their Mensuration, comprehending likewise the Principles of gauging Vessels of all Figures.

As in the former part of this treatise we took an inch for the smallest measure in length, and an inch square for the smallest superficial measure; so now, in treating of the mensuration of solids, we take a cubical inch for the smallest solid measure. Of these 109 make a Scots pint; other liquid measures depend on this, as is generally known.

In dry measures, the firlot, by statute, contains $19\frac{1}{4}$ pints; and on this depend the other dry measures: therefore, if the content of any solid be given in cubical inches, it will be easy to reduce the same to the common liquid or dry measures, and conversely to reduce these to solid inches. The liquid and dry measures, in use among other nations, are known from their writers.

"As to the English liquid measures, by act of parliament 1706, any round vessel, commonly called a cylinder, having an even bottom, being seven inches in diameter throughout, and six inches deep from the top of the inside to the bottom, (which vessel will be found by computation to contain 230 $\frac{907}{1000}$ cubical inches), or any vessel containing 231 cubical inches, and no more, is deemed to be a lawful wine-gallon. An English pint therefore contains $28\frac{7}{8}$ cubical inches; two pints make a quart; four quarts a gallon; 18 gallons a roundlet; three roundlets and an half, or 63 gallons, make a hogshead; the half of a hogshead is a barrel; one hogshead and a third, or 84 gallons, make a puncheon; one puncheon and a half, or two hogsheads, or 126 gallons, make a pipe or butt; the third part of a pipe, or 42 gallons, make a tierce; two pipes, or three puncheons, or four hogsheads, make a ton of wine. Though the English wine gallon is now fixed at 231 cubical inches, the standard kept in Guildhall being measured, before many persons of distinction, May 25th 1688, it was found to contain only 224 such inches.

"In the English beer measure, a gallon contains 282 cubical inches; consequently $35\frac{1}{4}$ cubical inches make a pint, two pints make a quart, four quarts make a gallon,

gallon, nine gallons a firkin, four firkins a barrel. In ale, eight gallons make a firkin, and 32 gallons make a barrel. By an act of the firſt of William and Mary, 34 gallons is the barrel, both for beer and ale, in all places, except within the weekly bills of mortality.

“ In Scotland it is known that four gills make a mutchkin, two mutchkins make a chopin; a pint is two chopins; a quart is two pints; and a gallon is four quarts, or eight pints. The accounts of the cubical inches contained in the Scots pint vary conſiderably from each other. According to our author, it contains 109 cubical inches. But the ſtandard-jugs kept by the dean of guild of Edinburgh (one of which has the year 1555, with the arms of Scotland, and the town of Edinburgh, marked upon it) having been carefully meaſured ſeveral times, and by different perſons, the Scots pint, according to thoſe ſtandards, was found to contain about $103\frac{4}{10}$ cubic inches. The pewterers jugs (by which the veſſels in common uſe are made) are ſaid to contain ſometimes betwixt 105 and 106 cubic inches. A caſk that was meaſured by the brewers of Edinburgh, before the commiſſioners of Exciſe in 1707, was found to contain $46\frac{7}{8}$ Scots pints; the ſame veſſel contained $18\frac{1}{10}$ Engliſh ale-gallons. Suppoſing this menſurating to be juſt, the Scots pint will be to the Engliſh ale-gallon as 289 to 750; and if the Engliſh ale-gallon be ſuppoſed to contain 282 cubical inches, the Scots pint will contain 108.664 cubical inches. But it is ſuſpected, on ſeveral grounds, that the experiment was not made with ſufficient care and exactneſs.

“ The commiſſioners appointed by authority of parliament to ſettle the meaſures and weights, in their act of February 19. 1618, relate, That having cauſed fill the Linlithgow firlot with water, they found that it contained $21\frac{1}{4}$ pints of the juſt Stirling jug and meaſure. They likewiſe ordain that this ſhall be the juſt and only firlot; and add, *That the wideneſs and breadneſs of the which firlot, under and above even over within the buirds, ſhall contain nineteen inches and the ſixth part of an inch, and the deepneſs ſeven inches and a third part of an inch.* According to this act (ſuppoſing their experiment and computation to have been accurate) the pint contained only 99.56 cubical inches; for the content of ſuch a veſſel as is deſcribed in the act, is 2115.85, and this divided by $21\frac{1}{4}$ gives 99.56. But, by the weight of water ſaid to fill this firlot in the ſame act, the meaſure of the pint agrees nearly with the Edinburgh ſtandard above mentioned.

“ As for the Engliſh meaſures of corn, the Wincheſter gallon contains $272\frac{1}{4}$ cubical inches; two gallons make a peck; four pecks, or eight gallons (that is 2178, cubical inches) make a buſhel; and a quarter is eight buſhels.

“ Our author ſays, that $19\frac{1}{2}$ Scots pints make a firlot. But this does not appear to be agreeable to the ſtatute above mentioned, nor to the ſtandard-jugs. It may be conjectured that the proportion aſſigned by him has been deduced from ſome experiment of how many pints, according to common uſe, were contained in the firlot. For if we ſuppoſe thoſe pints to have been each of 108.664 cubical inches, according to the experiment made in the 1707 before the commiſſioners of exciſe, deſcribed above; then $19\frac{1}{2}$ ſuch pints will amount to 2118.94, cubical inches; which agrees nearly with 2115.85, the meaſure of the firlot by ſtatute above mentioned. But it is probable, that in this he followed the act 1587, where it is ordained, That the wheat-firlot ſhall contain 19 pints and two joucattes. A wheat-firlot marked with the Linlithow ſtamps being meaſured, was found to contain about 2211 cubical inches. By the ſtatute of 1618 the barley-firlot was to contain 31 pints of the juſt Stirling-jug.

“ A Paris pint is 48 cubical Paris inches, and is nearly equal to an Engliſh wine-quart. The *Boiſſean* contains 644 68099 Paris cubical inches, or 780.36 Engliſh cubical inches.

“ The Roman *amphora* was a cubical Roman foot, the *congius* was the eighth part of the *amphora*, the *ſextarius* was one ſixth of the *congius*. They divided the *ſextarius* like the *as* or *libra*. Of dry meaſures, the *medimnus* was equal to two amphoras, that is, about $1\frac{1}{2}\frac{1}{5}$ Engliſh legal buſhels; and the *modius* was the third part of the *amphora*.”

PROPOSITION XLIII.

To find the ſolid content of a given priſm.—By the 29th prop. let the area of the baſe of the priſm be meaſured, and be multiplied by the height of the priſm, the product will give the ſolid content of the priſm.

PROPOSITION XLIV.

To find the ſolid content of a given pyramid.—The area of the baſe being found, (by the 30th prop.) let it be multiplied by the third part of the height of the pyramid, or the third part of the baſe by the height, the product will give the ſolid content, by 7th 12. Eucl.

COROLLARY.

If the ſolid content of a *fruſtum* of a pyramid is required, firſt let the ſolid content of the entire pyramid be found; from which ſubtract the ſolid content of the part that is wanting, and the ſolid content of the broken pyramid will remain.

PROPOSITION XLV.

To find the content of a given cylinder.—The area of the baſe being found by prop. 33. if it be a circle, and by prop. 35. if it be an ellipſe, (for in both caſes it is a cylinder,) multiply it by the height of the cylinder, and the ſolid content of the cylinder will be produced.

COROLLARY.

FIG. 23. And in this manner may be meaſured the ſolid content of veſſels and caſks not much different from a cylinder, as ABCD. If towards the middle EF it be ſomewhat groſſer, the area of the circle of the baſe being found (by 33d prop.) and added to the area of the middle circle EF, and the half of their ſum (that is, an arithmetical mean between the area of the baſe and the area of the middle circle) taken for the baſe of the veſſel, and multiplied into its height, the ſolid content of the given veſſel will be produced.

Note, That the length of the veſſel, as well as the diameters of the baſe, and of the circle EF, ought to be taken within the ſtaves; for it is the ſolid content within the ſtaves that is ſought.

PROPOSITION XLVI.

To find the ſolid content of a given cone.—Let the area

area of the base (found by prop. 33.) be multiplied into $\frac{1}{3}$ of the height, the product will give the solid content of the cone; for by the 10th 12. Eucl. a cone is the third part of a cylinder that has the same base and height.

PROPOSITION XLVII.

FIG. 24. 25. *To find the solid content of a* frustum *of a cone cut by a plane parallel to the plane of the base.*—First, let the height of the entire cone be found, and thence (by the preceding prop.) its solid content; from which subtract the solid content of the cone cut off at the top, there will remain the solid content of the *frustum* of the cone.

How the content of the entire cone may be found, appears thus: Let ABCD be the *frustum* of the cone (either right or scalenous, as in the figures 2. and 3.) let the cone ECD be supposed to be compleated; let AG be drawn parallel to DE, and let AH and EF be perpendicular on CD; it will be (by 2d 6. Eucl.) as CG:CA:: CD:CE; but (by art. 72. of part. 1.) as CA:AH::CE: EF; consequently (by 22d 5. Eucl.) as CG:AH::CD: FF; that is, as the excess of the diameter of the lesser base is to the height of the *frustum*, so is the diameter of the greater base to the height of the entire cone.

COROLLARY.

FIG. 26. Some casks whose staves are remarkably bended about the middle, and strait towards the ends, may be taken for two portions of cones, without any considerable error. Thus ABEF is a *frustum* of a right cone, to whose base EF, on the other side, there is another similar *frustum* of a cone joined, EDCF. The vertices of these cones, if they be supposed to be completed, will be found at G and H. Whence, (by the preceding prop.) the solid content of such vessels may be found.

PROPOSITION XLVIII.

FIG. 27. A cylinder circumscribed about a sphere, that is, having its base equal to a great circle of the sphere, and its height equal to the diameter of the sphere, is to the sphere as 3 to 2.

Let ABEC be the quadrant of a circle, and ABDC the circumscribed square; and likewise the triangle ADC; by the revolution of the figure about the right line AC, as axis, a hemisphere will be generated by the quadrant, a cylinder of the same base and height by the square, and a cone by the triangle. Let these three be cut any how by the plane HF, parallel to the base AB; the section in the cylinder will be a circle whose radius is FH, in the hemisphere a circle of the radius EF, and in the cone a circle of the radius GF.

By (art. 69. of part 1.) EAq, or HFq=EFq and FAq taken together, (but AFq=FGq, because AC=CD); therefore the circle of the radius HF is equal to a circle of the radius EF together with a circle of the radius GF; and since this is true every where, all the circles together described by the respective *radii* HF (that is, the cylinder) are equal to all the circles described by the respective *radii* EF and FG (that is, to the hemisphere and the cone taken together); but, (by the 10th 12. Eucl.) the cone generated by the triangle DAC is one third part of the cylinder generated by the square BC. Whence it follows, that the hemisphere generated by the rotation of the quadrant ABEC is equal to the remaining two third parts of the cylinder, and that the whole sphere is $\frac{2}{3}$ of the double cylinder circumscribed about it.

This is that celebrated 39th prop. 1. book of Archimedes of the sphere and cylinder; in which he determines the proportion of the cylinder to the sphere inscribed to be that of 3 to 2.

COROLLARY.

Hence it follows, that the sphere is equal to a cone whose height is equal to the semidiameter of the sphere, having for its base a circle equal to the superficies of the sphere, or to four great circles of the sphere, or to a circle whose radius is equal to the diameter of the sphere, (by prop. 41. of this.) And indeed a sphere differs very little from the sum of an infinite number of cones that have their bases in the surface of the sphere, and their common vertex in the centre of the sphere; so that the superficies of the sphere, (of whose dimension see prop. 41. of this) multiplied into the third part of the semidiameter, gives the solid content of the sphere.

PROPOSITION XLIX.

FIG. 28. *To find the solid content of a sector of the sphere.*—A spherical sector ABC (as appears by the cor. of the preceding prop.) is very little different from an infinite number of cones, having their bases in the superficies of the sphere BEC, and their common vertex in the centre. Wherefore the spherical superficies BEC being found (by prop. 42. of this), and multiplied into the third part of AB the radius of the sphere, the product will give the solid content of the sector ABC.

COROLLARY.

It is evident how to find the solidity of a spherical segment less than a hemisphere, by subtracting the cone ABC from the sector already found But if the spherical segment be greater than a hemisphere, the cone corresponding must be added to the sector, to make the segment.

PROPOSITION L.

FIG. 29. *To find the solidity of the spheroid, and of its segments cut by planes perpendicular to the axis.*—In prop. 44. of this, it is shewn, that every where EH : EG :: CF : CD; but circles are as the squares described upon their rays, that is, the circle of the radius EH is to the circle of the radius EG, as CFq to CDq. And since it is so every where, all the circles described with the respective rays EH, (that is, the spheroid made by the rotation of the semi-ellipses AFB around the axis AB) will be to all the circles described by the respective *radii* EG, (that is, the sphere described by the rotation of the semicircle ADB on the axis AB) as FCq to CDq; that is, as the spheroid to the sphere on the same axis, so is the square of the other axis of the generating ellipse to the square of the axis of the sphere.

And this holds, whether the spheroid be found by a revolution around the greater or lesser axis.

COROLLARY 1.

Hence it appears, that the half of the spheroid, formed by the rotation of the space AHFC around the axis AC, is double of the cone generated by the triangle AFC about the same axis; which is the 32d prop. of Archimedes of conoids and spheroids.

COROLLARY 2.

Hence, likewise, is evident the measure of segments of the

the ſpheroid cut by planes perpendicular to the axis. For the ſegment of the ſpheroid made by the rotation of the ſpace ANHE, round the axis AE, is to the ſegment of the ſphere having the ſame axis AC, and made by the rotation of the ſegment of the circle AMGE, as CF*q* to CD*q*.

But if the meaſure of this ſolid be wanted with leſs labour, by the 34th prop. of Archimedes of conoids and ſpheroids, it will be as BE to AC+EB; ſo is the cone generated by the rotation of the triangle AHE round the axis AE, to the ſegment of the ſphere made by the rotation of the ſpace ANHE round the ſame axis AE; which could eaſily be demonſtrated by the method of indiviſibles.

COROLLARY 3.

Hence it is eaſy to find the ſolid content of the ſegment of a ſphere or ſpheroid intercepted between two parallel planes, perpendicular to the axis. This agrees as well to the oblate as to the oblong ſpheroid; as is obvious.

COROLLARY 4.

FIG. 30. If a caſk is to be valued as the middle piece of an oblong ſpheroid, cut by the two planes DC and FG, at right angles to the axis: firſt, let the ſolid content of the half ſpheroid ABCED be meaſured by the preceding prop. from which let the ſolidity of the ſegment DEC be be ſubtracted, and there will remain the ſegment ABCD; and this doubled will give the capacity of the caſk required.

The following method is generally made uſe of for finding the ſolid content of ſuch veſſels. The double area of the greateſt circle, that is, of that which is deſcribed by the diameter AB at the middle of the caſk, is added to the area of the circle at the end, that is, of the circle DC or FG (for they are uſually equal), and the third part of this ſum is taken for a mean baſe of the caſk; which therefore multiplied into the length of the caſk OP, gives the content of the veſſel required.

Sometimes veſſels have other figures, different from thoſe we have mentioned; the eaſy methods of meaſuring which may be learned from thoſe who practiſe this art. What hath already been delivered, is ſufficient for our purpoſe.

PROPOSITION LI.

FIG. 31. and 32. *To find how much is contained in a veſſel that is in part empty, whoſe axis is parallel to the horizon.*—Let AGBH be the great circle in the middle of the caſk, whoſe ſegment GBH is filled with liquor, the ſegment GAH being empty; the ſegment GBH is known, if the depth EB be known, and EH a mean proportional between the ſegments of the diameter AB and EB; which are found by a rod or ruler put into the veſſel at the orifice. Let the baſis of the caſk, at a medium, be found, which ſuppoſe to be the circle CKDL; and let the ſegment KCL be ſimilar to the ſegment GAH (which is either found by the rule of three, becauſe as the circle AGBH is to the circle CKDL, ſo is the ſegment GAH to the ſegment KCL; or is found from the tables of ſegments made by authors); and the product of this ſegment multiplied by the length of the caſk will give the liquid content remaining in the caſk.

PROPOSITION LII.

To find the ſolid content of a regular and ordinate body.—A tetraedron being a pyramid, the ſolid content is found by the 44th prop. The hexaedron, or cube, being a kind of priſm, it is meaſured by the 43d prop. An octaedron conſiſts of two pyramids of the ſame ſquare baſe and of equal heights; conſequently its meaſure is found by the 44th prop. A dodecaedron conſiſts of twelve pyramids having equal equilateral and equiangular pentagonal baſes; and ſo one of theſe being meaſured (by the 44th prop. of this) and multiplied by 12, the product will be equal to the ſolid content of the dodecaedron. The icoſiaedron conſiſts of 20 equal pyramids having triangular baſes; the ſolid content of one of which being found (by the 44th prop.) and multiplied by 20, gives the whole ſolid. The baſes and heights of theſe pyramids, if you want to proceed more exactly, may be found by trigonometry. See TRIGONOMETRY.

PROPOSITION LIII.

To find the ſolid content of a body however irregular.—Let the given body be immerſed into a veſſel of water, having the figure of a parallelopipedon or priſm, and let it be noted how much the water is raiſed upon the immerſion of the body. For it is plain, that the ſpace which the water fills, after the immerſion of the body, exceeds the ſpace filled before its immerſion, by a ſpace equal to the ſolid content of the body, however irregular. But when this exceſs is of the figure of a parallelopipedon or priſm, it is eaſily meaſured by the 43d prop. of this, *viz.* by multiplying the area of the baſe, or mouth of the veſſel, into the difference of the elevations of the water before and after immerſion. Whence is found the ſolid content of the body given.

In the ſame way the ſolid content of a part of a body may be found, by immerſing that part only in water.

There is no neceſſity to inſiſt here on diminiſhing or enlarging ſolid bodies in a given proportion. It will be eaſy to deduce theſe things from the 11th and 12th books of Euclid.

"The following rules are ſubjoined for the ready computation of the contents of veſſels, and of any ſolids in the meaſures in uſe in Great Britain.

"I. To find the content of a cylindric veſſel in Engliſh wine gallons, the diameter of the baſe and altitude of the veſſel being given in inches and decimals of an inch.

"Square the number of inches in the diameter of the veſſel; multiply this ſquare by the number of inches in the height: then multiply the product by the decimal fraction .0034; and this laſt product ſhall give the content in wine-gallons and decimals of ſuch a gallon. To expreſs the rule arithmetically; let D repreſent the number of inches and decimals of an inch in the diameter of the veſſel, and H the inches and decimals of an inch in the height of the veſſel; then the content in wine-gallons ſhall be $DDH \times \frac{34}{10000}$, or $DDH \times .0034$. *Ex.* Let the diameter $D = 51.2$ inches, the height $H = 62.3$ inches, then the content ſhall be $51.2 \times 51.2 \times 62.3 \times .0034 = 555.27.342$ wine-gallons. This rule follows from prop. 33 and 45. for, by the former, the area of the baſe of the veſſel is in ſquare inches $DD \times .7854$; and by the latter, the content of the veſſel in ſolid

"inches

inches is DDH$\times$.7854; which divided by 231 (the number of cubical inches in a wine-gallon) gives DDH $\times$ 0034, the content in wine-gallons. But though the charges in the excise are made (by statute) on the supposition that the wine-gallon contains 231 cubical inches; yet it is said, that in sale, 224 cubical inches, the content of the standard measured at Guildhall (as was mentioned above) are allowed to be a wine-gallon.

"II. Supposing the English ale-gallon to contain 282 cubical inches, the content of a cylindric vessel is computed in such gallons, by multiplying the square of the diameter of a vessel by its height as formerly, and their product by the decimal fraction .0,027,851: that is, the solid content in ale-gallons is DDH$\times$.0,027,851.

"III. Supposing the Scots pint to contain about 103.4 cubical inches, (which is the measure given by the standards at Edinburgh, according to experiments mentioned above), the content of a cylindric vessel is computed in Scots pints, by multiplying the square of the diameter of the vessel by its height, and the product of these by the decimal fraction 0076. Or the content of such a vessel in Scots pints is DDH$\times$.0076.

"Supposing the Winchester bushel to contain 2187 cubical inches, the content of a cylindric vessel is computed in those bushels by multiplying the square of the diameter of the vessel by the height, and the product by the decimal fraction .0,003,606. But the standard bushel having been measured by Mr Everard and others in 1696, it was found to contain only 2145.6 solid inches; and therefore it was enacted in the act for laying a duty upon malt, *That every round bushel, with a plain and even bottom, being* 18$\frac{1}{2}$ *inches diameter throughout, and* 8 *inches deep, should be esteemed a legal* Winchester *bushel.* According to this act (ratified in the first year of Queen Anne) the legal Winchester bushel contains only 2150.42 solid inches. And the content of a cylindric vessel is computed in such bushels, by multiplying the square of the diameter by the height, and their product by the decimal fraction .0,003,625. Or the content of the vessel in those bushels is DDH $\times$ .0,003,625.

"V. Supposing the Scots wheat firlot to contain 21$\frac{1}{4}$ Scots pints, (as is appointed by the statute 1618), and the pint to be conform to the Edinburgh standards above mentioned, the content of a cylindric vessel in such firlots is computed by multiplying the square of the diameter by the height, and their product by the decimal fraction .00,358. This firlot, in 1426, is appointed to contain 17 pints; in 1457, it was appointed to contain 18 pints; in 1587, it is 19$\frac{1}{4}$ pints; in 1628, it is 21$\frac{1}{4}$ pints: and though this last statute appears to have been founded on wrong computations in several respects; yet this part of the act that relates to the number of pints in the firlot seems to be the least exceptionable; and therefore we suppose the firlot to contain 21$\frac{1}{4}$ pints of the Edinburgh standard, or about 2197 cubical inches; which a little exceeds the Winchester bushel, from which it may have been originally copied.

"VI. Supposing the bear-firlot to contain 31 Scots pints, (according to the statute 1618), and the pint conform to the Edinburgh standards, the content of a cylindric vessel in such firlots is found by multiplying the square of the diameter by the height, and this product by .000,245.

"When the section of the vessel is not a circle, but an ellipsis, the product of the greatest diameter by the least, is to be substituted in those rules for the square of the diameter.

"VII. To compute the content of a vessel that may be considered as a *frustum* of a cone in any of those measures.

"Let A represent the number of inches in the diameter of the greater base, B the number of inches in the diameter of the lesser base. Compute the square of A, the product of A multiplied by B, and the square of B, and collect these into a sum. Then find the third part of this sum, and substitute it in the preceding rules in the place of the square of the diameter; and proceed in all other respects as before. Thus, for example, the content in wine-gallons is $\overline{AA \times AB \times BB} \times \frac{1}{3} \times H \times .0034$.

"Or, to the square of half the sum of the diameters A and B, add one third part of the square of half their difference, and substitute this sum in the preceding rules for the square of the diameter of the vessel; for the square of $\frac{1}{2}A \times \frac{1}{2}B$ added to $\frac{1}{3}$ of the square of $\frac{1}{2}A - \frac{1}{2}B$, gives $\frac{1}{3}AA \times \frac{1}{3}AB \times \frac{1}{3}BB$.

"VIII. When a vessel is a *frustum* of a parabolic conoid, measure the diameter of the section at the middle of the height of the *frustum*; and the content will be precisely the same as of a cylinder of this diameter, of the same height with the vessel.

"IX. When a vessel is a *frustum* of a sphere, if you measure the diameter of the section at the middle of the height of the *frustum*, then compute the content of a cylinder of this diameter of the same height with the vessel, and from this subtract $\frac{1}{3}$ of the content of a cylinder of the same height, on a base whose diameter is equal to its height; the remainder will give the content of the vessel. That is, if D represent the diameter of the middle section, and H the height of the *frustum*, you are to substitute DD$-\frac{1}{3}$HH for the square of the diameter of the cylindric vessel in the first six rules.

"X. When the vessel is a *frustum* of a spheroid, if the bases are equal, the content is readily found by the rule in p. 708. In other cases, let the axis of the solid be to the conjugate axis as n to 1; let D be the diameter of the middle section of the *frustum*, H the height or length of the *frustum*; and substitute in the first six rules $DD - \frac{HH}{3nn}$ for the square of the square of the diameter of the vessel.

"XI. When the vessel is an hyperbolic conoid, let the axis of the solid be to the conjugate axis as n to 1, D the diameter of the section at the middle of the *frustum*, H the height or length: compute $DD \times \frac{1}{3nn} \times HH$, and substitute this sum for the square of the diameter of the cylindric vessel in the first six rules.

"XII. In general, it is usual to measure any round vessel, by distinguishing it into several *frustums*, and

"taking the diameter of the section at the middle of each *frustum*; thence to compute the content of each, as if it was a cylinder of that mean diameter; and to give their sum as the content of the vessel. From the total content, computed in this manner, they subtract successively the numbers which express the circular areas that correspond to those mean diameters, each as often as there are inches in the altitude of the *frustum* to which it belongs, beginning with the uppermost; and in this manner calculate a table for the vessel, by which it readily appears how much liquor is at any time contained in it, by taking either the dry or wet inches; having regard to the inclination or drip of the vessel, when it has any.

"This method of computing the content of a *frustum* from the diameter of the section at the middle of its height, is exact in that case only when it is a portion of a parabolic conoid; but in such vessels as are in common use, the error is not considerable. When the vessel is a portion of a cone or hyperbolic conoid, the content by this method is found less than the truth; but when it is a portion of a sphere or spheroid, the content computed in this manner exceeds the truth. The difference or error is always the same, in the different parts of the same or of similar vessels, when the altitude of the *frustum* is given. And when the altitudes are different, the error is in the triplicate *ratio* of the altitude. If exactness be required, the error in measuring the *frustum* of a conical vessel, in this manner, is $\frac{1}{4}$ of the content of a cone similar to the vessel, of an altitude equal to the height of the *frustum*. In a sphere, it is $\frac{1}{3}$ of a cylinder of a diameter and height equal to the *frustum*. In the spheroid and hyperbolic conoid, it is the same as in a cone generated by the right-angled triangle, contained by the two semiaxes of the figure, revolving about that side which is the semiaxis of the *frustum*.

"In the usual method of computing a table for a vessel, by subducting from the whole content the number that expresses the uppermost area, as often as there are inches in the uppermost *frustum*, and afterwards the numbers for the other areas successively; it is obvious that the contents assigned by the table, when a few of the uppermost inches are dry, are stated a little too high, if the vessel stands on its lesser base, but too low when it stands on its greater base; because, when one inch is dry, for example, it is not the area at the middle of the uppermost *frustum*, but rather the area at the middle of the uppermost inch, that ought to be subducted from the total content, in order to find the content in this case.

"XIII. To measure round timber: Let the mean circumference be found in feet and decimals of a foot; square it; multiply this square by the decimal .079,577, and the product by the length. Ex. Let the mean circumference of a tree be 10·3 feet, and the length 24 feet. Then 10 3 × 10 3 × 079,577 × 24=202.615, is the number of cubical feet in the tree. The foundation of this rule is, that when the circumference of a circle is 1, the area is .0,795,774,715, and that the areas of circles are as the squares of their circumferences.

"But the common way used by artificers for measuring round timber, differs much from this rule. They call one fourth part of the circumference the *girt*, which is by them reckoned the side of a square, whose area is equal to the area of the section of the tree; therefore they square the *girt*, and then multiply by the length of the tree. According to their method, the tree of the last example would be computed at 159. 13 cubical feet only.

"How square timber is measured, will be easily understood from the preceding propositions. Fifty solid feet of hewn timber, and forty of rough timber, make a load.

"XIV. To find the burden of a ship, or the number of tons it will carry, the following rule is commonly given. Multiply the length of the keel taken within board, by the breadth of the ship within board, taken from the midship beam from plank to plank, and the product by the depth of the hold, taken from the plank below the keelson to the under part of the upper-deck plank, and divide the product by 94, the quotient is the content of the tonnage required. This rule however cannot be accurate; nor can one rule be supposed to serve for the measuring exactly the burden of ships of all sorts. Of this the reader will find more in the Memoirs of the Royal Academy of Sciences at Paris, for the year 1721.

"Our author having said nothing of weights, it may be of use to add briefly, that the English Troy-pound contains 12 ounces, the ounce 20 penny-weight, and the penny-weight 24 grains; that the Averdupois pound contains 16 ounces, the ounce 16 drams, and that 112 pounds is usually called the hundred weight. It is commonly supposed, that 14 pounds Averdupois are equal to 17 pounds Troy. According to Mr Everard's experiments, 1 pound Averdupois is equal to 14 ounces 12 penny-weight and 16 grains Troy, that is, to 7000 grains; and an Averdupois ounce is $437\frac{1}{2}$ grains. The Scots Troy-pound (which, by the statute 1718, was to be the same with the French) is commonly supposed equal to $15\frac{3}{4}$ ounces English Troy, or 7560 grains. By a mean of standards kept by the Dean of Guild at Edinburgh, it is $7599\frac{3}{32}$ or 7600 grains. They who have measured the weights which were sent from London, after the union of the kingdoms, to be the standards by which the weights in Scotland should be made, have found the English Averdupois pound (from a medium of the several weights) to weigh 7000 grains, the same as Mr Everard; according to which, the Scots, Paris, or Amsterdam-pound, will be to the pound Averdupois as 38 to 35. The Scots Troy-stone contains 16 pounds, the pound 2 marks or 16 ounces, an ounce 16 drops, a drop 36 grains. Twenty Scots ounces make a Tron pound; but because it is usual to allow one to the score, the Tron pound is commonly 21 ounces. Sir John Skene, however, makes the Tron stone to contain only $19\frac{1}{2}$ pounds."

GEORGE,

GEORGE, or *Knights of St* GEORGE, has been the denomination of ſeveral military orders, whereof that of the garter is one of the moſt illuſtrious. See GARTER.

St GEORGE *del Mina*, the capital of the Dutch ſettlements, on the gold-coaſts of Guinea, ſituated ſeven or eight miles weſt of Cape-coaſt caſtle, the capital of the Britiſh ſettlements there: W. long. 5′, and N. lat. 5°.

Fort St GEORE, a town and fort on the coaſt of Cormandel, in the Hither India: E. long. 80°, and N. lat. 13°.

The town is divided into the White and Black town. The fort, and White-town, which adjoins to it, are inhabited only by Britiſh; the whole circumference, which is not above half a mile, being ſurrounded by a ſtone wall. The outward, or Black town, called Madraſs, has been lately encompaſſed by a ſtone-wall and baſtions, and is about a mile and a half in circumference; the whole being almoſt environed by a river and the ſea.

St GEORGE'*s*, the largeſt of the Bermuda, or Summer-iſlands.

Croſs of St GEORGE, a red one in a field argent, which makes part of the Britiſh ſtandard.

GEORGIA, in Aſia, a province bounded by Circaſſia and Dageſtan on the north, by the Caſpian ſea on the eaſt, by Armenia or Turcomania on the ſouth, and by Mingrelia on the weſt.

GEORGIA, in America, one of the Britiſh plantations, taken out of South-Carolina, from which it is ſeparated by the river Savannah on the north, and bounded by the Atlantic ocean on the eaſt, by the river of St John, which divides it from Spaniſh Florida, on the ſouth and weſt.

GEORGIC, a poetical compoſition upon the ſubject of huſbandry, containing rules therein, put into a pleaſing dreſs, and ſet off with all the beauties and embelliſhments of poetry.

Heſiod and Virgil are the two greateſt maſters in this kind of poetry.

The moderns have produced nothing in this kind, except Rapin's book of Gardening, and the celebrated poem entitled Cyder by Mr Philips, who, if he had enjoyed the advantage of Virgil's language, would have been ſecond to Virgil in a much nearer degree.

GERANITES, in natural hiſtory, an appellation given to ſuch of the ſemipellucid gems as are marked with a ſpot reſembling a crane's eye.

GERANIUM, CRANE'S BILL, in botany, a genus of the monodelphia decandria claſs. It has but one ſtylus; the ſtigmata are five; and the capſule is ſhaped like the bill of a crane. There are fifty-ſeven ſpecies, ſixteen of which are natives of Britain, *viz.* the cicutarium, or hemlock-leaved crane's bill; the maſchatum, or muſhed crane's bill; the maritimum, or ſea crane's bill; the nodoſum, or knotty crane's bill; the phœum, or ſpotted crane's bill; the ſylvaticum, or mountain crane's bill; the pratenſe, or crowfoot crane's bill; the robertianum, or herb Robert; the lucidum, or ſhining dove's-foot crane's bill; the rotundifolium, or round-leaved crane's bill; the perenne, or perennial dove's-foot crane's bill; the molle, or common dove's-foot crane's bill; the puſillum, or ſmall flowered dove's-foot crane's bill; the columbinum, or long ſtalked dove's foot crane's bill; the diſſectum, or jagged-leaved dove's-foot crane's bill; and the ſanguineum, or bloody crane's bill. The leaves of the robertianum and pratenſe were formerly uſed as aſtringents, but are now left out both of the London and Edinburgh diſpenſatories.

GERARDIA, in botany, a genus of the didynamia angioſpermia claſs. The calyx conſiſts of five ſegments; the corolla is bilabiated, the inferior lip being divided into three parts; the lobes are emarginated, the middle one being divided into two ſegments; and the capſule is bilocular, and opens at the baſe. There are five ſpecies, none of them natives of Britain.

GERFALCON, or GYRFALCON. See FALCO.

GERGENTUM, a town of Sicily, the Agrigentum of the ancients, about fifty five miles ſouth-eaſt of Palermo: E. long. 13° 30′, N. lat. 37° 20′.

GERMAINS, or *St* GERMAINS, a town and royal palace of France, fourteen miles north-weſt of Paris.

St GERMAINS is alſo a borough of Cornwal, eight miles weſt of Plymouth. It ſends two members to parliament.

GERM, among gardeners. See BUD.

GERMAN, in genealogy, denotes entire or whole: thus, a brother-german is one both by the father's and mother's ſide; and couſins german are the children of brothers or ſiſters.

GERMAN, or GERMANIC, alſo denotes any thing belonging to Germany; as the German empire, German flute, *&c.*

GERMANDER, in botany. See TEUCRIUM.

GERMANY, an extenſive empire of Europe, ſituated between 5° and 19° E. long. and between 45° and and 55° N. lat.; bounded by Denmark and the Baltic ſea on the north, by Poland and Hungary on the eaſt, by Switzerland and the Alps on the ſouth, and by France, Holland, *&c.* on the weſt.

It is divided into ten circles, three of which lie on the north, *viz.* Upper and Lower Saxony, and Weſtphalia; three on the ſouth, *viz.* Auſtria, Bavaria, and Swabia; three about the middle, *viz* Franconia, and the Upper and Lower Rhine; the tenth, which conſiſted of the duchy of Burgundy and the ſeventeen provinces of the Netherlands, have long been detached from the empire.

There are in Germany upwards of three hundred ſovereign princes and ſtates, moſt of them arbitrary in their reſpective territories.

GERMEN, or GERM. See BUD.

GERMERSHEIM, a town of Germany, ſubject to France, about ten miles eaſt of Landau: E. long. 8° 15′, and N. lat. 49° 12′.

GERMINATION, the firſt ſprouting of the ſeeds of plants. See AGRICULTURE, Part I.

GERONTES, in Grecian antiquity, a ſort of magiſtrates of ancient Sparta, anſwering to the areopagites at Athens.

GERTRUDENBURG, a fortified town of the united Netherlands, in the province of Holland, nine miles north of Breda; subject to the prince of Orange.

GERUND, in grammar, a verbal noun of the neuter gender, partaking of the nature of a participle, declinable only in the singular number, through all the cases except the vocative; as, nom. *amandum*, gen. *amandi*, dat. *amando*, accus. *amandum*, abl. *amando*.

GESNERIA, in botany, a genus of plants, of the didynamia class. The calix rests upon the germen, and consists of five segments; the corolla is bent inwards and backwards; the capsule is below the flower, and bilocular. There are three species, none of them natives of Britain.

GESTATION, among physicians. See PREGNANCY.

GESTRICIA, a province of Sweden, bounded by Helsingia on the north, by the Bothnic gulph on the east, by Upland on the south, and by Dalecarlia on the west.

GESTURE, in rhetoric, consists chiefly in the proper action of the hands and face.

CETHYLLIS, in botany, a genus of the decandria-monogynia class. The calix is a spatha; the corolla consists of six segments; and the capsule has three cells. There is but one species, a native of Africa.

GEVAUDAN, a territory of Languedoc, adjoining to the Cevennes.

GEUM, in botany, a genus of the icosandria-pentagynia class. The calix has eight segments; the petals are eight; and the seeds are hairy and caudated. There are five species, two of which are natives of Britain, *viz.* the urbanum, or common avens; and the the rivale, or water avens. The root of the avens is sometimes used as a stomachic.

GHENT, or GAUNT, a city and capital of Flanders, thirty miles north west of Brussels: E. long. 3° 36′, N. lat. 51°.

It is a large fortified town, twelve miles in circumference, and defended by a citadel; and yet is a place of no great strength, by reason of the vast extent of ground it takes in.

GIAGH, in chronology, a cycle of twelve years; in use among the Turks and Cathayans.

Each year of the giagh bears a name of some animal: the first, that of a mouse; the second, that of a bullock; the third, of a lynx or leopard; the fourth, of a horse; the fifth, of a crocodile; the sixth, of a serpent; the seventh, of a horse; the eighth, of a sheep; the ninth, of a monkey; the tenth, of a hen; the eleventh, of a dog; and the twelfth, of a hog.

They also divide the day into twelve parts, which they call giaghs, and distinguish them by the name of some animals. Each giagh contains two of our hours, and is divided into eight kehs, as many as there are quarters in our hours.

GIALLOLINO, in natural history, a heavy, friable, fine, yellow ochre, called Naples yellow, and much used among painters, who esteem it a very fine colour.

GIANT'S CAUSEWAY, a vast collection of a black kind of marble, called basaltes, in the county of Antrim, in Ireland. See BASALTES.

GIBBOUS, a term in medicine, denoting any protuberance or convexity of the body, as a person haunched, or hump backed.

GIBBOUS, in astronomy, a term used in reference to the enlightened parts of the moon, whilst she is moving from the first quarter to the full, and from the full to the last quarter: for all that time the dark part appears horned, or falcated; and the light one hunched out, convex, or gibbous.

GIBELINS, GIBELLINS, a famous faction in Italy, opposite to another called the Guelphs.

These two factions ravaged and laid waste Italy for a long series of years, so that the history of that country, for the space of two centuries, is no more than a detail of their mutual violences and slaughters. The Gibelins stood for the emperor against the pope: but concerning their origin and the reason of their names, we have but a very obscure account. According to the generality of authors, they rose about the year 1240, upon the emperor Frederick II.'s being excommunicated by the pope Gregory IX. Other writers maintain, that the two factions arose ten years before, though still under the same pope and emperor. But the most probable opinion is that of Maimbourg, who says, that the two factions of Guelphs and Gibellins arose from a quarrel between two ancient and illustrious houses on the confines of Germany, that of the Henries of Gibeling, and that of the Guelphs of Adorf.

GIBRALTAR, a port-town of Andalusia, in Spain, subject to Great Britain: W. long. 6°, and N. lat. 36°.

It stands at the foot of mount Calpe, one of Hercules's pillars, about sixteen miles north of Ceuta, in Africa, from which it is divided by the Streights, to which it gives name. It is built on a rock, in a peninsula, and can only be approached on the land-side by a very narrow passage between the mountain and the sea: cross this passage the Spaniards have drawn a line, and fortified it, to prevent the garrison's having any communication with the country.

The Straits of Gibraltar are about twenty-four miles long, and fifteen broad.

GIFT, in Scots law. See DONATION.

GIGG, or JIGG, in music, denotes a brisk and lively air; or an airy kind of dance to a sprightly measure.

GILAN, a province of Persia, bounded by the Caspian Sea on the north. Its capital is a city of the same name: E long. 48°, and N. lat. 37°.

GILBERTINES, a religious order founded in England by St Gilbert, in the reign of Henry I. The nuns followed the rule of St Benedict, and the monks that of Augustin. There were many monastries of this order in different parts of England.

GILDING, the art of spreading or covering a thing with gold, either in leaf or liquid.

We have this advantage over the ancients, in the manner of using and applying the gold, that the secret of painting in oil, lately discovered, furnishes us with means of gilding works, capable of enduring all the violence of time and weather, which theirs could not.

There

There are ſeveral methods of gilding in uſe among us, as gilding in water, gilding in oil, gilding by fire, &c.

The method of water- GILDING. Water-gilding requires more preparation than oil gilding, and is chiefly on wooden works, and thoſe made of ſtucco; and theſe too muſt be ſheltered from the weather. A ſize is uſed for this way of gilding made of ſhreds, &c. of parchment or gloves boiled in water to the conſiſtence of a jelly. If the thing to be gilt be of wood, it is firſt waſhed with this ſize, boiling hot, and then ſet to dry; and afterwards with white paint mixed up with the ſame ſize. Some uſe Spaniſh white for this purpoſe, and others plaſter of Paris, well beaten and ſifted. This ſized paint muſt be laid on with a ſtiff bruſh; which is to be repeated ſeldomer or oftener according to the nature of the work, as ten or twelve times in flat or ſmooth works; but ſeven or eight times will be ſufficient in pieces of ſculpture. In the former caſe they are applied by drawing the bruſh over the work, in the latter by daubing it. When the whole is dry, they moiſten it with fair water, and rub it over with ſeveral pieces of coarſe linen, if it be on the flat; if not, they beat or ſwitch it with ſeveral ſlips of the ſame linen, tied to a little ſtick, to make it follow and enter all the cavities and depreſſures thereof.

Having thus finiſhed the white, the next thing to be done, is to colour it with yellow ochre: but if it be a piece of ſculpture in relievo, they firſt touch it up, and prepare the ſeveral parts, which may have happened to have been disfigured, by the ſmall iron inſtruments, as gouges, chiſſels, &c. The ochre uſed for this purpoſe muſt be well ground and ſifted, and mixed up with the ſize before-mentioned. This colour is to be laid on hot; and in works of ſculpture, ſupplies the place of gold, which ſometimes cannot be carried into all the depreſſures and cavities of the foliages and ornaments. A lay is alſo applied over this yellow, which ſerves for the ground on which the gold is to be laid: this lay is uſually compoſed of Armenian bole, bloodſtone, black-lead, and a little fat; to which ſome add ſoap, and oil of olives; others, burnt bread, biſtre, antimony, glaſs of tin, butter, and ſugar-candy. Theſe ingredients being all ground down together with hot ſize, three lays of this compoſition is applied upon the yellow, the one after the other has been dried; being cautious not to put any into the cavity of the work to hide the yellow.

The bruſh uſed for this purpoſe, muſt be a ſoft one; and when the matter is become very dry, they go over it again with a ſtronger bruſh, to rub it down, and take off the ſmall grains that ſtick out, in order to facilitate the burniſhing of the gold.

To be prepared for gilding, you muſt have three ſorts of pencils; one to wet, another to touch up and amend, and a third to flatten; alſo a gilding cuſhion, for ſpreading the leaves of gold on when taken out of the book; a knife to cut them, and a ſquirrel's tail fitted with a handle; or elſe a piece of fine ſoft ſtuff on a ſtick, to take them up directly and apply them. You are firſt to begin with wetting your pencils; by which the laſt lay laid on with water is moiſtened, that it may the better receive and retain the gold. Then you are to lay the leaves of gold on the cuſhion; and if whole, you muſt take up with the ſquirrel's tail, but, if in pieces, with the other inſtrument, or the knife wherewith they are cut, and lay and ſpread them gently on the parts of the work you had moiſtened before. If the leaves, as they frequently do, happen to crack or break in laying on, theſe breaches muſt be made up with ſmall bits of leaf, taken up upon the repairing pencil, and the whole work is to be ſmoothed either with the ſame pencil, or another ſomething larger; the gold being preſſed into the dents, into which it could not be ſo eaſily carried by the ſquirrel's tail.

The work having been thus far gilded, muſt be ſet to dry, in order to be burniſhed and flatted. See BURNISHING.

The laſt operation is the applying the vermeil in all the little lines and cavities; and to ſtop and amend any little faults with ſhell-gold. The compoſition called of vermeil is made of gum guttæ, vermilion, and a little of ſome ruddy-brown, ground together with venetian varniſh and oil of turpentine. Some gilders, inſtead of this, make ſhift with fine lacca, or dragon's blood, with gum-water.

Sometimes, inſtead of burniſhing the gold, they burniſh the ground or compoſition laid on the laſt before it, and only afterwards waſh the part over with the ſize. This method is chiefly practiſed for the hands, face, and other nudities in relievo: which, by this means, do not appear ſo very brilliant as the parts burniſhed, though much more ſo than the parts perfectly flat.

To gild a piece of work, and yet preſerve white grounds, they apply a lay of Spaniſh white, mixed with a weak fiſh-glue, on all the parts of the ground, whereon the yellow or the laſt lay might run.

The method of GILDING *in oil.* This operation requires much leſs apparatus than that before-mentioned. The baſis or matter whereon the gold is laid, in this method, is the remains of colours found ſettled to the bottom of the pots in which painters waſh their pencils. This matter, which is very viſcid or ſticky, is firſt ground, and then paſſed through a linen-cloth, and thus laid on the matter to be gilt, after it is waſhed once or twice over with ſize; and if it be wood, with ſome white paint.

When this is almoſt dry, but yet is ſtill unctuous enough to catch and retain the gold, the leaf-gold is laid on, either whole, if the work be large, or cut to pieces, if ſmaller: the leaves of gold are taken up and laid on with a piece of fine, ſoft, well carded cotton; or ſometimes by a pallet for the purpoſe, or ſometimes with the knife with which the leaves were cut, according to the parts of the work that are to be gilded, or the breadth of the gold that is to be laid on. As the gold is laid on, they paſs over it a coarſe ſtiff pencil bruſh, to make it ſtick and as it were incorporate with the ground; and after this they mend any cracks that may

may have happened in it, either with the fame pencil or one that is fmaller, as has been fhewn before in water-gilding.

This kind of gilding is chiefly ufed for domes and roofs of churches, courts, banquetting-houfes, *&c.* and for figures of plafter of Paris, lead, *&c.*

The method of GILDING *with liquid gold.* This is performed by gold reduced to a calx and amalgamated with mercury, in the proportion of about an ounce of mercury to a dram of gold. To perform this, they heat a crucible red hot, and then put the gold and mercury into it, ftirring them gently about till the gold be found melted, and incorporated into a mafs with the mercury. When this is done, they caft them into water, to wafh and purify them; and out of that into other waters, where the amalgama, which is almoft as liquid as if there were nothing but quickfilver in it, may be preferved a long time for ufe.

Before they proceed to lay this amalgamated gold on the metal, they firft render the metal rough, by wafhing it over with aqua fortis, or aqua fecunda; and afterwards rinfe the metal in fair water, and fcour it a little with fine fand, and then it is ready for the gold.

They next cover over the metal with the mixture of gold and mercury, taking it up with a flip of copper, or a brufh made of brafs-wire, fpreading it as even as poffible, to do which they wet the brufh from time to time in fair water. Then they fet the metal to the fire, upon a grate, or in a fort of cage, under which ftands a pan of coals; and in proportion as the mercury, evaporating and flying off, difcovers the places where gold is wanting, they take care to fupply them by adding new parcels of amalgama.

Then the work is rubbed over with the wire-brufh, dipt in beer or vinegar, which leaves it in a condition to be brought to a colour which is the laft part of the procefs, and which the gilders keep to themfelves as a mighty fecret.

The method of GILDING *by fire on metal.* To prepare the metal, they fcratch it well, or rake it; then polifh it with a polifher; and afterwards fet it to the fire to blue, *i. e.* to heat, till it appear of a blue colour. When this has been done, they clap on the firft lay of leaf-gold, rubbing it lightly down with a polifher; and expofe it thus to a gentle fire. They ufually give it but three fuch lays, or four at the moft, each lay confifting of a fingle leaf for common works, and of two for extraordinary ones: after each lay, it is fet a-frefh to the fire; and after the laft lay, the gold is in condition to be burnifhed.

To gild paper. Grind bole-armoniac (with rain-water, and give one laying of it; when it is dry, take glair of eggs, and add to it a little fugar-candy and gum-water, which lay over the former; and upon this, when it is dry enough, lay leaf-filver, or leaf gold.

To gild the leaves of books. Take bole-armoniac, eight penny-weight; fugar-candy, two penny-weight: mix and grind them with glair of eggs: then on a bound book (while it is in the prefs, after it hath been fmeared with glair of eggs, and is dried) fmear the faid compofition; let it dry, then rub it well and polifh it; then with fair water wet the edges of the book, and fuddenly lay on the gold, prefs it down gently with cotton, let it dry, and then polifh it with a tooth.

GILL, a meafure of capacity, containing a quarter of an Englifh pint.

GILLS, in ichthyology. See BRANCHIÆ.

GILOLO, a large ifland of the pacific ocean, lying between 1° S. lat. and 2° N. lat. and between 125° and 128° E. long.

GILOLO is alfo the name of the capital of the above ifland, fituated in 40′ N. lat.

GIN, in mechanics, a machine for driving piles, fitted with a windlafs and winches at each end, where eight or nine men heave, and round which a rope is reeved that goes over the wheel at the top: one end of this rope is feized to an iron-monkey, that hooks to a beetle of different weights, acccording to the piles they are to drive, being from eight to thirteen hundred weight; and when hove up to a crofs-piece, near the wheel, it unhooks the monkey, and lets the beetle fall on the upper end of the pile, and forces the fame into ground: then the monkey's own weight over-hauls the windlafs, in order for its being hooked again to the beetle.

GINGEN, an imperial city of Germany, twenty miles E. of Ulm: E. long. 10°, and north lat. 48° 36′.

GINGER, the root of a fpecies of amomum, too well known to need any defcription: It is a very ufeful fpice in cold flatulent colics, and in laxity and debility of the inteftines.

GINGLYMUS, in anatomy. See ANATOMY, p. 149.

GINSENG, a fmall root brought from North America, and fometimes from China. It has a fweet tafte, accompanied with a flight bitterifhnefs and warmth. The Chinefe look upon it as an univerfal reftorative in all decays.

GIRONNE, a large city and bifhop's fee of Spain, in the province of Catalonia, forty-five miles north-eaft of Barcelona: E. long. 2° 35′, and N. lat. 32°.

GIRONNE′, or GIRONNY, in heraldry, a coat of arms divided into girons, or triangular figures, meeting in the centre of the fhield, and alternately colour and metal. See Plate XCVII. fig 5.

GISBORN, a market-town of Yorkfhire, fifty miles weft of York.

GISBOROUGH, another market-town of Yorkfhire, thirty-feven miles north of York.

GISORS, a city of Normandy in France, twenty-eight miles fouth-eaft of Rouen: E. long. 1° 25′, N. lat. 50° 10′.

GLACIS, in building, an eafy infenfible flope or declivity.

The defcent of the glacis is lefs fteep than that of the talus. In gardening, a defcent fometimes begins in talus, and ends in glacis.

The glacis of the corniche, is an eafy imperceptible flope in the cymatium, to promote the defcent and draining off the rain-water.

GLACIS, in fortification, that mafs of earth which ferves

as

as a parapet to the covered way, ſloping eaſily towards the champain or field.

GLADDON. See Iris.

Glade, in gardening and agriculture, an opening and light paſſage made through a wood, by lopping off the branches of trees along that way.

GLADIATORS, in antiquity, perſons who fought generally in the arena at Rome, for the entertainment of the people.

The gladiators were uſually ſlaves, and fought out of neceſſity; though ſometimes freemen made profeſſion thereof, like our prize fighters, for a livelihood. The Romans borrowed this cruel diverſion from the Aſiatics; and we find that the very high-prieſts had their ludi pontificales, and ludi ſacerdotales. As from the earlieſt ages of antiquity we read that it was cuſtomary to ſacrifice priſoners of war to the manes of the great men that fell in the engagement; in proceſs of time they came to ſacrifice ſlaves at the funerals of all perſons of condition; but as it would have appeared barbarous to cut their throats like beaſts, they were appointed to fight with each other, and do their beſt to ſave their own lives by killing their adverſary.

Hence aroſe the maſters of arms called laniſtæ, and and men learned to fight. Theſe laniſtæ bought ſlaves to train up to this cruel trade, whom they afterwards ſold to ſuch as had occaſion to exhibit ſhews. Junius Brutus, who expelled the kings, was the firſt that honoured the funeral of his father with theſe inhuman diverſions at the ſepulchre of the deceaſed; but afterwards they were removed to the circus and amphitheatres; and other perſons, beſides ſlaves, would hire themſelves to this infamous office.

They were all firſt ſworn that they would fight till death; and if they failed, they were put to death, either by fire, ſwords, clubs, whips, *&c.* It was uſual with the people, or emperor, to grant them life when they ſhewed no ſigns of fear. Auguſtus decreed that it ſhould always be granted them.

From ſlaves and freed men, the wanton ſport ſpread to perſons of rank, as we find in Nero's time. And Domitian exhibited combats of women in the night-time: we alſo read, that dwarfs encountered with one another. Conſtantine the Great firſt prohibited theſe combats in the Eaſt; but the practice was not entirely aboliſhed in the Weſt before Theodoric king of the Oſtrogoths, in the year 500.

When any perſon deſigned to entertain the people with a ſhow of gladiators, he ſet up bills in the public places, giving an account of the time, the number and names of the combatants, and the circumſtances whereby they were to be diſtinguiſhed; each having his ſeveral badge, which generally was a peacock's feather: they alſo gave notice what time the ſhow would laſt; and ſometimes gave repreſentations of theſe things in painting, as is practiſed among us, by thoſe who have any thing to ſhow at fairs, *&c.*

Upon the day appointed for the ſhow, in the firſt place the gladiators were brought out all together, and obliged to take a circuit round the arena in a very ſolemn and pompous manner. After this they proceeded, *paria componere*, to match them by pairs, in which great care was taken to make the matches equal. The firſt ſort of weapons they made uſe of were ſtaves, or wooden files, called rudes; and the ſecond were effective weapons, as ſwords, poinards, *&c.*

The firſt were called *arma luſoria*, or *exercitoria;* the ſecond, *decretoria*, as being given by decree or ſentence of the prætor, or of him at whoſe expence the ſpectacle was exhibited.

They began to fence or ſkirmiſh with the firſt, which was to be the prelude to the battle; and from theſe, when well warmed, they advanced to the ſecond, with which they fought naked. The firſt part of the engagement was called *ventilare*, *præludere;* and the ſecond *dimicare ad certum*, or *verſis armis pugnare.*

When any received a remarkable wound, either his adverſary or the people uſed to cry out, *Habet*, or, *Hoc habet.* If the vanquiſhed ſurrendered his arms, it was not in the victor's power to grant him life: it was the people during the time of the republic, and the prince or people during the time of the empire, that were alone empowered to grant this boon. The two ſigns of favour and diſlike given by the people were, *premere pollicem*, and *vertere pollicem*; the former of which M. Dacier takes to be a clenching of the fingers of both hands between one another, and ſo holding the two thumbs upright cloſe together, was a ſign of the peoples admiration of the courage ſhewn by both combatants; and at the ſame time for the conqueror to ſpare his antagoniſt's life: but the contrary motion, or bending back of the thumbs, ſignified the diſſatiſfaction of the ſpectators, and authoriſed the victor to kill the other combatant downright for a coward. The emperor ſaved whom he liked, if he was preſent at the ſolemnity, in the ſame manner.

After the engagement, ſeveral marks of favour were conferred on the victor, particularly a branch of palm-tree; and oftentimes a ſum of money, perhaps gathered up among the ſpectators: but the moſt common rewards were the pileus and the rudis; the former being given only to ſuch gladiators as were ſlaves, for a token of obtaining their freedom; but the rudis ſeems to have been beſtowed both on ſlaves and freemen, with this difference, that it procured the former no more than a diſcharge from any further performance in public, upon which they commonly turned laniſta: but the rudis, when given to ſuch perſons as, being free, had hired themſelves out for theſe ſhows, reſtored them to a full enjoyment of their liberty. See Pileus, Rudis and Lanista.

GLADIOLUS, in botany, a genus of the triandria monogynia claſs. The corolla is ringent, and divided into ſix parts. There are ten ſpecies, none of them natives of Britain.

GLAMA. See Camelus.

GLAMORGANSHIRE, a county of South Wales, bounded by Brecknockſhire on the north, and by the Briſtol channel on the ſouth. Its capital is Landaff.

GLAND, in anatomy. See Anatomy, p. 307.

GLANDERS,

GLANDERS. See FARRIERY, p. 557.

GLANS, in anatomy. See ANATOMY, p. 270.

GLARIS, the capital of one of the cantons of Switzerland, of the ſame name, the inhabitants of which are both proteſtant and popiſh: it is ſituated thirty-five miles ſouth-eaſt of Zurich, in E. long. 9°, and N. lat. 47°.

GLASGOW, a large city of Scotland, in the ſhire of Lanerkſhire, or Clydeſdale, ſituated on the river Clyde, twenty miles north-weſt of Lanerk, and forty miles weſt of Edinburgh, in 4° 8′, W. long. and 55° 5′, N. lat.

This is one of the moſt elegant towns in Scotland. It has an univerſity, and a good foreign trade.

GLASS, a tranſparent, brittle, factitious body, produced by the action of fire upon a fixt ſalt and ſand, or ſtone, that readily melts.

The chemiſts hold, that there is no body but may be vitrified, or converted into glaſs; being the laſt effect of fire, as all its force is not able to carry the change of any natural body beyond its vitrification.

When or by whom the art of making glaſs was firſt found out is uncertain: ſome will have it invented before the flood; but without any proof. Neri traces the antiquity of this art as far back as the time of Job: but Dr Merret will have it as ancient as either pottery, or the making of bricks: becauſe that a kiln of bricks can ſcarce be burnt, or a batch of pottery be made, but ſome of the bricks and the ware will be at leaſt ſuperficially turned to glaſs; ſo that it muſt have been known at the building of Babel, and as long before as the making of bricks was uſed. It muſt have been known, conſequently, among the Egyptians, when the Iſraelites were employed by them in making bricks. Of this kind, no doubt, was that foſſil glaſs mentioned by Ferrant. Imperat. to be found under-ground in places where great fires had been. The Egyptians indeed boaſt, that this art was taught them by the great Hermes. Ariſtophanes, Ariſtotle, Alexander Aphrodiſæus, Lucretius, and John the divine, put us out of all doubt that glaſs was in uſe in their days.

Pliny relates, that it was firſt diſcovered accidentally in Syria, at the mouth of the river Belus, by certain merchants driven thither by a ſtorm at ſea, who, being obliged to continue there, and dreſs their victuals, by making a fire on the ground, where there was great plenty of the herb kali; that plant burning to aſhes, its ſalts mixed and incorporated with ſand, or ſtones fit to vitrify, and produced glaſs: that this accident being known, the people of Sidon, in that neighbourhood, aſſayed the work, improved the hint, and brought it into uſe; and that this art has been improving ever ſince.

Venice, for many years, excelled all Europe in the fineneſs of its glaſſes; but of late the French and Engliſh have excelled in the Venetians, ſo that we are no longer ſupplied with this commodity from abroad.

Nature and characters of GLASS. Naturaliſts are divided in what claſs of bodies to rank glaſs: ſome making it a concrete juice; others a ſtone; others again rank it among ſemi-metals; but Dr Merret obſerves, that theſe are all natural productions, whereas glaſs is a factitious compound, produced by fire, and never found in the earth, but only the ſand and ſtone that form it: that metals are formed by nature into certain ſpecies; and that fire only produces them, by its faculty of ſeparating heterogeneous, and uniting homogeneous bodies: whereas it produces glaſs, by uniting heterogeneous matter, *viz.* ſalt and ſand, of both which it evidently conſiſts; 100 ℔ weight of ſand yielding above 150 ℔ of glaſs.

The ſame learned doctor gives us a preciſe and accurate enumeration of the ſeveral characters, or properties of glaſs, whereby it is diſtinguiſhed from all other bodies, *viz* 1. That it is an artificial concrete of ſalt and ſand, or ſtones. 2. Fuſible by ſtrong fire. 3. When fuſed, tenacious and coherent. 4. It does not waſte nor conſume in the fire. 5. When melted, it cleaves to iron. 6. When it is red hot, it is ductile, and may be faſhioned into any form; but not malleable; and capable of being blown into a hollowneſs, which no mineral is. 7. Frangible when thin, without annealing. 8. Friable, when cold. 9. Diaphanous, whether hot or cold. 10. Flexible and elaſtic. 11. Diſſoluble by cold and moiſture. 12. Only capable of being graven or cut with a diamond, or other hard ſtone and emery. 13. Receives any dye or colour both externally and internally. 14. Not diſſoluble by aqua fortis, aqua regia, or mercury. 15. Neither acid juices nor any other matter extract either colour, taſte, or any other quality from it. 16. Admits of poliſhing. 17. Neither loſes weight nor ſubſtance by the longeſt and moſt frequent uſe. 18. Gives fuſion to other metals, and ſoftens them. 19. The moſt pliable thing in the world, and that which beſt retains the faſhion given it. 20. Not capable of being calcined. 21. An open glaſs being filled with water in the ſummer time, will gather drops of water on the outſide, juſt ſo far as the water on the inſide reaches; and a perſon's breath blown on it will manifeſtly moiſten it. 22. Little glaſs balls filled with water, mercury, and other liquor, and thrown into the fire, as alſo drops of green glaſs being broken, will fly aſunder with a great noiſe. 23. Neither wine, beer, nor any other liquor, will make it muſty, or change its colour, or ruſt it. 24. It may be cemented, as ſtones and metals. 25. A drinking glaſs, partly filled with water, and rubbed on the brim with a wet finger, yields muſical notes, higher or lower as the glaſs is more or leſs full, and will make the liquor friſk and leap.

Materials for making of GLASS. The materials whereof glaſs is made, we have already mentioned to be ſalt and ſand, or ſtones. The ſalt here uſed, is procured from a ſort of aſhes, brought from the Levant, called polverine, or rochetta; which aſhes are thoſe of a ſort of water-plant, called kali, cut down in ſummer, dried in the ſun, and burnt in heaps, either on the ground, or on iron grates; the aſhes falling into a pit, grow into a hard maſs, or ſtone, fit for uſe.

To extract the ſalt, theſe aſhes, or polverine, are powdered and ſifted, then put into boiling water, and there kept till one third of the water be conſumed; the whole

whole being ftirred up, from time to time, that the afhes may incorporate with the fluid, and all its falts be extracted: then the veffel is filled up with new water, and boiled over again, till one half be confumed; what remains is a fort of lee, ftrongly impregnated with falt. This lee, boiled over again in frefh coppers, thickens in about twenty-four hours, and fhoots its falt; which is to be ladled out, as its fhoots, into earthern pans, and thence into wooden fats to drain and dry. This done, it is grofly pounded, and thus put in a fort of oven, called calcar, to dry. It may be added, that there are other plants, befides kali, which yield a falt fit for glafs: fuch are the alga, or fea weed, the common way-thiftle, bramble, hops, wormwood, woad, tobacco, fern, and the whole leguminous tribe, as peafe, beans, *&c.*

The fand or ftone, called by the artifts Tarfo, is the fecond ingredient in glafs, and that which gives it the body and firmnefs. Thefe ftones, Agricola obferves, muft be fuch as will fufe; and of thefe fuch as are white and tranfparent are beft; fo that cryftal challenges the precedency of all others.

At Venice they chiefly ufe a fort of pebble, found in the river Tefino, refembling white marble, and called cuogolo. Indeed Ant. Neri affures us, that all ftones which will ftrike fire with fteel, are fit to vitrify: but Dr Merret fhews, that there are fome exceptions from this rule. Flints are admirable; and when calcined, powdered, and fearched, make a pure white cryftalline metal: but the expence of preparing them makes the mafters of our glafs-houfes fparing of their ufe. Where proper ftones cannot be fo conveniently had, fand is ufed; which fhould be white, and fmall, and well wafhed, before it be applied: fuch is ufually found in the mouths and fides of rivers. Our glafs-houfes are furnifhed with a fine fand for cryftal, from Maidftone; the fame with that ufed for fand boxes, and in fcouring; and with a coarfer for green glafs from Woolwich. For cryftal glafs, to 200 ℔ of tarfo, pounded fine, they put 130 ℔ of falt of polverine; mix them together, and put them into the calcar, a fort of reverberatory furnace, being firft well heated. Here they remain baking, frying, and calcining, for five hours, during which the workman keeps mixing them with a rake, to make them incorporate: when taken out, the mixture is called frit, or bollito.

It may be further obferved, that glafs might be made by immediately melting the materials without thus calcining, and making them frit: but the operation would be much more tedious.

A glafs much harder than any prepared in the common way may be made by means of borax, in the following manner. Take four ounces of borax, and an ounce of fine white fand, reduced to powder, and melt them together in a large clofe crucible fet in a wind furnace, keeping a ftrong fire for half an hour: then take out the crucible, and, when cold, break it; and there will be found at the bottom a hard, pure glafs, capable of cutting common glafs almoft like a diamond. This experiment duly varied, fays Dr Shaw, may lead to fome confiderable improvements in the art of glafs, enamels, and artificial gems. It fhews us an expeditious method of making glafs without the ufe of fixed falts, which has generally been thought an effential ingredient in glafs, and which is the ingredient that gives common glafs its foftnefs; and it is not yet known, whether calcined cryftal, or other fubftances being added to this falt, inftead of fand, it might not make a glafs approaching to the nature of a diamond.

Kinds of GLASS. Of thefe materials we have many forts of glafs made, which may principally be diftinguifhed according to their beauty: as the cryftal flint glafs, the cryftal white glafs, the green glafs, and the bottle glafs. Again thefe feveral forts are diftinguifhed by their feveral ufes: as plate or coach glaffes, looking-glaffes, optic glaffes, *&c.* which are made of the firft fort. The fecond fort includes crown-glafs, toys, phials, drinking-glaffes, *&c.* The third fort is well known by its colour, and the fecond by its form.

Balas coloured GLASS is made thus: Put into a pot cryftal frit, thrice wafhed in water; tinge this with manganefe prepared into a clear purple; to this add alumen cativum fifted fine in fmall quantities, and at feveral times; this will make the glafs grow yellowifh, and a little reddifh, but not blackifh, and always diffipates the manganefe. The laft time you add manganefe, give no more of the alumen cativum, unlefs the colour be too full. Thus will the glafs be exactly of the colour of the balas-ruby.

Red GLASS. A blood-red glafs may be made in the following manner: Put fix pounds of glafs of lead, and ten pounds of common glafs, into a pot glazed with white glafs: when the whole is boiled and refined, add, by fmall quantities, and at fmall diftances of time, copper calcined to a rednefs, as much as, on repeated proofs, is found fufficient: then add tartar in powder by fmall quantities at a time, till the glafs is become as red as blood; and continue adding one or other of the ingredients till the colour is quite perfect.

Yellow GLASS. It is a neceffary remark in glafs-making, that the cryftal glafs made with falt that has an admixture of tartar will never receive the true gold yellow, though it will all other colours: for yellow glafs, therefore, a falt muft be prepared from polverine, or pot afhes alone, to make the glafs.

Furnaces for the making GLASS. In this manufacture, there are three forts of furnaces; one, called calcar, is for the frit; the fecond is for working the glafs; the third ferves to anneal the glafs, and is called the leer. See FURNACE.

The calcar A (Plate XCVII. fig. 1.) refembles an oven ten feet long, feven broad, and two deep: the fuel, which in England is fea coal, is put into a trench on one fide of the furnace; and the flame reverberating from the roof upon the frit, calcines it. The glafs-furnace, or working furnace B, is round, of three yards diameter, and two high; or thus proportioned. It is divided into three parts, each of which is vaulted. The lower part C is properly called the crown, and

and is made in that form. Its ufe is to keep a brifk fire of coal and wood, which is never put out. The mouth of it is called the bocca. There are feveral holes in the arch of this crown, through which the flame paffes into the fecond vault, or partition, and reverberates into the pots filled with the ingredients above mentioned. Round the infides are eight or more pots placed, and piling pots on them. The number of pots is always double that of the boccas D, or mouths, or of the number of workmen, that each may have one pot refined to work out of, and another for metal to refine in while he works out of the other. Through the working holes the metal is taken out of the pots, and the pots are put into the furnace; and thefe holes are ftopped with moveable covers made of lute and brick, to fcreen the workmens eyes from the fcorching flames. On each fide of the bocca, or mouth, is a bocarella, or little hole, out of which coloured glafs, or finer metal, is taken from the piling pot. Above this oven, there is the third oven or leer, about five or fix yards long, where the veffels, or glafs, is annealed, or cooled: this part confifts of a tower, befides the leer F, into which the flame afcends from the furnace. The tower has two mouths, through which the glaffes are put in with a fork, and fet on the floor or bottom: but they are drawn out on iron pans, called fraches, through the leer, to cool by degrees; fo that they are quite cold by the time they reach the mouth of the leer, which enters the farofel, or room where the glaffes are to be ftowed.

But the green glafs furnace is fquare; and at each angle it has an arch for annealling, or cooling glaffes. The metal is wrought on two oppofite fides, and on the other two they have their colours, into which are made linnet holes, for the fire to come from the furnace to bake the frit, and to difcharge the fmoke. Fires are made in the arches to anneal the work, fo that the whole procefs is done in one furnace.

Thefe furnaces muft not be of brick, but of hard fandy ftones. In France, they build the outfide of brick, and the inner part to bear the fire is made of a fort of fuller's earth, or tobacco-pipe clay, of which earth they alfo make their melting-pots.

Mr Blancourt obferves, that the worft and roughef work in this art, is the changing the pots, when they are worn out, or cracked. In this cafe the great working hole muft be uncovered; the faulty pot muft be taken out with iron hooks and forks, and a new one muft be fpeedily put in its place, through the flames, by the hands only. For this work, the man guards himfelf with a garment made of fkins, in the fhape of a pantaloon, that covers him all but his eyes, and is made as wet as poffible: the eyes are defended with a proper fort of glafs.

Inftruments for making of Glass. The inftruments made ufe of in this work, may be reduced to thefe that follow. A blowing pipe, made of iron, about two feet and a half long, with a wooden handle. An iron rod to take up the glafs, after it is blown, and to cut off the former. Sciffars to cut the glafs when it comes off from the firft hollow iron. Shears to cut and fhape great glaffes, *&c.* an iron ladle, with the end of the handle cafed with wood, to take the metal out of the refining pot, to put it into the workmens pots. A fmall iron ladle, cafed in the fame manner, to fkim the alkalic falt that fwims at top. Shovels, one like a peel, to take up the great glaffes; another, like a fire-fhovel, to feed the furnace with coals. A hooked iron fork, to ftir the matter in the pots. An iron rake for the fame purpofe, and to ftir the frit. An iron fork, to change or pull the pots out of the furnace, *&c.*

Working or blowing round Glass. The tools thus provided, the workman dips his blowing pipe into the melting-pot; and by turning it about, the metal fticks to the iron more firmly than turpentine. This he repeats four times, at each time rolling the end of his inftrument, with the hot metal thereon, on a piece of iron G, over which is a veffel of water which helps to cool, and fo to confolidate, and to difpofe that matter to bind more firmly with what is to be taken next out of the melting pot. But after he has dipt a fourth time, and the workman perceives there is metal enough on the pipe, he claps his mouth immediately to the other end of it H, and blows gently through the iron tube, till the metal lengthens like a bladder about a foot. Then he rolls it on a marble ftone I, a little while, to polifh it, and blows a fecond time, by which he brings it to the fhape of a globe of about eighteen or twenty inches diameter. Every time he blows into the pipe, he removes it quickly to his cheek, otherwife he would be in danger, by often blowing, of drawing the flame into his mouth; and this globe may be flattened by returning it to the fire, and brought into any form by ftamp-irons, which are always ready. When the glafs is thus blown, it is cut off at the collet, or neck, which is the narrow part that ftuck to the iron. The method of performing this is as follows: the pipe is refted on an iron bar, clofe by the collet; then a drop of cold water being laid on the collet, it will crack about a quarter of an inch, which, with a flight blow, or cut of the fhears K, will immediately feparate the collet.

After this is done, the operator dips the iron rod into the melting-pot, by which he extracts as much metal as ferves to attract the glafs he has made, to which he now fixes this rod at the bottom of his work, oppofite to the opening made by the breaking of the collet. In this pofition the glafs is carried to the great bocca, or mouth of the oven, to be heated and fcalded, by which means it is again put into fuch a foft ftate, that, by the help of an iron inftrument, it can be pierced, opened, and widened without breaking. But the veffel is not finifhed till it is returned to the great bocca: where it being again heated thoroughly, and turned quickly about with a circular motion, it will open to any fize, by the means of the heat and motion. And by this means we come to learn the caufe why the edge of all bowls and glaffes, *&c.* are thicker than the other parts of the fame glaffes; becaufe in the turning it about in the heat, the edge thickens; and the glafs being as it were doubled in that part, the circumference appears like a felvage.

If

If there remains any superfluities, they are cut off with the shears L; for till the glass is cool, it remains in a soft, flexible state. It is therefore taken from the bocca, and carried to an earthen bench, covered with brands, which are coals extinguished, keeping it turning; because that motion prevents any settling, and preserves an evenness in the face of the glass, where, as it cools, it comes to its consistency; being first cleared from the iron rod by a slight stroke by the hand of the workman.

If the vessel conceived in the workman's mind, and whose body is already made, requires a foot, or a handle, or any other member or decoration, he makes them separate; and now assays to join them with the help of hot metal, which he takes out of the pots with his iron rod: but the glass is not brought to its true hardness, till it has passed the leer, or annealing oven, described before.

Working, or blowing, of window or table GLASS. The method of working round glass, or vessels of any sort, is in every particular applicable to the working of window or table-glass, till the blowing iron has been dipt the fourth time. But then, instead of rounding it, the workman blows, and so manages the metal upon the iron plate, that it extends two or three feet in the form of a cylinder. This cylinder is put again to the fire, and blown a second time, and is thus repeated till it is extended to the dimensions required, the side to which the pipe is fixed diminishing gradually till it ends in a pyramidical form; so that, to bring both ends nearly to the same diameter, while the glass is thus flexible, he adds a little hot metal to the end opposite the pipe, and draws it out with a pair of iron pinchers, and immediately cuts off the same end with the help of a little cold water, as before.

The cylinder being now open at one end, is carried back to the bocca, and there, by the help of cold water, it is cut about eight or ten inches from the iron pipe or rod; and the whole length at another place, by which also it is cut off from the iron rod. Then it is heated gradually on an earthen table, by which it opens in length, while the workman, with an iron tool, alternately lowers and raises the two halves of the cylinder, which at last will open like a sheet of paper, and fall into the same flat form in which it serves for use; in which it is preserved by heating it over again, cooling it on a table of copper, and hardening it twenty-four hours in the annealing furnace, to which it is carried upon forks. In this furnace an hundred tables of glass may lie at a time, without injury to each other, by separating them into tens, with an iron shiver between, which diminishes the weight by dividing it, and keeps the tables flat and even.

This was the method formerly made use of for blowing plate-glass, looking-glasses, *&c.*; but the workmen, by this method, could never exceed fifty inches in length, and a proportional breadth, because what were larger were always found to warp, which prevented them from reflecting the objects regularly, and wanted substance to bear the necessary grinding. These imperfections have been remedied by an invention of the Sieur Abraham Thevart, in France, about the year 1688, of casting or running large plates of glass in the following manner.

Casting, or running of large looking-GLASS *plates.* The furnace G, fig. 2. is of a very large dimension, environed with several ovens, or annealing furnaces, called carquasses, besides others for making of frit, and calcining old pieces of glass. This furnace, before it is fit to run glass, costs 3500l. It seldom lasts above three years, and even in that time it must be refitted every six months. It takes six months to rebuild it; and three months to refit it. The melting-pots are as big as large hogsheads, and contain about 2000 weight of metal. If one of them bursts in the furnace, the loss of the matter and time amounts to 250l. The heat of this furnace is so intense, that a bar of iron laid at the mouth thereof becomes red hot in less than half a minute. The materials in these pots are the same as described before; and A is the man breaking the frit for that purpose. When the furnace is red-hot, these materials are put in at three different times, because that helps the fusion; and in twenty-four hours they are vitrified, refined, settled, and fit for casting. H is the bocca, or mouth of the furnace; K is the cistern that conveys the liquid glass it receives out of the melting-pots in the furnace to the casting table. These cisterns are filled in the furnace, and remain therein six hours after they are filled; and then are hooked out by the means of a large iron chain, guided by a pulley marked I, and placed upon a carriage with four wheels marked L, by two men P P. This carriage has no middle piece; so that when it has brought the cistern to the casting-table M, they slip off the bottom of the cistern, and out rushes a torrent of flaming matter O, upon the table: this matter is confined to certain dimensions by the iron rulers N, N, N, which are moveable, retain the fluid matter, and determine the width of the glass; while a man R, with the roller Q resting on the edge of the iron rulers, reduceth it as it cools to an equal thickness, which is done in the space of a minute. This table is supported on a wooden frame, with trustles for the convenience of moving to the annealing furnace; into which, strewed with sand, the new plate is shoved, where it will harden in about ten days. After this, the glass needs only be ground, polished, and foliated for use.

Grinding and polishing of plate-GLASS. Glass is made transparent by fire, but it receives its lustre by the skill and labour of the grinder and polisher, the former of whom takes it rough out of the hands of the maker.

In order to grind plate glass, they lay it horizontally upon a flat stone-table, (fig. 3.) made of a very fine-grained free-stone; and for its greater security they plaster it down with lime, or stucco: for otherwise the force of the workmen, or the motion of the wheel with which they grind it, would move it about.

This stone-table is supported by a strong frame A, made of wood, with a ledge quite round its edges, rising about two inches higher than the glass. Upon this glass to be ground, is laid another rough glass not above half so big, and so loose as to slide upon it; but

cemented

cemented to a wooden plank, to guard it from the injury it muſt otherwiſe receive from the ſcraping of the wheel, to which this plank is faſtened; and from the weights laid upon it, to promote the grinding, or friture, of the glaſſes. The whole is covered with a wheel, B, made of hard light wood, about ſix inches in diameter; by pulling of which backwards and forwards alternately, and ſometimes turning it round, the workmen who always ſtand oppoſite to each other, produce a conſtant attrition between the two glaſſes, and bring them to what degree of ſmoothneſs they pleaſe, by firſt pouring in water and coarſe ſand; after that, a finer ſort of ſand, as the word advanceth, till at laſt they muſt pour in the powder of ſmalt. As the upper or incumbent glaſs poliſhes, and grows ſmoother, it muſt be taken away, and another from time to time put in its place.

This engine is called a mill by the artiſts, and is uſed only in the largeſt ſize glaſſes; for in the grinding of the leſſer glaſſes, they are content to work without a wheel, and to have only four wooden handles faſtened to the four corners of the ſtone which loads the upper plank, by which they work it about.

When the grinder has done his part, who finds it very difficult to bring the glaſs to an exact plainneſs, it is turned over to the care of the poliſher, who with the fine powder of tripoli-ſtone, or emery, brings it to a perfect evenneſs and luſtre. The inſtrument made uſe of in this branch, is a board, *c*, *c*, furniſhed with a felt, and a ſmall roller, which the workman moves by means of a double handle at both ends. The artiſt in working this roller, is aſſiſted with a wooden hoop or ſpring, to the end of which it is fixed: for the ſpring, by conſtantly bringing the roller back to the ſame points, facilitates the action of the workman's arm.

Painting in Glass. The ancient manner of painting in glaſs was very ſimple; it conſiſted in the mere arrangement of pieces of glaſs of different colours in ſome ſort of ſymmetry, and conſtituted what is now called Mowork. See Mosaic.

In proceſs of time they came to attempt more regular deſigns, and alſo to repreſent figures heightened with all their ſhades: yet they proceeded no farther than the contours of the figures in black with water-colours, and hatching the draperies after the ſame manner on glaſſes of the colour of the object they deſigned to paint. For the carnation, they uſed glaſs of a bright red colour; and upon this they drew the principal lineaments of the face, *&c.* with black.

But in time, the taſte for this ſort of painting improving conſiderably, and the art being found applicable to the adorning of churches, baſilics, *&c.* they found out means of incorporating the colours in the glaſs itſelf, by heating them in the fire to a proper degree; having firſt laid on the colours. The colours uſed in painting or ſtaining of glaſs are very different from thoſe uſed in painting either in water or oil colours.

For black, Take ſcales of iron, one ounce; ſcales of copper, one ounce; jet, half an ounce; reduce them to powder, and mix them. For blue, Take powder of blue, one pound; ſal nitre, half a pound; mix them and grind them well together. For carnation, Take red chalk, eight ounces; iron ſcales and litharge of ſilver, of each two ounces; gum arabic, half an ounce; diſſolve in water; grind altogether for half an hour as ſtiff as you can; then put it in a glaſs and ſtir it well, and let it ſtand to ſettle fourteen days. For green, Take red lead, one pound; ſcales of copper, one pound; and flint, five pounds; divide them into three parts; and add to them as much ſal nitre; put them into a crucible, and melt them with a ſtrong fire; and when it is cold, powder it, and grind it on a porphyry. For gold colour, Take ſilver an ounce; antimony, half an ounce; melt them in a crucible; then pound the maſs to powder; and grind it on a copper plate; add to it yellow oker, or brick-duſt calcined again, fifteen ounces; and grind them well together with water. For purple, Take minium, one pound; brown ſtone, one pound; white flint, five pounds; divide them into three parts, and add to them as much ſal nitre as one of the parts; calcine, melt, and grind it as you did the green. For red, Take jet, four ounces; litharge of ſilver, two ounces; red chalk, one ounce; powder them fine, and mix them. For white, Take jet, two parts; white flint, ground on a glaſs very fine, one part; mix them. For yellow, take Spaniſh brown, ten parts; leaf ſilver, one part; antimony, half a part; put all into a crucible, and calcine them well.

In the windows of ancient churches, *&c.* there are to be ſeen the moſt beautiful and vivid colours imaginable, which far exceed any of thoſe uſed by the moderns, not ſo much becauſe the ſecret of making thoſe colours is entirely loſt, as that the moderns will not go to the charge of them, nor be at the neceſſary pains, by reaſon that this ſort of painting is not now ſo much in eſteem as formerly. Thoſe beautiful works which were made in the glaſs-houſes were of two kinds.

In ſome, the colour was diffuſed through the whole ſubſtance of the glaſs. In others, which were the more common, the colour was only on one ſide, ſcarce penetrating within the ſubſtance above one third of a line; though this was more or leſs according to the nature of the colour; the yellow being always found to enter the deepeſt. Theſe laſt, though not ſo ſtrong and beautiful as the former, were of more advantage to the workmen, by reaſon that on the ſame glaſs, though already coloured, they could ſhew other kind of colours where there was occaſion to embroider draperies, enrich them with foliages, or repreſent other ornaments of gold, ſilver, *&c.*

In order to this, they made uſe of emery, grinding or wearing down the ſurface of the glaſs, till ſuch time as they were got through the colour to the clear glaſs. This done, they applied the proper colours on the other ſide of the glaſs. By theſe means, the new colours were hindered from running and mixing with the former, when they expoſed the glaſſes to the fire, as will appear hereafter.

When indeed the ornaments were to appear white, the glaſs was only bared of its colour with emery, without tinging the place with any colour at all; and this

this was the manner by which they wrought their lights, and heightnings, on all kinds of colour.

The firft thing to be done, in order to paint or ftain glafs, in the modern way, is to defign, and even colour the whole fubject on paper. Then they chufe fuch pieces of glafs as are clear, even, and fmooth, and proper to receive the feveral parts, and proceed to diftribute the defign itfelf, or papers it is drawn on, into pieces fuitable to thofe of the glafs; always taking care that the glaffes may join in the contours of the figures, and the folds of the draperies; that the carnations, and other finer parts, may not be impaired by the lead with which the pieces are to be joined together. The diftribution being made, they mark all the glaffes as well as papers, that they may be known again: which done, applying every part of the defign upon the glafs intended for it, they copy, or transfer, the defign upon this glafs with the black colour diluted in gum water, by tracing and following all the lines and ftrokes as they appear through the glafs with the point of a pencil.

When thefe ftrokes are well dried, which will happen in about two days, the work being only in black and white, they give a flight wafh over with urine, gum arabic, and a little black; and repeat it feveral times, according as the fhades are defired to be heightened, with this precaution, never to apply a new wafh till the former is fufficiently dried.

This done, the lights and rifings are given by rubbing off the colour in the refpective places with a wooden point, or the handle of the pencil.

As to the other colours above-mentioned, they are ufed with gum water, much as in painting in miniature; taking care to apply them lightly, for fear of effacing, the out-lines of the defign; or even, for the greater fecurity, to apply them on the other fide; efpecially yellow, which is very pernicious to the other colours, by blending therewith. And here too, as in pieces of black and white, particular regard muft always be had not to lay colour on colour, or lay on a new lay, till fuch time as the former are well dried.

It may be added, that the yellow is the only colour that penetrates through the glafs, and incorporates therewith by the fire; the reft, and particularly the blue, which is very difficult to ufe, remaining on the furface, or at leaft entering very little. When the painting of all the pieces is finifhed, they are carried to the furnace, or oven, to anneal, or bake the colours.

The furnace here ufed is fmall, built of brick, from eighteen to thirty inches fquare. At fix inches from the bottom is an aperture to put in the fuel, and maintain the fire. Over this aperture is a grate, made of three fquare bars of iron, which traverfe the furnace, and divide it into two parts. Two inches above this partition, is another little aperture, through which they take out pieces to examine how the coction goes forward. On the grate is placed a fquare earthen pan, fix or feven inches deep; and five or fix inches lefs every way than the perimeter of the furnace. On the one fide hereof is a little aperture, through which to make trials, placed directly oppofite that of the furnaces deftined for the fame end. In this pan are the pieces of glafs to be placed, in the following manner. Firft, the bottom of the pan is covered with three ftrata, or layers, of quick lime pulverifed; thofe ftrata being feparated by two others of old broken glafs, the defign whereof is to fecure the painted glafs from the too intenfe heat of the fire. This done, the glaffes are laid horizontally on the laft or uppermoft layer of lime.

The firft row of glafs they cover over with a layer of the fame powder, an inch deep; and over this they lay another range of glaffes, and thus alternately till the pan is quite full; taking care that the whole heap always end with a layer of the lime-powder.

The pan being thus prepared, they cover up the furnace with tiles, on a fquare table of earthen ware, clofely luted all round; only leaving five little apertures, one at each corner, and another in the middle, to ferve as chimneys. Things thus difpofed, there remains nothing but to give the fire to the work. The fire for the firft two hours muft be very moderate, and muft be increafed in proportion as the coction advances, for the fpace of ten or twelve hours; in which time it is ufually compleated. At laft the fire, which at firft was charcoal, is to be of dry wood, fo that the flame covers the whole pan, and even iffues out at the chimneys.

During the laft hours, they make effays, from time to time, by taking out pieces laid for the purpofe through the little aperture of the furnace, and pan, to fee whether the yellow be perfect, and the other colours in good order. When the annealing is thought fufficient, they proceed with great hafte to extinguifh the fire, which otherwife would foon burn the colours, and break the glaffes.

Glass *of lead*. See Chemistry, p. 136.

Glass *porcelain*, the name given by many to a modern invention of imitating the china-ware with glafs.

The method of making it, as given by Mr Reamur, who was the firft that carried the attempt to any degree of perfection, is as follows.

The glafs veffels to be converted into porcelain, are to be put into large veffels, fuch as the common fine earthen difhes are baked in; or into fufficiently large crucibles: the veffels are to be filled with a mixture of fine white fand, and of fine gypfum; or plafter ftone, burnt into what is called plafter of Paris; and all the interftices are to be filled up with the fame powder, fo that the glafs veffels may no where touch either one another, or the fides of the veffels they are baked in.

The veffel is to be then covered down, and luted, and the fire does the reft of the work: for this is only to be put into a common potter's furnace, and when it has ftood there the ufual time of baking the other veffels, it is to be taken out, and the whole contents will be found no longer glafs, but converted into a white opake fubftance, which is a very elegant porcelain, and has almoft the properties of that of china.

GLASS *of antimony*. See CHEMISTRY, p 87.

GLASTONBURY, a market town of Somerfetfhire, five miles fouth of Wells.

GLATZ, the capital of a county of the fame name in Bohemia, 100 miles eaft of Prague: E. long. 16° 8′, N. lat. 50° 25′.

GLAUBER's SALT. See CHEMISTRY, p. 127.

GLAUCION, in ornithology. See ANAS.

GLAUCIUM, in botany. See CHELIDONIUM.

GLAUCOMA, in medicine, the change of the cryftalline humour of the eye into an azure-colour. See MEDICINE.

GLAUCUS, in ichthyology. See SQUALUS.

GLAUX, in botany, a genus of the pentandria-monogynia clafs. The calix confifts of one leaf; it has no corolla; the capfule has one cell, 5 valves, and 5 feeds. There is but one fpecies, *viz*. the maritima, fea-milkwort, or glafs-wort, a native of Britain.

GLAZIER, an artificer who works in glafs. See GLASS.

The principal part of a glazier's bufinefs confifts in fitting panes and plates of glafs to the fafhes and window-frames of houfes, pictures, *&c*. and in cleaning the fame.

GLAZING, the polifhing or crufting over earthen ware, by running melted lead or litharge over it.

The common ware is glazed with a compofition of 50 lb. clean fand, 70 lb. lead-afhes, 30 lb. wood-afhes, and 12 lb. falt, all melted into a cake. With this mixture they glaze it over, and then fet it in an earthen glazing pan; taking care that the veffels do not touch one another. As feveral colours are ufed for this purpofe, we fhall give the following receipts, from Smith's laboratory. 1. For a black, take lead-afhes, 18 parts; iron-filings, 3; copper-afhes, 3; and zaffer, 2: this, when melted, will make a brown black; and if you would have it blacker, put fome more zaffer to it. 2. For blue, take lead-afhes, 1 lb. clear fand or pebble, 2 lb. falt, 2 lb. white calcined tartar, 1 lb. Venice or other glafs, 16 lb. and zaffer, half a pound: mix them well together; and after melting, quench them in water, and then melt them again; which operation is to be repeated feveral times; and if you would have it fine and good, it will be proper to put the mixture into a glafs furnace for a day or two. 3. A brown glazing may be given with a mixture of lead-glafs, 12 parts, and common glafs and manganefe, of each one part. 4. A citron-yellow may be made of 6 parts of red-lead, 7 parts of fine red brick-duft, and 2 parts of antimony, all melted together. 5. A flefh-colour, with 12 parts of lead-afhes, and one of white glafs. 6 For a green-colour, take 8 parts of litharge, 8 parts of Venice-glafs, 4 parts of brafs-duft, and melt them together for ufe; or melt together two parts yellow glafs, with as much copper-duft. 7. For a gold-yellow, take of antimony, red lead, and fand, an equal quantity, and melt them into a cake. 8. For a fine purple brown, take lead-afhes, 15 parts; clear fand, 18; manganefe, 1; white glafs, 15 meafures; and 1 of zaffer. 9. For a fine red, take antimony, 2 lb. litharge, 3 lb. ruft of iron calcined, 1 lb. and grind them to a fine powder. 10. For a fine white glazing, take 2 lb. of lead, 1 lb. of tin, and calcine them to afhes; of which take 2 parts; of calcined flint or pebble, 1 part; of falt, 1 part; and mixing them well together, melt them into a cake. At Rotterdam, they make a fine fhining white glazing, by melting together 2 lb. clean tin-afhes, 10 lb. lead afhes, 2 lb. fine Venice-glafs, and $\frac{1}{2}$ lb. tartar. 11 A yellow glazing is made of 4 ounces of red lead, and 2 ounces of antimony, melted together. 12. For a fine yellow, take red lead, 3 pints; antimony and tin, of each 2 lb. then melting them into a cake, grind it fine; and repeating this feveral times, you will have a good yellow.

GLEBE, among miners, fignifies a piece of earth, wherein is contained fome mineral ore.

GLEBE, in law, the land belonging to a parifh-church, befides the tithes.

GLECHOMA, in botany, a genus belonging to the didynamia gymnofpermia clafs. The calix confifts of five fegments; and each pair of antheræ are difpofed in the form of a crofs. There are three fpecies, two of which are natives of Britain, *viz*. the hederacea, or ground-ivy; and the arvenfis, or upright ground-ivy. The leaves of the hederacea are corroborant, aperient, and detergent.

GLEDITSIA, in botany, a genus of the polygamia dioecia clafs. The calix of the hermaphrodite has four fegments; the corolla four petals; there are fix ftamina, and one piftillum. The calix of the male confifts of three leaves, and the corolla of three petals; and it has fix ftamina. The calix of the female confifts of five leaves, and the corolla of five petals; it has but one piftillum; and the capfule is a legumen. There are two fpecies, none of them natives of Britain.

GLEET, in medicine, the flux of a thin limpid humour from the urethra. See MEDICINE.

GLIRES, the name of Linnæus's fourth order of mammalia See NATURAL HISTORY.

GLENOIDES, the name of two cavities, or fmall depreffions, in the inferior part of the firft vertebra of the neck.

GLIS, in zoology. See SCIURUS.

GLISCHROMICTHES, in natural hiftory, the name by which Dr Hill calls the tougher and more vifcid loams.

GLISTER, in furgery. CLYSTER.

GLOBE, in practical mathematics, an artificial fpherical body, on the convex furface of which are reprefented the countries, feas, *&c*. of our earth; or the face of the heavens, the circles of the fphere, *&c*. See GEOGRAPHY.

GLOBULARIA, in botany, a genus of the tetrandria monogynia clafs. The common calix is imbricated; and the proper calix is tubular and below the fruit; the upper labium of the corollulæ is divided into two parts, and the under one into three; and the receptacle is paleaceous. There are feven fpecies, none of them natives of Britain.

GLOBULE, a diminutive of globe, frequently ufed by phyficians in fpeaking of the red fpherical particles of the blood.

GLOCESTER,

GLOCESTER, the capital of Glocefter-fhire, ninety miles weft of London: W. long. 2° 16′, and N. lat. 51° 50′.

It is a bifhop's fee, and fends two members to parliament.

GLOGAW, a city of Silefia, fituated on the river Oder, forty five miles north weft of Breflaw: E long 16° 8′, and N. lat 51° 40′.

Leffer GLOGAW, a town of Silefia, fifty miles fouth of Breflaw.

GLORIOSA, SUPERB LILY, in botany, a genus of the hexandria monogynia clafs. The corolla confifts of fix undulated and reflected petals; and the ftylus is oblique. There is but one fpecies, a native of Malabar.

GLOSSARY, a fort of dictionary, explaining the obfcure and antiquated terms in fome old author.

GLOSSOPETRA, in natural hiftory, a genus of extraneous foffils, fo called from their having been fuppofed the tongues of ferpents turned into ftone, though they are really the teeth of fharks, and are daily found in the mouths of thofe fifhes, where ever taken.

GLOTTIS, in anatomy. See ANATOMY, p. 300.

GLOW WORM See CICINDELA.

GLUCKSTAT. a fortified town of Germany, fituated on the eaft fide of the river Elbe, thirty miles northweft of Hamburgh: E. long. 9°, and N. lat. 54° 20′.

GLUE, among artificers, a tenacious vifcid matter, which ferves as a cement to bind or connect things together.

Glues are of different kinds, according to the various ufes they are defigned for, as the common glue, glove-glue, and parchment-glue; whereof the two laft are more properly called fize.

The common or ftrong glue is chiefly ufed by carpenters, joiners, cabinet makers, *&c.* and the beft kind is that made in England, in fquare pieces of a ruddy brown colour; and, next to this, the Flanders glue. It is made of the fkins of animals, as oxen, cows, calves, fheep, *&c.* and the older the creature is, the better is the glue made of its hide. Indeed, whole fkins are but rarely ufed for this purpofe, but only the fhavings, parings, or fcraps of them; or the feet-finews, *&c.* That made of whole fkins, however, is undoubtedly the beft; as that made of finews is the very worft.

The method of making GLUE. In making glue of parings. they firft fteep them two or three days in water; then wafhing them well out, they boil them to the confiftence of a thick jelly; which they pafs, while hot, through ozier-bafkets, to feparate the impurities from it, and then let it ftand fome time, to purify it further: when all the filth and ordures are fettled to the bottom of the veffel, they melt and boil it a fecond time. They next pour it into flat frames or moulds, whence it is taken out pretty hard and folid, and cut into fquares pieces or cakes. They afterwards dry it in the wind, in a fort of coarfe net; and at laft ftring it, to finifh its drying.

The glue made of finews, feet, *&c.* is managed after the fame manner; only with this difference, that they bone and fcour the feet, and do not lay them to fteep.

The beft glue is that which is oldeft; and the fureft way to try its goodnefs, is to lay a piece to fteep three or four days, and if it fwell confiderably without melting, and when taken out refumes its former drinefs, it is excellent.

A glue that will hold againft fire or water, may be made thus: mix a handful of quicklime with four ounces of linfeed oil; boil them to a good thicknefs, then fpread it on tin-plates in the fhade, and it will become exceeding hard, but may be eafily diffolved over a fire, as glue, and will effect the bufinefs to admiration.

Method of preparing and ufing GLUE. Set a quart of water on the fire, then put in about half a pound of good glue, and boil them gently together till the glue be entirely diffolved and of a due confiftence. When glue is to be ufed, it muft be made thoroughly hot; after which, with a brufh dipped in it, befmear the faces of the joints as quick as poffible; then clapping them together, flide or rub them lengthwife one upon another, two or three times, to fettle them clofe; and fo let them ftand till they are dry and firm.

GLUME, among botanifts. See BOTANY, p. 637.

GLUTÆUS, in anatomy. See ANATOMY, p 204.

GLYCINE, in botany, a genus of the diadelphia decandria clafs. The calix is bilabiated: and the pod confifts of two cells. There are nine fpecies, none of them natives of Britain.

GLYCYRRHIZA, LIQUORICE, in botany, a genus of the diadelphia decandria clafs. The calix is bilabiated; and the pod is oval and compreffed. There are three fpecies, none of them natives of Britain.

The common liquorice is cultivated in moft countries of Europe for the fake of its root. That which is cultivated in Britain is preferable to fuch as comes from abroad; this laft being generally mouldy, which this root is very apt to become, unlefs kept in a dry place. The powder of liquorice ufually fold is often mingled with flour, and probably too often with fubftances not quite fo wholefome: the beft fort is of a brownifh yellow colour (the fine pale yellow being generally fophifticated) and of a very rich fweet tafte, much more agreeable than that of the frefh root. Liquorice is almoft the only fweet that quenches thirft; whence it was called by the Greeks *adipfon.* Galen takes notice, that it was employed in this intention in hydropic cafes, to prevent the neceffity of drinking. Mr Fuller, in his *Medicina gymnaftica*, recommends this root as a very ufeful pectoral, and fays it excellently foftens acrimonious humours, at the fame time that it proves gently detergent: and this account is warranted by experience.

GLYPH, in fculpture and architecture, denotes any canal or cavity ufed as an ornament.

GMELINA, in botany, a genus of the didynamia angiofpermia clafs. The calix has four teeth; the corolla is bell-fhaped, and divided into four fegments; the antheræ are divided into two parts; and the fruit is a bilocular drupa. There is but one fpecies, a native of the Indies.

GNAPHALIUM, CUDWEED, in botany, a genus of the fyngenefia

ſyngeneſia polygamia ſuperflua claſs. The receptacle is naked; the pappus is plumoſe; and the calix is imbricated. There are 41 ſpecies, five of them natives of Britain, *viz.* the dioicum, mountain cudweed, or cat's foot; the margaritaceum, or American cudweed; the luteo-album, or Jerſey cudweed; the ſylvaticum, or upright cudweed; and the uliginoſum, or black-headed cudweed.

GNAT, in zoology. See MUSCA.

GNESNA, the capital city of great Poland, ſituated one hundred and ten miles weſt of Warſaw: E. long. 18°, and N. lat. 53°.

It is the ſee of an archbiſhop, who is always primate of Poland. See POLAND.

GNIDIA, in botany, a genus of the octandria monogynia claſs. The calix is funnel ſhaped, and conſiſts of four ſegments; the petals are four, and inſerted into the calix; and the berry contains but one ſeed. There are three ſpecies, none of them natives of Britain.

GNOMON, in dialling, the ſtyle, pin, or cock of a dial; which, by its ſhadow, ſhews the hour of the day. See DIALLING.

GNOMON, in aſtronomy, a ſtyle erected perpendicular to the horizon, in order to find the altitude of the ſun.

GNOMON *of a globe*, the index of the hour-circle. See GEOGRAPHY.

GNOMONICS, the art of dialling. See DIALLING.

GNOSTICS, in church-hiſtory, Chriſtian heretics ſo called, it being a name which almoſt all the ancient heretics affected to take, to expreſs that new knowledge and extraordinary light to which they made pretenſions; the word gnoſtic ſignifying a learned or enlightened perſon.

GOA, a city and ſea-port of the hither India, ſituated in an iſland of the river Mandoua, and ſubject to the Portugueſe: E. lon 73° 20′, and N. lat. 15° 20′.

GOAT, in zoology. See CAPRA.

GOAT'S BEARD, in botany. See TRAGOPOGON.

GOAT'S RUE, in botany. See GALEGA.

GOAT SUCKER, in ornithology. See CAPRIMULGUS.

GOBIUS, in ichthyology, a genus of fiſhes belonging to the order of thoracici. They have two holes between the eyes, four rays in the membrane of the gills; and the belly-fins are united in an oval form. There are eight ſpecies, principally diſtinguiſhed by the number of rays in their fins.

GOD, one of the many names of the Supreme Being. See RELIGION.

GODDESS, a heathen deity of the female ſex.

The ancients had almoſt as many goddeſſes as gods; ſuch were Juno, the goddeſs of air; Diana, the goddeſs of woods, *&c.* And under this character were repreſented the virtues, graces, and principal advantages of life; Truth, Juſtice, Piety, Liberty, Fortune, Victory, *&c.*

It was the peculiar privilege of the goddeſſes to be repreſented naked on medals; for it was ſuppoſed that the imagination muſt be awed and reſtrained by the conſideration of the divine character.

GOLCONDA, the capital of a province of the ſame name in the hither India: E. long. 77°, and N. lat. 16°.

GOLD. See CHEMISTRY, p. 78, and 129.

GOLD-WIRE, a cylindrical ingot of ſilver, ſuperficially gilt, or covered with gold at the fire, and afterwards drawn ſucceſſively through a great number of little, round holes, of a wire-drawing iron, each leſs than the other, till it be ſometimes no bigger than a hair of the head.

It may be obſerved, that before the wire be reduced to this exceſſive fineneſs, it is drawn through above an hundred and forty different holes; and that each time they draw it, it is rubbed afreſh over with new wax, both to facilitate its paſſage, and to prevent the ſilver's appearing through it.

GOLD-WIRE *flatted*, is the former wire flatted between two rollers of poliſhed ſteel, to fit it to be ſpun on a ſtick, or to be uſed flat, as it is, without ſpinning, in certain ſtuffs, laces, embroideries, *&c.* See STUFF, *&c.*

GOLD-THREAD, or SPUN-GOLD, is a flatted gold, wrapped or laid over a thread of ſilk, by twiſting it with a wheel and iron bobbins.

Manner of forming GOLD-WIRE, *and* GOLD-THREAD, *both round and flat*. Firſt, an ingot of ſilver, of twenty-four pounds, is forged into a cylinder, of about an inch in diameter: then it is drawn through eight or ten holes, of a large, coarſe, wire-drawing iron, both to finiſh the roundneſs, and to reduce it to about three fourths of its former diameter. This done, they file it very carefully all over, to take off any filth remaining on the forge; then they cut it in the middle; and thus make two equal ingots thereof, each about twenty ſix inches long, which they draw through ſeveral new holes, to take off any inequalities the file may have left, and to render it as ſmooth and equable as poſſible.

The ingot thus far prepared, they heat it in a charcoal fire; then taking ſome gold leaves, each about four inches ſquare, and weighing twelve grains, they join four, eight, twelve, or ſixteen of theſe, as the wire is intended to be more or leſs gilt; and when they are ſo joined, as only to form a ſingle leaf, they rub the ingots reeking hot with a burniſher. Theſe leaves being thus prepared, they apply over the whole ſurface of the ingot, to the number of ſix, over each other, burniſhing or rubbing them well down with the blood-ſtone, to cloſe and ſmoothe them. When gilt, the ingots are laid anew in a coal fire; and when raiſed to a certain degree of heat, they go over them a ſecond time with the blood-ſtone, both to ſolder the gold more perfectly, and to finiſh the poliſhing. The gilding finiſhed, it remains to draw the ingot into wire.

In order to this, they paſs it through twenty holes of a moderate drawing iron, by which it is brought to the thickneſs of the tag of a lace: from this time the ingot loſes its name, and commences gold-wire. Twenty holes more of a leſſer iron leaves it ſmall enough for the leaſt iron; the fineſt holes, of which laſt ſcarce exceeding the hair of the head, finiſh the work.

To diſpoſe the wire to be ſpun on ſilk, they paſs it between

between two rollers of a little mill: these rollers are of nicely polished steel, and about three inches in diameter. They are set very close to each other, and turned by means of a handle fastened to one of them, which gives motion to the other. The gold wire in passing between the two, is rendered quite flat, but without losing any thing of its gilding, and is rendered so exceedingly thin and flexible, that it is easily spun on silk thread, by means of a hand wheel, and so wound on a spool or bobin.

GOLD-LEAF, or BEATEN GOLD, is gold beaten with a hammer into exceeding thin leaves, so that it is computed, that an ounce may be beaten into sixteen hundred leaves, each three inches square, in which state it takes up more than 159052 times its former surface.

This gold they beat on a block of black marble, about a foot square, and usually raised three feet high: they make use of three sorts of hammers, formed like mallets, of polished iron: the first, which weighs three or four pounds, serves to chase, or drive; the second, of eleven or twelve pounds, to close; and the third, which weighs fourteen or fifteen pounds, to stretch and finish. They also make use of four moulds of different sizes, *viz.* two of vellum, the smallest whereof consists of forty or fifty leaves, and the larger of two hundred; the other two, consisting each of five hundred leaves, are made of bullocks guts well scoured, and prepared. See MOULD.

Method of preparing and beating GOLD. They first melt a quantity of pure gold, and form it into an ingot: this they reduce, by forging, into a plate about the thickness of a sheet of paper; which done, they cut the plate into little pieces about an inch square, and lay them in the first or smallest mould to begin to stretch them: after they have been hammered here a while with the smallest hammer, they cut each of them into four, and put them into the second mould, to be extended further.

Upon taking them hence, they cut them again into four, and put them into the third mould; out of which they are taken, divided into four, as before, and laid in the last, or finishing mould, where they are beaten to the degree of thinness required.

The leaves thus finished, they take them out of the mould, and dispose them into little paper-books, prepared with a little red bole, for the gold to stick to; each book ordinarily contains twenty-five gold leaves. There are two sizes of these books; twenty-five leaves of the smallest only weigh five or six grains, and the same number of the largest nine or ten grains.

It must be observed, that gold is beaten more or less, according to the kind or quality of the work it is intended for; that for the gold-wire drawers to gild their ingots withal, is left much thicker than that for gilding the frames of pictures, &c. withal. See GILDING.

GOLD-FINCH, in ornithology. See FRINGILLA.

GOLDSMITH, or, as some chuse to express it, *silversmith*, an artist who makes vessels, utensils, and ornaments, in gold and silver.

The goldsmith's work is either performed in the mould, or beat out with the hammer or other engine. All works that have raised figures, are cast in a mould, and afterwards polished and finished: plates, or dishes, of silver or gold, are beat out from thin flat plates; and tankards, and other vessels of that kind, are formed of plates soldered together, and their mouldings are beat, not cast. The business of the goldsmiths formerly required much more labour than it does at present; for they were obliged to hammer the metal from the ingot to the thinness they wanted: but there are now invented flatting-mills, which reduce metals to the thinness that is required, at a very small expence. The goldsmith is to make his own moulds, and for that reason ought to be a good designer, and have a taste in sculpture: he also ought to know enough of metallurgy, to be able to assay mixed metals, and to mix the alloy.

GOLDEN, something that has a relation to gold, or consists of gold.

GOLDEN *number*. See ASTRONOMY, p. 492.

GOLDEN *rule*. See ARITHMETICK, p. 381.

GOLDINGEN, a city of Poland, in the duchy of Courland, sixty miles west of Mittau: E. long. 22°, N. lat 57°.

GOMBRON, the greatest sea-port town in Persia, situated on the strait at the entrance of the gulph of Persia, opposite to the island of Ormus: E. long. 55° 30′, N. lat. 27° 30′.

GOMERA, one of the Canary islands, subject to Spain, and situated west of Teneriff: W. long. 18°, N. lat. 28°.

GOMORRO *islands*, situated between 10° and 13° S. lat. on the eastern coast of Africa.

GOMPHOSIS, in anatomy. See ANATOMY, p. 148.

GOMPHRENA, the *purple everlasting flower*, in botany, a genus of the pentandria digynia class. The calix consists of three coloured leaves; the nectarium is cylindrical, with ten teeth; and the capsule contains one seed. There are seven species, none of them natives of Britain.

GONDOLA, in naval architecture, a flat kind of boat, very long and narrow, chiefly used on the canals at Venice.

GONORRHOEA, in medicine, an involuntary efflux of the seminal juices, and some other recrementitious matter. See MEDICINE.

GOOD, in general, whatever is apt to cause or increase pleasure, or diminish pain in us; or, which amounts to the same, whatever is able to procure or preserve to us the possession of agreeable sensations, and remove those of an opposite nature.

Moral GOOD, denotes the right conduct of the several senses and passions, or their just proportion and accommodation to their respective objects and relations. See MORALS.

GOOD-HOPE, or *Cape of* GOOD-HOPE, the most southern promontory of Africa, where the Dutch have built a good town and fort: E. long. 16° and N. lat. 34° 15′.

GOOSE, in ornithology. See ANAS.

GOOSEBERRY, in botany. See RIBES.

Goose-neck, in a ſhip, a piece of iron fixed on the one end of the tiller, to which the laniard of the whip-ſtaff or the wheel-rope comes, for ſteering the ſhip.

Goose-wing, in the ſea-language. When a ſhip ſails before, or with a quarter wind on a freſh gale, to make the more haſte, they launch out a boom, and ſail on the lee ſide; and a ſail ſo fitted, is called a gooſe-wing.

GOR, the capital of a province of the ſame name, in the Eaſt Indies, ſubject to the Mogul: E. long. 85°, N. lat. 31° 15′.

GORCUM, a city of the United Provinces, ſituated in that of Holland, on the river Waal, twenty two miles eaſt of Rotterdam: E. long. 4° 50′, N lat. 51° 50′.

GORDIAN knot, in antiquity, a knot made in the leathers or harneſs of the chariot of Gordius, king of Phrygia, ſo very intricate, that there was no finding where it began or ended.

The inhabitants had a tradition, that the oracle had declared, that he who untied this knot, ſhould be maſter of Aſia. Alexander having undertaken it, was unable to accompliſh it; when fearing leſt his not untying it ſhould be deemed an ill augury, and prove a check in the way of his conqueſts, he cut it aſunder with his ſword, and thus either accompliſhed or eluded the oracle.

GORE, in heraldry, one of the abatements, which, according to Guillim, denotes a coward. It is a figure conſiſting of two arch lines drawn one from the ſiniſter chief, and the other from the ſiniſter baſe, both meeting in an acute angle in the middle of the feſs point. See Plate XCVII. fig. 4.

GORGE, in architecture, the narroweſt part of the Tuſcan and Doric capitals, lying between the aſtragal, above the ſhaft of the pillar, and the annulets.

Gorge, in fortification, the entrance of the platform of any work. See Fortification.

GORGED, in heraldry, the bearing of a crown, coronet, or the like, about the neck of a lion, a ſwan, *&c.* and in that caſe it is ſaid, the lion or cygnet is gorged with a ducal coronet, *&c.*

Gorged is alſo uſed when the gorge or neck of a peacock, ſwan, or the like bird, is of a different colour or metal from the reſt.

GORGONA, the name of two iſlands; one in the Pacific Ocean on the coaſt of Peru, W. long. 79°, N. lat. 3°; the other in the Mediterranean, twenty five miles weſt of Leghorn.

GORGONS, in antiquity, a warlike female nation of Lybia, in Africa, who had frequent quarrels with another nation of the ſame ſex, called Amazons.

GORLITZ, a city of Upper Saxony, in Germany, fifty miles eaſt of Dreſden: E. long. 15° 6′, N. lat. 51° 12′.

GOSHAWK. See Falco.

GOSLAR, an imperial city of Lower Saxony, in Germany, thirty miles ſouth of Brunſwick: E. long. 10° 30′, N. lat. 52°.

GOSPEL, the hiſtory of the life, actions, death, reſurrection, aſcenſion and doctrine of Jeſus Chriſt.

The word is ſaxon, and of the ſame import with the Latin term *evangelium*, which ſignifies glad tidings, or good news.

This hiſtory is contained in the writings of St Mathew, St Mark, St Luke, and St John; who from thence are called evangeliſts. The Chriſtian church never acknowledged any more than theſe four goſpels as canonical; notwithſtanding which, ſeveral apocryphal goſpels are handed down to us, and others are entirely loſt.

GOSSYPIUM, in botany, a genus of the monodelphia polyandria claſs. The calix is double, the exterior one conſiſting of three leaves; the capſule has four cells; and the ſeeds are covered with down. There are four ſpecies, none of them natives of Britain.

GOTHA the capital of the duchy of Saxe Gotha, in Upper Saxony; E. long. 10° 36′, N. lat. 51°.

It is ſubject to the duke of Saxe Gotha, brother of her royal highneſs the princeſs dowager of Wales.

GOTHIC, in general, whatever has any relation to the Goths: thus, we ſay, Gothic cuſtoms, Gothic architecture, *&c.*

GOTHLAND, the moſt ſouthern province of Sweden, being a peninſula ſurrounded on three ſides by the Baltic Sea. It is ſubdivided into Eaſt and Weſt Gothland, Smaland, Halland, Bleken, and Schonen.

Gothland, is alſo an iſland of the Baltic, ſituated without the province of Gothland and Livonia.

GOTTENBURG, a port-town of Sweden, ſituated between the Sound, on the coaſt of the Schaggerack Sea, near the entrance of the Baltic.

GOTTINGEN, a city of Germany, in the circle of Lower Saxony and dukedom of Brunſwick: E. long. 9° 45′, N. Lat. 51° 32′.

GOTTORP, a city of the dukedom of Sleſwic, in Denmark, and capital of the territories of the duke of Holſtein Gottorp: E. long. 10°, N. lat. 54° 40′.

GOUDE, a city of the United Netherlands, in the province of Holland, ten miles north-eaſt of Rotterdam.

GOVERNMENT, in general, is the polity of a ſtate, or an orderly power conſtituted for the public good.

Civil government was inſtituted for the preſervation and advancement of mens civil intereſts, and for the better ſecurity of their lives, liberties, and properties. The uſe and neceſſity of government is ſuch, that there never was an age or country without ſome ſort of civil authority: but as men are ſeldom unanimous in the means of attaining their ends, ſo their difference in opinion in relation to government, has produced a variety of forms of it. To enumerate them, would be to recapitulate the hiſtory of the whole earth. But they may, in general, be reduced to one of theſe heads: either the civil authority is delegated to one or more, or elſe it is ſtill reſerved to the whole body of the people; whence ariſes the known diſtinction of government into monarchy, ariſtocracy, and democracy.

Mr Hooker thinks, that the firſt government was arbitrary, and adminiſtered by a ſingle perſon; till it was found by experience, that to live by one man's will, was the cauſe of all mens miſery: and this, he concludes, was the original of inventing laws. The Roman and moſt of the Grecian ſtates were built up-

on

on the republican plan; but when the Goths, and other northern nations, destroyed the Roman empire, and extended their conquests into far distant countries, they established, where ever they came, a mixed form of government. The preservation of this constitution depending upon the balance between the king, nobility, and people, the legislative power was lodged in these three states, called by different names in different countries; in the north, diets; in Spain, cortes; in France, estates; and in Britain, parliaments. The excellency of this mixed government, consists in that due poise or balance between rule and subjection, so justly observed in it, that by the necessary concurrence of the nobility and commons, in making and repealing all laws, it has the main advantage of an aristocracy, and a democracy, and yet is free from the disadvantages and evils of either of them. This mixed form of government is, however, now driven almost out of Europe, in some parts of which we can hardly find the shadow of liberty left, and in many there is no more than the name of it remaining. France, Spain, Portugal, Denmark, and part of Germany, were all, an age or two ago, limited monarchies, governed by princes, well advised by parliaments or courts, and not by the absolute will of one man. But now all their valuable rights and liberties are swallowed up by the arbitrary power of their princes: whilst we in great Britain have still happily preserved this noble and ancient Gothic constitution, which all our neighbours once enjoyed. There is such a due balance of property, power, and dominion in our constitution, that, like the ancient government of Sparta, it may be called an empire of laws, and not of men; being the most excellent plan of limited monarchy in the world.

Governments are commonly divided into two classes, arbitrary and free governments; but there are many differed sorts of each. Thus the governments of France and Spain are generaly called arbitrary; tho' they differ as much from the governments of Turky and other eastern empires, where absolute dispoticism prevails, as they do from the government of England, and other European nations, where liberty is said to flourish in its fullest perfection.

Government is also a post or office which gives a person the power or right to govern or rule over a place, a city, or province, either supremely or by deputation.

Government is also used for the city, country, or place to which the power of governing is extended.

GOURD, in botany. See Cucurbita.

GOUT, in medicine. See Medicine.

GRABOW, or Grubow, a town of Lower Saxony and duchy of Mecklenburg: E. long. 11° 36′, N. lat. 53° 32′.

GRACE, among divines, is taken, 1st, For the free love and favour of God, which is the spring and source of all the benefits which we receive from him. 2dly, For the work of the spirit, renewing the soul after the image of God, and continually guiding and strengthening the believer to obey his will, to resist and mortify sin, and to overcome it.

Grace, in geography, a city of Provence, in France, fifteen miles south-west of Nice: E. long. 6° 50′, N. lat. 43° 40′.

Act of Grace, the appellation given to the act of parliament 1696, *c.* 32. which allows prisoners for civil debts to be set at liberty, upon making oath, that they have not wherewithal to support themselves in prison, unless they are alimented by the creditors upon whose diligences they were imprisoned, within ten days after intimation made for that purpose. See Scots Law, tit. 32.

Days of Grace, three days immediately following the term of payment of a bill, within which the creditor must protest it, if payment is not obtained, in order to intitle him to recourse against the drawer. See Scots Law, tit. 21.

Grace is also a title of dignity given to dukes, archbishops, and in Germany to barons and other inferior princes.

Graces, in heathen mythology, three goddesses, whose names were Aglia, Thalia, and Euphrosyne; that is, shining, flourishing, and gay; or, according to some authors, Pasithae, Euphrosyne, and Ægiale. Some make them the daughters of Jupiter, and Eurynome, or Eunomia, the daughter of Oceanus; but the most common opinion is, that they were the daughters of Bacchus and Venus.

They are sometimes represented dressed, but more frequently naked; to shew, perhaps, that whatever is truly graceful, is so in itself, without the aid of exterior ornaments. They presided over mutual kindness and acknowledgment; bestowed liberality, eloquence, and wisdom, together with a good grace, gaiety of disposition, and easiness of manners.

GRACULA, in ornithology, a genus belonging to the order of picæ. The bill is convex, cultrated, and bare at the point; the tongue is not cloven, but is fleshy and sharpish; it has three toes before, and one behind. There are eight species, principally distinguished by their colour.

GRACULUS, in ornithology. See Corvus.

GRADATION, in general, the ascending step by step, or in a regular and uniform manner.

GRADISKA, a city of Sclavonia, situated on the river Save, twenty-five miles west of Posega: E. long. 18°, N. lat. 45° 33′.

GRADUATE, a person who has taken a degree in the university. See Degree.

GRAFT, or Graff, in gardening, a cion or shoot of a tree inserted into another, so as to make it yield fruit of the same nature with that of the tree from whence the graft was taken. See Gardening.

GRAIES, a market-town of Essex, situated on the river Thames, seventeen miles east of London.

GRAIN, all sorts of corn, as wheat, barley, oats, rye, *&c.* See Corn, Wheat, *&c.*

GRAMMAR.

GRAMMAR.

GRAMMAR is *the art of ſpeaking or of writing any language with propriety.*

Grammar conſidered as an *Art*, neceſſarily ſuppoſes the previous exiſtence of language; and as its deſign is to teach any language to thoſe who are ignorant of it, it muſt be adapted to the genius of that particular language of which it treats.—A juſt method of grammar, therefore, ſuppoſing a language introduced by cuſtom, without attempting any alterations in it, furniſhes certain obſervations called rules, to which the methods of ſpeaking uſed in this language may be reduced; this collection of rules is what is called a grammar of any particular language. For the greater diſtinctneſs with regard to theſe rules, grammarians have uſually divided this ſubject into four diſtinct heads, *viz.* ORTHOGRAPHY, or *the art of combining letters into ſyllables, and ſyllables into words;* ETYMOLOGY, or *the art of deducing one word from another, and the various modifications by which the ſenſe of any one word can be diverſified;* SYNTAX, or what relates *to the conſtruction or due diſpoſition of the words of a language into ſentences or phraſes*; and PROSODY, or that which treats of *the quantities and accents of ſyllables, and the art of making verſes.*

But grammar conſidered as a *Science*, views language in itſelf: neglecting particular modifications, or the analogy which *words* may bear to *each other*, it examines the analogy and relation between *words* and *things*; diſtinguiſhes between thoſe particulars which are *eſſential* to language, and thoſe which are only *accidental*; and thus furniſhes a certain ſtandard by which different languages may be compared, and their ſeveral excellencies or defects pointed out. This is what is called PHILOSOPHIC or UNIVERSAL GRAMMAR.

OF UNIVERSAL GRAMMAR.

IT is not neceſſary here to inquire how language was originally invented, to trace the various changes it may have undergone, or to examine whether any one language may be conſidered as the original from which all others have been derived: it is ſufficient for our purpoſe to obſerve, that all mankind, however diverſified in other reſpects, agree in the common uſe of language; from which it appears, that language is not merely accidental and arbitrary, but founded in the nature of things, and within the reach of all mankind. It is therefore an object worthy of a philoſophic inquiry to diſcover the foundations upon which this univerſal fabric has been raiſed.

The deſign of ſpeech is to publiſh to others the thoughts and perceptions of our mind. The moſt acute feelings of man, as well as of every other animal, are expreſſed by ſimple inarticulate ſounds, which, as they tend to the preſervation of the individual, are univerſally underſtood. Theſe inarticulate but ſignificant ſounds, therefore, conſtitute a natural and univerſal language, which man, as a mere ſenſitive being, partakes in common with the other animals. But as man is not only endowed with ſenſation, but with the faculty of reaſoning, ſimple inarticulate ſounds are inſufficient for expreſſing all the various modifications of thought, or for communicating to others a chain of argumentation: it was therefore neceſſary to call in the aid of *articulation*; which by modifying theſe ſimple ſounds, and by fixing a particular meaning to theſe modifications, forms the language peculiar to man, and which diſtinguiſhes him from all other animals, and enables him to communicate with facility all that diverſity of ideas with which his mind is ſtored. Theſe ſounds, thus modified and having a determinate meaning, are called WORDS; and as all language is compoſed of ſignificant words variouſly combined, a knowledge of them is neceſſary previous to our acquiring an adequate idea of language.

But, as it is by words that we expreſs the various ideas which occur to the mind, it is neceſſary to examine how ideas themſelves are ſuggeſted, before we can aſcertain the various claſſes into which words may be diſtributed. With this view, therefore, let us ſuppoſe a reaſonable being, devoid of every prepoſſeſſion whatever, placed upon this globe. His attention would, in the firſt place, be directed to the various objects which he ſaw exiſting around him: theſe he would naturally endeavour to diſtinguiſh from one another, and give them names, by means of which the idea of them might be recalled when the objects themſelves were abſent. This is one copious ſource of words, and forms a natural claſs which muſt be common to every language; and which is diſtinguiſhed by the name of NOUNS. And as theſe nouns are the names of the ſeveral ſubſtances which exiſt, they have likewiſe been called SUBSTANTIVES.

It would likewiſe be early diſcovered, that every one of theſe ſubſtances were endowed with certain qualities or attributes, to expreſs which another claſs of words would be requiſite. Thus, *to be weighty*, is a quality of matter; *to think*, is an attribute of man. Therefore, in every language, words have been invented to expreſs the various qualities of the ſeveral objects which exiſt. Theſe may all be comprehended under the general denomination of ATTRIBUTIVES.

Theſe two claſſes of words muſt comprehend all things that exiſt; for whatever exiſts, muſt of neceſſity be either a ſubſtance, or the attribute of ſome ſubſtance; and hence theſe two claſſes muſt comprehend all thoſe words which are ſignificant of themſelves, and may be called WORDS SIGNIFICANT OF THEMSELVES. If any other words occur, they can only be ſignificant in ſo far as they tend to explain or connect the words of the two former claſſes.

But, although theſe words form the baſis or matter of a language, in the ſame manner as ſtones form the matter

A GRAMMATICAL TABLE,

EXHIBITING

A Syſtematic View of WORDS naturally arranged into diſtinct CLASSES, with their ſeveral Subdiviſions.

All LANGUAGE is compoſed of WORDS; each of which may be thus defined, A SOUND SIGNIFICANT OF WHICH NO PART IS OF ITSELF SIGNIFICANT.---Theſe may be arranged into two general diviſions; which may be called

- **PRINCIPALS**, comprehending all ſuch words as ARE SIGNIFICANT OF THEMSELVES; which muſt be either
  - **SUBSTANTIVES**, which are all thoſe words that ARE EXPRESSIVE OF THOSE BEINGS WHICH EXIST OF THEMSELVES, AND NOT AS THE ENERGIES OF ANY THING ELSE. Theſe may be divided into two orders, *viz.*
    - **NOUNS**, properly ſo called, being the NAMES OF ALL THOSE BEINGS WHICH EXIST. Theſe may be divided into three kinds, each of which admit of the ſubdiviſions after-mentioned, *viz.*
      - NATURAL, or thoſe which are THE NAMES OF NATURAL SUBSTANCES; ſuch as
        - GENUS: ANIMAL, — SPECIES: MAN, — INDIVIDUAL: ALEXANDER, CYRUS, *&c.*
        - SPECIES: DOG, — INDIVIDUAL: CERBERUS, ARGUS, *&c.*
      - ARTIFICIAL. The ſeveral names of ARTIFICIAL OBJECTS; ſuch as
        - GENUS: EDIFICE, — SPECIES: HOUSE, — INDIVIDUAL: THE VATICAN, *&c.*
        - SPECIES: CHURCH, — INDIVIDUAL: ST PAUL's, THE ROTUNDO, *&c.*
      - ABSTRACT, or thoſe which are ABSTRACTED FROM QUALITIES; ſuch as
        - GENUS: MOTION, — SPECIES: FLIGHT, — INDIVIDUAL: THE FALCON's FLIGHT, *&c.*
        - SPECIES: COURSE, — INDIVIDUAL: THE COURSE OF A GREY-HOUND, *&c.*
      - Nouns of all kinds admit of the following ACCIDENTS, *viz.*
        - GENDER, which is a certain affection of nouns relating to the ſex of the ſubſtance whoſe names they are. For in nature every object is either a male or a female, or ſomething neither the one nor the other. Grammarians, therefore, following this idea, have divided the names of beings into three claſſes; calling thoſe that denote *males*, of the MASCULINE *gender;* thoſe which denote *females*, they have called of the FEMININE *gender;* and thoſe which denote neither one nor other, of the NEUTER *gender.*
        - NUMBER. As there is no object in nature ſingle and alone, it is evident, that every noun ought to have ſome variation to expreſs, whether it is one object of which mention is made, or more than one;---and accordingly we find, that nouns in every language have ſome method of expreſſing this.---If one is mentioned, it is called the SINGULAR *number;* if more, it is called the PLURAL *number.* Some languages have a variation, called CASES; but this is only accidental, not eſſential.
    - Or **PRONOUNS**, which are a ſpecies of words invented for SUPPLYING THE PLACE OF NOUNS IN CERTAIN CIRCUMSTANCES. They are of two kinds, *viz.*
      - PREPOSITIVE. So called becauſe they are capable of LEADING A SENTENCE. Theſe are divided into three orders, called the pronouns of the
        - FIRST PERSON; in Engliſh, I; ſo called, becauſe it is ſubſtituted in the name of the ſpeaker, who is always principal with reſpect to his own diſcourſe. It appears under two different forms, being I when the ſpeaker is the active cauſe of any effect, and ME when it is the paſſive ſubject.---Each of theſe admit of a plural; I has the plural WE, and ME the plural US.
        - SECOND PERSON,----THOU; ſo called, becauſe it is employed to denote the party addreſſed, who may be conſidered as the ſecond in diſcourſe. It likewiſe admits of two different forms; being THOU when it is the active cauſe, and THEE when it is the paſſive ſubject.---Each of theſe alſo admit of a plural; THOU having the plural YE, and THEE the plural YOU.
        - THIRD PERSON,----HE, SHE, IT: which words are employed to denote any object which may be the ſubject of the converſation, different from either the ſpeaker or party addreſſed: and as this ſubject may be either a *male*, or a *female*, or ſome object neither one nor other, it admits of a word for each; HE, with its paſſive HIM, for *males;* SHE, with its paſſive HER, for *females;* and IT, which admits of no paſſive, for *neuters:*---all of theſe, like the other pronouns-perſonal, admit of plurals;---THEY being the plural for all three when active, and THEM when paſſive.
        - IMPROPER; ſo called, becauſe although they are ſometimes employed as pronouns, yet at other times they appear as ARTICLES; of this kinds are the words ALL, ANY, SOME, THIS, *&c.* When theſe are employed as pronouns, they aſſume the power, and ſupply the place of a noun; when they are articles, they require the aſſiſtance of a noun as other articles do. The words, THY, MY, MINE, THINE, *&c.* have been improperly conſidered as pronouns, as they never are ſuch.
      - Or SUBJUNCTIVE. So called, becauſe it cannot lead a ſentence, but ſerves to SUBJOIN SOME OTHER WHICH WAS PREVIOUS. Of this kind are,
        - WHICH, WHO, and THAT. This ſubjunctive-pronoun may be ſubſtituted in the place of every noun whatever, whether expreſſive of *genus, ſpecies*, or *individual;* as, the *animal* WHICH, the *man* WHO, *Alexander* THAT, *&c.* Nay, this may even become the ſubſtitute of the *prepoſitive-pronouns themſelves;* as, when we ſay, *I* WHO *now write, you* WHO *now read, he* WHO *wrote, ſhe* WHO *ſpoke, &c.* Hence, therefore, this ſubjunctive is a real pronoun from ſubſtitution; and it has this peculiarity beſides, that it is not only a *ſubſtitute*, but withal a *connective.*
  - Or **ATTRIBUTIVES**, which are thoſe words which ARE EXPRESSIVE OF THOSE THINGS WHICH EXIST AS THE ATTRIBUTES OF SOMETHING ELSE. Theſe may be divided into two diſtinct claſſes, *viz.*
    - **ATTRIBUTIVES of the FIRST ORDER**, which comprehends all thoſe words that are expreſſive of the ATTRIBUTES OF SUBSTANCES. And as all attributes are either MUTABLE, as in the objects of ſenſation, or IMMUTABLE, as in the objects of intellection and ſcience; therefore theſe are divided into
      - VERBS, or thoſe words expreſſive of any attribute WHOSE ESSENCE CONSISTS IN MOTION OR ITS PRIVATION. Every attribute of this kind may be repreſented as exiſting in three different ſtates, to which grammarians have given theſe names;
        - 1. INFINITIVE MODE; in which the attribute is exhibited in a manner perfectly indefinite, MERELY AS AN ATTRIBUTE WHICH MAY BE JOINED WITH A SUBSTANTIVE; as in the words *to walk, to write*, &c.
        - 2. PARTICIPLE ACTIVE or PRESENT; in which the attribute is repreſented as actually in a STATE OF EXERTION; as in the word *writing.*
        - 3. PARTICIPLE PERFECT, or PAST; in which the attribute is repreſented as HAVING FINISHED ITS EXERTION; as in the word *written.*
        - But although verbs do not in ſtrictneſs admit of any other variations, except theſe three above mentioned; yet, as the connection is ſo intimate between the attribute and its energizer, and the ſpeaker, who unites theſe together, the contrivers of ſome languages have conſidered them as the ſame, and have invented certain variations to expreſs theſe different relations. The names and meaning of which are as follows,
          - MODES are thoſe variations which denote a difference in the PERCEPTION OR VOLITION of the ſpeaker; as, *I write, I* CAN *write, do* THOU *write.*
          - TENSES are thoſe variations to the TIME WHEN THE ACTION EXHIBITED BY THE VERB took place; which muſt be either paſt, preſent, or future; as, *I* DO *write, I* DID *write, I* SHALL *write, &c.*
          - PERSON, as the name implies, are the variations occaſioned by a difference of the energizer; as, I *wrote*, HE *wrote*, SHE *wrote, &c.*
          - NUMBER relates to the number of energizers, and is either ſingular or plural; as, I *write*, WE *write*, &c.---Verbs have likewiſe been diſtinguiſhed into the following kinds, *viz.*
            - 1ſt, ACTIVE, or thoſe where the energizer leads the ſentence; as when we ſay, *Cato loved.*
            - 2d, PASSIVE, where the paſſive object leads; as, *Portia is loved.*
            - 3d, NEUTER, where the energizer is always of neceſſity the paſſive ſubject; as, *Cæſar walketh.*
            - 4th, RECIPROCAL, or VERBS MIDDLE, as the Greeks called them, where the energy returns upon the energizer; as, *Brutus killed himſelf.*----Of theſe different kinds of verbs, two diſtinctions only can be ſuppoſed neceſſary,---ACTIVE and NEUTER;----becauſe the paſſive is only a variation of theſe, as alſo the reciprocal.
      - And ADJECTIVES, or thoſe words which denote any attribute WHOSE ESSENCE DOES NOT CONSIST IN MOTION OR ITS PRIVATION. Or, in other words, all thoſe words are called adjectives WHICH EXPRESS THE SEVERAL QUANTITIES and QUALITIES OF ALL THINGS; ſuch as *good* and *bad, black* and *white, large* and *ſmall*, &c.----As theſe attributes are in their own nature quite invariable, ſo the words which expreſs them can in ſtrictneſs admit of no variation whatever; ſo that where-ever we meet with variations of this ſort, we ought to conſider then as accidents, not as eſſential to language.
    - **ATTRIBUTIVES of the SECOND ORDER**, or thoſe words which denote the ATTRIBUTES OF ATTRIBUTES. Theſe are commonly called
      - ADVERBS, which may be divided into two kinds, *viz.*
        - I. Thoſe that are common to ALL ATTRIBUTIVES OF THE FIRST ORDER; and may be divided into adverbs
          - Of INTENSION and REMISSION, or of QUALITIES CONTINUOUS; as in the words MODERATELY, VASTLY, EXCEEDINGLY, *&c.* Theſe admit of the different degrees of compariſon.
          - Of QUANTITY DISCRETE; as, ONCE, TWICE, THRICE, *&c.*
          - Of RELATION; as, MORE, MOST, LESS, LEAST, EQUALLY, PROPORTIONALLY, *&c.*
          - Of QUALITY; as, HONESTLY, PRUDENTLY, WISELY, BRAVELY, *&c.*
        - II. Thoſe confined to VERBS, properly ſo called; and are of the following kinds, *viz.*
          - Of TIME; as, THEN, AFTERWARD, FORMERLY, JUST NOW, TO-DAY, TO-MORROW, *&c.*
          - Of PLACE; as, THERE, FAR, HENCE, *&c.* as alſo adverbs derived from prepoſitions; as, UPWARD, DOWNWARD, *&c.*
          - Of INTENSIONS and REMISSIONS PECULIAR to MOTION; as, SPEEDILY, HASTILY, SLOWLY, *&c.*
          - Of INTERROGATION or RELATION; as, WHEN, WHERE, WHENCE, WHITHER, *&c.*
- **ACCESSORIES**, comprehending all thoſe words which ONLY BECOME SIGNIFICANT BY RELATION TO OTHERS. Theſe are divided into
  - **DEFINITIVES**, which are all thoſe words which ſerve to DEFINE AND ASCERTAIN ANY PARTICULAR OBJECT, SO AS TO SEPARATE IT FROM OTHERS OF THE SAME CLASS, AND THUS DENOTE ITS INDIVIDUALITY. Theſe are commonly called
    - ARTICLES, which may be divided into two kinds, *viz.*
      - PROPER, or thoſe words which ALWAYS APPEAR AS ARTICLES ON ALL OCCASIONS. Theſe are, in Engliſh,
        - A, or AN, And THE — Theſe are both of them employed to DEFINE and ASCERTAIN INDIVIDUALS belonging to the ſeveral GENERA or SPECIES of ſubſtances. Thus, *houſe* is a term totally indefinite; A *houſe* denotes a particular houſe, ſeparated from others with which we may be totally unacquainted; THE *houſe*, denotes that it is now recollected as an object formerly known.
      - Or IMPROPER, or thoſe words which only SOMETIMES APPEAR AS ARTICLES. Theſe are either
        - PRONOMIAL, or thoſe pronouns which ſometimes ſtand as *definitives*, and ſometimes as *ſubſtitutes.* Of this kind may be reckoned THIS, ANY, ALL, SOME, and many others. Theſe, when they are employed as *articles*, never ſtand by themſelves, but require the aſſiſtance of a noun, which they define; whereas when they are pronouns, they muſt of neceſſity appear by themſelves, and ſupply the place of a noun. In this caſe likewiſe may be ranked theſe words which are commonly called *pronouns-poſſeſſive;* as, HIS, HERS, MY, MINE, THINE, *&c.* which, as they always ſerve to define a particular object, are more properly *definitives*, than either *pronouns* or *adjectives.*
        - Or, NOMIAL; ſo we could call thoſe nouns, which, laying aſide their nature as *nouns*, aſſume the character and office of *articles*, like them requiring the aſſiſtance of another noun which they ſerve to *define* and *aſcertain.* Of this kind may be reckoned all nouns in that ſtate which is commonly called the *genitive caſe* in the Engliſh language; as, ALEXANDER's, POMPEY's, *&c.* for theſe only ſerve to aſcertain the individuality of the noun with which they are aſſociated.
  - And **CONNECTIVES**, or thoſe words which are employed to CONNECT OTHER WORDS, AND OUT OF SEVERAL DISTINCT PARTS TO MAKE ONE COMPLETE WHOLE. Theſe may be divided into two kinds, *viz.*
    - CONJUNCTIONS; by which name are diſtinguiſhed all thoſe connectives whoſe office it is to CONJOIN SENTENCES. Theſe are divided into two kinds, *viz.*
      - CONJUNCTIVE, properly ſo called; or thoſe words which CONJOIN SENTENCES, AND THEIR MEANING ALSO. Theſe are either
        - COPULATIVE. The principal of which is the word AND.----As this only *couples* ſentences, it is applicable to all ſuch ſubjects whoſe natures are *not incompatible*, or where the coincidence may be only *accidental*, not *eſſential.* As in the ſentence, "*Leucippus* was a ſtatuary, AND *Priſcian* a grammarian;" here the coincidence is only accidental.
        - Or CONTINUATIVE, which conſolidate ſentences more intimately; and therefore are only applicable where the coincidence is *eſſential;* as, when we ſay, "The ſun ſhines BECAUSE the ſky is clear." Theſe may be divided into two kinds, *viz.*
          - SUPPOSITIVE, as in the word IF, which denotes *connection;* but does not ſuppoſe *actual exiſtence;* as in this example, "You will live happily, IF you live honeſtly."
          - POSITIVE, which not only denote connection, but alſo implies actual exiſtence. They are either
            - CASUAL, or thoſe which ſubjoin *effects* to *cauſes;* as the words BECAUSE, SINCE, *&c.* as in this example, "You live happily, BECAUSE you live honeſtly."
            - COLLECTIVE, or thoſe employed in demonſtrations and ſcience, properly ſo called, where the *cauſe* being firſt known, by its effects we diſcover the *conſequences;* as the words THEREFORE, THEN, *&c.* as in this example, "The moon intervenes, THEREFORE the ſun is in eclipſe."
      - And DISJUNCTIVE, or thoſe words which at the ſame time that they CONJOIN SENTENCES, DISJOIN THEIR MEANINGS. They are either
        - SIMPLE, or thoſe which do no more than merely disjoin; as, "EITHER it is day, OR it is night;" the alternative being left indefinite.
        - Or ADVERSATIVE, or thoſe which at the ſame time that they disjoin, *oppoſe* and *define.* Theſe are either,
          - ABSOLUTE; as the word BUT; as in this example, "*Brutus* was a patriot, BUT *Cæſar* was not."
          - COMPARATIVE; as in the words AS and THAN, *&c.* Theſe not only mark oppoſition, but that equality or exceſs which ariſes among ſubjects when compared; as for example, "*Virgil* was AS great a poet AS *Cicero* was an orator."
          - ADEQUATE, where the cauſe is ſuppoſed adequate to the effect. The principal of theſe is the word UNLESS; as in this example, "*Troy* will be taken, UNLESS the *palladium* be preserved." This ſuppoſes that the preſerving the palladium would be ſufficient to prevent it.
          - INADEQUATE, where the cauſe is ſuppoſed not to be ſufficient to produce the effect; as the word ALTHOUGH, in this example, "*Troy* will be taken ALTHOUGH *Hector* defend it." Here the efforts of Hector are ſuppoſed to be inefficacious.
    - And PREPOSITIONS, or thoſe auxiliary words, whoſe office it is to CONJOIN WORDS WHICH OF THEMSELVES REFUSE TO COALESCE. All of them denote ultimately ſome relation of PLACE; and are either
      - PROPER, or thoſe which literally denote different relations of PLACE, either
        - CONTIGUOUS; as when we ſay, "*Caius* walked WITH a *ſtaff;* the *ſtatue* ſtood UPON a *pedeſtal*," *&c.*
        - DETACHED; as when we ſay, "*he* is going TO *Italy;* the *ſun* is riſen ABOVE the *hills*," &c.
        - Of MOTION; as in this example, "to ſupport *uneaſy ſteps* OVER the *burning marle.*" Or
        - Of REST; as in this example, "*he*, with looks of cordial love, hung OVER *her* enamoured."
        - In theſe inſtances it is obvious, that when theſe prepoſitions denote *motion* or *reſt*, they vary their character with the verb to which they are joined.
      - Or METAPHORICAL. For, as thoſe who are above another in *place* have generally the advantage over them, theſe prepoſitions have been employed to denote that *ſuperiority* or *inferiority.* Thus, we ſay of a king, "*he* ruled OVER his *people;*" of a ſoldier, "*he* ſerved UNDER ſuch a *general*," &c.

INTERJECTIONS are a ſpecies of words which are not included under any of theſe claſſes above-mentioned; and indeed theſe can hardly be conſidered as a part of artificial language, and they may be rather called a part of that natural language with which man is endowed in common with other animals, by which we expreſs thoſe paſſions and natural emotions which ſpontaneouſly ariſe in the human ſoul upon the view of intereſting events.-----Theſe therefore do not, like other words, depend upon compact for their meaning, but are expreſſions of nature, and therefore univerſally underſtood;----the form which they aſſume by articulation being no part of their eſſence,----the tone with which they are uttered conſtituting their whole eſſence.----Of this kind are the words, *Ha! Alas! Fie!* &c.

of a building; yet, as stones cannot be arranged into a regular structure without a cement to bind and connect them, so these original words stand in need of others to connect them, before they can be made to express all the variety of our ideas. Another order of words, therefore, were necessary, which, although not of themselves significant, yet, when joined with others, might acquire a meaning. These form a second general class of words that may be called WORDS NOT OF THEMSELVES SIGNIFICANT, and which cannot acquire any meaning but so far as they serve either to EXPLAIN or CONNECT the others.

Hence, therefore, all words which can possibly be invented, may be divided into two general classes; those that are SIGNIFICANT OF THEMSELVES, and those that are NOT. Words which are significant of themselves, are either expressive of the names of substances, and therefore called SUBSTANTIVES; or, of qualities, which we call ATTRIBUTIVES. Words which are not significant of themselves, must acquire a meaning either as defining or connecting others, which we shall arrange under the two classes of DEFINITIVES and CONNECTIVES, each of which shall be examined in their order.

CHAPTER I.

Of SUBSTANTIVES.

SUBSTANTIVES may be divided into two classes, *viz.* those which are primary, commonly called NOUNS; and those of a secondary order, which are often substituted for nouns, and are hence called PRONOUNS: each of which we shall consider separately.

Section I. *Of* Substantives *of the First Order, called* NOUNS.

NOUNS are *all those words by which objects or substances are denominated, and which distinguish them from one another, by names applicable to each, without marking either quantity, quality, action, or relation.* And as all the objects which exist must be either in the same state that they were produced by *nature*, or changed from their original state by *art*, or *abstracted* from substances by the powers of imagination, this naturally suggests a division of nouns into NATURAL, as *man, vegetable, tree*, &c.; ARTIFICIAL, as *house, ship, watch*, &c.; or ABSTRACT, as *whiteness, temperance*, &c.

But the diversity of objects being so great as to render it impossible for any person to know the distinct names of every individual, therefore it has been found expedient to arrange them under certain general classes, the names of which may be more easily acquired, so that by referring any unknown object to the class to which it belongs, we in some measure supply the want of proper names. Hence, therefore, each of the above species of nouns are divided into those which denote genera, species, and individuals. Thus, in natural substances, *animal, vegetable*, and *fossile*, denote genera; *man, dog, tree, metal*, are species; and *Alexander, Cæsar, oak, gold*, are individuals. In artificial substances, *edifice* is a genus; *house, tower, church*, are species; and the *Vatican, Tron-church*, and *Herriot's hospital*, are individuals. In *abstract* substances, *motion* is a genus; *flight* and *course*, are species; the *flight of Mahomet*, the *course of a greyhound*, are individuals. Each of these general classes might be subdivided into many smaller; but as these lesser divisions can only relate to the particular genius of different languages, it does not fall within our plan to consider them. We therefore proceed to take notice of the accidents which accompany nouns. Of which kind may be reckoned *number* and *gender*.

As nouns are the names of substances, and as there may be many substances of the same kind, therefore nouns must be adapted to express whether there is one or more of those objects of which we speak. Nouns, therefore, in every language, admit of a certain variation to denote this circumstance, which is called *number*. Thus, in the English language, when we speak of a single place of habitation, we call it *a house*; but if of more, we call them *houses*. In the first of these cases the noun is said to be in the *singular*, and in the last case, the *plural* number: nor does the English, or any other language except the Greek, admit of any other variation but these two: and although the Greek language admits of a particular variation of the noun called the *dual* number, which is a plural limited to two objects; yet this cannot be considered as to language; and it is perhaps doubtful whether this variation ought to be considered as an elegance or a defect in that language.

But although number be a natural accident of nouns, it can only be considered as essential to those which denote genera or species, as it does not descend to individuals. Thus we say, *animal*, or *animals, vegetables*, and *fossils*; as also, *man*, or *men, dogs, trees*, &c. But we only say, *Xenophon, Cesar, Bucephalus*, &c. in the singular. Nor do these admit of a plural, excepting when we consider any proper name, as a general appellative under which many others are arranged, when it is no longer the name of an individual, but that of a species, and as such admits of a plural; as the *Alexanders*, the *Ptolemies*, the *Howards*, the *Pelhams*, the *Montagues*, &c. The reason of all which will be obvious, if we consider, that every genus may be found whole and entire in each of its *species*; for *man, horse*, and *dog*, are each of them an entire and complete *animal:* and every species may be found whole and entire in each of its individuals; for *Socrates, Plato*, and *Xenophon*, are each of them compleatly and entirely a *man*. Hence it is, that every *genus*, though ONE, is multiplied into MANY; and every *species*, though ONE, is also multiplied into MANY, *by reference to those beings which are their subordinates*. But as *no individual has any such subordinates*, it can never in strictness be considered as MANY, and so is truly an INDIVIDUAL as well in *nature* as in *name*, and therefore cannot admit of number.

Besides number, another accident of nouns is *gender*, the nature of which may be thus explained: As nouns are the names of the various objects in nature; and as the distinctions of sex is perceptible among all those objects which are animated; and as those which are inanimate cannot

cannot admit of any ſex at all; therefore all the beings which can become the objects of our ſpeculation, may be conſidered as either *males*, or *females*, or ſuch as admit of *no* ſex, and therefore may be ſaid to be neuter, or of *neither* ſex. Hence, therefore, grammarians have made a threefold diſtinction of nouns, into *maſculine genders*, or thoſe which denote *males*; *feminine*, or thoſe which denote *females*; and *neuters*, which denote thoſe ſubſtances that admit of no ſex. But, although the origin of genders is thus ſo clear and obvious; yet every language that we know of, except the Engliſh, deviates from the order of nature, and often attributes ſex to thoſe ſubſtances which are totally incapable of any; nay, ſome languages are ſo particularly defective in this reſpect, as to claſs every object inanimate as well as animate under either the *maſculine* or *feminine genders*, as they admit of no gender for thoſe that are of neither ſex. This is the caſe with the French, Italian, and Spaniſh. But the Engliſh, ſtrictly following the order of nature, puts every noun which denotes a male animal, and no others, in the *maſculine* gender; every name of a female animal, in the *feminine*; and every animal whoſe ſex is not obvious, or known, as well as every inanimate object whatever, in the *neuter* gender. Nor does this rule admit of any exceptions; although poets take the liberty of perſonifying any objects they think proper, and endow them with whatever ſex ſuits their purpoſe beſt; which ſerves admirably to diſtinguiſh between the cool language of philoſophy, and the enthuſiaſm of poetry.

Although *Caſes* are not neceſſary accidents of nouns; yet as they have been often conſidered as ſuch, it will perhaps be deemed proper to take ſome notice of them. —As natural objects remain the ſame, although viewed from many different points of view, they are not in their own nature altered, although they may be connected with others in many different ways: their names therefore ought to remain unchanged, although their relations to other words may be varied. However, there are certain circumſtances in which nouns may be conſidered with reſpect to their relation *to*, and connection *with* other words, which occur more frequently than others. Some languages, (particularly the Greek and Latin) expreſs *ſome* of theſe circumſtances, by a variation of the original noun, which variations are called CASES. But the Engliſh, and almoſt all the modern languages of Europe, have followed the order of nature, and allow the noun to remain the ſame, expreſſing its relation and connection with other words by the help of diſtinct words called prepoſitions.—Which of theſe methods is beſt, it is not our preſent purpoſe to inquire. See LANGUAGE.

It has been ſuppoſed the Engliſh nouns admit of one variation which anſwers to the genitive caſe of the Latins.—Thus the word *Alexander* is an Engliſh noun in its proper form, and in that caſe which in Latin would be called the *Nominative*. The variation which they called the *Genitive* Caſe, is expreſſed in Engliſh by adding the prepoſition OF before the noun; thus, OF *Alexander*. But the ſame meaning may be conveyed by the word *Alexander's*; for the meaning is the ſame if I ſay the houſe *of Alexander*, or *Alexander's* houſe. This, therefore, has been called a true inflection of the original noun. However, although this opinion has been adopted by all grammarians, it appears to have been adopted without ſufficient examination, as will be evident from the following conſiderations.

There are certain circumſtances in which this ſuppoſed genitive cannot be ſuſtituted inſtead of the other: for I may ſay, I ſpeak OF *Alexander*, I write OF *Cæſar*, I think OF *Pompey*; but I cannot ſay, I ſpeak *Alexander's*, I write *Cæſar's*, or I think *Pompey's*. Hence theſe two are not in all caſes ſynonymous terms; and therefore one of them muſt be conſidered as only accidentally coinciding with the other in particular circumſtances.

Again, every one of theſe ſuppoſed genitives can with propriety aſſume all the various ſigns of the different *caſes* in the Engliſh language: for we may ſay ſimply, as in the nominative caſe, *Alexander's* houſe; but we can alſo ſay, OF *Alexander's houſe*, TO, WITH, FROM, IN, BY, or FOR *Alexander's houſe*, &c. If this then be a real genitive, it requires the ſign of the genitive, as well as of the other caſes, to explain it; which would be an abſurdity too great to be admitted.—But it may be aſked, if theſe are not genitives, to what claſs of words can they be referred?

In anſwer to this, it has been already obſerved, that the variety of ſubſtances is ſo great, that it is impoſſible for any perſon to know the names of every one of them; and therefore they have been arranged under the ſeveral orders of genera and ſpecies. We now further obſerve, that as the individuals are ſo exceedingly numerous, it would be impoſſible even to invent proper names for each, and far leſs would it be poſſible to make theſe names be known to every perſon who might accidentally ſee them: therefore when we want to aſcertain any individual object, and diſtinguiſh it from all the other individuals of the ſame ſpecies, we are obliged to have recourſe to particular epithets, or definitives, to aſcertain that individual.—Thus, I ſee a particular houſe which I want to diſtinguiſh from other houſes; this has no particular name of its own; I muſt therefore aſcertain it in the beſt manner I can; and as the ſhorteſt is always the beſt, we moſt naturally denominate it from its owner or poſſeſſor if we know him, and therefore call it *Alexander's*, *James's*, or *John's* houſe.—Here then we ſee, that the words *Alexander's*, *James's*, and *John's*, do not ſtand as nouns, but as *articles* or *definitives* ſerving to aſcertain and point out the individuality of the noun with which they are joined, and are much nearer allied to adjectives than to ſubſtantives. Theſe, therefore, like other articles, do not alter the caſe of the noun; ſo that the term *Alexander's houſe*, is as much the proper name of a particular houſe, as *Alexander* or *James* are the proper names of particular men, and of conſequence may be varied thro' the different caſes as well as the other.—It is ſurpriſing, that this idea never occurred to grammarians; for *St Peter's* at Rome, and *St Paul's* at London, are as truly the proper names of theſe two noble edifices, as the *Rotundo* or the *Circus* are the proper names of two other ſtructures.—We may therefore ſafely conclude, that the Engliſh language admits of no caſes at all, and that the only eſſential accidents of nouns are gender and number.

Section II. *Of* Subftantives *of the Second Order, called* Pronouns.

All converfation paffes between individuals. When thefe individuals are unknown to each other, how fhall the one fpeaker addrefs the other, when he knows not his name; or how explain himfelf by his own name, of which the other is wholly ignorant? This might perhaps have been at firft effected by pointing; but as this method behoved to be extremely inconvenient and defective, it was neceffary that a particular clafs of words fhould be invented for this purpofe; and as thefe words always fupply the place of a noun, they have been called PRONOUNS;—the nature of which may be explained as follows.

Suppofe the parties converfing to be wholly unacquainted, and the fubject of the converfation to be the fpeaker himfelf: here, to fupply the place of pointing, the inventors of language have furnifhed the fpeaker with the pronoun *I*; *I write*, *I defire*; and as the fpeaker is always principal with refpect to his own difcourfe, they have therefore called this the *pronoun* of the FIRST perfon.

Again, fuppofe the fubject of the converfation to be the party addreffed: here, for fimilar reafons, they invented the pronoun THOU, THOU *writeft*, THOU *walkeft*; and as the party addreffed is next in dignity to the fpeaker, or at leaft comes next with reference to the difcourfe, they therefore called this the *pronoun* of the SECOND perfon.

But as the fubject of the converfation may be fome third object different from either the fpeaker or the party addreffed, another pronoun was neceffary; and as this object might be either a *male* or a *female*, or a *neuter*, it was neceffary to have one pronoun for each of the genders, HE for the *mafculine*, SHE for the *feminine*, and IT for the neuter: and this, in diftinction to the former, was called the *pronoun* of the THIRD perfon.—Hence the diftribution of pronouns into *perfons*.

We have already feen that nouns admit of number; pronouns, which are their fubftitutes, likewife admit of number. There may be many fpeakers of the fame fentiment, as well as one who including himfelf fpeaks the fame fentiment with MANY; fpeech may likewife be addreffed to MANY at a time as well as to ONE; and the fubject of the difcourfe may likewife be MANY; therefore the pronoun of every one of the *perfons* muft admit of number, to exprefs this fingularity or plurality. Hence, therefore, the pronoun of the firft perfon *I*, has the plural WE; that of the fecond perfon THOU, has the plural YOU; and that of the third perfon HE, SHE, or IT, has the plural THEY, which is equally applied to all the three genders.

With regard to gender, we do not find in any language that the pronouns of the *Firft* or *Second* perfons admit of any diftinction in this refpect: nor was it neceffary that they fhould; as the fpeaker and party addreffed are ufually prefent with one another, this diftinction is generally obvious from drefs and external appearance. But this is not the cafe with regard to the pronoun of the *Third* perfon; of whofe character and diftinctions we often know no more than what we learn from the difcourfe itfelf; and hence it is, that in almoft all languages the pronoun of the third perfon admits of genders, as we have already feen the Englifh admits of the triple diftinction of mafculine, feminine, and neuter.—The utility of which threefold diftinction will be beft fhewn by an example. Suppofing there was no fuch diftinction, and that we fhould read in any hiftory HE caufed HIM to deftroy HIM, and were told that the pronoun which is here thrice repeated ftood each time for fomething different; that is to fay, for a man, for a woman, and for a city, whofe names were Alexander, Thais, and Perfepolis. Taking the pronoun thus divefted of its genders, it does not appear which of the three was deftroyed, which the deftroyer, or which the caufe that moved to the deftruction. But there is no ambiguity when we hear the genders diftinguifhed; and when, inftead of the ambiguous fentence, *he* caufed *him* to deftroy *him*, we are told with the proper diftinctions that SHE caufed HIM to deftroy IT. Then we know with certainty, that the promoter was the *woman*, that her inftrument was the *hero*, and that the fubject of her cruelty was the unfortunate *city*.—From this example we would be furprifed how the *Italian*, *French* and *Spanifh* could exprefs themfelves with precifion or elegance, with no more than two variations of this perfon.

From the fame caufes as a diftinction of gender is unneceffary in the pronouns of the firft and fecond perfons, we fee the reafon why a fingle pronoun to each perfon, an *I* for the firft, and a THOU for the fecond, are fufficient for all the purpofes of language, as thefe are always fuppofed prefent and obvious. But it is not fo with refpect to the third perfon, as the various relations of different objects made it neceffary to have not *one*, but *many*; fuch as, HE, SHE, IT, THIS, THAT, OTHER, SOME, ALL, ANY, *&c.*

Although we have faid that there is only one pronoun for each of the firft and fecond perfons, yet the Englifh reader may perhaps be puzzled with finding two diftinct words applied to each; I and ME, for the firft perfon; THOU and THEE, for the fecond. The learned reader will at once fee that thefe two words ME and THEE are equivalent to the *accufative* cafe of the Latin pronoun: but, in order to make the meaning of this as plain as poffible without embarraffing ourfelves about unneceffary terms, we fhall only obferve, no effect can be produced without a caufe, and no action can be performed without producing fome effect. The fame perfon may in different circumftances be either the active and efficient caufe *of*, or the paffive fubject who fuffers *by* an action: fome languages have therefore formed different words to exprefs the fame object in thefe different circumftances. Thus in the Latin fentences, *Brutus amavit Caffium*, Brutus loved Caffius; and *Caffius amavit Brutum*, Caffius loved Brutus; the word *Brutus* in the firft, and *Caffius* in the fecond, is the form which the noun affumes when it is ufed as the efficient caufe; and *Brutum* and *Caffium* the forms which the fame nouns affume when they are reprefented as the paffive fubjects. This laft then was what was called the *accufative* cafe of the noun, and the firft was called the *nominative*. We have already feen that the Englifh noun admits of no cafes, the active fubject always preceding the verb, and the paffive following it, as is plain from the above fentences, where *Brutus* and *Caffius* remain changed in both fituations; and the fame might be obferved of all other modern languages: yet

yet the English and all modern languages admit of a different word to exprefs the different ftate of the pronouns. Thus, we fay, I *efteem* THEE, I *admire* HIM, I *love* HER: in all of which fentences *I*, the pronoun of the firft perfon, is the *active*, and THEE of the fecond perfon, and HE and HER of the third, are the *paffive* fubjects, and are therefore expreffed by the words THEE, HIM, and HER. But if the cafe be reverfed, and the pronoun of the firft perfon becomes the paffive fubject, and the others the active, they affume a different form; thus, THOU *efteemeft*, HE *admires*, SHE *loves*—ME. Hence, therefore, it appears that we have two diftinct words for each of thefe pronouns to exprefs the different ftates in which they may be reprefented, exactly analogous to the nominative and accufative cafes of the Romans—Whether thefe are to be admitted as cafes of our pronouns, or whether they may not rather be confidered as diftinct words formed for that particular purpofe, is of little confequence for us to enquire; as, in whatever light they may be confidered, this variation cannot be looked upon as an effential part of language, but only as a particular refinement, invented to prevent the difagreeable repetition of the pronoun, which behoved frequently to have happened without this contrivance. This feems to be the only reafon why pronouns have been endowed with this variety, and not nouns. For as nouns are in themfelves greatly diverfified, the famenefs of founds does not here fo often occur as it would have done in the pronouns, where the fame I, THOU, HE, SHE, or IT, anfwers for the name of every object which occurs in nature; but, by this diverfity in the form of the words, this circumftance is in fome meafure obviated. And it is probably for the fame reafon, that the plural of each of thefe pronouns is fo very different from the fingular. Thus, from I of the firft perfon is formed WE in the plural, and from ME the plural US; from THOU and THEE the plurals YE and YOU; from HE, SHE,—HIM, HER, and IT, the plurals THEY, and THEM. In all of which there is not the leaft refemblance between the fingular and plural of any one word; and, except in HE and HIM, THEY and THEM, there is not any fimilarity between what may by fome be thought to be the different *cafes* of the fame word.

We have feen that the fame object may fometimes be the caufe of an action, and fometimes the object which fuffers by it. We now obferve, that the fame object may fometimes be, with regard to the fame action, both the active caufe and paffive fubject; as when we fay, *Brutus killed himfelf*. In which cafe it is evident, that Brutus was both the caufe that produced, and the object that fuffered by the action; the pronoun himfelf being put for his name; for, were it not for the famenefs of the found, and the ambiguity which would be occafioned by it, we might furely fay *Brutus killed Brutus*. It was therefore neceffary to have a particular pronoun for the paffive fubject, in all thofe cafes where the fame object was the agent; and on this account the word SELF has been invented, having the plural SELVES. This pronoun therefore, which ferves on all occafions to reprefent the action as returning upon the agent that produced it, may be called the reciprocal pronoun; which has this peculiarity, that it can never ftand by itfelf, but muft alway have the affiftance of the pronoun in whofe place it is fubftituted; as, MYSELF, THYSELF, HIMSELF, HERSELF, ITSELF, with their plurals. But although this feems to have been the original ufe of this pronoun; yet, in the Englifh language, its ufe has been extended further; and, from its always having a reference to the agent of any action, it has been employed to denote that agent by way of emphafis, as performing the action without the aid or affiftance of any other; as, *he himfelf went*. And from this circumftance it has been further extended to denote any object as performing or fuffering any thing which we would not naturally have expected from its known character or nature; as in this fentence: "The moft daring of mankind are fometimes ftartled before they venture upon the commiffion of any extraordinary crime; even Cæfar HIMSELF felt the utmoft perturbation of mind before he dared to pafs the Rubicon."

Thefe are all that can be properly called *perfonal pronouns*; but there are others which are derived from them, called *poffeffive pronouns*, as, MY, THY, MINE, HIS, HERS, ITS, *&c.* the nature of which it will be neceffary here to explain. We have already fhewn how nouns, when they came to denote poffeffion, were no longer to be confidered as nouns, but rather as definitives or articles; fo the pronouns which we here confider, being the real fubftitutes of *nominal* articles, ought alfo to be confidered as a diftinct clafs of pronomial articles: for as thefe never, in any cafe, can be fubftituted for a noun, they cannot be confidered as pronouns. Grammarians have been led into the miftake of placing them under this head, becaufe they are the fubftitutes of thefe words, which, altho' they affume the appearance of nouns, only perform the part of definitives. Thus we have feen, that when we fay, *Alexander's houfe*; the word *Alexander's* can only be confidered as a definitive: and, in the fame manner, if Alexander was the fpeaker, he might fay, MY *houfe*; if the party addreffed, it would be THY *houfe*; or if any third perfon, HIS, and in the fame manner HERS or ITS *houfe*. In all which cafes this poffeffive pronoun is fubftituted for that word which only ferves to define and afcertain the identity of the noun, and not for the noun itfelf, which muft always be either expreffed or underftood. Hence the reafon why one pronoun becomes the fubftitute of this noun and its proper definitive, whether that definitive appears in the form of a noun or pronoun: for I can fay, "*Alexander's houfe* is more elegant than *Mary's*, or *his houfe* is more elegant than *hers*, although IT neither is fo commodious nor agreeable to live in." In which example it is plain, that the words *his* and *hers* are ftrictly the fubftitutes only of *Alexander's* and *Mary's*, and nothing more; whereas the pronoun IT is the fubftitute of the whole noun with its definitive *Alexander's houfe*. The other clafs of pronouns poffeffive, MINE, THINE, *&c.* as they do not fo much ferve to diftinguifh individuals, as to afcertain the property of the thing fpoken of, which may, in a certain fenfe, be confidered as an attribute thereof, are more nearly allied to attributives, and have therefore by fome been called adjectives. And

it must be acknowledged, that these two classes of words are so nearly allied to one another, that it is difficult to ascertain, in all cases, the precise boundary between them.

Besides these, there are other words which sometimes assume the province of pronouns, and are generally considered as belonging to this class, although in many cases improperly; such as, THIS, THAT, ANY, SOME, THESE, THOSE, ALL, and some others; which may be called *improper* pronouns. To distinguish when they may be considered as pronouns, we may observe, that when they stand by themselves, and supply the place of a noun, as when we say, THIS *is virtue*, *give me* THAT, then are they pronouns. But when they are associated to some noun, as when we say, THIS HABIT *is virtue*, or THAT MAN *defrauded me*; then, as they do not supply *the place* of a noun, but only serve to *ascertain* one, they fall rather under the species of *definitives*, or *articles*. And indeed it must be confessed, that these, as well as the possessive pronouns, are more properly adapted to define and ascertain individuals among nouns, than to supply their place; and therefore are oftener to be considered as articles than as pronouns. The best rule to distinguish when they are to be considered as the one or the other, is this. The genuine PRONOUN *always stands* by *itself*, assuming the power of a NOUN, and supplying its *place*. The genuine ARTICLE *never stands* by *itself*, but appears at all times *associated to something else*, requiring a noun for its support, as much as *attributives* or *adjectives*.

The three orders of pronouns already mentioned, may be called *prepositive*; because they are capable of introducing or leading a sentence, without having reference to any thing previous. But there is another order of pronouns which can never be employed but to *connect* sentences, and must therefore always have a reference to some sentence that precedes them; as, WHO, WHICH, WHAT. The nature of which may be explained as follows.

Suppose I say, LIGHT *is a body*; LIGHT *moves with great celerity*; these would apparently be two distinct sentences. But if, instead of the second LIGHT, I were to place the prepositive pronoun IT, and say, LIGHT *is a body*, IT *moves with great celerity*; the sentences would still be distinct, and two. But if I add a *connective* (as for example AND) saying, LIGHT *is a body*, AND IT *moves with great celerity*; I then, by connection, make the two into *one*. Now it is *in the united powers of a connective and another pronoun*, that we may see the force and character of the pronoun here treated of. For if, instead of the words AND IT, we substitute THAT or WHICH; saying, LIGHT *is a body* WHICH *moves with great celerity*; the sentence still retains its *unity*, and becomes, if possible, more compact than before. We may therefore call this pronoun the SUBJUNCTIVE; because it cannot introduce an original sentence, but only serves *to subjoin one to some other which is previous*.

The application of this *subjunctive*, like the other pronouns, is universal. It may be the substitute of all kinds of substantives, natural, artificial, or abstract; general, special, or particular: for we may say, The *man who*, the *ship which*; *Alexander who*, *virtue which*, &c. Nay, it may even be the substitute of all the other pronouns and is therefore of course expressive of all the three persons. Thus we say, I WHO *now write*; THOU WHO *now readest*; HE WHO *now heareth*, &c. And thus the SUBJUNCTIVE is truly a *pronoun* from its *substitution*; there being no substantive existing in whose place it may not stand. At the same time it is essentially distinguished from the other pronouns by this particular, that it is not only a *substitute*, but likewise a *connective*.

As to the accidents of this pronoun: From its performing the part of a connective, it of course follows, that neither *gender* nor *number* can be considered as essential to it; because these are always expressed in the preceding parts of the sentence to which it refers; nor do we in fact find, that this pronoun, at least in modern languages, admits of any distinction to denote *number*, although the English language admits of one variation for the *gender*; as we employ WHO for the *masculine* and *feminine*, and WHICH for the *neuter* gender, thus: *The man*, or *the woman* WHO *went to Rome*; *the* TREE *which stands on yonder plain*, *&c.* It likewise admits of a variation similar to that of the accusative case; at least when applied to males or females. For when the object which it represents is the efficient cause of action, it is WHO; as, *the man* WHO *fell*, *&c.*; but when it is the passive subject, it then, in certain circumstances, takes the form of WHOM; as, *the man of* WHOM *I speak*; although this is not universal; as we likewise say, *the man* WHO *was beaten*. But the neuter admits of no such distinctions, as we equally say, *the tree* WHICH *fell*, or *the tree of* WHICH *I spoke*. But both of these admit of a variation to denote possession or qualities, which is the word WHOSE for all genders. Thus, we say, *Socrates* WHOSE *only study was virtue*; *Elizabeth* WHOSE *reign was glorious*.

To conclude: We have seen that substantives are either *primary* or *secondary*; or, in other words, NOUNS or PRONOUNS. The NOUNS denote substances, either *natural*, *artificial*, or *abstract*; and these either *general*, *special*, or *particular*. The PRONUNS, their substitutes, are either *prepositive* or *subjunctive*: the PREPOSITIVE is distinguished into three orders, called the *first*, the *second*, and the *third* persons: the SUBJUNCTIVE includes the powers of all the three, having *superadded*, as of its own, the peculiar force of a connective.

CHAPTER II.

Of ATTRIBUTIVES.

As all attributives must either be expressive of the attributes of SUBSTANCES, or of other ATTRIBUTES, we divide this class into two kinds; calling those of the first kind, ATTRIBUTIVES of the FIRST ORDER; and those of the second kind, ATTRIBUTIVES of the SECOND ORDER.

Section I. Attributives *of the First Order*.

Attributives are all those *principal* words that denote *attributes* considered as attributes. Such, for example, are

are the words, *black, white, great, little, wise, eloquent, to write, to walk, to speak,* &c. all of which are the *attributes of substances*. Thus *black* is an attribute of *jett, white* of *snow;—wise* and *eloquent,* as also, *to write* and *speak,* are attributes of *men.*

In examining the different attributes of substances, we readily perceive that some of them have their essence in *motion*; such are, *to walk, to fly, to strike, to live, &c.* Others have it in the *privation* of *motion*; as, *to stop, to rest, to cease, to die, &c.* And others have it in subjects that have *nothing to do* with either *motion* or its *privation*; such are the attributes of *great* and *little, wise* and *foolish, white* and *black,* and, in a word, the several *quantities* and *qualities* of all things. This therefore furnishes a natural division of attributives of this order; and grammarians have called all those, whose essence consists in *motion* or its *privation,* VERBS; and all the others have been called ADJECTIVES; each of which we shall consider separately.

I. Of Verbs.

VERBS are all those principal words which denote *attributes,* whose essence consists in *motion,* or *energies,* (for we chuse to make use of this last term, as it implies the exertions of the mind as well as those of the body), or their *privation.* This order of attributives differs from the other called *adjectives*; not only in the particular above-mentioned, but also because adjectives denote only qualities or quantities, which do not admit of any change of state; whereas the verbal attributives may be considered as in several different states, and therefore admit of several variations in the term employed to express these. It may, in the first place, be considered as a simple attribute or energy, without particularizing any circumstance relating to the state it may be in; as in the word WRITE. Or, in the second place, as these are all attributes which denote motions or energies, they may be represented as in the state of actual motion or exertion; as in the word WRITING. Or, lastly, the motion or energy may be finished, and its effect completed; as in the word WRITTEN. Hence, therefore, every verb admits of a threefold variation in every language, in each of which languages they are distinguished by some particular names. Our grammarians have given the name of the INFINITIVE MODE to the original verb itself, and the other two variations of it are both distinguished by the name of PARTICIPLES; that variation which exhibits the verb in its state of energy being called the PARTICIPLE PRESENT or ACTIVE, and the other variation is called the PARTICIPLE PERFECT or PAST.

These variations of the verb are founded in the nature of things, and therefore must be found in every language under some form or other. As to the other supposed variations of verbs relating to person, number, time, *&c.* the slightest reflection on this subject will shew, that a verb, considered as a simple attributive, can admit of none of these affections, but must for ever remain the same at all times and in all situations whatever; for who does not see, that the attribute *to write* is the same whether it is possessed by *you,* by *me,* or by any number of different persons? Nor does this attribute suffer any change, whether it is represented as having been exerted a *thousand years ago,* or at *this present moment,* or at *any other* assignable period of duration; but, like every other attribute, it must remain for ever the same. For however *substances* may vary with time, and be incessantly changing; yet *attributes* of every sort are altogether beyond its power. And we must easily perceive, that the attribute which is expressed by the word GOOD, is the same now as it was at the creation, or will be while the world exists. And in the same manner, *to walk, to write, to fly,* denote attributes, which must each of them preserve their own particular nature during all the successive ages of time. Hence therefore we see, that the verbal attribute must for ever remain in that state, or modification, in which it is at first represented. Nor can it suffer any change, however different the circumstances may be in which it can be applied in language. All, therefore, that can be said of these several variations with which grammarians have usually endowed verbs, is this, That, as an attributive, it hath such an intimate connection with a substantive, as necessarily to be united with one, before it can make a principal figure in language: And as that union may be represented as taking place at different times, and under different circumstances, the inventors of some languages have contrived to express these different connections by a single word, instead of doing it by different words, as the thing in itself would naturally require; in the same manner as those who use the short-hand method of writing, make a single character express a whole word, or sentence: And as it was most natural for the contrivers of these words to derive them from the verb itself of which they are compounded, they have each of them become a *real* variation of the original *word* which expresses the verbal attribute; and, from thus being a variation of the verbal *word,* they have at last come to be considered as an *essential* variation of the *verb itself,* which has occasioned those contradictory definitions, and that confusion of ideas which we meet with among all writers on this subject. But as we here consider language as in itself, without regarding the particular forms under which it may appear, we must reject all these variations of *persons, numbers, modes,* and *tenses,* which the verb itself has usually been supposed to undergo; and consider them, not as essential variations of the verb itself, but as variations produced in language by the combination of the verb with other parts of speech; and therefore relating to *syntax,* and of course belonging to those grammatical disquisitions alone which treat of the peculiarities of any particular language. But as these variations have been so universally considered as essential parts of the verb itself, and as the terms which this division of the verb have introduced into grammar are so frequently to be met with, it will be necessary to explain in some measure the meaning of these several terms.

In the natural world, no attribute can possibly exist without a substance to which it belongs, nor any substance without possessing certain attributes. So necessary and intimate is the connection between these, that it is as impossible

impoffible to feparate them, as to create or annihilate the feveral fubftances that poffefs thefe attributes. But although we are thus circumfcribed as to our bodily powers, the mind admits not of fuch limitation; but can with the utmoft facility feparate every quality from every object whatever, and confider them apart; as, *colour* without *fuperficies*, *fuperficies* without *folidity*, or *weight* without *matter*, &c. and, when thus feparated, apply them to what objects, and in what manner, it pleafes. In this manner the mind abftracts thofe attributes which denote *motions* or *energies* from their *agents* or *energizers*, in the fame way as it abftracts *qualities* from their *fubftances*. And it is thefe energies thus abftracted, which form that fpecies of words called *verbs*; in the fame manner as thofe attributes which denote *quantities* and *qualities* abftracted from their neceffary fubftances, form *adjectives*. Thus, the term *to walk*, denotes a particular *energy* as confidered perfectly apart from every *energizer*, in the fame manner as the word *good* denotes a certain *quality* without regard to any particular *fubftance*.

Here then we difcover a moft effential difference between the order of nature, and that reprefentation of it which man makes by means of words. For in *nature*, every quality muft at all times be united with fome fubftance, nor can ever be exhibited feparate from it; but in *language*, every attributive, if it be confidered at all, muft be feparated from the object to which it naturally belongs. Hence we fee the reafon why, in language, every *energy* and energizer, not only *may* be confidered feparately, but *muft* for ever remain feparate, unlefs they be united by fome other power than what is neceffarily their own. For the attribute *to write*, can no more be united to *man* its proper energizer, than a motion could commence without a caufe; and till this attribute is united to its proper energizer, it muft remain in a great meafure dead and inefficacious in language.—To communicate life and energy, therefore, to this inert attribute, it muft be united to its proper energizer; which can only be effected by the help of an affertion of the fpeaker himfelf; which may be confidered as the fame with regard to language, as life is in the natural world.

It is evident that, by the affiftance of an affertion, the fpeaker is enabled to write any energy to any particular energizer, and thus, without making any change upon the attribute itfelf, reprefent a variety of changes produced upon other bodies by its means.—Thus, if I fay, *I write*, what do I more than affert that I myfelf am poffeffed of that particular attribute denoted by the verb *to write*? If I fay, *You write*, or *He writes*, what do I more than affert that another perfon is poffeffed of that particular attribute or energy?—If I fay, *He* DID *write*, I only affert that the fame attribute was poffeffed at another time, by the fame perfon, as before. Hence therefore, by the help of this affertion of the fpeaker, we are enabled to join this particular attribute to many different energizers, as well as to reprefent thefe different combinations as occurring at many different times; fo that the fame atribute may thus be made to appear under a great many different circumftances, and exhibit a great variety of changes upon other objects, although itfelf remains unchanged; the feveral variations which we perceive, only relating to the objects with which it is combined, or the means by which that union is effected.—In the fame manner it often happens, that any object in nature, a houfe for example, may appear extremely different when viewed from different fituations.

From the intimate connection that takes place between the energy, the energizer, the affertion, and time, thefe feveral acceffories have been confidered as effential parts of the verb; and therefore fome grammarians have defined a verb to be *A word denoting an energy, with time, and an affertion*. But if we were thus to confound things with thofe which may neceffarily accompany them, we could never arrive at a clear perception of any fubject whatever. But not to enter into the arguments that might be produced to fhew the impropriety of this definition, we fhall only obferve, that by the univerfal acknowledgment of all grammarians this cannot be juft. For they unanimoufly agree, that the *infinitive mode* is not only *a part* of every verb, but the *moft effential part*; as it forms the root from which all the other parts are derived. But as this mode neither denotes either time or an affertion, it is evident that thefe, even by their own acknowledgment, can be at beft but acceffories, and not effential parts of the verb.

From thefe arguments, therefore, we muft conclude, that the verb itfelf admits of no other variations but thofe already taken notice of;—that before it can produce any active effect in language, like every other attribute, it muft be united to fome proper energizer;—that this union in language can never be effected but by means of an exertion of the vital powers of the fpeaker, whereby he either publifhes his perception thereof, or his will that it fhould be;—and that this union may be reprefented as taking place at all the different times that can be affigned. Thefe, therefore, are each of them neceffary accompaniments of a verb, but each of them feparate and diftinct in their own nature, not only from this verb, but from one another; and it becomes an effential part of the fyntax of every language, to confider the various ways in which thefe can be combined and affect one another.—Nay, fo intimate has this connection been thought to be by fome, that the contrivers of certain languages have arranged them under particular claffes, for the fake of diftinctnefs and precifion.—The form which a verb affumed, when thus varied in all the ways that their particular language would admit of, was called the CONJUGATION of the verb; the feveral parts of which may be underftood from the following fketch.

When the verb is confidered under the compound form of which we now fpeak, it can admit of variations chiefly in three refpects. For, firft, fuppofing the *attribute*, the *energizer*, and the *time* when that attribute was exerted by the energizer, to be the fame; a variation may be occafioned by a change being produced in the *perception* or *volition* of the fpeaker, (which, for brevity, we will call the *affertion*,) as in thefe examples: *I write*, SCRIBO; *I may write*, SCRIBAM; *do you write*, SCRIBE. The variations produced by this means have been called MODES. Secondly, Suppofing the *attribute*, the *energizer*, and the *affertion*, to be the fame; a change may be produced in the *time*, as in thefe examples: *I do write*,

write, SCRIBO; *I did write*, SCRIPSI; *I ſhall write*, SCRIBAM, *&c.* The variations produced from this cauſe have been called TENSES. And, thirdly, Suppoſing the *attribute*, the *time*, and the *aſſertion*, to remain unchanged, there may be a difference in the *energizer*; and this likewiſe admits of a diviſion: for as the energizer may be only *one* or more perſons, it muſt have a variation into *ſingular* and *plural* on theſe accounts; as in theſe examples: *I write*, SCRIBO; *thou writeſt*, SCRIBAS; *he writes*, SCRIBAT; and in the plural, *we write*, SCRIBAMUS; *ye write*, SCRIBATIS; *they write*, SCRIBANT. The variations produced from this cauſe have been called PERSON and NUMBER.——Theſe are all the variations which have been made in the Latin or Greek languages; and therefore our grammarians, who have adopted every idea they have of grammar from theſe languages, mention no more: but it was not neceſſary that they ſhould have ſtopt here, for an attribute is ſurely as ſuſceptible of the diſtinction of ſex as of perſon, ſo that they might have had a variation for *Gender* alſo; and inſtead of having one word SCRIBAT to anſwer for all the three genders, *he*, *ſhe*, or *it wrote*, they might have had three different words —The compoſers of the Hebrew language have adopted this plan, and admit of two variations on this account; and the Ruſſian language admits of a like variation in their verb for theſe genders; as in this example: ON ZOHELAL, *he has done*; ONA ZOHELALA, *ſhe has done*, &c. But as the two languages above mentioned do not admit of this diſtinction, therefore all the variations that our verbs are ſaid to admit of are MODES, which include within them TENSES, which include under them PERSONS, under which head is included NUMBER; and theſe are all the parts into which a CONJUGATION has been divided.—As to what concerns the nature and leſſer diſtinctions of each of theſe, the following general remarks may be ſufficient.

With regard to MODES; as this relates ſolely to the *perception* or *volition* of the ſpeaker, it neceſſarily follows, that there ought to be a diſtinct and particular MODE for each diverſity that there can can be in his manner of perceiving or willing any thing whatever, the principal of which are the following.

If we ſimply declare that we perceive any object, or that ſuch a thing is or will be, without any limitation or contigency, it forms what has been called the DECLARATIVE OR INDICATIVE MODE; as, *I write.*—Again, if we ſimply repreſent it to be within our *power*, or to depend upon our choice, it forms two other modes, which may be called the POTENTIAL, as, *I can write;* or the ELECTIVE, as, *I may write.*—In the ſame manner, if the ſpeaker repreſents himſelf, or any other object, as *determined* to perform any action, or as *compelled* to it, or as it is his *duty* to perform it; theſe form ſo many diſtinct modes, which may be called the DETERMINATIVE, as, *I will write*; the COMPULSIVE, as, *I muſt write*; and OBLIGATIVE, as, *I ſhould write.* But although each of theſe repreſents the ſpeaker as perceiving the agent under a different light with reſpect to the action; yet as all of them, except the indicative, agree in this, that however much they may repreſent it as the *duty* or *inclination*, &c. of the agent to perform any action with which they are aſſociated, yet as they are ſtill of the nature of contingents which may never take effect, they are frequently ſubjoined to any other verb; therefore the Latins have comprehended all of theſe under one mode which they have called the SUBJUNCTIVE. We only take notice of this circumſtance here, to ſhew, that however naturally *ſentences* may be diſtinguiſhed into modes, according to the different ſituation of the ſpeaker; yet as the whole order of the variation of words in the conjugation of a verb is merely arbitrary, thoſe who invent them may arrange them into what order they pleaſe, and call them by what names they may think moſt proper. But however they may vary the names or external arrangement, this does not affect the things themſelves. For by whatever name the *mode* may be known which comprehends the words expreſſive of theſe ſeveral meanings, the ſentences formed by theſe will be either *potential*, *obligative*, *compulſive*, &c. as above explained.

All theſe modes above mentioned only relate to the different *perceptions* of the ſpeaker. But as man is not only endowed with the powers of *perception*, but thoſe of *volition* alſo, he muſt have words to expreſs theſe; which forms another order of modes. As he is not only dependent himſelf, but has others depending upon him, he may *command*, *intreat*, *beg*, *pray*, *wiſh*, *inquire.*—Hence, therefore, ſo many different orders of modes, the IMPERATIVE, REQUISITIVE, PRECATIVE, OPTATIVE, INTERROGATIVE, *&c.* to which may be added the VOCATIVE. But although each of theſe diſplay a diſtinct affection of the ſpeaker, yet grammarians have allotted only one variation of their verb for all of theſe purpoſes, called the IMPERATIVE MODE; all the other volitions being expreſſed by this, or ſome other modes, by the help of particular contrivances, which are different in different languages.

With regard to that variation of the verb which relates to *time*, called TENSES: As an action or event may be repreſented as happening at any aſſignable period of time, it is neceſſary to divide that duration into certain parts, that we may be able to repreſent the different relations which events bear to one another with reſpect to this particular. The firſt and moſt obvious diviſion of time is into *preſent*, *paſt*, and *future*. But we may go farther ſtill in our diviſions of time. For as time paſt and future may be infinitely extended, we may in *univerſal time paſt* aſſume *many particular times paſt*, and in *univerſal time future many particular times future*, ſome more, ſome leſs remote, and correſponding to each other under different relations. Even *preſent time*, however, in ſtrict phyſical truth, it may be incapable of it, is by the power of the imagination brought to admit of theſe differences, and as neceſſarily implies *ſome degree of extenſion*, as every given line however minute: And hence it is not ſufficient for language to denote INDEFINITELY mere *paſt*, *preſent*, or *future* times; but on many occaſions to DEFINE with more preciſion what *kind* of *paſt*, *preſent*, or *future* is meant.

Tenſes, therefore, or thoſe variations of a verb which denote a difference of *time* only, may be all divided into PRESENT, PAST, and FUTURE; each of which may be ſubdivided into DEFINITE and INDEFINITE. The *definite*

definite tenses are those where the particular instant of time, whether present, past, or future, is pointed out. The indefinite are those where past, present, or future time is indicated in general, without confining it to a particular instant in either of these cases. These have been distinguished among grammarians by the name of AORISTS.—Thus when Milton makes Adam say,

Millions of spiritual creatures WALK *the earth,*
Unseen, both when we wake and when we sleep,

the verb WALK means not that they were walking at that instant only when Adam spoke, but *indefinitely* in any instant whatever. So likewise, when the same author calls hypocrisy,

—— *the only evil which* WALKS
Invisible except to God alone.

the verb WALKS has the like aoristical signification. *He* WENT, *he* FELL, are *aorists* of the past, as they do not specify any particular instant, but refer to past time in general. So likewise in the legislative sentences, *thou shalt not kill, thou shalt not steal, &c* the same aoristical meaning is perceived, as the prohibition does not relate to any *particular time future*, but is extended indefinitely to *every* time *future*.

But it is not sufficient for a language to denote time in this indefinite manner: it is necessary likewise that it should be capable of specifying any particular instant of time in an exact and definite manner. Thus, if, instead of the word WALK in the first sentence above quoted, we were to put ARE WALKING, it brings down the verb to denote a particular time, and specifies that these *spiritual creatures* are, at that very *instant* in which Adam speaks, walking upon the earth unseen. In like manner, in the second sentence, if the word WALKS were changed to IS WALKING, it denotes, that hypocrisy, at that *particular instant* in which the sentence was pronounced, was walking invisible upon the earth. And in the same manner, WAS WALKING, or WILL BE WALKING, each of them denote, that these energies *were* or *will be* exerted at a particular specified time. These, therefore, form so many distinct definite tenses, under whatever technical name these may be known.

Here then we see the use of that distinction of the different states of the verb, into the *verb properly so called*, and *participles*. For as the verb itself exhibits the word as altogether *indefinite*; when this is joined to its proper energizer, it forms all these INDEFINITE TENSES which our language requires. Thus, *I write, I did write, I will write, I may write, I can write, &c.* each of them, although they represent the attribute as united to the energizer in some *past, present*, or *future* time, do not specify any particular instant, and are therefore so many aorists or indefinite tenses. Whereas in the *participle* the attribute is represented as in a state of exertion, it necessarily follows, that if it be ever united to its energizer, it must point out the particular instant when that union took effect, and of consequence form as great a variety of DEFINITE TENSES as the verb forms of indefinite. Thus, *I am writing*, necessarily implies that I am actually exerting this particular energy at the *very instant* that I declare it. So likewise if I say *I was writing*, it indicates, that at one *particular instant* of past duration, to which this has a reference, I was actually employed in that particular occupation. This instant is generally fixed by some collateral circumstance; as, "upon the twentieth day of August last, at 12 o'clock, *I was writing*;" or, "when the thunder broke upon the tower in my neighbourhood, *I was writing*," *&c.* And the same may be said of future time; as, "to morrow at ten o'clock *I shall be writing*," *&c.* In all of which cases it is obvious, that a particular *now* or *instant* is pointed out, in which the attribute is represented as united to its proper energizer. We might here proceed to shew the various times that each of these different states of the verb might be made to indicate; the number of *tenses* that each mode admitted of; the several changes that might be produced by joining the *participle perfect* with any object; which cannot be here called the *energizer*, but the *subject*; for as the energy is by this participle represented as compleated, if it has any connection with any person, as the attribute cannot be affected by any energizer after it is compleated, it must of necessity affect the person, instead of being affected by it; and hence it is that the several variations produced by this participle perfect have been called the PASSIVE VOICE of the verb. But as all these particulars only relate to the construction of one particular language, it would lead us a great deal too far from the particular subject of which this article treats. We shall therefore only observe, that besides the above variations of the verb, which the Greeks and Romans have thought proper to make, the terms of which we have adopted; there are many others that they might with equal propriety have made, but which they rather chose to express by the help of other words called *adverbs* But some other languages have gone further in this respect, and endowed their verbal word with several variations to express several other circumstances than they do. This is particularly the case with the Hebrew language, which, besides the variation for gender above mentioned, has allotted certain other variations of its verb to express several other circumstances. Thus, PAKAD in that language signifies *he visited*; PAKEDA, *she visited, &c.* PIKKED, *he visited diligently*; HEPHKED, *he made him visit*; and HETHPEKED, *he visited himself*. In this manner is every verb in that language varied; and each of these different conjugations of their verb admits of a particular variation for the passive of each —Hence, therefore, the conjugation of a verb in that language admits of a great many variations which neither the Greeks nor Romans were acquainted with: for besides the distinctions of *modes, tenses, persons*, and *number*, they have divided their verb into so many distinct divisions to answer for these distinctions above mentioned, which they have denominated KAL, PIHEL, HIPHIL, and HITHPAHEL, with their passives NIPHAL, PUHAL, and HOPHAL; each of which admits of variations through all the *modes, tenses, persons, numbers*, and *genders* which any of their verbs admit of.

The only use which we meant to make of these observations on the Hebrew verbs, is this: That as the authors, who have formed their idea of grammar from the forms which the several parts of speech admit of in the Greek and Latin languages, have supposed that every variation which these languages admitted of was a natural and necessary part of language; and that therefore every language which did not admit of the same number of variations,

tions with theirs in every part of fpeech, was in fo far defective and incomplete. So, for the fame reafon, an author who had formed his idea of grammar upon the model of the Hebrew tongue, would as naturally fuppofe, that the feveral variations which the verb admitted of in his own favourite language, were effential and neceffary; and that, of confequence, every language which did not admit of as many variations was imperfect and incomplete. But to any one who confiders this matter with attention, it will appear, that there could be no end to thefe unneceffary difcuffions and groundlefs claims of fancied fuperiority: for if compound words have fuch an advantage over fimple, the Chinefe language, in which we are told almoft every fentence has a particular compound character to exprefs it, muft be by far the moft perfect in the world; but fo far is this from being the cafe, that every one allows it to be the moft imperfect and incomplete. The only method, therefore, which remains for us to confider this fubject is, to diregard every particular form of language, and confider the words in themfelves, as divefted of every extraneous circumftance, and obferve what variations they neceffarily require, allowing every particular language to compound thefe with one another in what manner they fhall think moft proper. It is in this manner we have confidered the verbal attributives, and endeavoured to difentangle them from thefe unneceffary fetters with which they have been loaded, and reftore them to their own original freedom.

Befides the variations above-mentioned, verbs have been diftinguifhed from one another in a different manner; the names and nature of which may be thus explained.

We have already feen, that all verbs, as they denote *energies*, neceffarily have reference to certain *energizing fubftances*. For, how could there be fuch energies as *to love*, *to fly*, *to wound?* &c. were there not fuch beings as *men*, *birds*, *fwords*, &c. Farther, every energy not only requires an energizer, but is neceffarily converfant about fome fubject. For example, if we fay, *Brutus loves*, we muft needs fupply—loves *Cato*, *Caffius*, or fome one. And thus it is, that every energy is neceffarily fituated between two fubftantives, an energizer which is *active*, and a fubject which is *paffive*. If the energizer leads the fentence, the energy has been faid to follow its character, and becomes what we call a VERB ACTIVE: thus we fay, BRUTUS AMAT, *Brutus loves*. On the contrary, if the paffive fubject be principal, it is faid to follow the character of this too, and becomes what we call a VERB PASSIVE: thus we fay, PORTIA AMATUR, *Portia is loved*. But in fome verbs it happens, that the energy *always keeps within the energizer*, and never paffes out to any extraneous fubject. Thus, when we fay, *Cæfar walketh*, *Cæfar fitteth*, it is impoffible that the energy *fhould pafs out*, becaufe both the *energizer* and the *paffive fubject* are united in the *fame perfon*. For what is the caufe of this walking or fitting? it is the *will* and *vital powers* belonging to *Cæfar:* and what is the fubject made fo to move or fit? it is the *body* and *limbs* belonging alfo to the fame *Cæfar*. This fpecies of verbs have been by grammarians diftinguifhed by the name of VERBS NEUTER, as if they were void both of *action* and *paffion*, when perhaps they may be rather faid to imply both. It is in this manner, that verbs have been diftinguifhed into the three claffes of *active*, *paffive*, and *neuter*. Thefe, however, might with more propriety be divided into two claffes, which might be called verbs TRANSITIVE, and NOT TRANSITIVE; the firft clafs including all thofe verbs which are ufually called *active*, with the *paffives* belonging to them; for it is evident, that thefe paffives are not verbs themfelves, but a variation only of a verb; and the fecond clafs including thofe verbs commonly called *neuter*.

Some languages, as the Greek and French, have another clafs of verbs, which are called by the firft VERBS MIDDLE, and by the laft RECIPROCAL VERBS; which are employed to denote that ftate of any tranfitive verb, when the energizer himfelf becomes the fubject; as thus, *Brutus killed himfelf*, &c. But as thefe only exprefs a flight variation of an accompaniment of a verb, they have no claim to be confidered as a diftinct fpecies.

II. Of ADJECTIVES.

ADJECTIVES are all thofe words which denote attributes whofe effence does not confift in motion or its privation: or, in other words, they are thofe words which denote the attributes of quantity, quality, and relation; fuch as, *many*, *few*, *great* and *little*, *black* and *white*, *good* and *bad*, *double*, *treble*, *quadruple*, &c.

As thefe attributes admit of no change of ftate, nor can be effected by the variations of time, or any other accident, but are in their own nature perfectly fixed and invariable, the words which exprefs them ought to be in all fituations and on all occafions the fame. For as the qualities *good* or *bad*, *black* or *white*, admit of no change in their own nature, whether they be applied to a *man*, to a *woman*, to *many*, or to *few*; neither ought the word which expreffes any one of thefe attributes in ftrictnefs to admit of any alteration, whether it be joined to one or other of thefe fubftantives. So that although in fome languages, from the particular conftruction of the other parts of fpeech, it has been found neceffary to endow their adjectives with the threefold diftinction of *gender*, *number*, and *cafe*; yet this muft only be confidered as an accidental variation occafioned by particular circumftances, and not in the leaft effential to language, but rather a deviation from the order of nature, which would require them to be kept invariably the fame in all cafes. This order, the Englifh language (which in this and almoft every other cafe is moft ftrictly conformable to the nature of things than any other language we are acquainted with) moft ftrictly obferves; as we fay equally, *a good man*, or *a good woman*, *a good houfe*; or *good men*, *good houfes*, &c.

It has probably been from obferving, that the adjectives in fome particular languages are endowed with variations conformable to the *gender*, *number*, and *cafe* of their fubftantives, that grammarians have been led into the ftrange abfurdity of ranging them with nouns, and feparating them from verbs; though with refpect to verbs they are pefectly homogeneous, and with refpect to nouns they are quite the contrary. Adjectives are homogeneous with refpect to verbs, as both forts denote *attributes;*

attributes; they are heterogeneous with respect to nouns, as *never properly denoting substances*.

Besides original adjectives, there is another class which are formed from substantives. Thus when we say, *the party of Pompey, the style of Cicero, the philosophy of Socrates*; in these cases, the party, the style, and philosophy spoken of, receive a stamp and character from the persons they respect, and actually pass into attributives, and as such assume the form of *adjectives*. And hence we say *the Pompeian party, the Ciceronian style*, and *the Socratic philosophy*. In like manner, for a trumpet of brass, we say, *a brasen trumpet*; for a crown of gold, *a golden crown*, &c. Even pronomial substantives admit the like mutation; as, instead of saying the book *of me, of thee*, or *of him*, we say, *my* book, *thy* book, *his* book, *&c*. Yet it must be acknowledged, that these, as they often serve rather to define a noun than to denote any quality appertaining it, they partake more of the nature of *articles* than *adjectives*; so that it is in many cases difficult to ascertain exactly to which class they are to be referred. But of this we have already taken particular notice, p. 713. col. 2. & 716. col. 2.

The nature of these variations of adjectives which have been called *degrees of comparison*, will be more properly explained under the following section.

Section II. *Of* Attributives *of the Second Order, called* ADVERBS.

As the attributives hitherto mentioned denote the *attributes* of *substances*, so there is an inferior class of them which denote the *attributes* only of *attributes*. To explain these by examples of either kind: when we say, "*Cicero* and *Pliny* were both of them *eloquent*; *Statius* and *Virgil* both of them *wrote*;" in these instances, the attributes *eloquent* and *wrote*, are immediately referable to the substantives *Cicero, Virgil*, &c.: As, therefore, denoting the *attributes of substances*, we call them ATTRIBUTIVES OF THE FIRST ORDER. But when we say, "*Pliny* was *moderately* eloquent, but *Cicero exceedingly* eloquent; *Statius* wrote *indifferently*, but *Virgil* wrote *admirably*:" in these instances, the attributives *moderately, exceedingly, indifferently*, and *admirably*, are not referable to *substantives*, but to *other attributes*; that is, to the words *eloquent* and *wrote*: As, therefore, denoting *atributes* of *attributes*, we call them ATTRIBUTIVES OF THE SECOND ORDER. These have been, by grammarians, called ADVERBS. And indeed, if we take the word VERB in its most comprehensive signification, as including all the words which denote the *attributes* of *substances*, (which was the sense in which Aristotle and many of the most ancient grammarians employed it) we shall find the name ADVERB to be a very just appellation, as denoting a *part of speech the natural appendage of verbs*. So great is this dependence in grammatical syntax, that an *adverb* can no more subsist without its *verb*, than a *verb* can subsist without its *substantive*.

Among the attributes of substances are reckoned quantities and qualities. Thus we say, *a white garment, a high mountain*, &c. Now some of these quantities and qualities are capable of *intension* and *remission*. Thus we say, *a garment* EXCEEDINGLY *white, a mountain* TOLERABLY OF MODERATELY *high*. Hence, then, one copious source of secondary attributives, or adverbs, to denote these two, that is, *intension* and *remission*; such as, *greatly, vastly, extremely, sufficiently, moderately, tolerably, indifferently*, &c.

But where there are different intensions of the same attribute, they may be *compared* together: thus, if the garment A be EXCEEDINGLY *white*, and the garment B be MODERATELY *white*, we may say, the garment A is MORE *white* than the garment B. In these instances, the adverb MORE not only denotes intension, but *relative intension*. Nay, we stop not here, as we not only denote intension *merely relative*, but *relative intension than which there is none greater*. Thus we not only say, the *mountain* A *is* MORE *high than the mountain* B, but that *it is the* MOST *high of all mountains*. Even *verbs*, properly so called, as they admit of *simple intensions*, so they admit also of these *comparative ones*. Thus, in the following example, *Fame he* LOVETH MORE *than riches, but virtue of all things he* LOVETH MOST; the words MORE and MOST denote the different *comparative intensions* of the verbal attribute *loveth*.

Hence the rise of COMPARISON of adjectives, and of its different *degrees*, which cannot well be more than the two species above-mentioned; one to denote *simple excess*, and one to denote *superlative*. Were we indeed to introdnce more degrees than these, we ought perhaps to introduce *infinite*, which is absurd. For why stop at a limited number, when in all subjects susceptible of intension the intermediate excesses are in a manner infinite? There are infinite degrees of *more white*, between the *first simple white*, and the superlative *whitest*; and the same may be said of *more* great, *more* strong, *more* minute, &c. The doctrine of grammarians about three such degrees of comparison, which they call the *positive*, the *comparative*, and the *superlative*, must be absurd; both because in their positive there is no comparison at all, and because their superlative is a comparative as much as their comparative itself. Examples to evince this may be met with every where; *Socrates was the* MOST WISE *of all the Athenians*; *Homer was the* MOST SUBLIME *of all poets*, &c.

The authors of language have in some instances contrived a way to retrench these comparative adverbs, by expressing their force by an inflection of the primary attributive. Thus, instead of *more fair*, they say, FAIRER; instead of *most fair*, FAIREST: and the same method of composition takes place both in the Greek and Latin languages; with this difference however between the genius of these languages and ours, that we are at liberty to form the comparison, either in the one method or the other: but in these languages, the comparison is almost never formed by the assistance of the adverb, but always by the inflection of the adjective; and hence this inflection is always considered by them as a necessary accident of the adjective. But this method of expressing the power of the adverb has reached no farther than to adjectives,

adjectives, or to their participles, which were ſo nearly allied to adjectives. Verbs were perhaps thought to be too much diverſified, to admit of more variations without perplexity.

Some qualities admit of compariſon, others admit of none: ſuch, for example, are thoſe which denote *that quality of bodies ariſing from their figure*; as, when we ſay, a *circular* table, a *quadrangular* court, a *conical* piece of metal, *&c.* The reaſon is, that a million of things participating the ſame figure, participate it *equally* if they do it at all. To ſay, therefore, that while A and B are both quadrangular, that A is more or leſs quadrangular than B, is abſurd. The ſame holds in all attributives denoting *definite quantities* of whatever nature. For, as there can be no *compariſon* without *intenſion* or *remiſſion*, and as there can be no intenſion and remiſſion in things *always definite*, therefore theſe attributives can admit of no compariſon. By the ſame method of reaſoning, we diſcover the cauſe why *no ſubſtantive is ſuſceptible of theſe degrees of compariſon.* A *mountain* cannot be ſaid MORE TO BE or TO EXIST than a *mole-hill*; nor the *lion* A cannot be *more a lion* than the lion B: but the *more* or *leſs* muſt be ſought for in their quantities or qualities; a mountain is *more bulky* than a mole-hill, and the lion A is *more fierce* than the lion B; the exceſs being always derived from their attributes.

Of the adverbs or ſecondary qualities already mentioned, thoſe denoting intenſion and remiſſion may be called adverbs of QUANTITY CONTINUOUS; *once*, *twice*, *thrice*, &c. are adverbs of QUANTITY DISCRETE; *more* and *moſt*, *leſs* and *leaſt*, to which may be added *equally*, *proportionally*, &c. are adverbs of RELATION. There are others of QUALITY; as when we ſay, HONESTLY *induſtrious*, PRUDENTLY *brave*, *they fought* BRAVELY, *he painted* FINELY, *&c.*

The adverbs hitherto mentioned, are common *to verbs of every ſpecies*; but there are ſome which are confined to *verbs* properly ſo called, that is to ſay, to ſuch as denote *motions* or *energies* with their *privations*. All *motion* and *reſt* imply *time* and *place* as a kind of neceſſary coincidence. Hence, if we would expreſs the *place* or *time* of either, we muſt needs have recourſe to adverbs formed for this purpoſe; of PLACE, as when we ſay, *he ſtood* THERE, *he went* HENCE, *he travelled* FAR, *&c.*; or of TIME, as when we ſay, *he ſtood* THEN, *he went* AFTERWARD, *he travelled* FORMERLY, *&c.* Should it be aſked, Why *adverbs of time*, when verbs have *tenſes?* The anſwer is, though tenſes may be ſufficient to denote the greater diſtinctions of time, yet to denote them all by tenſes would be a perplexity without end. What a variety of forms would be neceſſary to denote *yeſterday*, *to day*, *to-morrow*, *formerly*, *juſt now*, *now*, *immediately*, *preſently*, *ſoon*, *hereafter?* &c.

To theſe adverbs juſt mentioned may be added thoſe which denote the *intenſions* and *remiſſions peculiar to* MOTION, ſuch as *ſpeedily*, *haſtily*, *ſwiftly*, *ſlowly*, &c.; as alſo adverbs of *place* made out of *prepoſitions*, ſuch as *upward* and *downward*, from *up* and *down*. In ſome inſtances the prepoſition ſuffers no change, but becomes an adverb by nothing more than its application; as when we ſay, *he rides* ABOUT, *he was* NEAR *falling*, &c.

There are likewiſe adverbs of INTERROGATION; ſuch as, *where*, *whence*, *whither*, *how*, &c. of which there is this remarkable, that when they loſe their *interrogative power*, they aſſume that of a *relative*, ſo as to repreſent the *relative* or *ſubjunctive pronoun*; as in this doggerel tranſlation of a line from Virgil,

And corn doth grow WHERE *Troy town ſtood*;

that is to ſay, *corn groweth in that place* IN WHICH *Troy ſtood*, the power of the relative being implied in the adverb. It is in like manner, that the *relative pronoun* becomes an *interrogative*; as in this line from Milton,

WHO *firſt ſeduc'd them to that foul revolt?*

The reaſon of this is as follows: the *pronoun* and *adverbs* here mentioned are all, in their original character, RELATIVES. Even when they become interrogatives, they loſe not this character, but are ſtill relatives as much as ever: the difference is, that *without* an interrogation they have reference to a ſubject which is *antecedent*, *definite*, and *known*; *with* an interrogation, to a ſubject which is *ſubſequent*, *indefinite*, and *unknown*, and which it is expected the anſwer ſhould expreſs and aſcertain. WHO *firſt ſeduc'd them?* The queſtion itſelf ſuppoſes a ſeducer, to which, though *unknown*, the pronoun *who* has a reference—*Th' infernal ſerpent.* Here, in the anſwer, we have the ſubject, which was *indefinite*, *aſcertained*; ſo that we ſee WHO, in the *interrogation*, is as much a *relative* as if it had been ſaid originally, without any interrogation at all, *It was the infernal ſerpent* WHO *firſt ſeduced them*: and thus interrogatives and relatives mutually paſs into one another.

Having thus conſidered all thoſe parts of ſpeech which ARE SIGNIFICANT OF THEMSELVES, we proceed to thoſe AUXILIARY PARTS, which are ONLY SIGNIFICANT WHEN ASSOCIATED WITH OTHERS, which we have already ſaid are either DEFINITIVES or CONNECTIVES. Of which in their order.

CHAPTER III.

Concerning DEFINITIVES commonly called ARTICLES.

THE knowledge of man is at beſt but limited and confined. Although we have invented words to denominate almoſt all the ſubſtances which exiſt, yet as it is impoſſible for any perſon to be acquainted with all of theſe, it was neceſſary to fall upon ſome contrivance in language to obviate the difficulties which would ariſe from this cauſe. With this view, we have already ſeen, that ſubſtances have been diivded into general claſſes, each of which includes under it ſeveral leſſer ſubdiviſions; the names of which general claſſes, being but few, may be more eaſily retained, as *animal*, *edifice*, *motion*, &c. for by referring the ſeveral objects that we may accidentally ſee, and with which we are unacquainted, to the ſeveral claſs to which they may belong, we are in ſome meaſure enabled to communicate our ideas without the know-

ledge

ledge of the particular names. But as this particular object must in some manner be distinguished from others of the same class to which it belongs, a particular class of words was found necessary to define and ascertain these individuals, which has given rise to this order of words of which we now treat, and which we have called *definitives*, because they serve to *define and ascertain any particular object, so as to separate it from the general class to which it does belong, and, of course, denote its individuality*. The principal of these definitives have been usually called ARTICLES, the nature of which may be explained as follows.

Supposing I see an object with which I am totally unacquainted, having a head and limbs, and appearing to possess the powers of self-motion and sensation. If I know it not as an individual, I refer it to its proper species, and call it *a dog*, *a horse*, *a lion*, or the like; and if none of the names of any species with which I am acquainted fit it, I refer it to the genus, and call it *an animal*.

But this is not enough. The object at which we are looking, and want to distinguish, is perhaps an individual.—Of what kind? *Known* or *unknown?* Seen now *for the first time*, or *seen before* and now remembered? It is here we shall discover the use of the two articles A and THE; for the article A respects our *primary* perception, and denotes individuals as *unknown*; whereas THE respects our *secondary* perception, and denotes individuals as *known*. To explain this by an example, I see an object pass by which I never saw till then: What do I say? *There goes* A *beggar with* A *long beard*. The man departs, and returns a week after: What do I then say? *There goes* THE *beggar with* THE *long beard*. Here the article only is changed, the rest remains unaltered. Yet mark the force of this apparently minute change. The individual *once vague* is now recognised as *something known*, and that merely by the efficacy of this latter article, which tacitly insinuates a kind of *previous* acquaintance, by referring a present perception to a like perception already past. Hence therefore we see, that although the articles A and THE are both of them *definitives*, as they circumscribe the latitude of genera and species, by reducing them, for the most part, to denote individuals; yet they differ in this respect, that the article A leaves the individual itself *unascertained*, but the article THE *ascertains the individual also*, and is for that reason the more accurate definitive of the two. They differ likewise in this respect, that as the article A serves only to separate one particular object from the general class to which it belongs, it cannot be applied to plurals. But as the article THE serves to define objects, or refer to them as already known, without relation to number, or any other circumstances, it is applicable to both numbers indiscriminately, as well as nouns of every *gender*, without suffering any sort of change; for it is evident, that no variation of the nature of the noun can make any difference in those words which serve to define or denote a certain reference to them. So that although we find some modern languages which admit of a variation of their article, which relates to the gender of the noun with which it is associated, yet this cannot be considered as essential to this species of words: and so far is this from being an improvement to the language, that it only serves to perplex and confuse, as it always presents a particular idea of sex, where in many cases it is not in the least necessary.

Of all the parts of speech which may be considered as essential to language, there is none in which we find so many languages defective as in this. For we know of no language, except our own, which has the particular article A; and the Latin language has no word of the same import with the word THE. The reason of which deficiency is, that as other parts of speech may be so easily converted from their original meaning, and be made to assume the character of definitives, they have made some of these perform both of these offices; and as the article A only separates a particular object, and is therefore so nearly allied to a *numeral*, many languages, as the *French*, *Italian*, *Spanish*, and *German*, have made the numeral word ONE supply its office, while others, as the Greek, have denoted this particular object by a mere negation of the other article; and as the article THE agrees with pronouns in this respect, that they both *denote reference*, the Latins made their pronoun, by a forced periphrasis, supply the place of this. But all of these methods of supplying the want of the genuine article are defective, as will appear more particularly by and by.

As articles are by their nature definitives, it follows of course, that they cannot be united with such words as are in their own nature *as definite as they may be;* nor with such words which, *being indefinite, cannot properly be made otherwise*; but only with those words *which, tho' indefinite, are yet capable, through the article, of becoming definite*. Hence we see the reason why it is absurd to say THE I, or THE THOU, because nothing can make these pronouns more *definite* than they are; and the same may be said of proper names. Neither can we say THE BOTH, because these words are *in their own nature* each of them perfectly defined. Thus, if it be said, "I have read BOTH poets," this plainly indicates *a definite pair*, of whom some mention has been made already. On the contrary, if it be said, "I have read TWO poets," this may mean *any pair* out of all that ever existed. And hence this numeral, being in this sense *indefinite*, (as indeed are all others as well as itself,) is forced *to assume the article* whenever it would become *definite*. Hence also it is, that as TWO, when taken alone, has reference to some *primary* and *indefinite* perception, while the article THE has reference to some perception *secondary* and *definite*, it is bad language to say TWO THE MEN, as this would be *blending of incompatibles*, that is to say, of a *defined substantive* with an *undefined attributive*. On the contrary, to say BOTH THE MEN, is good and allowable; because the substantive cannot possibly be less apt, by being defined, to coalesce with an attributive which is defined as well as itself. So likewise it is correct to say, THE TWO MEN; because here the article, being placed at the beginning, *extends its power* as well through substantive as attributive, and equally tends to *define* them both.

As some of the words above admit of no article, *because*

cause they are by nature as definite as may be; so there are others which admit it not, *because they are not be defined at all.* Of this sort are all INTERROGATIVES. If we question about substances, we cannot say THE WHO IS THIS; but WHO IS THIS? And the same as to *qualities*, and both kinds of *quantities*: for we say, without an article, WHAT SORT OF, HOW MANY, HOW GREAT? The reason is, the article THE respects beings *already known*, and interrogatives respect beings *about which we are ignorant*; for as to what we know, interrogation is superfluous. In a word, the *natural associators with articles* are ALL THOSE COMMON APPELLATIVES WHICH DENOTE THE SEVERAL GENERA AND SPECIES OF BEINGS. It is these, which, by assuming a different article, serve either to explain an individual upon its first being perceived, or else to indicate, upon its return, a recognition or repeated knowledge.

But although proper names do not admit of the article, being in their own nature *definite*; yet as these often fall into *homonymic*, that is, different persons often go by the same name, it is necessary to distinguish these from one another, to prevent the ambiguity that this would occasion. For this purpose we are obliged to have recourse to *adjectives* or *epithets*. For example, there were two *Grecian chiefs* who bore the name of *Ajax*; and was it not without reason that *Mnestheus* uses *epithets*, when his intention was to distinguish the one from the other: "If both *Ajaxes* cannot be spared, (says he) "at least let mighty *Telamonian Ajax* come." But as epithets are in their own nature perfectly *indefinite*, seeing the same adjective may be applied to infinite subjects, it is necessary to define these when we want to apply them to any particular object; so that it is necessary to endow these with an article, that they may have a *reference to some single person only*. And thus it is we say, *Trypho* THE *grammarian*, *Appolodorus* THE *Cyrenian*, &c. It is with reason, therefore, that the article is here also added, *as it brings the adjective to an individuality as precise as the proper name.* Even common appellatives, by the help of an article, come to have the force of proper names, without the assistance of any epithet whatever. Thus, in English, *city* is a name common to many places, and *speaker* a name common to many men. Yet if we prefix the article, THE CITY means our metropolis; and the THE SPEAKER, a high officer in the British parliament. And hence, by an easy transition, the article, from denoting *reference*, comes to denote *eminence* also; that is to say, from implying an *ordinary* pre-acquaintance, to presume a kind of *general and universal notoriety.* Thus, among the Greeks, THE POET meant *Homer*, and THE STAGYRITE meant *Aristotle*; not but that there were many poets beside *Homer*, and many *stagyrites* besides *Aristotle*, but none equally illustrious.

The articles already mentioned are those strictly so called; but, besides these, there are the PRONOMIAL ARTICLES, such as *this*, *that*, *any*, *some*, *all*, *other*, *none*, &c. Of these we have already spoken in the chapter upon pronouns, where we have shewn when they may be taken as pronouns, and when as articles. Yet, in truth, if the essence of an article be to *define* and *ascertain*, they are much more strictly articles than any thing else, and ought to be considered as such in universal grammar. Thus, when we say, "THIS picture I approve, but THAT I dislike;" what do we perform by the help of these definitives, but bring down the common appellatives to denote individuals? So when we say, "SOME men are virtuous, but ALL men are mortal;" what is the natural effect of this ALL and SOME, but to define that *universality* and *particularity* which would remain indefinite were we to take them away? The same is evident in such sentences as these: "SOME substances have sensation, OTHERS want it; choose ANY way of acting, and SOME men will find fault, *&c.*" For here, SOME, OTHER, and ANY, serve all of them to *define* different parts of a given whole; SOME, to denote a *definite part*; ANY, to denote an *indefinite*; and OTHER, to denote the *remaining part*, when a part has been already assumed. Even the attributive pronouns, *my*, *thy*, *his*, *her's*, &c. are, in strictness, more properly articles than any thing else, seeing each of them serve only to define and ascertain the individual object to which they are applied. As when we say, "MY house is less commodious than YOUR'S; HER form is more elegant than HIS, *&c.*" For in these examples what do the words MY and YOUR'S do, but ascertain two individual *houses*; or the words HIS and HER'S, but ascertain two individual *forms*, which are compared with one another? In the same manner we have already seen nouns sometimes lay aside their own proper character, and become definitives, as in the words ALEXANDER'S, CÆSAR'S, POMPEY'S, *&c.* which may be said to form so many NOMIAL ARTICLES. But of these we have spoken so fully in the chapter of nouns, that it is unnecessary to say more of them in this place.

Before we leave this subject, we shall produce one example to shew the utility of this species of words; which, although of themselves insignificant, and seemingly of small importance; yet, when properly applied, serve to make a few general terms be sufficient for the accurate expression of a great variety of particulars, and thus makes language capable of expressing things *infinite*, without wandering into infinitude itself.——To explain this, let the general term be MAN, which I have occasion to employ for the denoting of some particular. Let it be required to express this particular, as *unknown*; I say, A *man*:—*Known*; I say, THE *man*:—*Definite*; A CERTAIN *man*:—*Indefinite*; ANY *man*:—*Present and near*; THIS *man*:—*Present and distant*; THAT *man*:—*Like like to some other*; SUCH *a man*:—*Different from some other*; ANOTHER *man*:—*An indefinite multitude*; MANY *men*:—*A definite multitude*; A THOUSAND *men*:—*The ones of a multitude, taken throughout*; EVERY *man*:—*The same ones, taken with distinction*; EACH *man*:—*Taken in order*; FIRST *man*, SECOND *man*, &c.—*The whole multitude of particulars taken collectively*; ALL *men*:—*The negation of that multitude*; NO *man*:—*A number of particulars present, and at some distance*; THESE *men*:—*At a greater distance, or opposed to others*; THOSE *men*:—*A number present and near*; THESE *men*:—*A number of individuals different from another number*;

ber; OTHER *men*:—*A great number of individuals taken collectively*; MANY *men*:—*A small number*; FEW *men*:—*A proportionally greater number*; MORE *men*:—*Smaller number*; FEWER *men*:—And so on we might go almost to infinitude. But not to dwell longer upon this article, we shall only remark, "that minute changes in PRINCIPLES, lead to mighty changes in EFFECTS; so that PRINCIPLES are well entitled to regard, however trivial they may appear.

CHAPTER IV.

Of CONNECTIVES.

CONNECTIVES, according as they connect either *sentences* or *words*, are called by the different names of CONJUNCTIONS, OR PREPOSITIONS. Of these names, that of the *preposition* is taken from a mere accident, as it commonly stands in connection before the part which it connects. The *conjunction*, as is evident, has reference to its *essential character*. We shall treat of these two separately.

Section I. *Of* CONJUNCTIONS.

A CONJUNCTION is *a part of speech void of signification itself, but so formed as to help signification, by making* TWO *or more significant sentences to be* ONE *significant sentence*. As, therefore, it is the *essence* of a conjunction to *connect sentences*; at the same time that they do this, they must either *connect* their *meaning* or *not*. For example, let us take these two sentences, *Rome was enslaved,—Cæsar was ambitious*, and connect them together by the conjunction BECAUSE; *Rome was enslaved*, BECAUSE *Cæsar was ambitious*. Here the *meanings*, as well as the *sentences*, appear to be connected. But if I say, *manners must be reformed*, OR *liberty will be lost*; here the conjunction OR, though it join the sentences, yet, as to their respective *meanings*, is a perfect *disjunctive*. And thus it appears, that though all conjunctions *conjoin sentences*, yet, with respect to the *sense*, some are CONJUNCTIVE, and others are DISJUNCTIVE.

Those *conjunctions which conjoin both sentences* and their meanings are either COPULATIVES OF CONTINUATIVES. The principal copulative in *English* is AND. The continuatives are much more numerous; IF, BECAUSE, THEREFORE, WHEREFORE, HENCE, THAT, &c. The difference between these is this: The *copulative* does no more than barely *couple* sentences, and is therefore applicable to all subjects whose natures are *not incompatible*: *Continuatives*, on the contrary, by a more intimate connection, consolidate sentences *into one continuous whole*; and are therefore applicable only to subjects which have an *essential coincidence*: For example, it is no way improper to say, *Lysippus was a statuary*, AND *Priscian a grammarian*; *the sun shineth*, AND *the sky is clear*; because these are things that may co-exist, and yet imply no absurdity. But it would be absurd to say, *Lysippus was a statuary*, BECAUSE *Priscian was a grammarian*; though not to say, *the sun shineth* BECAUSE *the sky is clear*. The reason is, with respect to the first, the *co-incidence* is merely *accidental*: with respect to the last, it is *essential*, and founded in nature.

As to the *continuatives*, they are SUPPOSITIVE, such as *if*; or POSITIVE, such as *because, therefore, as, &c.* Take examples of each:—*You will live happily* IF *you live honestly*:—*You live happily* BECAUSE *you live honestly*:—*You live honestly*, THEREFORE *you live happily*. The difference between these *continuatives* is this: The *suppositives* denote *connection*, but do not assert actual existence; the *positives* imply both the *one* and the *other*.

These *positives* above-mentioned are either CASUAL, such as *because, since, as, &c.* or COLLECTIVE, such as *therefore, wherefore, &c.* The difference between which is this: The *casuals* subjoin *causes* to *effects*; "*the sun is in ecclipse* BECAUSE *the moon intervenes*:" The *collectives* subjoin *effects* to *causes*; "*the moon intervenes*, THEREFORE *the sun is in eclipse*." We therefore use *casuals* in those instances where the *effect* being conspicuous we seek for its *cause*; and *collectives*, in demonstrations and science, properly so called, where the *cause* being first known, by its help we discern *effects*.

All these *continuatives* are resolvable into *copulatives*: For, instead of saying, BECAUSE *it is day, it it is light*; we may say, *It is day*, AND *it is light*. Instead of IF *it is day, it is light*; we may say, *It is at the same time necessary to be day*, AND *to be light*. The reason is, That the power of the *copulative* extends to all connections, as well to the *essential* as to the *casual*. Hence the continuative may be resolved into a *copulative and something more*; that is to say, into a *copulative* implying an *essential* coincidence in the subjects conjoined.

As to *casual conjunctions*, we may further observe, that there is no one of the four species of causes which they are not capable of denoting. For example, *the* MATERIAL *cause*; *The trumpet sounds*, BECAUSE *it is made of metal*. *The* FORMAL; *The trumpet sounds*, BECAUSE *it is long and hollow*. *The* EFFICIENT; *The trumpet sounds*, BECAUSE *an artist blows it*. *The* FINAL; *The trumpet sounds*, THAT *it may rouse our courage*. It is worth observing, that the three first causes are expressed by the strongest affirmation; because, if the *effect* actually be, that must be also. But this is not the case with respect to the last, which is only affirmed as a thing that *may* happen. The reason is, That however this may be the end which set the artist first to work, it may still be beyond his power to obtain, and which, like all other contingents, may either happen or not. Hence also it is connected by a particular conjunction, THAT, absolutely confined to this *cause*.

We now come to the DISJUNCTIVE CONJUNCTIONS; a species of words which bear this contradictory name, because, while they DISJOIN *the sense*, they CONJOIN *the sentences*.

With respect to these, we may observe, that as there is a principle of UNION diffused through all things by which THIS WHOLE is kept together and preserved from dissipation; so there is, in like manner, a principle of DI-

VERSITY diffused through all, the source of *distinction*, of *number*, and of *order*. Now, it is to express in some degree the *modifications of this diversity*, that DISJUNCTIVE CONJUNCTIONS seem at first to have been invented.

Of these *disjunctives*, some are SIMPLE, some ADVERSATIVE. *Simple*; as when we say, EITHER *it is day*, OR *it is night*:—*Adversative*; as when we say, *It is not day*, BUT *it is night*. The difference between these is, that the *simple* do no more than *merely* disjoin; the *adversative* disjoin with a concomitant *opposition*. Add to this, that the *adversative* are *definite*; the *simple indefinite*. Thus, when we say, *the number three is not an even number*, BUT *an odd*; we not only *disjoin* two opposite attributes, but we *definitely* affirm one, and deny the other. But when we say, *the number of the stars is* EITHER *even* OR *odd*; though we assert one attribute *to be*, and the other *not to be*, yet the alternative is notwithstanding left *indefinite*.

As to *adversative disjunctives*, it has been already said, that they imply OPPOSITION. Now, there can be no opposition of the *same* attribute in the *same* subject; as when we say, *Nereus was beautiful*: but the opposition must be either of the *same* attribute in different subjects, as when we say, "*Brutus* was a *patriot*, BUT *Cæsar* was not;" or of *different* attributes in the *same* subject, as when we say, "*Gorgius* was a *sophist*, BUT not a *philosopher*;" or of *different* attributes in *different* subjects, as when we say, "*Plato* was a *philosopher*, BUT *Hippias* was a *sophist*." The conjunctions used for all these purposes may be called *absolute* adversatives.

But there are *other* adversatives besides these; as when we say, "*Nereus* was more beautiful THAN *Achilles*;—*Virgil* was AS great a *poet* AS *Cicero* was an *orator*." The character of these latter is, that they go farther than the former, by marking not only *opposition*, but that *equality* or *excess* which arises from the comparison of subjects; and therefore they may be called *adversatives of comparison*.

Besides the adversatives here mentioned, there are two other species, of which the most eminent are UNLESS and ALTHOUGH: For example, "*Troy* will be taken, UNLESS the *Palladium* be preserved; *Troy* will be taken, ALTHOUGH *Hector* defend it." The nature of these adversatives may be thus explained. As every *event* is naturally allied to its *cause*, so, by parity of reason, it is opposed to its *preventive*; and as every cause is either *adequate* or *inadequate*, (inadequate, when it endeavours, without being effectual), so in like manner is every *preventive*. Now, *adequate* preventives are expressed by such adversatives—as UNLESS: "*Troy* will be taken, UNLESS the *Palladium* be preserved;" that is, that this alone is *sufficient* to prevent it. The *inadequate* are expressed by such adversatives as ALTHOUGH: "*Troy* will be taken, ALTHOUGH *Hector* defend it;" that is, *Hector*'s defence will prove *ineffectual*. These may be called adversatives ADEQUATE and INADEQUATE.

Before we leave this subject, we may observe, that the words *when* and *where*, and all others of the same nature, such as *whence*, *whether*, *whenever*, *where-ever*, *&c.* may be called ADVERBIAL conjunctions; because they participate the nature both of adverbs and conjunctions; of *conjunctions*, as they *conjoin* sentences; of *adverbs*, as they denote the attributes either of *time* or *place*. And these *adverbial* conjunctions (contrary to the character of *accessary* words, which have strictly no signification but when associated with other words) have a kind of *obscure* signification when taken alone, by denoting these attributives of time and place. And hence it is, that they appear in grammar like *zoophytes* in nature, a kind of middle beings, of amphibious character, which, by sharing the attributes of the higher and the lower, conduce to link the whole together.

Section II. *Of those* Connectives, *called* PREPOSITIONS.

A PREPOSITION *is a part speech devoid itself of signification, but so formed as to unite two words that are significant and that refuse to coalesce of themselves.* This connective power (which relates to words only, and not to sentences) will be better understood by the following observations.

Some things naturally coalesce and unite of *themselves*, while others refuse to do so *without help*, and as it were by compulsion. For example, all quantities and qualities coalesce immediately with their substances: thus it is we say, *a fierce lion*, *a vast mountain*, &c. In like manner actions coalesce with their agents, and passions with their patients: thus it is we say, *Alexander conquers*, *Darius is conquered*. Nay, as every energy is a kind of medium between its agent and patient, the whole three, agent, energy, and patient, coalesce with the same facility; as when we say, *Alexander conquers Darius*. Farther than this, as the greatest part of attributives themselves may be characterised, as when we say of such attributives as *ran*, *beautiful*, *learned*, &c. "he ran *swiftly*, she was *very* beautiful, he was *moderately* learned," *&c.* these must readily coalesce with the attributes which they thus characterise. From all which it appears, that *those parts of speech unite of themselves in grammar whose original archetypes unite of themselves in nature*. Hence, therefore, it is, that although substances naturally coincide with their attributes, yet they absolutely refuse doing so one with another: and hence those known maxims in physics, that *body is impenetrable*, that *two bodies cannot possess the same place*, &c.

From these principles it follows, that when we form a sentence, the substance without difficulty coincides with the verb, from the natural coincidence of substance with energy; *the* SUN WARMETH: so likewise the energy with the subject on which it operates; WARMETH *the* EARTH: so likewise both substance and energy with their proper attributes; *the* SPLENDID SUN GENIALLY WARMETH *the* FERTILE EARTH. But suppose we are to add other substantives, as, for instance, *air*, or *beams*; how could these coincide, or under what character be introduced? not either as the *energizer* of the verb, nor as *the subject on which it operates*; for both of these places are already filled up, the first by the word SUN, and the last by the substance EARTH: not as *attributes* to these last, or to any other thing; for attributes by nature

ture they neither *are* nor *can be made*. Here, then, we perceive the rise and use of *prepositions*: by these we connect those substantives to sentences, which, at the time, are unable to *coalesce of themselves*. Let us assume, for instance, a pair of these connectives, THROUGH and WITH, and mark their effect upon the substances here mentioned; *the splendid sun* WITH *his beams genially warmeth* THROUGH *the air the fertile earth*: the sentence, as before, remains entire and one; the substantives required are both introduced, and not a word which was there before is displaced from its proper station.

It must be here observed, that *most* if not *all* prepositions seem originally formed to denote the relations of *place*; because this is that grand *relation* which *bodies* or *natural substances* maintain at all times to one another, whether they are contiguous or remote, whether in motion or at rest: thus we have prepositions to denote the *contiguous relation of body*; as when we say, *Caius walked* WITH *a staff*; *the statue stood* UPON *a pedestal*; *the river ran* OVER *a precipice*: others for the *detached relation*; as when we say, *he is going* TO *Italy*; *the sun is risen* ABOVE *the hills*; *these figs came* FROM *Turkey*: So as to *motion* and *rest*; only with this difference, that here the preposition varies its character with the verb: thus if we say, *that lamp hangs* FROM *the ceiling*, the preposition FROM assumes the character of *quiescence*: but if we say, *that lamp is falling* FROM *the ceiling*, the preposition assumes a character of *motion*. So in Milton;

——*To support uneasy steps*
OVER *the burning marle*——

Again,

——*He with looks of cordial love*
Hung OVER *her enamour'd.*——

In the first of these examples, OVER denotes *motion*, and in the last it denotes *rest*.

But though the original use of prepositions was to denote the relations of *place*, they could not be confined to this office only; but by degrees extended themselves to subjects *incorporeal*, and came to denote relations as well *intellectual* as *local*. Thus because, in *place*, he who is *above* has commonly the advantage of him who is *below*, we transfer OVER and UNDER to *dominion* and *obedience*: of a king we say, *he ruled* OVER *his people*; of a common soldier, *he served* UNDER *such a general*: so too we say, WITH *thought*; WITHOUT *attention*; *thinking* OVER *a subject*; UNDER *anxiety*; FROM *fear*; OUT OF *love*; THROUGH *jealousy*, &c. All which instances, with many of the like kind, shew, that the *first words* of men, like their *first ideas*, had an immediate reference to *sensible objects*; and that, in after days, when they began to discern with their *intellect*, they took these words which they found already made, and transferred them, by *metaphor*, to *intellectual conceptions*. There is indeed no method to express new ideas, but either by *metaphor*, or by *coining new words*; both which have been practised by philosophers, according to the nature and exigence of the occasion.

In the foregoing use of prepositions, we have seen how they are employed by way of *juxta-position*; that is to say, where they are prefixed to a word without becoming a part of it: but they may be also used by way of *composition*; that is, they may be prefixed to a word so as to become a part of it: thus, to UNDER*stand*, to FORE*tell*, to OVER*act*, to UNDER*value*, to OUT*go*, &c. are so many distinct words formed by prepositions joined intimately with some other word: in all which cases, the prepositions commonly transfuse something of their own meaning into the word with which they are compounded; and this imparted meaning, in most instances, will be found resolvable into some of the relations of *place*, as used either in its *proper* or *metaphorical* acceptation.

BESIDES the above parts of speech, there is another, which cannot be comprehended under any of the foregoing classes, called INTERJECTIONS: of this kind are the words, AH! ALAS! FIE! *&c.* *This species of words coincide with no part of speech, but are either uttered alone, or else thrown into a sentence, without altering its form either in syntax or signification.* It may be therefore objected, that as we say, that all language is divided into the several parts above enumerated, and this class cannot be comprehended in any of these divisions; of course, the analysis that we have made cannot be just, because it does not comprehend the whole. To this objection it may be answered, that the language of which we have been treating, is that which has been formed by mutual compact, for the purposes of reasoning and speculation; that besides this artificial language, man, like every other sensitive animal, is endowed with a natural language, by which he can express any strong sensation. This language does not owe its characteristical expression to the arbitrary form of articulation; but derives its whole force from the tone of voice, and modification of countenance and gesture: and of consequence these tones and gestures express the same meaning without any relation to the articulation which they may assume, and are therefore universally understood by all mankind. Now, *interjection* is the name by which we distinguish these natural expressions: these cannot be properly called words, or parts of speech; but certain adventitious sounds, or voices of nature, expressing those passions and natural emotions which spontaneously arise in the mind upon the view or narrative of interesting events. We must, therefore, still conclude, that all language properly so called is composed of *words*, all of which may be arranged into the several classes above-mentioned; and as a recapitulation of the whole that we have said, we subjoin the following table, which presents at one view the several classes and subdivisions of words.

GRAMMONT, a town of the Auftrian Netherlands, in the province of Flanders, fituated on the river Dender: E. long. 3° 50′, and N. lat. 50° 55′.

GRAMPOUND, a borough-town of Cornwal, thirty-eight miles fouth-weft of Launcefton: W. long. 5° 25′, and N. lat. 50° 20′. It fends two members to parliament.

GRAMPUS, in ichthyology. See DELPHINUS.

GRANADA, a province of Spain, bounded by Andalufia on the north, by Murfia and the Mediterranean on the eaft, by the fame fea on the fouth, and by Andalufia on the weft.

GRANADA, the capital city of the provine of Granada in Spain, fituated two hundred miles fouth of Madrid: W. long. 3° 40′, and N. lat. 37° 15′.

GRANADA, a province of Terra Firma, in South America, bounded on the north by the provinces of Carthagena and St Martha, on the eaft by Zeneguela, by Popoyan on the fouth, and by Darien on the weft.

GRANADA, a city of Mexico, in North America, fituated on the fide of the lake Nicaragua: W. long. 89°, and N. lat. 11° 8′.

GRANADA is alfo the moft foutherly of the Caribbee-iflands, fituated one hundred and fifty miles fouth-weft of Barbadoes: W. long. 61° 30′, and N lat. 12° 15.

GRANADIER, a foldier armed with a fword, a firelock, a bayonet, and a pouch full of hand-granadoes. They wear high caps, are generally the talleft and brifkeft fellows, and are always the firft upon all attacks.

Every battalion of foot has generally a company of granadiers belonging to it, or elfe four or five granadiers belong to each company of the battalion; which, on occafion, are drawn out, and form a company of themfelves. Thefe always take the right of the battalion.

GRANADILLA. See PASSIFLORA.

GRANADILLOS, fome of the Caribbee-iflands, fituated between the ifland of St Vincent and Granada; but fo inconfiderable, that no nation has thought them worth poffeffing.

GRANADO, a hollow ball or fhell, of iron or other metal, about two inches and a half in diameter; which, being filled with fine powder, is fet on fire by means of a fmall fufee, faftened to the touch-hole, made of the fame compofition as that of a bomb: as foon as the fire enters the fhell, it burft into many pieces, much to the damage of all that ftand near.

GRANARY, a building to lay or ftore corn in, efpecially that defigned to be kept a confiderable time.

Sir Henry Wotton advifes, to make it look towards the north, becaufe that quarter is the cooleft and moft temperate. Mr Worlidge obferves, that the beft granaries are built of brick, with quarters of timber wrought in the infide, to which the boards may be nailed, with which the infide of the granary muft be lined fo clofe to the bricks, that there may not be any room left for vermin to fhelter themfelves. There may be many ftories one above another, which fhould be near the one to the other; becaufe the fhallower the corn lies, it is the better, and more eafily turned.

GRAND JURY, in Englifh law, is the jury who find bills of indictment before juftices of peace and goal-delivery, or of oyer and terminer, *&c.* againft any offenders that may be tried for the fact.

GRANDE, a branch of the river Niger in Africa, which difcharges itfelf into the Atlantic ocean, in 15° W. long. and 11° N. lat.

GRANDE, is alfo a river of Brafil, in the province of Del Rey, in South America, which difcharges itfelf into the Atlantic ocean, in 51° W. long. and 32° S. lat.

GRANDEE, a defignation given to a nobleman of Spain or Portugal.

The grandees are fuffered to be covered before the king, who treats them like princes, ftyling them Illuftrious, in his letters; and in fpeaking to them, or of them, they are ftyled Eminences.

GRANDENTZ, or GRAUDENTZ, a city of Poland, forty-two miles fouth of Dantzick: E. long. 19°, and N. lat. 53° 30′.

GRANDPRE, a town of Champaign, in France, thirty miles eaft of Rheims: E. long. 4° 56′, and N. lat. 49° 18′.

GRANICUS, a little river near the Hellefpont, in the Leffer Afia, where Alexander fought the firft battle with the forces of Darius.

GRANITE, in natural hiftory, a diftinct genus of ftones, compofed of feparate and very large concretions rudely compacted together; of great hardnefs, giving fire with fteel, not fermenting with acids, and flowly and imperfectly calcinable in a great fire.

Of this genus there are three fpecies: 1. The hard white granite, with black fpots, commonly called moor-ftone: this is a very valuable kind, confifting of a beautiful congeries of very varioufly conftructed and differently coloured particles, not diffufed among or running in one another, but each pure and diftinct, though firmly adhering to whichever of the others it comes in contact with, and forming a very firm mafs: it is much ufed in London for the fteps of public buildings, and on other occafions where great ftrength and hardnefs are required. 2. The hard red granite, variegated with black and white, and common in Egypt and Arabia. 3. The pale whitifh granite, variegated with black and yellow. This is fometimes found in ftrata, but more frequently in loofe nodules, and is ufed for paving the ftreets.

GRANIVOROUS, an appellation given to animals which feed on corn or feeds. Thefe are principally of the bird-kind.

GRANT, in law, a conveyance in writing of fuch things as cannot pafs or be conveyed by word only; fuch are rents, reverfions, fervices, *&c.*

GRANTHAM, a borough-town of Lincolnfhire, twenty-two miles fouth of Lincoln. It fends two members to parliament.

GRANVILLE, a port-town of Normandy, from whence the noble family of Carteret take the title of earl.

GRANULATED, fomething that has undergone granulation. See the next article.

GRANULATION, according to Cramer, is the reducing

cing metals to ſmall particles, in order to promote their fuſion and mixture with other bodies.

GRAPE, the fruit of the vine. See VINE.

GRAPHOMETER, a mathematical inſtrument, otherwiſe called a ſemi-circle, the uſe of which is to obſerve any angle whoſe vertex is at the centre of the inſtrument in any plane (though it is moſt commonly horizontal, or nearly ſo), and to find how many degrees it contains. See GEOMETRY, p. 696. and Plate XCV. fig. 14.

GRAPNELS, a ſort of anchors with four flooks, ſerving for boats to ride by.

There is alſo a kind called fire and chain grapnels, made with four barbed claws inſtead of flooks, and uſed to catch hold of the enemy's rigging, or any other part, in order for boarding them.

GRASS, in botany, &c. a name given to ſeveral diſtinct plants; as, the agroſtis, or couch graſs; the briza, or quaking-graſs, &c. Under the term graſs are alſo comprehended all manner of herbaceous plants ſerving for the food of cattle, as clover, ryegraſs, &c.

GRASSHOPPER, in zoology. See GRYLLUS.

GRATIOLA, in botany, a genus of the diandria monogynia claſs. The corolla is irregular; the capſule has two cells; and the calix conſiſts of ſeven leaves. There are four ſpecies, noneof them natives of Britain.

GRATZ, a city of Germany, and capital of the duchy of Stiria, ſixty-five miles ſouth of Vienna: E. long. 15° 55′, and N. lat 47° 20′.

GRAVE, in muſic, is applied to a ſound, which is of a low or deep tone.

GRAVE, in geography, a ſtrong city of the Netherlands, in the province of Dutch Brabant, eight miles ſouth of Nimeguen: E. long. 5° 45′, N. lat. 51° 50′.

GRAVEL, in natural hiſtory and gardening, a congeries of pebbles, which, mixed with a ſtiff loam, makes laſting and elegant gravel walks; an ornament peculiar to our gardens, and which gives them the advantage over thoſe of other nations.

GRAVEL, in medicine. See MEDICINE.

GRAVESEND, a port-town of Kent, ſituated on the ſouthern ſhore of the river Thames, twenty miles eaſt of London.

GRAVINA, a city and biſhop's ſee of the kingdom of Naples, twenty-ſeven miles ſouth-weſt of Barri: E. long. 17°, and N. lat. 41°.

GRAVITATION. See MECHANICS.

GRAVITY. See MECHANICS.

Specific GRAVITY. See HYDROSTATICS.

GRAY, in geography, a city of Franche Compte in France, twenty-two miles north-weſt of Beſançon: E. long. 5° 32′, N lat. 47° 30′.

GREASE, a ſwelling and gourdineſs of the legs of a horſe. See FARRIERY.

GREECE, the preſent Rumelia, and the ancient Hellas, is ſituated between 20° and 26° E. long and between 36° and 44° N. lat.

It reaches from the Adriatic ſea eaſtward to the Archipelago, and is generally a healthy and fruitful country.

GREEK, or GRECIAN, any thing belonging to ancient Greece.

The Greek language, as preſerved in the writings of the celebrated authors of antiquity, as Homer, Heſiod, Demoſthenes, Ariſtotle, Plato, Xenophon, &c. has a great variety of terms and expreſſions, ſuitable to the genius and occaſions of a polite and learned people, who had a taſte for arts and ſciences.

GREEK BIBLE. See BIBLE.

GREEK CHURCH. See CHURCH.

GREEK MONKS and NUNS, of whatever order, conſider St Baſil as their founder and common father, and eſteem it the higheſt crime to deviate in the leaſt from his conſtitutions. There are ſeveral beautiful convents with churches, in which the monks perform divine ſervice day and night. Some of the monks are cœnobites, or live together, wear the ſame habit, eat at the ſame table, and purſue the ſame exerciſes and employments.

GREEN, one of the original colours, exhibited by the rays of light. See OPTICS.

GREEN, among painters. See BOTANY, p. 634.

Gamboge will give five or ſix ſorts of green with verdigreaſe. But the yellow, which ſome prefer before all others, is made of French berries; which is either deeper or fainter, according as the liquor is more or leſs ſtained by them. In like manner, a yellow, drawn from the roots of the barberry or mulberry, will anſwer the ſame purpoſe, being mixed with tranſparent verdigreaſe. As to verdigreaſe itſelf, it produces a fine bluiſh green, flows readily in the pencil, and may even ſerve as an ink to write with; but is ſubject to decay. Mountain-green is uſed for a graſs colour. Verditer is a light green, ſeldom uſed but to colour landſkips that ſeem afar off. Sap-green is dark and dirty, and therefore never uſed but to ſhadow over greens in the darkeſt places. Copper-green is an excellent tranſparent and ſhining graſs-green, if thickened in the ſun ſhine, or over a gentle fire. It is the moſt uſed of any green in waſhing of prints or maps.

GREEN-CLOTH, a board, or court of juſtice, held in the compting-houſe of the king's houſhold, compoſed of the lord ſteward, and officers under him, who ſit daily. To this court is committed the charge and overſight of the king's houſhold in matters of juſtice and government, with a power to correct all offenders, and to maintain the peace of the verge, or juriſdiction of the court royal; which is every way about two hundred yards from the laſt gate of the palace where his majeſty reſides.

It takes its name, *board of green cloth*, from a green cloth ſpread over the board where they ſit.

Without a warrant firſt obtained from this court, none of the king's ſervants can be arreſted for debt.

Clerks of the GREEN CLOTH, are two officers of the board of green-cloth, who appoint the diet of the king and his houſhold; and keep all records, ledgers and papers relating thereto; make up bills, parcels and debentures for ſalaries, and proviſions and neceſſaries for the officers of the pantry, buttery, cellar, &c.

They

They alſo wait upon foreign princes when entertained by his majeſty.

Green finch, in ornithology, the Engliſh name of the greeniſh fringilla, with the wings and tail variegated with yellow. See Fringilla.

GREEN-HOUSE, or conſervatory, a houſe in a garden contrived for ſheltering and preſerving the moſt tender and curious exotic plants, which, in our climate, will not bear to be expoſed to the open air during the winter ſeaſon. Theſe are generally large and beautiful ſtructures, equally ornamental and uſeful.

GREENLAND, or *Weſt* Greenland, extends from the meridian of London to 50° W. long. and from 60° to 80° N. lat.

The Danes have ſome colonies here, and pretend to the property of the whole. However, the Dutch make very free with the fiſhery on this coaſt, notwithſtanding the repreſentations and even menaces of the Danes on that head.

GREENWICH, a town of Kent, ſituated on the ſouthern ſhore of the Thames, five miles eaſt of London; remarkable for its royal and magnificent hoſpital, erected for decayed or diſabled ſeamen who have ſerved their country, and for its palace and moſt delightful park.

On the top of a ſteep hill in the park, ſtands the royal obſervatory, built by Charles II. and furniſhed with all manner of inſtruments for aſtronomical obſervations, and a deep dry well for obſerving the ſtars by day.

GREGARIOUS, among zoologiſts, a term applied to ſuch animals as do not live ſolitary, but in herds, flocks, or coveys.

GREGORIAN calendar, that which ſhews the new and full moon, with the time of Eaſter, and the moveable feaſts depending thereon, by means of epacts, diſpoſed through the ſeveral months of the Gregorian year. See Astronomy, p. 490.

Gregorian year. See Astronomy, p. 490.

GRENOBLE, a city of France, capital of Dauphiny, forty-five miles ſouth-eaſt of Lyons, and thirty-ſix miles ſouth-weſt of Chamberry: E. long. 5° 28′, and N. lat. 45° 12′.

GRENOCK, or Greenock, a port-town of Scotland, near the mouth of the river Clyde; being the principal ſtation for the herring-fiſhery.

GREWIA, in botany, a genus of the gynandria polyandria claſs. The calix conſiſts of five leaves; the petals are five; at the baſe of each petal there is a nectariferous ſcale; and the berry has four cells. There are two ſpecies, none of them natives of Britain.

GREY, or Gray, a mixed colour partaking of the two extremes, black and white.

GRIFFON, in heraldry, an imaginary animal, feigned by the ancients to be half eagle and half lion; by this form they intended to give an idea of ſtrength and ſwiftneſs joined together, with an extraordinary vigilance in guarding the things intruſted to its care. Thus the heathen naturaliſts perſuaded the ignorant, that gold mines were guarded by theſe creatures with incredible watchfulneſs and reſolution.

GRIMPERG, a city of Germany, in the circle of the Lower Rhine, and earldom of Triers: E. long. 6° 35′, N lat. 49° 40′.

GRIMSBY, a borough and port-town of Lincolnſhire, ſituated at the mouth of the Humber: E. long. 4′, N. lat. 53° 34′. It ſends two members to parliament.

GRINDING, the reducing hard ſubſtances to fine powders.

Method of Grinding *optic glaſſes*. Mr Huygens directs, in general, to make the breadth of the concave tool, plate, diſh, or form, in which an object-glaſs muſt be ground, almoſt three times the breadth of the glaſs. Though in another place he ſpeaks of grinding a glaſs whoſe focal diſtance was 200 feet, and breadth 8¼ inches, in a plate only fifteen inches broad. But for eye-glaſſes, and others of leſſer ſpheres, the tools muſt be broader in proportion to the breadth of theſe glaſſes, to afford room enough for the motion of the hand in poliſhing. Mr Huygens made his tools of copper, or of caſt braſs, which, for fear they ſhould change their figure by bending, can hardly be caſt too thick: however, he found by experience, that a tool fourteen inches broad, and half an inch thick, was ſtrong enough for the forming glaſſes to a ſphere of thirty-ſix feet diameter; when the tool was ſtrongly cemented upon a cylindrical ſtone an inch thick, with hard cement made of pitch and aſhes.

In order to make moulds for caſting ſuch tools as are pretty much concave, he directs, that wooden patterns ſhould be turned in a lathe, a little thicker and broader than the tools themſelves; but for tools that belong to ſpheres above twenty or thirty feet diameter, he ſays it is ſufficient to make uſe of flat boards turned circular to the breadth and thickneſs required. When the plates are caſt, they muſt be turned in a lathe exactly to the concavity required; and for this purpoſe it is requiſite to make a couple of braſs gages in the manner following, according to the directions of Mr Molyneux.

Take a wooden pole, a little longer than the radius of the ſpherical ſurface of the glaſs to be formed; and through the ends of it ſtrike two ſmall ſteel points, at a diſtance from each other equal to the radius of the ſphere intended; and by one of the points hang up the pole againſt a wall, ſo that this upper point may have a circular motion in a hole or ſocket made of braſs or iron, fixt firmly to the wall. Then take two equal plates of braſs or copper, well hammered and ſmoothed, whoſe length is ſomewhat more than the breadth of the tool of caſt braſs, whoſe thickneſs may be about a tenth or a twelfth of an inch, and whoſe breadth may be two or three inches. Then having faſtened theſe plates flat againſt the wall in a horizontal poſition, with the moveable point in the pole, ſtrike a true arch upon each of them. Then file away the braſs on one ſide exactly to the arch ſtruck, ſo as to make one of the braſs edges convex, and the other concave; and to make the arches correſpond more exactly, fix one of the plates flat upon a table, and grind the other againſt it with emery. Theſe are the gages to be made uſe of in turning the braſs tools exactly to the ſphere required.

GRINDSTEAD, or *East* GRINDSTEAD, a borough-town of Suffex, twenty-four miles directly fouth of London, which fends two members to parliament.

GRIPSWALD, a town of Germany, in the circle of Upper Saxony, and province of Swedifh Pomerania, fituated on a bay of the Baltic fea: E. long. 13° 40′, N. lat. 54° 15′.

GRISONS, allies of Switzerland; their country is almoft of a circular form, about fixty miles over every way, and is bounded on the north by Tyrol and part of Switzerland; on the eaft, by Tyrol and Trent; on the fouth, by Italy; and by the Swifs cantons on the weft.

GRIST, in country-affairs, denotes corn-ground, or ready for grinding.

GROATS, in country-affairs, oats after the hulls are off, or great oat-meal.

GROCERS, anciently were fuch perfons as engroffed all merchandize that was vendible; but now they are incorporated, and make one of the companies of the city of London, which deals in fugar, foreign fruits, fpices, *&c.*

GROENLAND, or SPITZBERGEN, a cold miferable country without inhabitants, and with very few animals or vegetables, fituated between 10° and 30° E. long. and between 77° and 82° N. lat.

GROGRAM, a kind of ftuff, made of filk and mohair.

GRONINGEN, the capital of a province of the fame name, which makes one of the feven united provinces: E. long. 6° 40′, N. lat. 53° 20′.

GRONOVIA, in botany, a genus of the pentandria monogynia clafs. The petals are five, inferted along with the ftamina into a bell-fhaped calix; and the berry is dry, contains one feed, and fituate below the flower. There is but one fpecies.

GROOM, a name particularly applied to feveral fuperior officers belonging to the king's houfehold, as groom of the chamber, groom of the ftole. See STOLE, and WARDROBE.

GROOM is more particularly ufed for a fervant appointed to attend on horfes in the ftable.

GROOVE, among miners, is the fhaft or pit funk into the earth, fometimes in the vein, and fometimes not.

GROOVE, among joiners, the channel made by their plough in the edge of a moulding, ftyle, or rail, to put their pannels in, in wainfcotting.

GROSS-BEAK, in ornithology. See LOXIA.

GROSSULARIA. See RIBES.

GROTESQUE, or GROTESK, in fculpture and painting, fomething whimfical, extravagant, and monftrous; confifting either of things that are merely imaginary, and have no exiftence in nature; or of things fo diftorted, as to raife furprize and ridicule.

GROTSKA, a city of Silefia, and capital of a duchy of the fame name, thirty miles fouth of Breflaw: E. long. 17°, N. lat. 50° 40′.

GROTTO, a large deep cavern or den in a mountain or rock.

Of thefe we find feveral remarkable ones in different parts of the world. The moft celebrated one of our own country, is that called Ookley-hole, on the fouth fide of Mendip hills. Its length is about two hundred yards, and its height various; being in fome places very low, and in others eight fathoms. There is another at Puzzoli, about four leagues from Naples, called the Dog's Grotto; becaufe a dog thrown into it is immediately killed, by a deftructive vapour equally fatal to all animals within its reach. The milky grotto, *crypta lactea*, about a mile from the ancient village of Bethlehem, is faid to have been thus called from the holy virgin's letting fall fome drops of her milk in it; on which account the earth of this cavern has been fuppofed to poffefs the virtue of reftoring womens milk.

GROTTO is alfo ufed for a fmall artificial edifice made in a garden, in imitation of a natural grotto.

The outfides of thefe grottos are ufually adorned with ruftic architecture, and their infide with fhell-work, coral, *&c.* and alfo furnifhed with various fountains, and other ornaments.

The following is recommended as a good cement for grotto-work. Take two parts of white rofin, melt it clear, add to it four parts of bees-wax; when melted together, add fome flower of the ftone you defign to cement, two or three parts, or fo much as will give the cement the colour of the ftone; to this add one part of the flower of fulphur: firft incorporate all together over a gentle fire, and afterwards knead it with your hands in warm water. With this faften the ftones, fhells, *&c.* after they are well dried, and warmed before the fire.

GROVE, in gardening, a fmall wood impervious to the rays of the fun.

Groves are not only great ornaments to gardens, but are alfo the greateft relief againft the violent heats of the fun, affording fhade to walk under in the hotteft parts of the day, when the other parts of the garden are ufelefs.

GROUND, in agriculture, is much the fame with earth or foil. See AGRICULTURE, p. 50.

GROUND-IVY, in botany. See GLECHOMA.

GROUND-PINE, in botany. See TEUCRIUM.

GROUP, in painting and fculpture, is an affemblage of two or more figures of men, beafts, fruits, or the like, which have fome apparent relation to each other.

GROUSE, or GROWSE. See TETRAO.

GRUBS, in medicine, certain unctuous pimples arifing in different parts of the face, but chiefly in the alæ of the nofe.

GRUBBING, in agriculture, the digging or pulling up the ftubs and roots of trees.

GRUBENHAGEN, a town and caftle of Lower Saxony, and duchy of Brunfwic, remarkable for its mines of filver, copper, iron, and lead: E. long. 9° 36′, and N. lat. 51° 45′.

GRUME, in medicine, denotes a concreted clot of blood, milk, or other fubftance. Hence grumous blood is that which approaches to the nature of grume, and by its vifcidity, and ftagnating in the capillary veffels, produces feveral diforders.

GRUMOSE *roots*, fuch as are knotty, and faftened to one head, like thofe of celandine and anemonies.

GRUS, in ichthyology. See ARDEA.

GRYLLUS, in zoology, the name of the cricket and locust kind, which, together with the grasshoppers, make only one genus of insects, belonging to the order of hemiptera: the characters of which are these: the antennæ are setaceous and filiform; the exterior wings are membranaceous, narrow, and have much of the appearance of the wings of some of the fly kind; the thorax is compressed and angulated; and the legs are formed for leaping. There are no less than 64 species. See Plate LXXXVI. fig. 3. 4. 5.

GRYPHITES, in natural history, an English CROW'S STONE, an oblong fossile shell, very narrow at the head, and becoming gradually wider to the extremity, where it ends in a circular limb; the head or beak of this is very hooked or bent inward.

GUADALAJARA, a city of Mexico, in North America, and the capital of Guadalajara, or New Galicia: W. long 108°, and N. lat. 20° 45′.

GUADALAVIAR, a river of Spain, which rises in the province of Arragon, and runs south-east through the province of Valencia, falling into the Mediterranean a little below the city of Valencia.

GUADALAXARA, a city of Spain, in the province of New Castile, twenty eight miles north-west of Madrid: W long. 2° 50′, and N. lat. 40° 40′.

GUADALUPE, one of the largest of the Caribbee-islands, eighty miles north of Martinico, subject to France: W. long. 61°, and N. lat. 16° 30′.

GUADIANA, a river of Spain, which rises in the middle of New Castile, and running through Estremadura, enters Portugal; where, passing through the provinces of Alentejo and Algarva, it discharges itself into the Atlantic ocean.

GUADILBARBAR, a river of Africa, which rises in the mountains of Atlas, runs through the kingdom of Tunis, and falls into the Mediterranean sea near Bona.

GUADILQUIVIR, a river of Spain, which rises in the mountains of Segura in New Castile, runs the whole length of Andalusia, and passing by Cordova and Seville falls into the Atlantic ocean at St Lucar.

GUADIX, a city of Spain, in the province of Granada: W. long 3°, and N. lat. 37° 15′.

GUAJACUM, in botany, a genus of the decandria-monogynia class. The calix consists of five unequal segments; the petals are five, and inserted into the calix; and the capsule is angular, and has from three to five cells. There are three species, all natives of the Indies.
